Laser cutting process is well suitable process for the cutting applications of high strength temperature resistant alloys, that are very difficult to cut with conventional process. Moreover, the lasers are widely using now-a-days for variety of cutting operations in many varieties of industries. Because of its complex nature of its operation, it is not easy to control so as to get the desired quality of cut in case of laser beam cutting process. This necessitates the importance of research to be carried out on the various processes i.e cutting, drilling, and welding etc by using the laser apparatus. The research mainly concentrated on the conduction of experiments i.e the cutting operation on Haste alloy C276 with CO2 laser beam. Total 31 trails are done using the CO2 laser beam apparatus. Laser power, speed, gas pressure and focal distance were the parameters chosen to vary. The outputs measured are surface roughness and the burr height which are direct measure to the quality of the cut surfaces. Two dimensional plots are plotted and analyzed the reasons for the increase or decrease of output with either the increase or decrease of input process parameters. Also, 3D plots are plotted to know the interactions.

Key words: Laser Machining / Cutting process / Haste alloy C278 / Process variables / Output responses

Abstract

In railways the damage of rails at the joints due to heavy load transport has been a common issue for the last few years. To overcome this problem to some extent in this project, the projects will try to reduce dynamic vibration at rail joints. In this project, we will compare the frequencies of conventional rail pad in railways with the EPDM (Ethylene Propylene Diene Monomer) material-based pads with different layers at rail joints in railway track. EPDM rubber exhibits very good mechanical properties which last for long period. All the frequencies will be recorded with the help of vibration meter which consists of the sensor. The behavior of the track is also finding with the analysis tool (ANSYS – harmonic analysis).The main motto of this project is to Analysis of Vibration Attenuation at Rail Joints with Dynamic Vibration Absorber by Using EPDM Rubber. The Attenuation of dynamic vibration will be found through the collection of data from the rail with vibration meter and those values are utilized for harmonic analysis. The final output will be giving us how effectively EPDM rubber pads will optimize and sustain under the dynamic vibration in

rails. This project is helpful in the future scope of railways, vibration reduction mechanisms and other sectors.

Introduction

Railway is seen as a means of environmental-friendly transportation by providing clean and efficient mass transit. However, problems arising by the railway transportation become public, technical and administrative concern. The predominant source of noise from railway is related with the rolling of wheel on the rail. The rail track roughness on the wheel causes vibration and the structure radiates noise. Rail tracks are equipped with rail pads which are underneath the rail.(See Table 2.1 Table 2.2).

The following Fig. 1.1 shows the typical ballast railway track. It consists of ballast and sub-ballast underneath, concrete sleepers; the two rails fasten to the sleepers. It also includes sub-grade which gives support to the track from deformation.

The rail fastener is equipped with rail clip, rail insulator, rail pad and rail shoulder which is shown in Fig. 1.2. Rail pad is insulated between concrete sleeper and the steel rail. Rail pad is a provision of comforting element between the steel rail and concrete surface. All together are finally fastened to the sleeper. The main function of rail fastener is to give firm stiffness to the rail and transfer the dynamic progressive frequencies from rail to sleeper.

The concrete sleepers are the barriers that transfer high frequencies forces from rail to the ballast. It acts as an insulator between the rails. The vibrations are reduced from rail to ballast through sleepers.

Vincent N et al. [1] explained theoretical optimization of track components to reduce rolling noise. For the noise from the track, it has been shown that the stiffness of the rail pads, located between the rail and sleepers, has a strong influence on the levels of noise. It controls the balance of the vibration response of the rail and sleeper and the rate of decay of vibration along the rail.

Thompson DJ et al. [2] explained about track dynamic behavior at high frequencies, theoretical models and laboratory measurements. A track model is used in which the rail is represented as a Timoshenko beam on a continuous spring–mass–spring foundation representing the rail pad, sleeper and ballast.

Nashif ADet al. [3] discussed in addition, a number of test samples of 0.15m lengths of rail were assembled with the absorber using the different materials. These were tested to

ensure that the expected tuning frequencies were obtained in practice.

Cremer Let al. [4] explained in frequency response measurements on a 4m length of rail, the modes of the finite length can be clearly seen in the response at low frequencies, whilst the decay along the length of the 4m section is small. A procedure is therefore required based on measuring the modal damping (expressed as a damping loss factor) and converting this to an equivalent decay rate.

Hay et al. [5] found that the majority of the track failures and maintenance cost are ascribed to the track substructures (especially ballast and sub grade). These have raised the concern to observe static and dynamic behaviors of the substructure whereas many theories and methods have been developed.

Ford et al. [6] Determined how systems comprising a concrete sleeper, rail section, and rail pads respond to vibration. In a laboratory, a sleeper was embedded in ballast contained by a wooden box on a concrete floor. The tests were done using an electro-dynamic shaker to excite the top surface of the rail in the frequency of 0–1000Hz.
From the literature, it is revealed that many studies have been carried out for the dynamic behavior of the railways and is mainly depending on the railway track which analyzes the frequencies of the track. The problem statement is to evaluate the modal analysis and harmonic response to the rail structure and by using EPDM rubber material. The vibrations can be reduced by using absorber material in rails. To study the dynamic frequencies of rail in various cases in the modal analysis is the present objective of this work. To analyze the dynamic parameter at the rail joints with single-layer HDPE pad, single and double-layer EPDM pad. To compare the results of the dynamic frequencies responses and also receptance at the rail joints cross section along with selected rubber material to HDPE from the experimental data.

Modal 1: I-cross-section of rail

The dimensional data is taken from standards of Indian Railways. The most common rail sections used in Indian railways are 52 kg and 60 kg rail. This I-cress section is used in modal analysis for design. The rail track structure is modeled by using Solid Edge 2020 software and the model is analyzed. In this model, EPDM pads are used in the place of HDPE pads in the rail track. The cross-section of rail track I-section is shown in Fig. 2. …

Modal analysis on rail

The rail model is created in Solid Edge 2020 in pact module (Fig. 4.) the cross-section is created in sketch module shown in Fig. 5. Pad operation is done to extrude the cross-section. The rail length of is 3000 mm, web and flange lengths are 150 mm and 97 mm, flange thickness is 22 mm and web thickness is 16.5 mm which is shown in Fig. 6. …

Experimental readings

Placement of single layer EPDM pad in railway track in Fig. 12. The minimum frequency range exhibits 90 Hz and maximum frequency of 1112 Hz is shown in the graph of Fig. 13. Mean frequency value in single layer EPDM pad is 499.21 Hz.

Harmonic response is generated in HTC VB − 8205 Software, RS-232 USB Cable is used as data transmission cable in between system and vibration meter shown in Table 3.1.

The total deformation is done; the modal is set to harmonic response. The minimum frequency is …

Results and discussion

Vibrations which are occurred by the contact of the rail wheel and track makes the vehicle initiates dynamic loading by using railway track structure. In this work modal analysis and experimental work is done for HDPE rubber pads, single layered EPDM pads and double layered EPDM pads. Three types of modals are created in Solid Edge 2020 and modal analysis. The dimensions and materials have taken from literature review and present analysis results are compared. Absorbers arrangement considered …

Conclusions

The EPDM rubber material has high resistance to dynamic forces and shows effective nature than other rubber pads.

Based on the experimental work following conclusions are drawn.

i) The dynamic frequency of welded rails with HDPE pads is having 1190Hz mean value. Whereas, the dynamic frequency of rail track with single- and double-layers EPDM pad their mean values are 499Hz and 335Hz respectively. …

ii) The experimental values clearly show that single- and double-layers EPDM pad dynamic frequencies are …

…

Future scope

The EPDM rubber that has chosen has high mechanical and thermal properties to withstand high frequencies compared to other rubber pads. The performance of rubber material, elastomeric materials may be the only choice in critical sensitive locations. The specifications of ballast materials structures include dynamic stiffness requirements for the intended frequency range over which vibrations isolation is desired. The rubber chosen for reducing the vibrations in the rail track having the minimum …

Abstract

The present technology, composites are playing an important role in industrial application as well as human applications. Natural fibers provide better features and advantages than synthetic fibers. The naturally reinforced polymer matrix composites are familiar with the exploration of lightweight, degradable, durable materials. This paper mainly focuses on the preparation of sample specimens according to ASTM standards with help of corn powder which is collected by refining the corn tree stem part along with reinforcements by using the hand-layup method. Perform mechanical tests like tensile, compression, and Izod impact tests on prepared specimens to draw the mechanical properties and analyze the mechanical behavior of composition factors. The DoE (Design of Experiments) is to draw the input parameters, and Grey relational analysis and Principal component analysis are used for finding the weights of process parameters. By analyzing the results it is observed that the most significant parameter carried out at ABS-12%, Guar Gum-12%, and CMC-8% with

values 0f compression strength is 80.48 MPa, Tensile strength is 60.45 MPa, and Izod Impact strength is 0.276 Joules.

Introduction

In recent days due to the increase in environmental effects [1] most industries and individuals are more concerned about polymer-based composite materials [2]. Polymer-based materials are made up of natural organic fillers [3] which are eco-friendly and recyclable and are also termed Green Composites [4]. This makes polymer-based composite materials one of the major research areas. Natural composites are more effective because of their biodegradability, general availability, and recyclability [5]. Specific properties of regular fiber composite [6] are lightweight, low cost, inexhaustible, and high strength. These composites exhibit better mechanical behaviour [7] under various loading conditions. The plant fibers can also be utilized in various methodologies for improving the lattice structure and can also mix with recyclable lattice materials like polyester, epoxy, etc.

The flexural modulus of a composite can be improved by utilizing extruder fibers [8]. As these fibers are treated with salt, it has a high concentration of salt. Normal plant fibers can also be utilized to build up a mix with non-biodegradable lattice material like unsaturated polyester, and epoxy tar. Most of the researchers are as used different bio-degradable polymers such as fiber in a different orientation, banana woven [9] sisal [10], saw dust [11] along with reinforcements like coconut fiber, and shell-type materials which are made up of natural materials. The strengths of these polymers are has improved with these different bio-degradable materials in different proportions. Based on the above literature I have chosen a plants base material that is eco-friendly with an objective to enhance its strength. The chosen material is mixed with various polymers in different proportions and is tested for strength, compression, and impact tests.

Workflow

The flow chart as shown in Fig. 1. describes the step-by-step procedure followed to obtain the optimum process parameters.

Define the quality characteristics: It defines the inherent characteristic of product, each characteristic distinguished product future. The characteristic of the product depends on several parameters such as usability, function ability, availability, portability, reliability and maintainability.

Find the noise factors: Generally, most of the researchers considered noise …

Compression and tensile tests

The specimen sizes and prepared specimens are shown in Fig. 2 and Fig. 3. The electronic tensiometer as shown in Fig. 4(a) is a versatile and compact bench model horizontal testing machine [2], [4] with capacity of 20KN. The specimen was mounted in the grips of an electronic tensiometer model PC-2000 with a 10mm gauge length. In this mini universal tensile testing machining is popularly used for testing tensile, compression, shear, and flexural properties of various materials. The tests were …

Scanning electron Microscopy(SEM)

SEM is a mature technology that is used widely in various scientific applications. In the field of materials metallurgy, SEM is a strong tool. It operates in a high vacuum environment. The essential premise is that a suitable source such as a tungsten filament or field emission cannon produces an electron beam. The electron beam is accelerated by a high voltage (i.e., 10–30 KV) and is passed through a series of apertures and electromagnetic lenses to produce a thin beam of an electron, which …

Grey relational Analysis(GRA) and principal components Analysis(PCA)

The grey relational analysis theory was developed and implemented by Deng. Most of the researchers carried out the weights of the performance characteristics considered as substitute relative weights which were helpless to get optimum results by a selection of individual decision using GRA.

In this case, GRA with principal component analysis (PCA) helps to draw the optimized process parameters. Based on the original data which come from basic analysis with help of

independent principal …

GRA and PCA

There are several steps involved in Grey Relational Analysis(GRA) with PCA to carry out the weights for respective optimized process parameters.

Step 1:Find out the Signal to noise ratio(SNRA) values for corresponding responses drawn from various tests as shown in Table 2.

When Small value is the high-quality parameter then follow Eq. (1),

$$\eta = -10\log_{10}\left(\frac{1}{n}\right)\sum_{i=1}^{n}\frac{1}{y_{ij}^2}$$

When Larger value is the high-quality parameter then follow Eq. (2),

$$\eta = -10\log_{10}\left(\frac{1}{n}\sum_{i=1}^{n}y_{ij}^2\right)$$

If not (i.e, Nominal the better) use this …

Comparative study

The Fig. 9 represents the comparative study between present and past/proposed work. By the observing data it can be stated that there is consider improvement in the compression strength and tensile strength. …

Conclusion

The mechanical behavior of corn powder reinforced composites is studied under variation in compositions. The experimental results validate that the strength of composite materials used in this paper has increased when compared with polymeric resin in terms of tensile and compression strengths and also shows a considerable improvement in Izod impact tests. Grey relational analysis(GRA) and PCA are applied to optimize the process parameters for tensile, compression, and Impact tests.

Abstract

The fiber composite plays a vital role in various applications in the current scenario. Natural fibers provide the desired advantages over synthetic fibers. Fiber composites deliver the exploration of durable, degradable, and lightweight materials. In several industrial sectors, transportation of materials from one place to another place is required. Materials like thermocoal boxes and iron boxes are inefficient in strength, weight, and cost. In order to overcome these, natural fiber-based composites, which give both strength and durability with low weight and cost, are chosen. This work explains the sample preparation using Arhar powder with an addition of reinforcements using the hand lay-up method by obeying the ASTM standards. To analyze the performance of the sample specimen, properties evaluated like Compression, Flexural, and other tests were conducted. GRA (Grey-Relational Analysis) with PCA (Principal-Component Analysis) was employed to carry out the most significant parameters, the most significant factor, and the weights of optimal parameters. Based on the output responses, it is experiential that the most effective parameter and best combination factor at Acrylonitrile butadiene styrene (ABS-4%), Guar Gum (8%), and Carboxy methyl cellulose (CMC-8%) with the values of 83.12 MPa compression strength, 61.70 MPa tensile strength and 0.249 joules of Impact strength.

Abstract

Cooling storage devices are most important to store food items, medicines, etc. For long-term applications so that only we have designed these devices. Nowadays, we are using refrigerators to store food items and medicines, but due to these devices, the environment will be affected, because these are releasing harmful gases like Hydrofluorocarbon (HFCs) and chlorofluorocarbons (CFCs). Due to these gases, human respiratory will be affected, to prevent this defect thermoelectric module is used to produce cold temperatures as well as hot, it is worked based on the principles of both Peltier and Seebeck effect. Peltier module having semiconductor-based materials is thermally and electrically connected in parallel and series, respectively. By using this module to create the cooling device, we are able to shield the environment from the toxic gases that the refrigerator releases into the air. But this module never releases any harmful gases and never interferes with the human respiratory system, which is the only reason we were brought here. The TEC module had be chosen depending on calculations of passive heat load and the temperature that the cooling chamber must reach. Following the TEC's construction, cooling and discharge operations are tested both with and without the use of phase change material. The values are graphically depicted and tabulated. To find the multi-objective optimal solution, the value with the highest grey relatively grade is employed in the analysis and is regarded as the best option. Here, renewable energy source is used as an input power. In our solar system, solar energy is one of the abundant sources of renewable energy on the earth's surface.

Vacuum transportation is envisioned as a futuristic method with the merits of ultra-high-speed in a low-pressure environment to address the rising demand for high-speed transportation. The Hyperloop is a novel concept involving traveling in capsules within a partially evacuated tube at transonic speeds. The study focuses on determining the effects of changes in physical parameters of the capsule in the low-pressure environment by carrying out a Fluid-Structure Interaction (FSI) analysis. The results are obtained by employing a k-ε turbulence model based on Reynolds Averaged Navier Stokes (RANS), considering steady-state and three-dimensional conditions. An aerodynamic simulation of the capsule in a partially evacuated tube is performed using ANSYS 2020 at a system pressure of 100 Pa, a blockage ratio of 0.625, and a capsule speed of 300 ms^{-1}. The residual analysis determines that the solution converges, whereas the grid check shows that the final solution is mesh independent and throughout the domain; a negligible flow rate reaffirms the conservation of mass. The one-way FSI results show that maximum deformation is in the nose region where fluid initially interacts with the capsule, and the streamline aids in reducing the pressure. Therefore, FSI must be taken into account while modeling the Hyperloop capsule.

Topics

Newtonian mechanics, **Computer software**, **Computational fluid dynamics**, **Navier Stokes equations**, **Transonic flows**

Abstract

Aluminum alloy is a common material used in various engineering projects due to its exceptional properties. Due to its exceptional mechanical properties, composites are becoming more popular.Metal Matrix Composites (MMC) showing better properties than aluminium alloy by the addition of reinforcements such as Al2O3, SiC, BC and BN. Due to this, the machining of these materials becomes difficult by conventional methods of machining and there is a need of developing alternate machining practices. WEDM (Wire Electrical Discharge Machining) is one type of non-traditional forms of cutting that was intended for machining harder materials. The various independent variables considered in this investigation are pulse on duration (Ton), pulse off duration (Toff) to study the effects of these variables on various performance indicators, such as surface roughness, material

removal rate. Multiple Regression Analysis was adopted to analyze the relationship between the various process variables and the consequent desired output attributes.

Introduction

Modern manufacturing industries expect components to be produced with higher quality and with fewer resources, and they have enabled the existence of materials with an unusual combination of properties that traditional materials can never achieve. The visible composite materials are primarily used in the manufacture of automobile components, aerospace, and a variety of engineering applications. As previously stated, industries require components with a high load carrying capacity, an excellent combination of high strength and hardness, corrosion resistance, fatigue and wear resistance, the ability to weld and forge, and the ability to machine and cast. As a result, there is a need to meet the demand for more extensive applications of those materials with better and improved properties [1], [2]. The need for lightweight materials with improved properties and a higher strength-to-weight ratio is becoming increasingly important in a wide range of engineering applications. Metal Matrix Composites (MMC) are one of the materials that are enticing customers due to their properties such as lightweight and stability in higher temperature environments. MMC's are used in the manufacture of components for automobiles and aerospace industries. Composite material uses in aerospace applications [3], [4], [5], [6], [7], [8].

MMCs have superior mechanical properties that are not present in traditional metals and alloys used in structural, aerospace, and automotive applications. Aluminium alloys have a significant presence in structural materials due to their easy application and manufacturing properties. However, due to their poor heat and wear resistance, conventional aluminium alloys are not fully suitable in some applications, such as aerospace. To overcome such unfavourablebehaviours, the properties of aluminium alloys are improved by adding appropriate reinforcement particulates to create MMCs. [9], [10], [11].

Stir casting is one of the simplest composite preparation methods, and it results in good dispersion of the created composites.One of the most common methods used for making composite materials is stir casting because of its flexibility and capability of uniform distribution of reinforcements, stir casting is preferred for fabricating composites. This process results in good dispersion of the finished product. Due to their various properties, such as their strength and stiffness, MMCs are becoming more popular, due to the increasing number of investigations on the proposed approach [12], [13], [14], [15], [16], [17], [18], [19].

MMC development is progressing toward Hybrid MMC, which has more than one reinforcement and will help to make materials with improved properties, particularly in aluminium base materials. The application of these newly developed composites is expanding to include pistons, shafts, and bicycle frames. Aluminium oxide/silicon carbide reinforcement can be used to make connecting rods, and the reinforcement selection is also dependent on the applications where the material will be used for various uses such as nuclear parts, electronics appliances, and medical equipment [20], [21]. These materials are commonly used in the manufacture of connecting rods and other components. Most of the HMMCs are composed of silicon carbide and alumina. This makes them ideal for a wide range of automotive applications. One of the most commonly used non-metal reinforcements in the production of HMMC is B4C. This material has attractive properties and is widely used in the manufacture of various components [22], [23], [24], [25].

The homogeneous distribution of the carbon layer in aluminum HMMC helps improve the wear resistance of the material. This is also beneficial for the mechanical properties of the product. Through the use of reinforcements, the manufacturing process can additionally increase the overall strength andmechanical properties of the material [26], [27], [28]. The impact of 'SiC' on the strength and hardness of a certain type of composite material is studied. It is found that the addition of reinforcements can improve the performance of the material [29], [30], [31], [32].

According to the existing literature, there is need on study of AHMMC that is reinforced with Al_2O_3 and BN which are to be fabricated by stir casting technique, because of its flexibility and capability of uniform distribution of reinforcements, stir casting is preferred for fabricating composites, that comprises of AA2024 as the matrix material aluminium alloy that has been used in various engineering applications such as manufacturing of aerospace components, automobile and marine applications as they possessed low density, higher strength-to-weight ratio, sufficient hardness, resistance to wear and corrosion. As per the literature survey, it was found that limited research is done on this alloyand Al_2O_3/BN as reinforcements in varied proportions. Also, the analysis on machinability investigations of fabricated AHMMC using WEDM needs much attention by considering the duration of 'T_{on}', 'T_{off}' and applied current as independent variables. In this present investigation, an endeavour has been taken to analyze the machinability of fabricated composite using Taguchi, regression and ANOVA approaches.

Materials and methods

The input process variables pulse on time (T_{on}) (s), pulse off time (T_{off}) (s), and peak current at three levels have been taken into account in our current investigation, as shown in Table 1. There is a need for more experimentation to reveal the significance of process factors at different levels. Taguchi's design and analysis technique is used to tackle these types of challenges. For performing and assessing process parameters with the fewest number of experimental runs, a unique type of …

Results and discussion

The objective of the study is to analyze the various factors that affect the performance of HMMC in different applications. In order to identify the most effective process variables that can improve the performance of the material AHMMC (AA2024+Al_2O_3+BN) WEDM, the researchers conducted a series of experiments as per L_{27}.

MRR is an important performance measure for evaluating the efficiency of an unconventional machining process. WEDM is one of the advanced material removal processes …

Conclusions

The current exploratory work comprises the fabrication of AHMMC reinforced with (AA2024+Al2O3+BN) as well as machinability investigations on AHMMC WEDM. Taguchi's method has been advocated for experiment planning and analysis. The following are the findings of the investigations:

- Taguchi's technique was engaged to arrange the experiments based on the chosen independent variables for WEDM of AHMMC. Taguchi's response analysis was adopted to establish the most favourable factors for improved …

ABSTARCT

Direct Metal Laser Sintering (DMLS) is an additive manufacturing process that uses a high-powered laser to selectively fuse metal powder particles to create fully dense metal parts layer by layer. The process is commonly used for producing complex and intricate metal components with high accuracy. Inconel 718 is a high-strength, corrosion-resistant nickel-based super alloy. It is one of the most widely used materials in demanding applications where high-temperature and extreme environment resistance is required. In present research work the IN718 samples are manufactured by using DMLS and modeled by using CAD as per ASTM Standards. The modeled samples were saved in STL file and fabricated by DMLS method in different orientations. To know the mechanical properties of additively manufactured INCONEL 718 samples by mechanical tests like Tensile, compression, impact wear and corrosion tests will be performed. The results obtained for both the set of samples fabricated in different orientations will be compared with the values of wrought or casted samples of INCONEL 718 alloy and determine the DMLS fabricated parts has good mechanical properties compared to casted samples of INCONEL 718.

Keywords: *Inconel 718, DMLS Process, Horizontal, Vertical, Tensile and Compression Strength, impact strength.*

1.0 INTRODUCTION:

To a large extent, the advantages of modern civilization can be attributed to the higher standard of goods that now have access to. The quality of goods can be improved through proper design, which takes into account both functional and manufacturing requirements. Products are made by converting raw materials into finished goods, which include the design and production of goods using a wide range of techniques and methods. Subtractive manufacturing and additive manufacturing are the two broad categories under which the manufacturing industry can be divided. Nickel superalloys as Inconel are materials widely used in the aerospace industry among others for diffusers, combustion chamber, shells of gas generators and other, exposed to high temperature and pressure [3].

1.1 HISTORY OF ADDITIVE MANUFACTURING

In the early 2000s, additive manufacturing (AM) became popular because of the idea of materials being combined. As an alternative, the term "subtractive manufacturing" was coined to refer to a broad range of machining methods in which material removal is the primary method of producing a finished product. However, in the views of the general public, 3D printing still meant mainly polymer technologies, and the name AM was more commonly associated with the metalworking industry than polymer, inkjet, or stereolithography enthusiasts. Despite its invention in 1950, inkjet technology was the least known and, due to its complexity, was also the most misunderstood [6].

1.2 DIRECT METAL LASER SINTERING (DMLS)

Direct laser metal sintering (DLMS), also referred to as direct laser metal forming (DLMF) and selective laser melting (SLM), is a method wherein a highly intensive laser beam is directed onto a metal powder bed and fused metal particles according to a computer-aided design file (Shibli *et al.*, 2013). This technology is an extension of the SLS process, which also regenerates real 3D parts from layer-by-layer additions of fused metal powder. This technology allows the fabrication of human implants in minimum processing time, directly from computer-aided design models (Traini *et al.*, 2008). Laser-forming methods, like DLMS, allow the fabrication of functionally graded metallic implants with a gradient of porosity perpendicular to the long axis, which is helpful for bone in-growth. Schematic diagram of DMLS process is shown below:

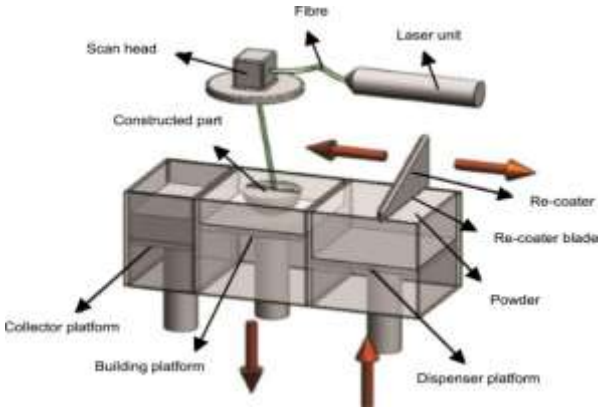

Figure 1.1: Schematic Diagram of DMLS

DMLS has the ability to produce fine features and thin walls, with good accuracy, resolution, and mechanical properties of the finished parts.

2. LITERATURE REVIEW

The experimentally investigated the mechanical properties of the components through DMLS process .mechanical properties of a component fabricated through DMLS process is more inferior to traditional manufacturing process. Process parameters such as layer thickness, scan speed, laser power has showing large impact on hardness [1].The study of the effect of tensile and fatigue properties of Inconel 718. Premature necking is generally seen in the specimen having t/d <1.Miniature specimens of Inconel718 has t/d>4 which provide good yield strength and uniform elongation and fatigue limit [2]. Investigated the fracture behaviour of nickel super alloy obtained from cast and additive manufacturing process [3]. Crack initiation has been significantly differs from microstructure of specimens. Specimen manufactured with additively manufacturing process has high fracture toughness at initiation and subsequent crack propagation [4].Analyzed the corrosion behavior of Inconel 718 manufactured with DMLS process is with commercial alloy. DMLS samples gives good corrosion resistance rather than commercial alloy due to high precipitation. In EDL analysis it was found that iron element is more in commercial alloy and nickel element is more in DMLS alloy [5].Experimentally investigated about build surface quality and fatigue behavior of additively manufactured Inconel718. SLM of Inconel 718powder is increasingly used to fabricate customized parts of jet engine. Surface quality of SLM parts is influenced by powder characteristics, process parameters and the layer wise fabrication [6].

3. METHODOLOGY

Selection of Material:

Material used for the present work is additively fabricated inconel718 samples, which is taken in powder form. Material composition will be mentioned below

Table 3.1: Chemical composition of In718 (Metal Composition Data)

Element	Sample composition (%)	Standard composition (%) [2]
Ni	53	55.0-55.5
Cr	18.2	17.0-21.0
Fe	18.1	18.5
Mo	2.8	3.0
Ti	1.1	0.65-1.15
Co	0.98	1.00
Nb+Ta	5.2	5.1

3.1 MATERIAL DESCRIPTION AND FABRICATION

Material used for fabrication of samples is inconel718. Initially the material is taken in the form of powder. In718 powder was obtained from EOS engineering Inc. The powder is sieved with a mesh size of 90 μm to avoid inhomogeneity in the distribution of the particle size. Table 3 represents the chemical composition of the employed Inconel 718 powder. The prepared files were transferred to a DMLS EOS M280 metal 3D printer (EOS GmbH Electro Optical Systems, Germany), equipped with a 400 W Ytterbium fiber laser. All samples were fabricated in 200 sliced layers.

3.2 MACHINE DESCRIPTION

The machine which is used for fabricating the samples is EOSM290.

Figure 3.1: EOSM280

(INTECH DMLS, Pvt Ltd, Bangalore**)**

EOS M 280 Produces highest quality metal parts in additive manufacturing. The robust system design and the powerful 400-watt fiber laser enable a reliably high performance day in, day out. The exceptional high beam quality of the laser spot and its excellent detail resolution is ideal for manufacturing highly complex DMLS components ensuring homogeneous part properties from part-to-part, job-to-job and machine-to-machine. The intuitive, open and productive CAM tool EOSPRINT allows optimization of CAD data ensuring a quick and easy job and workflow management.

Table 3.2: EOSM280 Machine specifications

(INTECH DMLS, Pvt Ltd, Bangalore**)**

Building volume	250 x 250 x 325 mm (9.85 x 9.85 x 12.8 in) (height incl. build plate)
Laser type	Yb fibre laser; 400 W
Precision optics	F-theta lens; high speed scanner
Layer thickness	40 microns
Scanning speed	960 mm/s
Focus diameter	100 µm (0.004 in)
Power consumption	MAX. 8,5 kW/ average 2,4 kW/with platform heating up to 3,2 Kw
Inert gas supply	7,000 hPa; 20 m³/h (102 psi; 706 ft³/h)
Dimensions (W x D x H)	2,500 x 1,300 x 2,190 mm (98.4 x 51.2 x 86.2 in)
Scan Strategy	Stripes

Powder bed fusion (PBF) is an additive manufacturing process and works on the same basic principle in that parts are formed through adding material rather than subtracting it through conventional forming operations such as milling**.** The PBF process begins with the creation of a 3D CAD model, which is numerically 'sliced' into several discrete layers.

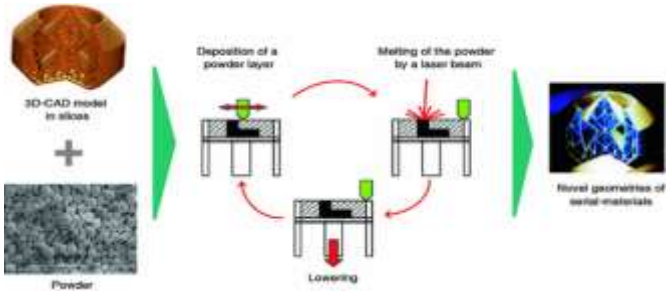

Figure 3.2: Powder Bed Fusion Method

In horizontal orientation we are taking length of the specimen in z direction and height of specimen in y direction.

Specimen length is along z direction =120mm

Specimen length is along y direction =2.50mm

One ends while the other end is fixed. We keep increasing the weight while at the same time measuring the change in the length of the sample. The tensile test is performed individually on both horizontal and vertical orientation and the results are compared. The material has known dimensions like length and cross sectional area .we then begin to apply weight to the material gripped.

Table 3.3: UTM specifications

Model	UTE 40
Max Capacity	400 KN
Measuring Range	0 – 400 KN
Clearances between columns	500 mm
Power supply	3Ø, 440 V, 1.7 KW

3.7.3 Dimensions of tensile Inconel 718 samples:

Dimensions of horizontal orientation sample for tensile test:

Figure 3.4: vertical orientation specimen

Tensile test is performed on the above mentioned dimensions of the specimen and the results are carried out. Dimensions of vertical orientation sample for tensile test:

In vertical orientation we are taking specimen length in x direction and height of the specimen in z direction.in our study we are considering only length and height of the specimen for tensile test.

Figure 3.5: l Horizontal orientation specimen

As per the ASTM standards

Specimen length is along x direction =120mm

Specimen height is along z direction = 2.50mm

Figure 3.6: Tensile Inconel specimens

Tensile test is performed on this vertical orientation specimen and the results are carried out.

After getting results of individual orientations of both the specimens we then compared their results .it was noticed that percentage of elongation tends to starts at tensile load of 78 N nearly. In which orientation better results are obtained are taken into consideration.

3.7.4 Compression test experimentation:

A compression test is a method for determining the behavior of materials under a compressive load. UTM is used for compressive test.

Compression test are conducted by loading the test specimen between the two plates and then applying a force to the specimen by moving the crossheads together.

Compression test generally used to determine mechanical properties such as elastic limit, proportional limit, yield point, yield strength and compressive strength.

During this test the specimen is compressed and deformation versus the applied load is recorded.

3.7.5 Dimensions of compression Inconel 718 samples:

Dimensions of compression test horizontal orientation specimen as per ASTM standards is as follows: in our study we are considering only length and height of the specimen for compression test.

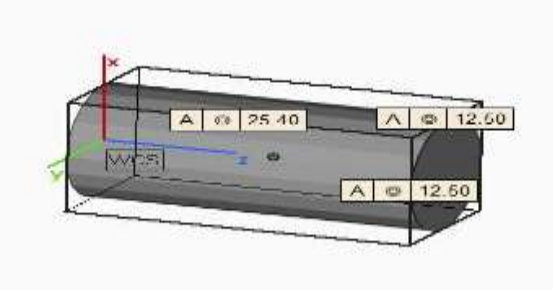

Figure 3.7: Compression specimen of horizontal orientation

Specimen length is along z direction =25.40mm

Specimen length is along x direction =12.50mm

Compression test is performed on these dimensions of the specimen and the results are carried out.

Compression test on the vertical orientation specimen:

In vertical orientation we are taking specimen length in z direction and height of the specimen in y direction.

Specimen length is along z direction =25.40mm

Specimen length is along y direction =12.50mm

Compression test is performed on this vertical orientation specimen and the results are carried out. It was noticed that compression tends to start at a compressive load of 120N.

In which orientation specimen will give best results are taken into consideration.

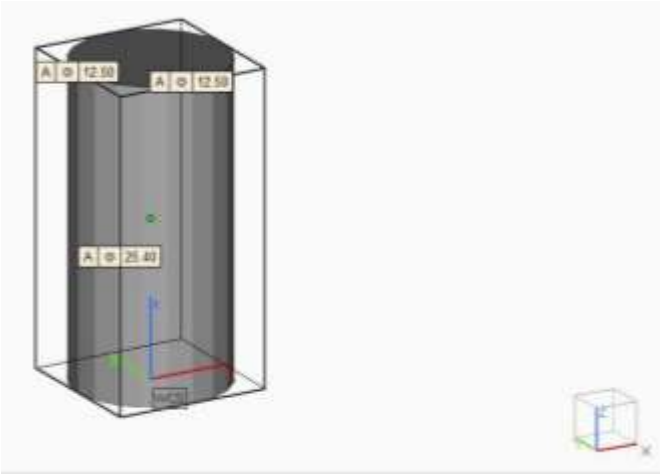

Figure 3.8: Compression specimen of vertical orientation

3.7.6 Impact test experimentation:

Figure 3.9: Charpy impact test machine

The process of impact testing is used to study the various characteristics of materials. These include toughness, hardness, ductility, and strength. It involves sudden application of a load to a specimen in order to determine its impact value.

Charpy impact test:

This test measures the amount of impact energy absorbed by the specimen when it is hit by pendulum and is considered as a good metal impact tester, it shows whether a specimen can be classified as ductile or brittle especially ferritic steels.

Table 3.4: Impact test machine specifications

Suitable for	**Charpy Tests**
Initial potential energy (joules)	300
Pendulum drop angle (degree)	140
Striking velocity of pendulum (m/sec)	5.182
Length of the pendulum (mm)	775
Effective weight of pendulum (kg)	22.5
Distance between pendulum and charpy impact specimen	± 7.75 mm Max

3.7.7 Dimensions of impact Inconel 718 samples:

Dimensions of impact test horizontal orientation of the specimen should be as follows: in our study we are considering only length and height of the specimen for the impact test

Figure 3.10: Impact specimen of horizontal orientation

Specimen length is along x direction = 55.00mm

Specimen height is along y direction =10.00mm

Impact test is performed on the specimen and results are carried out.

Vertical orientation of the specimen:

In vertical orientation of the specimen the dimensions is as follows:

Specimen length is along x direction = 55.00mm

Specimen height is along y direction = 10.00mm

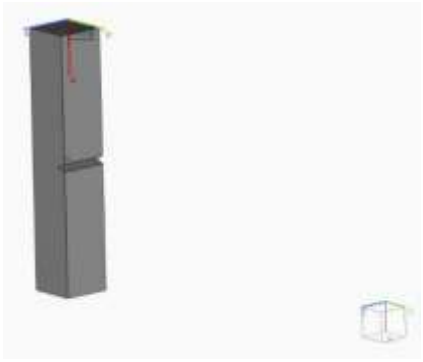

Figure 3.11: Impact specimen of vertical orientation

Results of vertical orientation are compared with horizontal orientation results.it was noticed that maximum energy absorbed by the specimen is at a impact load of nearly 250J. Better results are taken into consideration.

Impact specimen testing:

Figure 3.12: impact specimen before testing

Figure 3.13: Impact specimen after testing

The toughness of Inconel718 is determined by performing Charpy Impact test. The energy absorbed during the material fracture is given as **258 Joules.**

3.7.8 Corrosion test experimentation:

There are various types of corrosion tests.in our experiment we are using electro chemical corrosion testing. A potentiostat instrument is usually used to perform this sort of this test. A three electrode setup, including working electrode, reference electrode and counter electrode are usually used. Potential, current, and time are three important parameters in electrochemical tests.in these tests an applied potential generally scans in a certain range and the current is measured. In this test current is measured when the applied potential scans in a narrow range (-20mv) from lower to higher than corrosion potential.

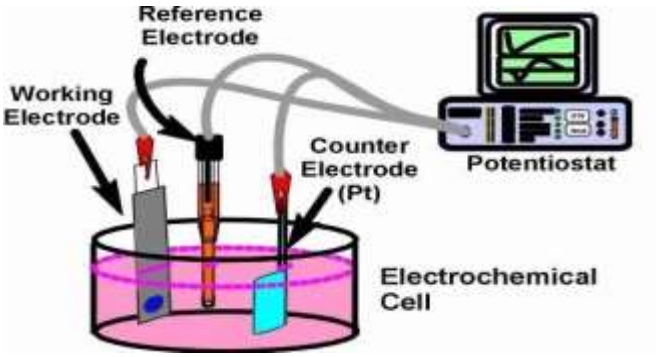

Figure 3.15: Schematic diagram of corrosion test

3.7.9 Dimensions of corrosion Inconel 718 samples:

Specifications of horizontal orientation specimen are as follows:

Specimen length is along x direction = 20.00mm

Specimen width is along y direction = 19.96mm

Specimen height is along z direction = 3.00mm

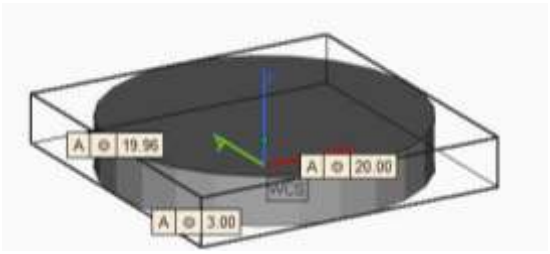

Figure 3.16: Corrosion specimen of horizontal orientation

Results are performed on the specimen and carried out.

Vertical orientation of corrosion specimen:

Specimen length is along y direction =20.00mm

Specimen width is along x direction

= 19.96mm

Specimen height is along z direction =3.00mm

3.8 SUMMARY:

In this chapter the properties of the material, process parameters, characteristics of the material and experimental setup are discussed briefly. The methodology and experimental procedure for fabrication are discussed elaborately.

4. RESULTS AND DISCUSSIONS

In this chapter experimental results obtained from the tensile test, compression test, corrosion test, wear test, of horizontal and vertical orientation Inconel 718 samples has been discussed.

4.1 Tensile test:

After performing the tensile test on Inconel 718 specimens of both horizontal and vertical layer orientations which are fabricated through DMLS process, the results obtained are yield strength and tensile strength, which is tabulated in table 4.1:

Table 4.1: Results of yield strength, tensile strength, % of elongation of horizontal and vertical layer orientation specimens as per ASTM standards are tabulated below

Tensile test results	Horizontal orientation specimen	Vertical orientation specimen
Yield strength (MPA)	787.52	794.18
Tensile strength (MPA)	974.67	885.30
% of elongation	17.18	36.18

From the above table it is observed that tensile strength for horizontal orientation specimen is higher than vertical orientation specimen. The reason behind that is, in horizontal layer orientation the tensile load applied is parallel to the layer fabrication and the bonding between the layers is more when compared to the vertically layer oriented Inconel specimen which results in more tensile strength.

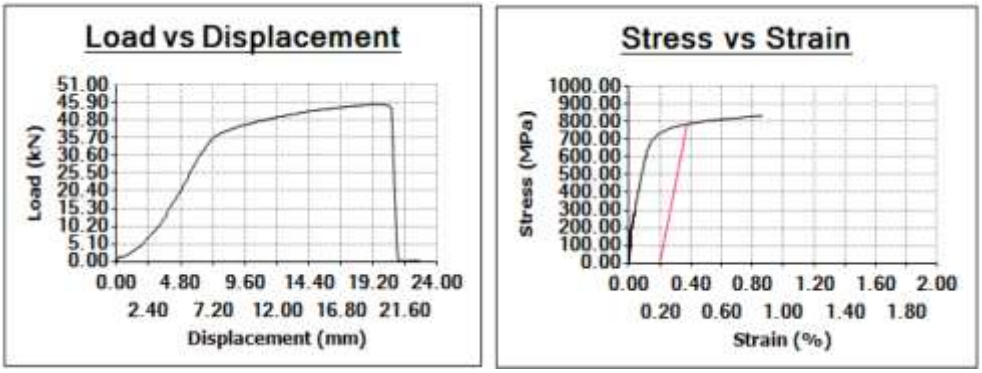

Figure 4.1: Stress strain graph of horizontal orientation Inconel tensile specimen:

Figure 4.1 shows the stress strain relationship of vertically oriented tensile specimen. From the graph it is observed that percentage of strain 0.36% is occurred when the stress of 794.18 MPA is applied on the specimen.

4.1.2 Compression test:

After performing the compression test on Inconel 718 specimens of both horizontal and vertical layer orientations which are fabricated through DMLS process, the results obtained are compression strength, which is tabulated in table 5.2:

Table 4.2: Results of compression strength of both horizontal and vertical layer orientation Inconel 718 specimen as per ASTM standards is tabulated below:

Compression test results	Horizontal orientation specimen	Vertical orientation specimen
Compression strength (MPA)	918.23	1156.29

From the above table it is observed that the compression strength of vertically oriented fabricated Inconel sample is higher than horizontally oriented fabricated sample. The reason behind that is in vertically oriented Inconel sample the no of specimen layers is more which offers more resistance to deformation. In horizontal orientation Inconel specimen the no of layers fabricated is less which offers less resistance to deformation.

Table 4.3: Results of corrosion resistance performed on horizontal and vertical orientation Inconel 718 specimens:

Corrosion test results	Horizontal layer orientation Inconel sample	Vertical layer orientation Inconel sample
Corrosion potential (Ecorr) mV	-305.110	-233.377
Corrosion current (I corr) uA	3.843	1.039
beta c (mV)	132.6	22.1
beta a (mV)	421.7	53.7

Chi²	25.0757	187.687
Chi / sqrt(N)	0.193315	2.7398
Equivalent weight(g/eq)	18.408	7.380
Density (g/cm3)	0.834	0.495
Surface area (cm2)	1.000	1
Corrosion rate (mmpy)	0.2337539	1.99518

With the help of tafel fit graph analysis tool, the corrosion rate can be determined if the user enters the values of equivalent weight, material density and the active surface area.

Figure 4.3: Tafel plot curve of Inconel 718 horizontal oriented specimen

Hardness test is performed on both horizontal and vertical layer orientation Inconel 718 samples. The results obtained are Rockwell hardness (HRC) and Vickers hardness (HV) values which are tabulated in the table 5.4

Table 4.4: Vickers hardness (HV) and Rockwell hardness (HRC) results of horizontal and vertical orientation Inconel 718 specimens:

Hardness test	**Horizontal layer orientation Inconel 718 specimen**		**Vertical layer orientation Inconel 718 specimen**	
No of trails	**Vickers hardness (HV)**	**Rockwell hardness (HRC)**	**Vickers hardness (HV)**	**Rockwell hardness (HRC)**
Trail 1	401.1	40.9	703.2	60.2
Trail 2	465.4	46.2	541.6	51.8
Trail 3	472.2	47.1	436.5	44.2
Trail 4	452.8	45.5	418.4	42.5
Trail 5	510.8	49.8	474.7	47.2
Average Hardness Value	**460.26**		**514.88**	

It is observed that average hardness for vertically oriented Inconel 718 specimen is higher than horizontal layer oriented Inconel specimen. The reason behind that is when the load is applied vertically on the samples the strength between the layers is more which causes buckling and indentation takes at more load.

4.1.3 Wear test:

Wear test is performed on both horizontal and vertical orientation Inconel 718 specimens by using wear testing machine. The input conditions applied for testing the wear is track diameter 70mm ,disc speed =500 rpm, distance run= 1KM, load applied = 20N.The results obtained the wear test are wear rate which is tabulated in table 5.5

Table 4.5: Wear rate results of horizontal and vertical orientation Inconel 718 samples:

Horizontal orientation Inconel 718 corrosion specimen			**Vertical orientation Inconel 718 corrosion specimen**		
Weight of specimen before testing (W1)	Weight of specimen after testing (W2)	Wear rate (mg) = (W1-W2)	Weight of specimen before testing (W1)	Weight of specimen after testing (W2)	Wear rate (mg) = (W1-W2)
8.0120	8.0106	1.4	21.6075	21.6041	3.4

It is observed that the wear rate of horizontal orientation corrosion specimen is less than vertically oriented corrosion specimen because in horizontally fabricated samples the strength between the two consecutive layers is comparatively less than the strength between the particles in a layer.

Figure 4.5: Time vs wear rate graph of horizontal orientation Inconel 718 corrosion specimen

Impact test is performed on both horizontal and vertical orientation Inconel 718 samples. The toughness of Inconel 718 is determined by performing charpy impact test. The result obtained from the impact test is impact resistance which is tabulated in the table 5.6:

Table 4.6: Impact resistance results of horizontal and vertical orientation Inconel 718 samples

Layer orientation	**Energy absorbed during fracture (joules)**
Horizontal layer orientation	258
vertical layer orientation	210

It is observed that impact resistance for horizontal orientation specimen is higher than vertical orientation Inconel specimen .the reason behind that is when the load applied parallel to layer fabrication the strength between the layers is more which offers high resistance to deformation.

5. CONCLUSIONS

The mechanical properties such as hardness, tensile strength, compression strength, impact resistance, wear resistance, corrosion resistance of Inconel 718 specimen of both horizontal and vertical layer orientations, fabricated by powder bed fusion process was studied experimentally. The following conclusions are drawn from the experimental results. Based on the experimental results it is concluded that the ultimate tensile strength, percentage of elongation, wear resistance, wear resistance, corrosion and impact resistance of horizontally fabricated sample is higher than that of vertically fabricated sample.

6. FUTURE SCOPE

The work can be extended to analyze other parameters and other mechanical properties. The level of experiments can be increased for better results. For better results and accuracy we can also use optimization techniques like taguchi analysis, in addition to experimental analysis. Material consumption can be reduced so that cost for fabricating the part is also reduced. The experiments can be planned by varying parameters and the orientation in angular.

Editor's Note

Women's empowerment has become substantial in the development of any country. Women's empowerment is nothing but empowerment of the country in all genera. Women and girls represent half of the world's population and therefore also half of its potential. But gender inequality persists every where and stagnates social progress. On average, women in the labor market still earn 23 percent less than men globally and women spend about three times as many hours in unpaid domestic and care work as men. Sexual violence and exploitation, the unequal division of unpaid care and domestic work, and discrimination in public office, all remain huge barriers. All these areas of inequality have been exacerbated by the COVID-19 pandemic: there has been a surge in reports of sexual violence, women have taken on more care work due to school closures, and 70% of health and social workers globally are women.

Gender equality is not only a fundamental human right, but a necessary foundation for a peaceful, prosperous and sustainable world. There has been progress over the last decades, but the world is not on track to achieve gender equality by 2030. Gender equality is defined in USAID's Gender Equality and Female Empowerment Policy as a state "in which both men and women have equal opportunity to benefit from and contribute to economic, social, cultural and political development; enjoy socially valued resources and rewards; and realize their human rights". The G20 countries are committed to promoting 'Gender Equality' which is essential for sustainable development, which includes ensuring that women and girls have equal access to education, health care, economic opportunities, and political participation.

Women have a strong relationship with nature and pro-environmental attitudes and beliefs. They have developed a unique set of values on environmental concerns. The perspectives of women towards nature influence how they approach environmental challenges. The role of Women in Environment Protection is remarkable. In India, Women started many environment protection movements prior to Independence which are remarkably continued till today.

I hope that the findings of various studies and the suggestions offered by the authors concerned would help the researchers, policy makers and practitioners of Women and Gender Studies. On behalf of the Editorial Board, I acknowledge the support given by the contributors and readers.

Women Play a Crucial Role in the Preservation of Environment

Dr. K. Kiran

Ms. Dasireddygari Jyothi

Dr. E. Mahadev Reddy

Abstract

Women contribute significantly and in a variety of ways to environmental preservation. At all levels, from neighbourhood grassroots activities to global policymaking, their contributions are essential. It is essential to recognize and enhance the role of women in environmental protection to achieve sustainable development and address pressing environmental concerns. Building a more equitable and environmentally sustainable world requires adhering to the core principles of gender equality and inclusivity. In India, Women play a crucial role in the movements for sustainability and environmental conservation. Their contributions are varied and significant, addressing the nation's many environmental problems. In India, women play important responsibilities in environmental protection. Empowering women is crucial for achieving sustainable goals as they play a central role in sustainable development. Sustainable development acknowledges the interdependence of social, economic, and environmental factors and is sometimes characterized as development that satisfies present demands while not impairing the capacity of future generations to satiate their own needs. Women have important and varied roles in sustainable development.

Keywords: Women, Indian, Environmental Protection, Movements, Sustainable etc.

Introduction

Women bear the brunt of environmental degradation and are essential in overseeing the management of natural resources within households and communities. They are responsible for the management of forests,

Indian Journal of Women and Development (Peer Reviewed Journal) ISSN 2231-3974
Vol.16 Issue:2 (November, 2023)

farmland, water, food, and fuel resources in communities globally. Women in developing countries are responsible for producing 60 to 80 percent of the food supply. However, they often face limitations in land ownership, access to loans, and obtaining insurance due to inheritance laws and cultural norms. The 1992 UN Earth Summit, the Chipko movement in India, and the Green Belt Movement in Kenya all emphasized the importance of women's voices and perspectives in sustainable development at all levels, from the top to the bottom.

Women around the world have demonstrated leadership, activism, and advocacy in tackling pressing environmental issues, and have played pivotal roles in various environmental movements. Their substantial contributions have impacted policies and practices, rallied communities, and heightened awareness.

The term "environment," originating from the French word meaning "to surround," encompasses the interactions between water, air, land, humans, other living beings, and property. In contrast, women have historically been perceived as the subordinate gender, often responsible for managing and conserving resources for their families on a global scale. Courageous women are taking the lead in various fields, such as exploring water resources worldwide and safeguarding forest reserves. Ester Boserup's book, Woman's Role in Economic Development, published in the early 1970s, played a pivotal role in sparking interest in the relationship between women and the environment. It wasn't until the 1980s that governments and policymakers began to give more attention to this connection.

Women's direct interaction with the environment has led to a deep understanding of it, resulting in significant roles as agriculturalists, water resource managers, and traditional scientists. Not only are women knowledgeable about the environment, but they are also protective and nurturing, as highlighted by Shettima (1996). Due to their primary

Opinion of the Farmers towards YSR Rythu Bharosa and PM Kisan Scheme - A Study

Dr. E. Mahadev Reddy

Abstract

YSR Rythu Bharosa is one of the Navaratnalu assistance schemes of Andhra Pradesh. The Andhra Pradesh Government is instigating "YSR Rythu Bharosa" from October 15th 2019 for affording financial assistance to the farmer families, including tenant farmers @ Rs.13,500/- per farmer family, per annum, to support the cultivators in meeting the investment during the crop season with a view to enable them to timely sourcing of quality inputs and services for higher crop productivity.

Under the YSR Rythu Bharosa-PM Kisan Scheme, the Andhra Pradesh State government gives financial assistance of Rs.13,500/- per year to eligible farmers in three different installments (May @ Rs. 7500/- + Sept./ Oct. @ Rs. 4000/- + & January @Rs.2000/- = total @ Rs.13,500/-). The entire amount of Rs. 13,500/- does not come via YSR Rythu Bharosa scheme alone, and as the name suggests, the direct cash transfer (Direct Benefit Transfer) includes Rs. 6000/- annually assured to eligible farmers under PM KISAN Samman Nidhi Scheme (PM-KISAN). In other words, while Rs. 7,500/- comes from the state government and another Rs. 6,000/- comes via PM KISAN scheme.

Keywords: Cultivators, Quality Inputs, Higher crop Produciton.

Introduction

YSR Rythu Bharosa was launched by Chief Minister of Andhra Pradesh Sri. Y.S. Jagan Mohan Reddy on 15th October, 2019 releasing Rs.3785 crore benefiting 38 lakh farmers in the A.P. State. Rythu Bharosa Kendras were later launched on 30th May 2020 to supply seedlings, fertilizers and seeds to horticulture, aquaculture and agriculture sectors. A total amount of Rs. 6,173 crores was spent on the scheme for the year

2019-20 and Rs. 6,928 crore for 2020- Rythu Bharosa Scheme. As you all know that the beneficiary list prepared by real-time government society (RTGS). The concerned authorities have identified around 66,54,891 landowner farmers who will get benefits under this scheme till date. The scheme has been implementing successfully even though in the pandemic period.

The Rythu Bharosa Scheme also called as the YSR Rythu Bharosa Scheme, is one of the welfare schemes for farmers launched by the Andhra Pradesh government in June 2019. It was implemented effectively from 15th October, 2019.

Online Application Process for Rythu Bharosa Scheme

To apply online, all you have to do is follow the steps given below:

1. Visit the official website of the scheme: https://ysrrythubharosa.ap.gov.in/RBApp/index.html
2. Click on the "Login" button on the right upper corner of the page.
3. Create your username, password, and enter the captcha given to log into the new account.

How to check beneficiary list

The beneficiary list will be prepared by the government on a district-wise level. This will be updated on the official website. To check if your name is on the list, follow the steps given below:

1. Visit the official website of the scheme: https://ysrrythubharosa.ap.gov.in/RBApp/index.html
2. Click on the "Login" button on the right upper corner of the page.
3. Log in using your username and password.
4. The beneficiary list will be displayed on the page with details such as

About the Book

Despite great strides made by the international women's rights movement over many years, women and girls around the world are still married as children or trafficked into forced labor and sex slavery. They are refused access to education and political participation, and some are trapped in conflicts where rape is perpetrated as a weapon of war. Around the world, deaths related to pregnancy and childbirth are needlessly high, and women are prevented from making deeply personal choices in their private lives. Human Rights Watch is working towards the realization of women's empowerment and gender equality—protecting the rights and improving the lives of women and girls on the ground. With this backdrop the work of ***'Rights of Women'*** *was executed.*

This book provides women's human rights and then explains the critique voiced concerning the national and international system in this esteem. Further, the chapters included in the book discuss about the violation of human rights with gender lens at home as well as in work place. Authors contributed the studies based on primary as well as secondary data. The authors focussed different domains of women rights both sense i.e., violation and protection. Hence the book chapters cover economic, education, legal and Social aspects which are crucial for empowerment of Women and Children in India. I thank the authors for contributing valuable information to carry out the book. The book is useful to the students and researchers of law, sociology, social work, rural development, extension studies, women and gender studies, etc.

Influence of Literacy Programmes on Women and Development

Dr. E. Mahadev Reddy

Abstract

"Literacy empowers women, enabling their mobility, enhancing decision making and ensuring better command over their own lives..."

Literacy is the key element for the development of any nation. It leads to better health, employability skills, and better employment opportunities and safeguard the more stable societies. The role of literacy and the development of aspects like social, economic and cultural development. Helping someone able to read and write effectively and to solve some mathematical elements or acquire basic skills of literacy take for granted, improves the future of everyone in the society. When learners have higher literacy levels the economic development is enhanced as well as individual and community well-being. Two-thirds of the world's adult illiterates are women. This situation has not changed in the last 20 years and the latest projection indicates that this ratio will remain at this level by 2015 (UNESCO Institute of Statistics). That means that

Abstract: The natural environment refers to all living and non-living components that exist without human interference. This word is frequently used to describe the Earth or specific areas of it. It includes all living organisms, weather patterns, climate, and natural resources that influence human survival and economic endeavours. In developing countries like India, women bear the primary responsibility for managing and conserving resources within their families. They dedicate significant amounts of time to tasks such as gathering and storing water, ensuring access to fuel, food, and fodder, as well as overseeing the management of various types of land, including forests, marshes, and agricultural areas. This paper discusses about how a women play a key role in protecting the natural environment by studying the practices and daily activities of Gangudupalli village women towards environmental protection.

Index Terms: **Women, India, Gangudupalli village, Environmental Protection, Sustainability, etc.**

I. INTRODUCTION

The term "environment," which means "to surround,". The word "environment" refers to the interaction of water, air, and land, as well as their interactions with one another, humans, other living things, and property. According to Schultz et al., [1] the women, environment and development (WED) -debate is based on a critical perspective of development policies, emphasizing the connection between modernization/industrialization, technology, and environmental degradation. Women, on the other hand, have long been considered the lower sex. On a worldwide scale, women are often in charge of managing and saving resources for their families. Women are breaking new ground in a range of sectors, including the investigation of the world's water resources and the conservation of forest resources.

Women play a vital role in the management of natural resources, including land, water, forests, and energy. Women in underdeveloped regions of the world are regarded as the primary consumers of natural resources such as land, forests, and water, as they are accountable for collecting food, fuel, and fodder [2]. They possess both traditional and modern knowledge about the natural environment surrounding them. In the past, women were often overlooked or disregarded, but there is now a growing recognition of the significant impact they have on the environment. Additionally, there is an increasing understanding of how the environment affects the health and well-being of women. This shift in perspective is evident in events such as the 1992 UN Earth Summit, the Chipko movement in India, and the Green Belt Movement in Kenya. These initiatives highlighted the importance of women's voices and perspectives in promoting sustainable development at all levels, from the highest decision-making bodies to local communities. In recent decades, environmental movements have increased as the movements for women's rights have also increased. Today's union of nature preservation with women's rights and liberation has stemmed from invasion of their rights in the past [3,4].

In the Asian and Pacific Island regions, the majority of women involved in the economy are engaged in the agriculture sector, which encompasses various activities such as work in own-account farms, labor in small enterprises for processing fruits, vegetables and fish, paid and unpaid work on other people's land, and collecting forest products. However, only a small percentage of these women, ranging from 10-20%, have been able to secure tenure to the land they work on due to economic and legal barriers. One such barrier is the gender disparity in access to loans, which results in women receiving fewer and less favorable loans to acquire land compared to men [5].

Women's direct involvement with the environment has resulted in a deep grasp of it. As a result, Women act as agriculturalists, water resource managers, traditional scientists, etc among others. Women interact with the natural and man-made environments more extensively than males, owing to their major duty for domestic and home administration. As a result, individuals are more vulnerable to the negative consequences of degraded home, neighbourhood, and city environments, and they incur a greater cost associated with living in substandard homes and communities with inadequate residential and health infrastructure. Women are predominantly responsible for farm work and domestic food production across the globe [6,7,8,9]. Although there is a growing trend of women taking on more agricultural tasks and expanding their involvement, the gender-based division of labour remains unchanged in terms of reproductive work.

It is imperative to comprehend the diverse methods through which women have actively engaged in the preservation and administration of the environment, with the intention of incorporating them into environmental management initiatives. The purpose of this manuscript is to evaluate the participation of women in environmental management, specifically focusing on a small village.

Status of Tribals in Professional Education: A Study in Ananthapuramu District

Mr. G. Gangadhara
Prof. R.B. Sathyavathi

Abstract

Tribal's are the group of people who live in forests or backward areas. They are completely dependent on forests for their livelihood and survival. Indian constitutional assembly members notified the facts that certain communities in India were suffering from extreme social, educational and economical backwardness. These communities were notified as Scheduled Caste and Scheduled Tribes as per the provisions contained in clause 1 of article 341 and 342 of the Constitution respectively.The criterion used to specify a community, as scheduled tribes are indications of primitive traits, distinctive culture, geographical isolation, shyness of contact with the community at large, and backwardness. This criterion was not spelt out in our constitution, but it has become more popular. Advisees were the most marginalized people in India. Their traditional life has been intrinsically permitted to the forest areas of India. Historically these communities have been the subject of stage inflicted oppression, trapping them in a vicious cycle of violence and poverty. The present paper is highlighted that the tribal community in professional education in Ananthapuramu district of Andhra Pradesh.

Key words: Tribals, education, development, professional

Introduction

The term Tribe generally referred as human social group which mainly live in a forest region and survive by hunting animals and by carrying out shifting cultivation. They have their own culture, religious beliefs and traditions which are completely different from main stream practices.

Tribals are the group of people who live in forests or backward areas. They are completely depended on forests for their livelihood and survival.

vivo Y200e

Indian constitutional assembly members notified the facts that certain communities in India were suffering from extreme social, educational and economical backwardness. These communities were notified as Scheduled Caste and Scheduled Tribes as per the provisions contained in clause 1 of article 341 and 342 of the Constitution respectively.

After the Africa, India has the largest tribal community in the world. Among the marginalized people, Tribals had a long history. In ancient times people were segregated as Tribals on various reasons. India is one of the diversified and largest tribal populated countries in the world. According to the 2011 census tribal population in India is 104 million or 8.6 percent of the total population.

In India Tribal communities have been recognized by the Indian constitution under the 'Schedule 5'. Hence the reorganization of the tribes in the constitution is known as "Scheduled Tribes". Article 366 (25) defines about Scheduled Tribes as "Such tribes or tribal communities or part of or groups within such tribes or tribal communities as we deemed under Article 342 to be Scheduled Tribes for the purpose of this constitution"

The criterion used to specify a community, as scheduled tribes are indications of primitive traits, distinctive culture, geographical isolation, shyness of contact with the community at large, and backwardness. This criteriawas not spelt out in our constitution but it has become more popular. Adivasisare the most marginalized people in India. Their traditional life has been intrinsically permitted to the forest areas of India. Historically these communities have been the subject of stage inflicted oppression, trapping them in a vicious cycle of violence and poverty.

India is the place of 705 ethnic groups which are notified as Scheduled tribes. According 2011 census 10.42 crore Indians (8.6%) areScheduled tribes. Since ancient period in India there has been discriminatory section. In this schedule tribes also one such kind facing the untouchability and discrimination. Although there has been constitutional safeguards in the Indian Constitution there has been practice of untouchability, prejudice and violence.

vivo Y200e 5G

government policy and its implementation, to hold public office and perform all public functions at all levels of government, and the right to participate in non-governmental organizations (NGOs) or associations concerned with the public and political life of the country. Article 8 requires State parties to "take all appropriate measures to ensure to women, on equal terms with men and without any discrimination, the opportunity to represent their Governments at the international level and to participate in the work of international organizations."

Although women's right to vote has been secured in nearly every country of the world, in practice, the right to vote can sometimes be meaningless

Conclusion

VET plays a crucial role in the social and economic development of a nation and is subjected to the rapidly changing needs of education, society, rural sector, industry and the environment.The politics and practices of a state-initiated, feminist conceived empowerment program for rural women in India seek to challenge. There is a need for policy measures to improve the technological level of women for higher productivity in employment. Microcredit has become one of several possible platforms from which rural women articulate their concerns about caste, poverty and the burden of raising daughters as successful individuals. Women are increasingly being recognized as equal partners in development.

I. INTRODUCTION

The term "environment," which means "to surround,". The word "environment" refers to the interaction of water, air, and land, as well as their interactions with one another, humans, other living things, and property. According to Schultz et al., [1] the women, environment and development (WED) -debate is based on a critical perspective of development policies, emphasizing the connection between modernization/industrialization, technology, and environmental degradation. Women, on the other hand, have long been considered the lower sex. On a worldwide scale, women are often in charge of managing and saving resources for their families. Women are breaking new ground in a range of sectors, including the investigation of the world's water resources and the conservation of forest resources.

Women play a vital role in the management of natural resources, including land, water, forests, and energy. Women in underdeveloped regions of the world are regarded as the primary consumers of natural resources such as land, forests, and water, as they are accountable for collecting food, fuel, and fodder [2]. They possess both traditional and modern knowledge about the natural environment surrounding them. In the past, women were often overlooked or disregarded, but there is now a growing recognition of the significant impact they have on the environment. Additionally, there is an increasing understanding of how the environment affects the health and well-being of women. This shift in perspective is evident in events such as the 1992 UN Earth Summit, the Chipko movement in India, and the Green Belt Movement in Kenya. These initiatives highlighted the importance of women's voices and perspectives in promoting sustainable development at all levels, from the highest decision-making bodies to local communities. In recent decades, environmental movements have increased as the movements for women's rights have also increased. Today's union of nature preservation with women's rights and liberation has stemmed from invasion of their rights in the past [3,4].

In the Asian and Pacific Island regions, the majority of women involved in the economy are engaged in the agriculture sector, which encompasses various activities such as work in own-account farms, labor in small enterprises for processing fruits, vegetables and fish, paid and unpaid work on other people's land, and collecting forest products. However, only a small percentage of these women, ranging from 10-20%, have been able to secure tenure to the land they work on due to economic and legal barriers. One such barrier is the gender disparity in access to loans, which results in women receiving fewer and less favorable loans to acquire land compared to men [5].

Women's direct involvement with the environment has resulted in a deep grasp of it. As a result, Women act as agriculturalists, water resource managers, traditional scientists, etc among others. Women interact with the natural and man-made environments more extensively than males, owing to their major duty for domestic and home administration. As a result, individuals are more vulnerable to the negative consequences of degraded home, neighbourhood, and city environments, and they incur a greater cost associated with living in substandard homes and communities with inadequate residential and health infrastructure. Women are predominantly responsible for farm work and domestic food production across the globe [6,7,8,9]. Although there is a growing trend of women taking on more agricultural tasks and expanding their involvement, the gender-based division of labour remains unchanged in terms of reproductive work.

It is imperative to comprehend the diverse methods through which women have actively engaged in the preservation and administration of the environment, with the intention of incorporating them into environmental management initiatives. The purpose of this manuscript is to evaluate the participation of women in environmental management, specifically focusing on a small village.

II. STUDY AREA

Gangudupalli is a Village in Chandragiri Mandal in Chittoor District of Andhra Pradesh State, India. It belongs to Rayalaseema region. It is located 6 KM from Chandragiri town and 21 KM towards West from District headquarters Sri Balaji. According to 2011 census, Gangudupalli Village Local Language is Telugu. Gangudupalli Village Total population is 1080 and number of houses are approximately 250. Female Population is 53.3%. Village literacy rate is 61.6% and the Female Literacy rate is 33.0%. Their major occupation is Agriculture, Cattle maintenance, Silkworm cocoon cultivation. Apart from that, few of them doing Jobs and businesses at various sectors located in and around Tirupati.

In this paper, we employ two different categories of data. The initial category consists of secondary source materials, acquired from prior research on women's participation in environmental preservation and control. These materials encompass books, journal publications, and articles obtained from online sources. The second category of data was procured from primary sources, specifically through the distribution of questionnaires to the women residing in the rural area of Gangudupalli Village.

III. REVIEW

3.1. Water Resource Management

Etta [10] conducted a survey in Mariko Lower-income settlement in Lagos, which revealed that women hold a pivotal role in managing communal water resources and fulfilling household water requirements. Women are primarily responsible for regulating and supervising communal taps or water points, and they often secure these sources to prevent damage by children. At the household level, women and girls are burdened with the task of fetching water for various domestic activities such as cooking and washing. Conversely, men tend to dominate the water trade. Unfortunately, these sources are susceptible to pollution, especially from untreated sewage, which poses significant health risks [11,10]. In rural areas, women are solely responsible for procuring water for their domestic needs. However, the methods and practices employed in obtaining water, particularly from riverbanks, contribute to water pollution [12].

3.2. Women in Agriculture

Women's contributions to agricultural production have been significant worldwide, with the Food and Agriculture Organization reporting that they are responsible for producing more than half of all food grown in 1996. In certain regions, such as sub-Saharan Africa and the Caribbean, women produce an astonishing 80% of basic foodstuffs. Adebayo et al [13] found that in Asia, women provide between fifty and ninety percent of the labour force for rice cultivation, while in Adamawa State, Nigeria, 60% of women are involved in farming. Jayasheela [14] outlines the various roles that women play in Indian agriculture, including production and distribution, planting and cultivation, weeding, hoeing, harvesting, and storage.

Women in Gangudupalli Village play a significant role in the agricultural sector by contributing to the production of rice, groundnuts, and sugarcane. Additionally, they are actively involved in cultivating livestock crops for their cows, buffalos, goats, and other animals. This highlights the close interaction between women and the environment, particularly the land. As victims of soil degradation, women have actively participated in initiatives aimed at conserving soil. A notable example of their involvement is the Agro-forestia project in Yatenga, Burkina Faso. Moreover, Igbo women have taken on traditional male agricultural responsibilities, in addition to their existing roles within the female sphere [15, 16].

3.3. Solid waste disposal

In the specified research domain, the rate of solid waste accumulation surpasses the pace of population expansion. The disposal of solid wastes commonly occurs at designated dumping sites or undeveloped areas. Women, owing to their proximity to the environment, actively engage in environmental stewardship by undertaking responsibilities such as cleaning and upholding cleanliness, particularly in relation to garbage disposal. Acknowledging the health hazards linked to waste, women assume the responsibility of ensuring its consistent removal at the communal level.

IV. RESULTS

The present section presents the outcomes of the questionnaire survey carried out to examine the extent of women's involvement in environmental management within the specified study area, namely Gangudupalli Village. The demographic characteristics, specifically age and marital status, of the women are presented in Table 1. It is worth mentioning that a mere 17.6% of the women surveyed are below the age of 22 years. The majority, accounting for 66.4%, belong to the middle age group (23-50 years), while only 16.0% are aged above 50 years. This distribution of age indicates that a significant proportion of the women are still in their prime years and possess the necessary Vigor to actively engage in environmental management activities.

Table 1. Age and marital status of survey women

S.No	Age Group	Number	Percentage
1	Below 22 years	18	17.6
2	Middle age (23-50) Years	65	66.4
3	Above 50 years (51-75)	17	16

Table 2 displays that a significant majority of female participants, specifically 66.4%, are involved in agricultural activities in the study area. Organic farming is the most used method of soil conservation by women. Planting trees is recognized as an effective approach to safeguarding the environment and mitigating hazards such as windstorms and erosion. The survey results indicate that almost 76.2% of women in the study area have planted trees or flowers within the past five years, further supporting the notion that women actively engage in tree planting. Fruit trees, such as mango, sapota, papaya, and various fruit plants, are frequently planted by women, serving the dual purpose of environmental protection and providing fruits for household consumption.

Table 2 Women involvement in Environmental Management

Involvement in Farming	Percentage(%)
Yes No	66.4 33.6
Planting trees (Farming/Around the house)	Percentage (%)
Yes No	76.2 23.8
Conserving methods	Percentage (%)

Organic farming planting	55.7 44.3
Major activities in Environmental Cleaning	Percentage (%)
Weeding Sweeping Drainage	22 63 15

The challenges faced by women in environmental management within the study region were identified by the participants as follows: firstly, there is a lack of environmental consciousness among the general population; secondly, there is a shortage of waste disposal facilities; and finally, there is an insufficiency in drainage systems.

V. RECOMMENDATIONS

To achieve sustainable development, it is recommended that active involvement of women in environmental management be promoted, while considering the obstacles they currently face. To bring about a transformation in the mindset of the populace and equip them with relevant knowledge, it is crucial that environmental education becomes mandatory for the majority of women. This will address the issue of individuals carelessly discarding paper scraps, fruit peels, plastic cans, and polythene bags on the streets for mere amusement.

Additionally, prioritizing women's education and ensuring access to education for girls should be considered a policy imperative. Educated women will play a significant role in bridging the gap between the environment and development. It is important to duly acknowledge and support the empowerment of women in sustainable human development, as well as their role in safeguarding the environment.

VI. CONCLUSION

In conclusion, it is evident that both married and single women have actively engaged in the preservation of the environment. However, a noteworthy proportion of women involved in this endeavour are married. This substantial presence of married women within the study area implies that they are more inclined to assume responsibility for the conservation and cleanliness of the environment due to their roles as homemakers. Consequently, this study has examined the diverse ways in which women have actively contributed to the protection of the environment and the management of natural resources, aiming to ensure the sustainable utilization of environmental resources.

Based on the findings, recommendations are proposed, particularly those that can facilitate the empowerment of women. The crucial role of women as managers of resources, advocates for the environment, and activists within their communities must be acknowledged when devising strategies for environmental protection. It is imperative to provide women with the opportunity to participate in environmental matters at the local, regional, national, and international levels. For women to have a substantial influence on decision-making processes, their representation should be equal to that of men. As resource managers, women should be consulted and supported in their ongoing efforts to safeguard the environment. Specifically, a greater inclusion of women in decision-making processes concerning environmental policies, programs, and funding is essential.

An Informal Economy of Women in Asmara (Eritrea): A Case Study

J. Lalu Naik[1], K. Surendranadha Reddy[2], and M. Surendra[3]
Department of Anthropology, Sri Venkateswara University, Tirupati, Andhra Pradesh[1,2]
Department of Sociology & Anthropology, College of Business and Social Sciences, Adi Keih, Eritrea, East Africa[3]

This case study focuses on the participation of women street vendors in the central business area of Asmara, Eritrea, particularly around the chicken market and outlying streets. Women who fail to find jobs in the formal sector engage in alternative work in the informal economy (street vending). Today, many street vendors depend on their illicit business to earn them and rescue themselves from different poverty levels. This case study seeks to examine the involvement of women in street vending activities. Therefore, this study aims to contribute to the apparent literature gaps by utilizing qualitative and ethnographic analysis of the cause of their participation and the problems they encounter. This study applied anthropological ethnographic fieldwork methodology. Furthermore, the study involved participant observation, semi-structured and in-depth interviews and photographs as a leading data collection method among the women vendors. Implementing these research methods examined the overall daily routine and livelihood of the street vending women. Additionally, focused on the reasons why they engaged and what practical problems they faced, both during the work in the street and other socio-cultural problems in their home, were examined and described in this literature.

Keywords: women, street vendor, informal economy, anthropology, ethnography

Economic sectors are broadly classified as formal and informal, i.e. dual economic systems. The formal sector is characterized by wage earning, licensed, and officially recognized by governmental institutions. On the other hand, the informal economy means self-employed, tax-free, and most diminutive or not recognized officially (ILO, 1993). The concept of the "informal sector" was initially claimed by the International Labor Organization (ILO) in a study on urban labour markets in Ghana by anthropologist Keith Hart (Plattner, 1989). However, it was mainly realized in developing countries after Second World War. The present study focuses on the participation of women in informal sector business in Asmara.

Informal economy (also termed "underground economy", "black market", & "moonlighting") (Plattner, 1989) refers to economic activities outside the state-regulated employment activities. It involves engagement in labour, circulation, and consumption of goods and services, mainly outside the Ken of the government (ibid). For example, a job held by an employee is considered informal if there is no social security contribution or respect for the employer's primary or minimum labour conditions, and the employee is not entitled to pay sick leave and paid annual leave. In other words, the working condition in the informal economy is not subject to the state's labour law. Hearle et al. (2019) found two billion informal workers in the global economy.

The labour law in Eritrea, for instance, defines informal economy for economic activities involving workers below 14 years of age and all unregistered private business enterprises that did not keep a written record of accounts, size of employee less or equal to three, not entitled of paid sick leave and paid annual leave, no social security coverage, and all contributing family workers (MLHW, 2018). Excluding the agriculture sector, about 451,636 workers (out of 1,435,886 employees) engage in the informal economy, about 31.5% of the total working force. In total, the percentage in the informal economy was higher for women (35.5%) than for men (27.3%) (MLHW, 2018).

The types of activities widely observed in the informal economy include agro-pastoral, manufacturing, workshops, street vending, housemaid, etc. and the present study deals with one of the different types of the informal economy, i.e., street vending. Street vendors often are self-employed, and there is no registration or tax cost; they work as a means of income in poor working conditions and without security. Municipal response to informal trade activities varies from city/town to city/town. Still, in principle, municipal offices try to stop these illegal commercial activities due to sanitation, traffic, crimes and revenue problems associated with this type of business. It is an easily understandable feature that the State neglects the intervention in informal activities. The study defined the purpose of this case study as street vending is one form of the informal sector which is not recognized by the law and regulations of any instruction and the workers do it without any protection. Moreover, street vendors are called invisible entrepreneurs working as part of the urban landscapes and closely analyzing the activity of their street businesses (Sekhani et al., 2019).

Can Life in Senior Care Homes Affects Psychological Well-Being of Older Widows

Madhavi B.M.[1]*, Jamuna D.[2], Srikanth Reddy V.[3]

ABSTRACT

In the era of modernization, with the transmission of values and morality, widows face several societal challenges. Illiteracy and economic dependency intensify the situation of these widows as they grow older. Widows their psychological, emotional and physical health has been affected due to chronic psychological distress. The objective of this present study is to examine the life experiences of older widows living in senior care homes and its impact on psychological wellbeing. The study was carried out on 160 older widows who are residing in pay and stay homes in the age group of 65-75 years, who are cognitively intact and communicative were enrolled in the study. The findings revealed that age, no education, lower income and joint family are the sources of psychological distress in older widows. Poor health appears to be an important factor among the institutionalized aged to effectively determine whether the individual can cope with major stresses.

Keywords: *Psychological health, Older Widows, Senior care homes.*

Aging is a series of process that begins with life and continue throughout the life cycle, ending with death. (Singh, Misra 2009). Population aging has become a universal phenomenon and is the result of a process known as "demographic transition" in which there is a shift from high mortality and fertility to low, leading to an increase in the proportion of elderly people in the total population. India, the second largest country in the world, is presently undergoing such a demographic transition (Seby, et al., 2011) with 72 million elderly persons above 60 years of age, which is expected to increase to 179 million in 2031 and further to 301 million in 2051 (Pracheth, 2013). Widowhood may be a tense life transition that a huge part of the overall population eventually ought to face. In this connection, the social relationships can account for variation in reaction and adaptation to the current vital event. Social links are possible to change after the loss of a spouse; these social links stored before may be distinguished from those after widowhood (Lundorff et al. 2019). The idea of well-being has been utilized moderately in the form of various terms like quality of life, life fulfillment, financial safety, individual satisfaction, social well-being, and mental well-being. More specifically, mental well-being is related to depression, anxiety, and stress, while social

wellbeing is related to social participation, social support, home attachment, and so on (Sharifian and Gruhn 2019). Trends are changing in modern urbanized societies in developing countries such as Pakistan which affected the mental and social well-being negatively among the older adults due to the changing trends of life. Education is always considered a good quality of foundation for widows' well-being. Older adult widows required proper knowledge to prevent sickness for their productive and healthy lives. Widowhood ratio is evident statistically over the globe especially among the older adults who crossed 65 years of age. The data showed that around 65% of women are widowed, and this number is higher than the men's counterpart which shows the life expectancy is higher among the women as compared with that of men (Ayuso, 2019).

Few studies carried out in 1980's on older widows. Ramamurti, (1989) assessed the contemporary psychosocial status of elderly widows belonging to forward and backward communities. The findings supported most of the common observations pertaining to the problems of widows in India. The widows had more problems of adjustment than non-widows in almost all the age groups. A variety of demographic, social, economic and personal factors influence the nutritional status of the elderly. Marital status, caste, locality, age and physiological needs were the most important predictors of mental health. Various intervention strategies were suggested to remove the negative self-attitudes and improve the psychological well - being of the elderly widows. Psychological health includes freedom from some qualities such as feelings of helplessness, worthlessness, feelings of depression, etc. To that extent, they contribute a positive evaluation of oneself which in turn may influence memory performance favorably, just as the case concerning good self-esteem (Ramamurti, 1997).

Health and physical status is probably an important concern and has a significant impact on intellectual functioning. Physical health is predictive of the maintenance of cognitive function (Schaie & Hertzog, 1986).

Maintenance of good mental health is one of the key indicators of successful aging. In psychosomatic medicine, theorists argue that certain patterns of psychological responding are damaging to or promoting physical health. It is often assumed that people who are sociable, upbeat, undemanding and easygoing are proved to be health related and to longevity (Friedman 1997).

Most of the studies of Successful Aging established the physiological and psychological benefits of education on cognition in older adults (Kubzansky et al., 1998). Empirical evidence for the effectiveness of cognitive–behavioral interventions with older adults has grown over the past 3 decades. Research apart from the age and memory performance the role of other variables also plays a critical role on memory performance which includes education, health, and individual differences are source variation in the memory performance (Zelinski et al, 2001). It was also noticed that the effect of socioeconomic status and prior life experiences on cognitive performance in older adults (Kramer et al., 2004).

Studies on elder care in Indian community settings and studies on old age homes indicate that more than 85% of the elderly stay in families (either with spouse or with adult children). It involves care giving interactions between family caregiver and the elderly care receiver. Jamuna, and Babu Rao, (2015) examined the factors that mediate care needs and care adequacy of men and women over the age of 60 years. The psychological care needs were examined in relation to socio familial, demographic and psychological variables viz., physical and psychological health status, social supports and cognitive status. The findings highlight

the implications in national policy on care and to evolve culturally suitable care models. The outcome of study would become important inputs to the existing care concerns of elderly in NPOP.

Li. et al., (2013) examined the relationship between transitions in volunteering activity and physical and psychological health outcomes among older adults in Taiwan. Approximately, 3% of older volunteers kept volunteering and 7% stopped or started their volunteering over time. Engaging in any volunteering, including continuous volunteering, discrete volunteering, active-to-inactive volunteering, and inactive-to-active volunteering, was significantly associated with better self-rated health and higher life satisfaction when compared with the non-volunteering group.

Social participation stages decline with the death of a partner, mostly owing to the bad spousal conditions which consequently raise the chances of loneliness among older adult widows (Jones et al. 2019). Despite the Article-25 of the Universal Declaration of Human Right which focuses on the quality of living standard, health, and well-being of oneself and of his family, as well as foodstuff, outfit, accommodation and treatment, vital societal facilities, and security for widows, the older adults have the variant level of social well-being due to diverse cultural values of the different societies (Ashiq and Asad 2017; Cardenas et al. 2019).

In view of these lacunae, the current study is contemplated with the following objectives.

- To examine the life experiences of older widows living in the senior care homes and its impact on psychological wellbeing.
- To assess the salient determinants of psychological wellbeing among older widow residents of senior care homes.

MATERIALS & METHODS

The present study included 160 older widows who stays in pay & stay senior care home and were aged 65 to 75 years (Mean age=70years). The study group included people who were willing to participate, had normal cognitive ability with the capacity to comprehend the instructions. The study excluded older widows who had trouble communicating and had been diagnosed with serious health issues, depression or anxiety problems (clinical cases). The widow participants were told about the nature, purpose, and voluntariness of their involvement, and was obtained signed informed consent following the Declaration of Helsinki principles (2003) and later amendments. All the participants in this study were residents of senior care homes. The personal data form used to know the socio-demographic categories of the older widows. The psychological health status was assessed through the Indian version of Cornell Medical Index (CMI) Health Questionnaire which was adopted and standardized for an ICSSR project on older widows. (Ramamurti et. al (1989). The older widows from senior care homes were divided into small groups with 10 in each and they were encouraged to open for focused group discussion on broad themes (provided by the researcher) on sources of anxiety. Inputs of each group discussion were shared by the group leader and the same data has been used in identifying the psychosocial issues in older widows.

RESULTS AND DISCUSSION

Table – 1 shows the sample characteristics of the older widows in senior care homes. 55% of the women are educated and 45% were uneducated. 58% of the sample are belongs to 65-70 years age group. 53.1% of the older widows coming from nuclear families and 46.9% were from joint families. Most of the older widows (54.4%) related to rural areas and 45.6% were from urban areas. 72.5% of older widows source of income is pension and 48.1% of women

are belongs to below middle-class group and 35.6% of women are from middle class economic status.

Table 1: Sample Characteristics of Older Widows of Senior Care Homes (N=160)

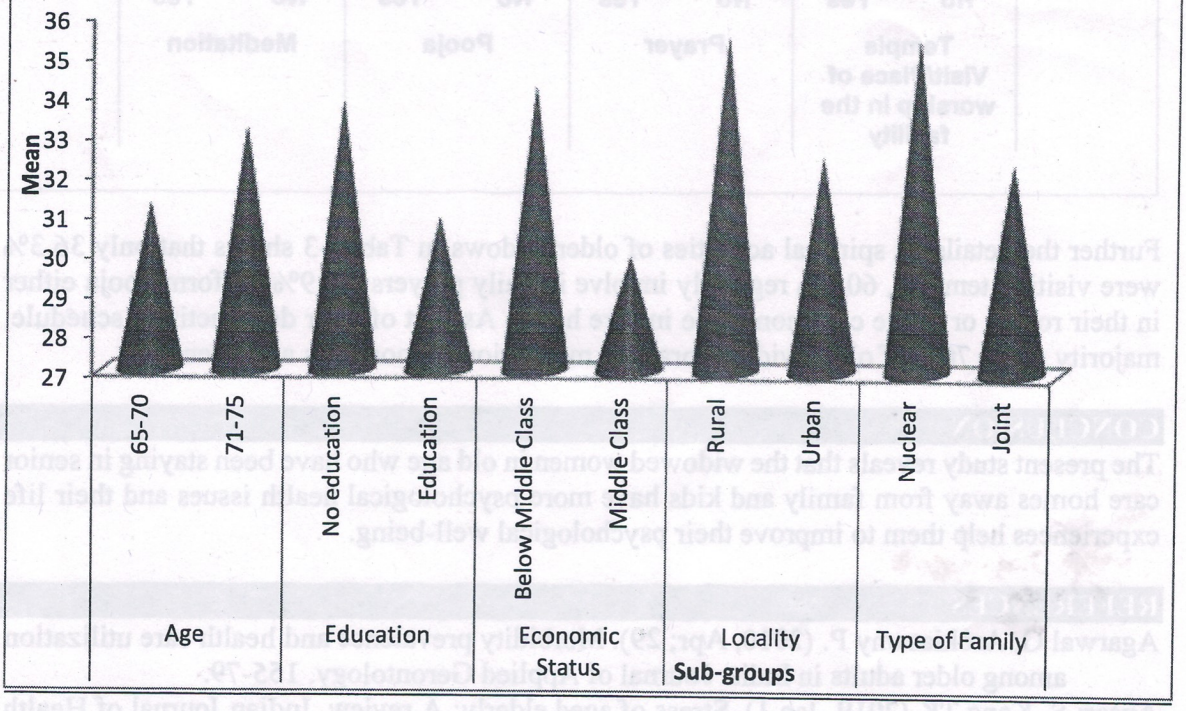
	Urban	73	35.48(3.65)	
****P<0.01; * P<0.05; @ Not Significant**				

A cursory glance of results on psychological health status (Table-2) indicate that the mean differences are statistically significant in term of their age, education, economic status. Older widows in 65-70 years, with basic education from middle class, from rural background and from joint family reported poor psychological well – being compared to their counterparts.

A few studies that look specifically at widows 'psychological wellbeing over duration of widowhood. Wilcox et al (2003) using data from the Women's Health Initiative compare married and widowed women, with the later distinguished by time since widowhood. They find that widowed women report more mental health problems than married women. This may reflect the effects on mental health of spousal care both for recent widows and comparable married women. An indication of the immediate mental health consequences of widowhood is the elevated risk of suicide reported by Luoma and Pearson (2002) among young widows and widowers.

There is little literature that relates the psychological well-being for widows and widowers to their economic resources. While Carr et al. (2000) argue that the emotional consequences of widowhood are affected by the quality of the marriage and dependence – financial and emotional – on the deceased partner, they do not examine how financial dependence separately contributes to emotional dependence. Earlier studies of widowhood noted the additional stress on bereaved widows who were financially dependent on deceased husbands (Morgan, 1981, Lopata, 1973). This pre- widowhood dependence may have been what Lee and DeMaris (2007) were attempting to capture by including pre-widowhood resources in their study of post-widowhood depression. That they found no effect may be because it is post-widowhood resources (or those resources relative to pre- widowhood resources) that are the appropriate explanatory variable.

Fig.1: Levels of Psychological health in Different Socio-Demographic Subgroups among Older Widows of senior care Homes



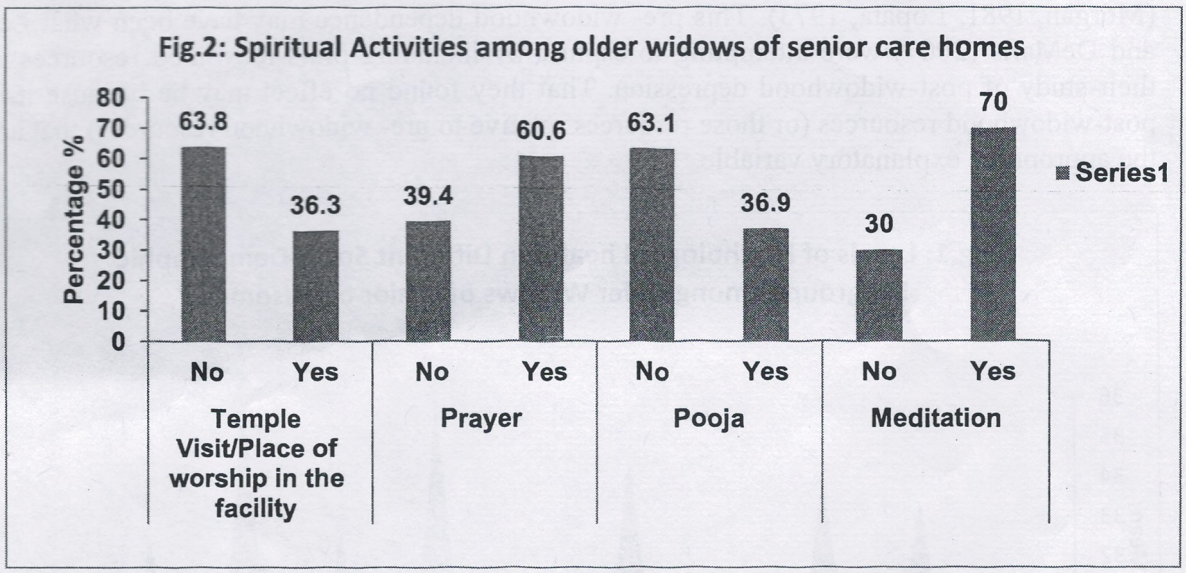


Table 3: Spiritual Activities Among Older Widows of Senior Care Homes

S.No.	Spiritual Activities	N	Percentage (%)
1.	**Temple Visit/Place of worship in the facility**		
	a) No	102	63.8
	b) Yes	58	36.3
2.	**Prayer**		
	No	63	39.4
	Yes	97	60.6
3.	**Pooja**		
	a)No	101	63.1
	b)Yes	59	36.9
4.	**Meditation**		
	a)No	48	30.0
	b)Yes	112	70.0

Further the details on spiritual activities of older widows in Table -3 shows that only 36.3% were visiting temples, 60.6% regularly involve in daily prayers; 36.9% perform pooja either in their rooms or in the common place in care home. As part of their daily activity schedule, majority about 70% of older widows practice meditation in mornings and evenings.

CONCLUSION

The present study reveals that the widowed women in old age who have been staying in senior care homes away from family and kids have more psychological health issues and their life cxperiences help them to improve their psychological well-being.

Social Supports and Social Adjustment among Older Widows Living in Pay and Stay Homes

Madhavi B.M. , Jamuna D., and Srikanth Reddy V.
Department of Psychology, S.V. University, Tirupati (A.P.)

ABSTRACT

The objective of this study was to examine the impact of social support on the social adjustment of 80 older widows, in the age group of 65-75 years, cognitively intact and communicative, and living in pay-and-stay homes in Andhra Pradesh. The Social support and social adjustment of individuals were assessed by using social support inventory (Ramamurti & Jamuna, 1991), and an adjustment inventory(Ramamurthi,1969), for older persons. The findings of the study suggest the importance of maximizing social networks to facilitate social adjustment in older widows to make their living experience in senior care homes meaningful and satisfying.

Keywords: Social Supports, Social Adjustment, Older Widows, Pay and stay Homes

One of the issues that most elderly people experience is limited support from family or relatives or significant others (Sharghi, *et al.*, 2018). Elderly individuals need contact with others to ask for help when they need it as a means to satisfy their emotional needs (Theurer, *et al.*, 2015). The transformation of social structures in recent decades

and the imbalance of the traditional joint family system, the care provider in the nuclear family have led to an increase in the number of old age homes and the culture of delivery of elderly people to these homes (Roberto, and Blieszner, 2015). However, some studies point to the benefits of living in care homes such as relationships with peers, access to nursing care and health facilities, lack of loneliness, and depression. When an elderly person is in a care home, he/she is likely to be physically, psychologically, emotionally, and economically dependent (Atadokhtw, *et al.*, 2015, Theurer, *et al.*, 2015) on non-family networks. Dependency can reduce self-esteem and increase depression in a senior care home. In one of the studies Unsar, *et al.*, (2016) reported higher levels of social support and Activities of Daily Living (ADL) in every resident of senior care homes.

There is enough evidence that many elderly people prefer attending and participating in activities of daycare centers rather than staying in care homes. Daily gatherings can increase the level of physical, mental, and social health of the elderly by enriching their leisure time through implementing various programs (Fields, 2016). Social support acts as a protective shield against mental health issues. It is associated with the reduction of depression, anxiety, and other psychological problems (Patil, *et al.*, 2015). It is still unclear whether older widows living in senior care homes have personal adjustment and perceive their social supports and to what extent they adjust to their social network. Generally, personal adjustment is in demand in old age due to diminishing health, limited capacity, poor mental ability, and increased economic dependency (Shukla, and Kiron, 2013).

Widowhood is an inevitable life event. It is a catastrophic event at any stage of life for the surviving partner with serious repercussions on their physical, economic, and emotional well-being, particularly in the first year of the loss or for a longer term in some cases (Wilcox, *et al.*, 2003). However, the emotional response to spousal loss is hypothesized to be different depending on various socio-demographic characteristics such as age, gender, onset of widowhood, living arrangement, functional ability to perform activities, health status, other

factors such as community involvement and economic conditions of the survivor (Moon, *et al.*, 2011, Agrawal, and Keshri, 2014)

One of the ingradients of successful ageing is the perception of Social support. It is shaped by the social networks within an area where the individual is located, and synchrony with those significant others at times of need. Keeping the above in view, the present study was planned with the following objectives:

- To examine the socio-demographic profiles of older widows living in the pay and stay homes.
- To study the social supports and social adjustment of older widows living in pay-and-stay homes.

Method

Sample

From a sample of 240 older widows in Pay-and - stay senior care homes, located across districts of the United Andhra Pradesh, only a sample of 80 residents from these homes, ages varying from 65 to 75 years, belonging to rural and urban areas, were selected by systematic random sampling method keeping in mind the accepted inclusion and exclusion criteria.

The subjects were explained about the nature, purpose, and voluntariness of their involvement, and signed informed consent was obtained. A trial interview was conducted to assess the subjects' capacity to communicate. The subjects without chronic illness and those cognitively intact were included in the study. The subjects in the study were individually administered the tests.

Tools used **:** The participants were administered Personal Data Form (PDF) to seek information on relevant socio-demographic characteristics, and Adjustment Inventory (Ramamurthi, (1969), to assess adjustment in older widows. A short form of perception of the Social Supports Inventory was used to measure social support in older widows.

And tools we again field tested on a sample of 5 widows to examine relevance. The test-retest reliability was 0.91. (after 15 days).

Results and Discussion

The analyses used a variety of descriptive techniques to describe the patterns of social participation following the loss of a spouse. Some analyses compared widows with controls to differentiate the effects of widowhood from aging, whereas additional analyses compared subgroups within the widowed sample to assess the differential responses to widowhood.

Table 1

Sample Characteristics of Older Widows of Pay & Stay Homes (N=80)

S.No.	Sub-groups	N	Percentage (%)
1.	Age		
	65-70	45	56.3
	71-75	35	43.7
2.	**Education**		
	No education	23	28.8
	Education	57	71.2
3.	**Type of Family**		
	Nuclear	29	36.3
	Joint	51	63.7
5.	**Locality**		
	Rural	35	43.8
	Urban	45	56.2
6.	**Source of Income**		
	Pension	50	62.5
	Property	20	25.0
	Others	10	12.5
7.	**Economic Status**		
	Below Middle class	21	26.2
	Middle Class	33	41.3
	Upper middle class	26	32.5
8.	**No. of members in the family**		
	2-4	48	60.0
	4-8	32	40.0

The sample characteristics of older widows in pay & stay homes were compiled to understand their details (Table -1). Age distribution of older widows shows that 56.3 per cent were in the 65-70 years and 43.7 per cent were in the 71-75 years age group. The educational status of older widows shows that about 28.8 per cent had no education, and 71.2 per cent were educated. All belong to the Hindu religion only. Distribution of older widows across family type (before their relocation) indicates that 36.3 per cent were with the nuclear family and 63.7 per cent were in a joint family setting. Older widows about 43.8 per cent were basically from semi-urban areas and 56.2 per cent were from urban areas. The source of income distribution shows that the majority of them (62.5%) receive pensions, 25 per cent have a property and only 12.5 per cent have other help. The details on economic status show that 26.2 per cent were from below the middle, 41.3 per cent were from the middle income group and 32.5 per cent were from the upper middle class. The number of children in the family shows that 60 per cent had 2 to 4 children, 40 per cent had 4 to 8 children.

	****P<0.01; * P<0.05; @ Not Significant**			

A cursory glance at results on social supports (Table 2) indicates that the mean differences are statistically significant in terms of their age, education levels, economic status, and type of family subgroups. Older widows in the 65–70 years age group, with education, except in upper-middle-class widows from joint families reported higher social support than their other counterparts in the sub-group (Figure 2).

Social adjustment in older widows living in senior care homes of different socio-demographic subgroups (Table 3) shows that there

are subgroup variations in social adjustment. Results on Social adjustment in subgroups of age, education, economic status, and type of family differed significantly (Table 3). Older widows in 71-75 years, with no education, from the lower middle class, from a rural background, and from nuclear family reported higher levels of social adjustment.

The present study sought to understand that decreased support from the significant would aggravate loneliness after partner loss. In line with the theory of loneliness (Weiss, 1975), as emotional and social loneliness in widows. Results showed that older adults were affected much more by partner loss regarding their emotional loneliness than their social loneliness. As stated emotional loneliness in widows increased social loneliness after partner loss, and remained higher in the long run. The deficit model of partner loss and the conservation of resource model suggests that increases in support may protect older adults from increases in loneliness. Although support increased immediately after partner loss, levels of support were not negatively related to emotional loneliness. In the final observation after partner loss, support was negatively associated with social loneliness. Thus, increased support protected older adults from social, but not from emotional loneliness. Thus the onset of widowhood and length of widowhood is detrimental to social adjustment.

Van Baarsen, *et al.*, (2001), and in line with Weiss's theory (1975), it was noticed that the loss of a partner affected emotional loneliness more than social loneliness. When older adults lose their partner, their emotional loneliness increases sharply; but their social loneliness increases only slightly. In the long run, emotional loneliness remains high. With their partner loss, older adults lose a major source of attachment of security, but not necessarily social integration. In sum, the loss of a partner is associated more with emotional loneliness than with social loneliness. Similar to the outcome of the present study marital status and its link with mental health has been explored previously, concluding that unmarried and widowed individuals show

higher rates of loneliness, lower life satisfaction, physical ailments, and higher mortality with advancing age (Zebhauser, *et al.*, 2014).

Further, an in-depth analysis of the case study of older widows in senior care homes and the social adjustment (Golden, *et al.*, 2009) determined that social networks independently affect mood and well-being in the elderly, and the risk of depression increases with the severity of loneliness. Another study found that older adults who had poorer social networks had also a worse quality of life (Kahn, *et al.*, 2003; Isabelli, C., 2006).) found that relationships between perceived social support and psychological well-being (depression, loneliness, and life satisfaction) were quite strong. Garousi, *et al.*, (2013) emphasized that supportive family behaviors are important sources of social support and could be in negative relation to depression and anxiety of diabetic patients.

In conclusion, this study shows how important changes in the social resources of older widows are for their social adjustment. The poor social adjustment and negative life expectancy of widows benefit from the broad range of social resources available in their networks of personal relationships and social adjustment in the community rather than in pay-and-stay homes. Moreover, widows experience additional benefits from their social resources when their instrumental support increases after a partner loss. More generally, it suggests that older widows derive benefits from their social resources, as a substitute for their partner loss. This would suggest that policy initiatives to enhance social resources in care homes are to be planned.

ABSTRACT: India is the home to the familiar plant *Cleistanthus collinus* (Roxb.) Benth. ex Hook. F (Euphorbiaceae) has great ethnomedicinal and therapeutic applications. The present study was designed to assess the phytochemical profile and investigate the antifungal effectiveness of leaf, bark and fruit extracts by using the agar well diffusion method. All crude extracts from leaf, bark, fruit and fractions derived also demonstrated significant antifungal activity (20-80%), but the methanol extracts showed a remarkable antifungal spectrum; as a result, GC-MS analysis was performed on it. From this GC-MS analysis, 14 chemicals, including alkanes, glycosides, phenols, flavonoids and steroids were identified, while leaf methanol extract has high phytochemical diversity with 9 compounds than bark with 6 compounds and fruit with 5 compounds. 1, 2, 3-Benzenetriol, 3-O-Methyl-d-glucose and Undecane are a few significant molecules with larger area percentages that demonstrated biological value. These compounds have been linked to anti-cancer, anti-inflammatory, anti-microbial and antioxidant properties. The current results collectively highlight the appreciable antimicrobial potential of *C. collinus* and its numerous chemical compounds that are physiologically active and offer a thorough understanding of the phytochemical profile, which could be exploited to create plant-based medications.

INTRODUCTION: Rising antibiotic resistance has emerged as a serious hazard to human well-being worldwide [1]. The rising prevalence of drug-resistant diseases necessitates identifying and isolating novel bioactive components from medicinal plant species utilizing standardized contemporary scientific techniques. Medicinal compounds obtained from plants might provide innovative and accessible techniques to pathogenic organisms.

QUICK RESPONSE CODE

DOI: 10.13040/IJPSR.0975-8232.14(10).4778-87

This article can be accessed online on www.ijpsr.com

DOI link: https://doi.org/10.13040/IJPSR.0975-8232.14(10).4778-87

According to the World Health Organisation (WHO), conventional drugs produced from plants with medicinal properties continue to assist 80% of poor countries. WHO has also documented a list of over 20,000 therapeutic plant species and identified these plants as a possible driver of new medications [2].

The antibiotic era, which has lasted barely 80 years, has recently entered a time of gradual and extensive appearance of drug-resist microbes, threatening to end this era. Microbial diseases, especially fungus, have quick reproductive rates, malleable genes, and the capacity to adapt to environmental conditions containing a high concentration of possible hazardous substances that apply significant selective stresses.

Fungi's eukaryotic chemistry makes them particularly dangerous infections due to a smaller range of selective therapeutic targets over which inhibitors not hazardous to human, animal, and plant hosts may be created. Moreover, there do not exist medicinal vaccination or supplementary immune-mediated therapies present to assist people in their health care, necessitating dependence on a restricted arsenal of antifungal medication classes to combat an increasing wave of fungal diseases [3]. The worldwide stress of fungus-related infections is escalating. Over 150 million severe instances concerning fungal illnesses occur each year worldwide, leading to nearly 1.7 million fatalities. The aforementioned numbers are rapidly increasing, owing to a variety of societal and medical advances in recent decades that have aided the proliferation of fungal diseases [4]. To settle this problem, novel antifungal drugs are required and plants are the main wellsprings of novel drugs.

Due to their vast and varied organic components, which may have an important physiological influence on the human body, medicinal plants have been used to treat human ailments for centuries. Natural assets, such as plants with medicinal properties, which possess a wide range of phytocompounds potential as traditional medicine for treating chronic and infectious illnesses, have long been seen as safer and more efficient options with fewer adverse effects than synthetic drugs [5]. Owing due to their diverse pharmaceutical qualities, plants high in bioactive phytomedicine components such as alkaloids, flavonoids, tannins, and polyphenols have been utilised to treat diseases [6].

Around 25% of the active ingredients of medicinal plants that have been used as legal drugs have been discovered [7]. *Cleistanthus collinus* is an essential medicinal tree that has piqued the interest of researchers owing to its potential for medication development. *C. collinus*, a member of the Euphorbiaceae family, is a small tree featuring ellipse foliage and its silken villous spike. It tends to occur in South Indian deciduous dry highland forests, Sri Lanka and Malaysia [8]. Cleistanthus A and Cleistanthus B, diphyllin glycosides, are cytotoxic to a variety of cancerous cell lines [9]. Because of its unique pharmacological active principles, the isolation of independent bioactive chemicals of *C. collinus* might be widely exploited in the pharmaceutical industry. Despite being a toxic plant, its active constituents have been investigated for medicinal qualities such as antihypertensive, diuretic, and anticancer properties. Active compounds in *C. collinus* that show ability will have a good probability of being developed into drug use [10]. The plant's stem bark can be used as an antiseptic in skin illnesses and to treat bovine hoof sores [11]. A detailed examination of the literature reveals that two have been discovered in the assay of anti-bacterial activity reports [12, 13] and one in antifungal activity [14] from this plant. The primary goal of this study was to appraise the GC-MS analysis study and examine the antifungal potentiality of diverse plant solvent extracts.

MATERIALS AND METHODS:

Sample Collection: The plant *C. collinus* was handpicked from the vicinity of Gopavaram village, Andhra Pradesh, India (17˚22’09.16” N 81˚47’48.42” E), in January 2022 and authenticated by Prof. N. Savithramma, Sri Venkateswara University, Botany Department, Tirupati, Andhra Pradesh, India, with accession number SVUH: 1226.

Extraction of Plant Material: Plant parts were harvested, dried in the shade at 32^{o}C and ground into a fine powder. The powder was then sieved through a 0.5 mm sieve to maintain consistent molecule size and stored in sterile containers until usage. For the extractions of leaves, bark and fruit, the following solvents were selected: methanol, ethyl acetate and chloroform in the ascending order of polarity. Using a soxhlet extractor, the phytochemicals from the plant material were isolated using the aforementioned solvents, which were then stored for 72 hours in sealed jars. A thick concentration was generated when the extracts were collected in a rotary evaporator at 45°C under reduced pressure. The crude extracts were kept in a 4°C refrigerator for future usage.

Collection of Test Pathogens: Four test fungal species; two non-filamentous human pathogens *Saccharomyces cerevisiae* (MTCC 4742), *Candida albicans* (MTCC 227) and two filamentous plant pathogens *Aspergillus niger* (MTCC 282) and *Aspergillus flavus* (MTCC 277) were utilized in

this work; they were acquired from the Microbial Type Culture Collection (MTCC), IMTECH, Chandigarh, India.

Preparation of Test Sample: The methanol, ethyl acetate and chloroform extracts were dissolved in 10% aqueous DMSO (Himedia) to get different concentrations (10 mg, 5 mg and 2.5 mg per 20µL). 10% aqueous DMSO was utilized as the negative control (solvent control). As positive reference standards, Fluconazole (Central Drug House P. Ltd., India) was employed for fungal strains at a dosage of 30µg/mL.

Antifungal Activity Assay: The agar well diffusion method was used to assess the antifungal potentialities of plant extracts in a Potato Dextrose Agar (PDA) medium. A sterilized L-shaped bent rod was used to disperse the 100 µL fungal inoculums evenly and allowed it to harden in the Petri plates.

With the aid of a sterile cork borer, 5mm-diameter wells were made on the plates and filled with various solvent extracts (10 mg, 5 mg and 2.5 mg per 20µL in 10% aqueous DMSO) positive and negative controls of 20 µL each.

After a 48-hour incubation period at 26°C, the inhibitory zone's diameter was determined. The usual positive and negative controls were fluconazole 30 µg/mL and DMSO (10%) and the results of each test were averaged after being repeated three times. A strict aseptic environment was maintained during the entire microbiological experiment.

GC-MS Analysis: The extracts were examined using the Agilent Technologies GC-MS (GC-8890, GC/MS 5977 MSD). With an 18 mL/min split flow and a 3 mL/min purge flow in the injection mode. The temperature of the oven was programmed to range from 75°C to a maximum of 360°C.

The column was a Polar Columns (DB-WAX) & HP-5 MS UI with a 1.21 mL/min flow rate and helium gas (99.99%) as the carrier gas. A temperature range of 60°C to 325^{o}C was set for the column. The GC-MS lasts for a total of 53.5 minutes. The sample pieces were ionized using the EI mode (70 eV). The spectra of the unknown components were compared to the spectrum of the known components using the Spectral Library and Database (licensed NIST 2017 Library; Software: Open Lab CDS 2.5 version).

RESULTS AND DISCUSSION:

Anti-fungal Activity: The antifungal bioassay findings against pathogens using crude extracts of the *C. collinus* plant (10 mg, 5 mg, and 2.5 mg of each) were described regarding the zone of inhibition's diameter. According to the observed inhibitory zones, which were also correlated with their tested doses, the entire extract and various fractions of *C. collinus* displayed strong antifungal activity against *C. albicans*, considerable anti-yeast ability against *S. cerevisiae* and moderate activity against *A. flavus* and *A. niger* **Table 1**.

The majority of the studied substances had strong inhibitory effects on *C. albicans*, among them fruit methanol crude extract showing the highest activity (25mm), followed by leaf methanol extract (21mm), bark ethyl acetate (19mm) and bark methanol (17.3mm). Methanol and ethyl acetate extracts showed high to moderate activity against test fungal pathogens while chloroform extracts had the lowest activity.

Here, *A. flavus* shows the strongest resistance to crude extracts of *C. collinus*, whereas *C. albicans* is the most vulnerable. It was discovered that the fractions containing the highest secondary metabolites concentration had higher levels of antifungal activity.

Moreover, the highest inhibitory properties against *A. flavus* were exhibited by the fruit methanol extract (12.3mm) followed by bark ethyl acetate (10.3mm) and bark methanol (10mm) extracts.

Whereas both ethylacetate and chloroform extracts of leaf and fruit did not show any activity. Contrary to *A. flavus*, *A. niger* was more susceptible to bark methanol extract (14mm) followed by fruit methanol extract (11.3mm).

The effectiveness of fluconazole has consistently outperformed that of plant solvent extracts, which has made it a recognized measure for comparing their effects. The DMSO containing well (negative control) exhibited no bioactivity.

TABLE 1: ANTIFUNGAL ACTIVITY OF DIFFERENT EXTRACTS (ME, EA &CH) AT THE DOSAGES OF 10mg, 5mg, AND 2.5mg

Plant part	Extract	*S. cerevisiae*			*C. albicans*			*A. flavus*			*A. niger*		
		10mg	5mg	2.5mg	10mg	5mg	2.5mg	10mg	5mg	2.5mg	10mg	5mg	2.5mg

Values represent mean ± standard deviations; ME stands for methanol extract, EA for ethyl acetate, CH for chloroform, and "-" for no zone of inhibition. A zone of inhibition with a diameter of less than 6 mm was considered inactive. Source: authors.

Furthermore, the antifungal activities of higher concentration (10mg) plant extracts were compared to the positive control fluconazole's inhibition capacity **Fig. 1**.

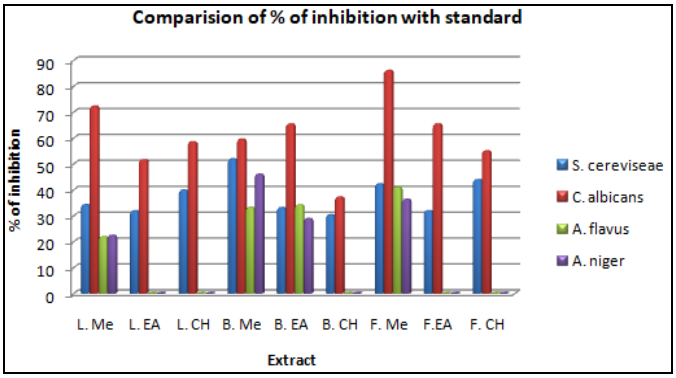

FIG 1: ANTIFUNGAL ACTIVITY (% OF INHIBITION) WITH RESPECT TO +' VE CONTROL

The highest percentage of inhibition (86.2%) against *C. albicans* was found in the fruit methanol extract *of C. collinus*, followed by leaf methanol (72.4%) and bark ethyl acetate (65.5%). The remaining eight plant extracts, except bark chloroform extract, demonstrated more than 50% inhibitory effect against *C. albicans* compared to the standard. All plant extracts inhibited *S. cerevisiae* growth in a medium-to-high range (30-55%). *S. cerevisiae* and *C. albicans* were more susceptible and all plant extracts tested inhibited their growth, whereas *A. flavus* and *A. niger* were more resistant and only methanol extracts with moderate activity, i.e., 20-45% when compared to standard, inhibited their growth. The antifungal activity of leaf acetone, water and benzene extracts from *C. collinus* studied by Majiet al., 2010 against *C.albicans* ranged from 13 to 8 mm[12] however in my study Methanol, Ethyl acetate and chloroform extracts of leaves showed higher activity ranged from 21 to 15 mm. Previous research employed aqueous and ethyl acetate solvent-based *C. collinus* leaf extracts against *C. albicans*, *C. tropicalis*, and *C. glabrata*, in which the ethyl acetate extract only showing action against *C. albicans* and other species being resistant [15]. In addition to previous data, the current investigation demonstrates that *C. collinus* methanol and ethyl acetate extracts are more efficacious than the chloroform extract. This might be because the kind of solvent utilized in the extraction technique substantially influences the subsequent characterization of phytochemicals. 1,2,3 Benzenetriole has strong antimicrobial properties [25, 26] and GC-MS analysis revealed that it was found in higher concentrations in all leaf, bark, and fruit methanol extracts; this may be a reason behind the results obtained in antifungal assays.

The antifungal screening supports *C. collinus* potentiality as a traditional cure for several fungal illnesses, including its usage as an antiseptic.

GC-MS Chemical Profiling: Methanol extracts were chosen for gas chromatography and mass spectrometry (GC-MS) analysis to examine the phytochemical composition because they displayed the highest antifungal efficacy compared to the other solvent extracts. This study demonstrates that a variety of physiologically active compounds are present in leaf, bark and fruit methanol extracts at various concentrations and also offers a thorough understanding of the phytochemical profile that may be exploited to create plant-based therapeutics.

GC/MS spectrum data of the methanol extracts showed several peaks **Fig. 2, 3** & **4** that indicated the presence of 14 different chemicals (9 from leaf, 6 from bark and 5 from fruit). Each of these chemicals was recognized and described using the mass fragmentation patterns and retention indices from the Spectral Library and Database (NIST 2017 Library). In **Table 1**, the active ingredients are listed in chronological order of retention durations, their peak area percentage, molecular formula, molecular weight, structural features and biological activities. To look at the biological effects of important substances, a review of the literature was conducted.

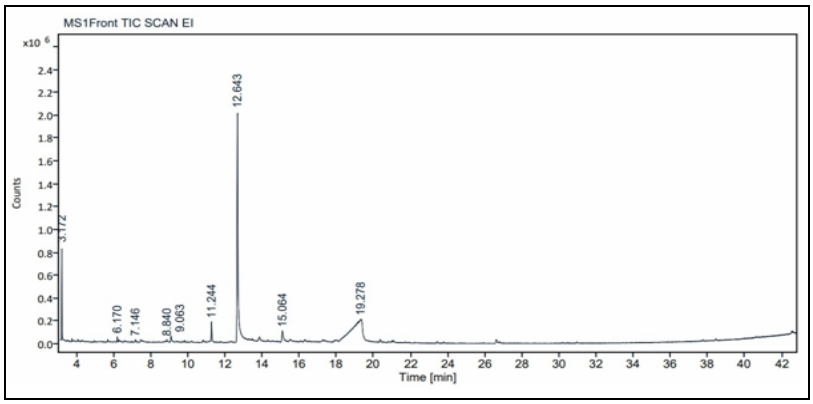

FIG. 2: GC-MS CHROMATOGRAM OF *C. COLLINUS* LEAF METHANOL EXTRACT

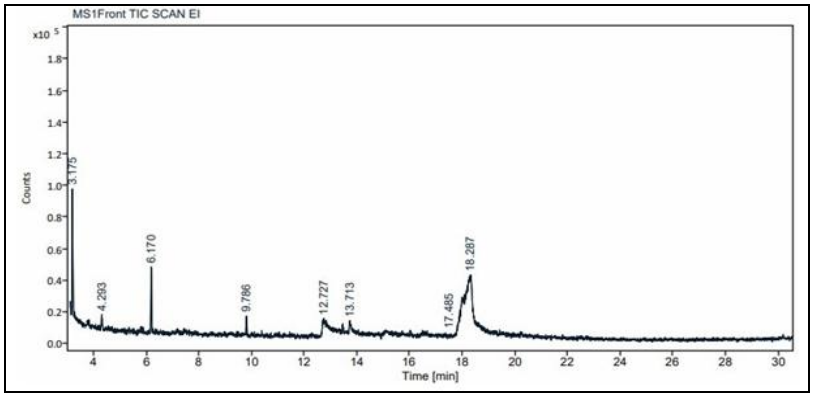

FIG. 3: GC-MS CHROMATOGRAM OF *C. COLLINUS* BARK METHANOL EXTRACT

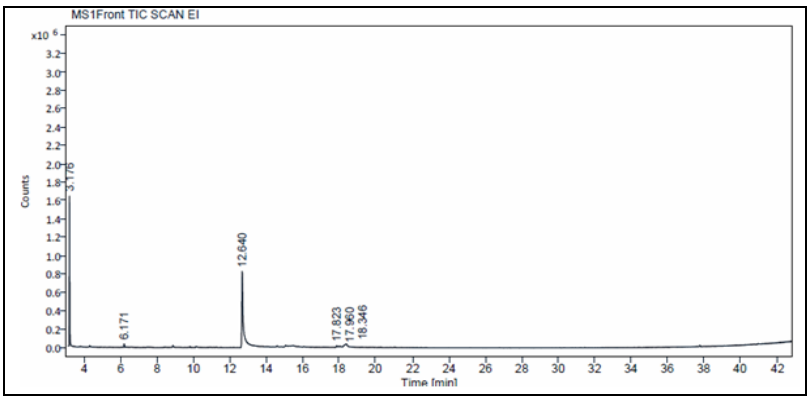

FIG. 4: GC-MS CHROMATOGRAM OF *C. COLLINUS* FRUIT METHANOL EXTRACT

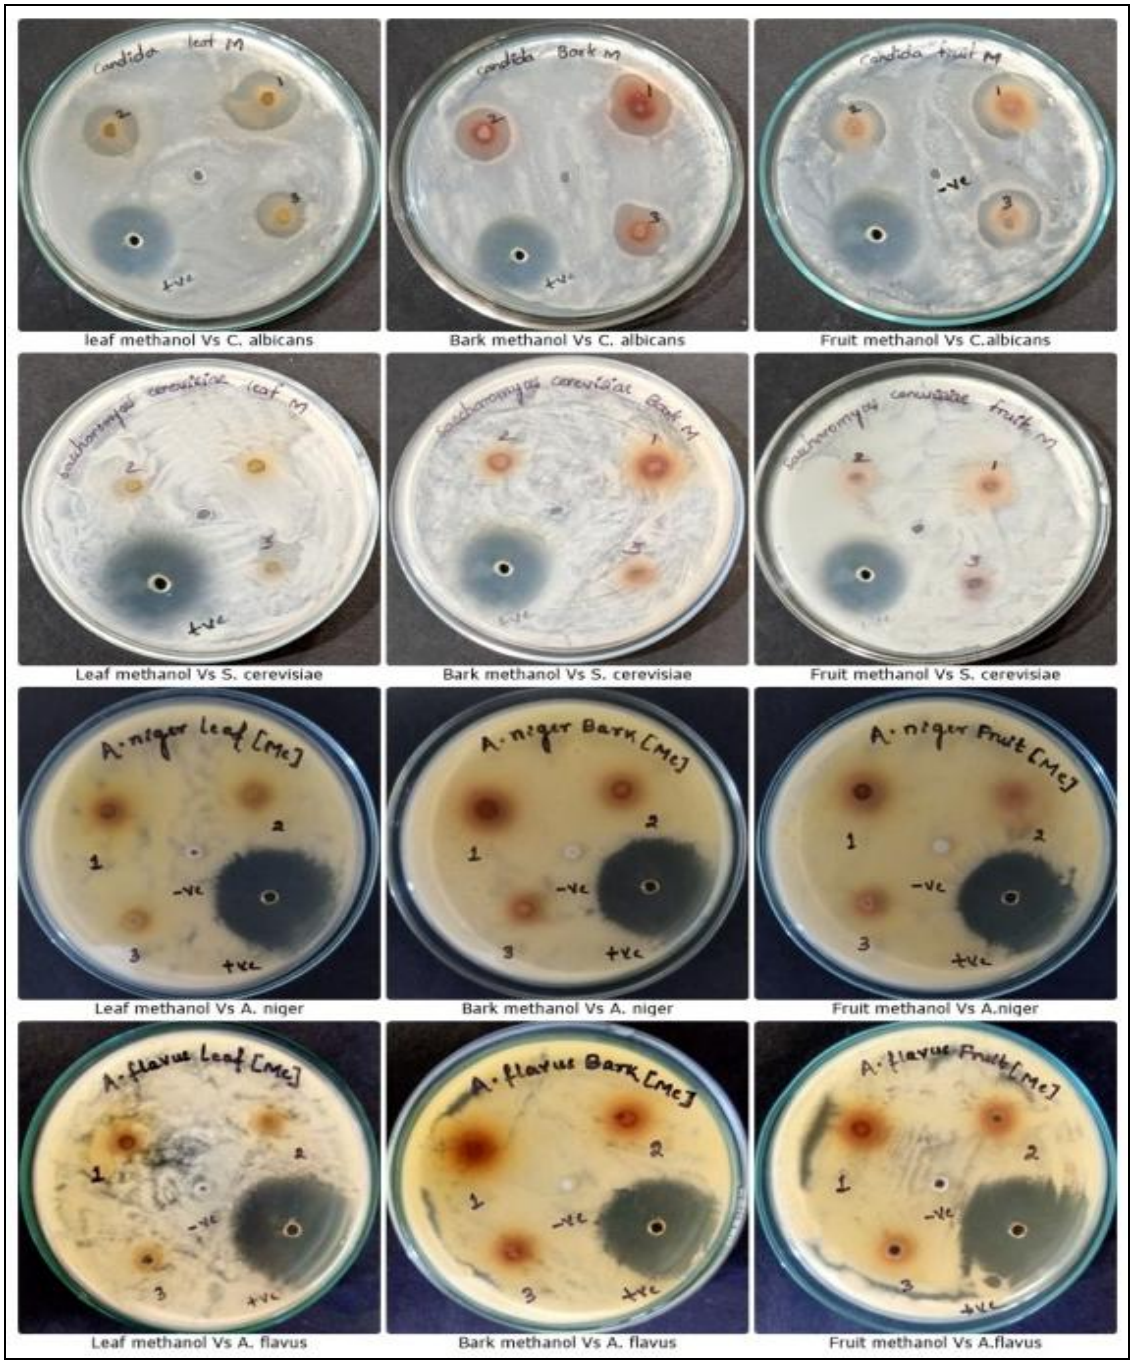
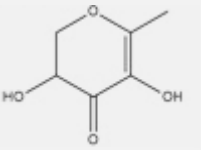
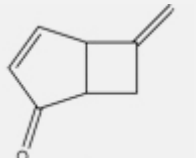
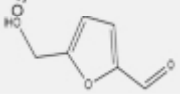
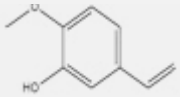
We discovered that most of the constituents in the *C. collinus* leaf methanol extract exhibit a variety of advantageous pharmacological and therapeutic activities. The leaf methanol extract provides a rich source of significant bioactive molecules. Ten different chemicals, including hydrocarbons, phenols, terpenes and glucose derivatives, were found to be present. Undecane, 1, 2, 3-Benzenetriol and 3-O-Methyl-d-glucose were discovered in all three plant sections, whereas fruit and bark extracts contained N-[3-[N-Aziridyl] propylidene] hexylamine. A little amount of the following compounds were detected only in the leaf methanol extract: 4H-Pyran-4-one, 2, 3-dihydro - 3, 5 – dihydroxy – 6 - methyl, 6-Methyl-enebicyclo [3.2.0] hept-3-en-2-one, 5-Hydroxymethylfurfural, Phenol, 5-ethenyl-2-methoxy and D-Allose. Only bark extracts included decane, 4(3H)-Pteridinone, 2-amino-7, 8-dihydro-8-methyl-6, 7-diphenyl and fruit extracts had trace amounts of phthalic acid, 5-methylhex-2-yl heptadecyl ester.

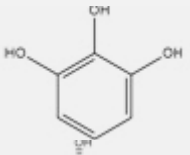


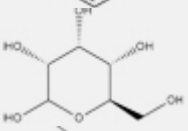


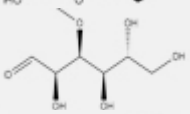


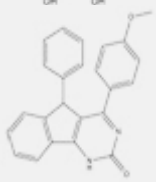


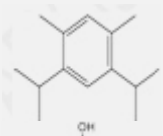


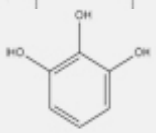


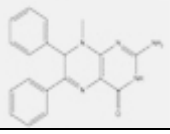


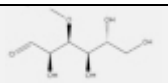


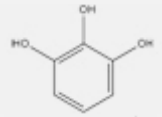












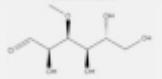


FIG 5: PICTORIAL DATA OF ANTIFUNGAL ACTIVITY OF *C. COLLINUS* (LEAF, BARK & FRUIT) METHANOL EXTRACTS

TABLE 2: BIOACTIVE CHEMICAL PROFILE OF *C. COLLINUS* THROUGH GC-MS

S. no.	Name of the compound	RT minutes	Mol. weight	Mol. formula	Area %	Structure	Importance
				Leaf			
1	Undecane	6.169	156.31	$C_{11}H_{24}$	0.55		Mild sex attractant[20]anti-inflammatory and antioxidant effects[21]
2	4H-Pyran-4-one, 2,3-dihydro-3,5-dihydroxy-6-methyl-	7.144	144.12	$C_6H_8O_4$	0.35		Antimicrobial, anti-inflammatory, Anti-proliferative[22]
3	6-Methylenebicyclo[3.2.0]hept-3-en-2-one	8.838	120.15	C_8H_8O	0.19		Bacteriostatic, fungistatic, anti-parasitic activity[23]
4	5-Hydroxymethylfurfural	9.063	126.11	$C_6H_6O_3$	0.43		Anti-oxidant activity[24]
5	Phenol, 5-ethenyl-2-methoxy-	11.245	150.17	$C_9H_{10}O_2$	2.00		Aromatic, flavoring, cytotoxic, anti-inflammatory, germination inhibitor, insect repellent[19]
6	1,2,3-Benzenetriol	12.645	126.1100	$C_6H_6O_3$	35.95		Anti-microbial, Antibiofilm and Antivirulence activity[25,26]
7	D-Allose	15.064	180.16	$C_6H_{12}O_6$	1.72		Anti-oxidant, Anti-tumour activity[27,28]
8	3-O-Methyl-d-glucose	19.277	194.18	$C_7H_{14}O_6$	25.33		Anti-tumor activity[29]
9	2-Oxo-5-phenyl-4-(4-methoxyphenyl)-1,2-dihydro-5H-indeno[1,2-d]pyrimidine	49.245	366.4	$C_{24}H_{18}N_2O_2$	27.54		-
				Bark			
1	Decane	4.294	142.28	$C_{10}H_{22}$	2.09		cocarcinogenic and tumor-promoting activities[30]
2	Undecane	6.169	156.31	$C_{11}H_{24}$	7.42		Mild sex attractant[20]anti-oxidant and anti-inflammatory activities [21]
3	Benzene, 1,5-dimethyl-2,4-bis(1-methylethyl)-	9.788	190.32	$C_{14}H_{22}$	2.89		-
4	1,2,3-Benzenetriol	12.726	126.1100	$C_6H_6O_3$	5.10		Anti-microbial, Apoptosis, Antibiofilm and Antivirulence activity[25, 26]
5	4(3H)-Pteridinone, 2-amino-7,8-dihydro-8-methyl-6,7-diphenyl-	13.714	331.4	$C_{19}H_{17}N_5O$	1.84		-

6	3-O-Methyl-d-glucose	18.290	194.18	$C_7H_{14}O_6$	67.88		Anti-tumor activity[29]
				Fruit			
1	Undecane	6.169	156.31	$C_{11}H_{24}$	0.95		Mild sex attractant[20]anti-oxidant and anti-inflammatory activities[21]
2	1,2,3-Benzenetriol	12.639	126.1100	$C_6H_6O_3$	63.09		Anti-microbial, Apoptosis, Antibiofilm and Antivirulence activity[25,26]
3	N-[3-[N-Aziridyl]propylidene] hexylamine	17.821	182.31	$C_{11}H_{22}N_2$	0.69		Anti-viral activity[31]
4	Phthalic acid, 5-methylhex-2-yl heptadecyl ester	17.959	502.8	$C_{32}H_{54}O_4$	0.17		Aminoglycoside antibiotic, Neuroprotective[32]
5	3-O-Methyl-d-glucose	18.346	194.18	$C_7H_{14}O_6$	4.03		Anti-tumor activity[29]

The chemicals found in this study were mostly stated to have anti-cancer, antibacterial, anti-virulence, anti-inflammatory, neuro-protecting, and antioxidant effects according to the reported biological activities. 1, 2, 3-Benzenetriol is a phenolic molecule that is most abundantly present in fruit extracts (63.09%), leaf extracts (35.95%) and bark extracts (5.1%). It is an effective anti-microbial and antiviral agent and leads to the death of cancer cells by apoptosis. The highest concentration of 3-O-Methyl-d-Glucose, a glucose derivative with good anti-cancer capabilities, was identified in the bark extract (67.88), followed by the leaf (25.33) and the fruit extract (4.03). Undecane is a hydrocarbon compound that is present in fruit and bark extracts in low amounts and high concentrations in bark extract (7.42).

It possesses anti-inflammatory and antioxidant activities. Decane contains co-carcinogenic and tumor-promoting properties but is reported only in bark extract. 2-Oxo-5-phenyl-4-(4-methoxyphenyl)-1, 2-dihydro-5H-indeno [1, 2-d] pyrimidine reported in leaf extract in high concentration (27.54), although its bioactivities have not been studied. Earlier work by Pratheepa M. *et al.,* 2012 revealed the GC-MS analysis of the plant leaf acetone extract which showed 8 different bioactive compounds from which the novel chemical dioctyl phthalate observed at a peak area of 95.23% which may operate as a very promising medicinal agent for persons suffering from cancer or afflicted with fatal diseases, *etc* [16]. Arulmanickam P. and Chitra T. *et al.,* 2020 studied leaf powder ethanolic extract and revealed 13 different types of bioactive compounds, but only six of them can carry out specific biological functions. These include alpha-methyl mannofuranoside (36.25%) for its antibacterial and antifungal activity, undecanoic acid (1.88%) for its cytotoxic, anticancer, and anti-microbe properties, 5-O-methyl-D-gluconic acid dimethylamide (4.86%) for its antioxidant and anti-microbial properties, Cyclopropanetetradecanoic acid, 2-Octyl-, Methyl ester (3.20) for its anti-microbial activity and Pentanoic acid, 2 (Aminooxy) (3.59%) for its Anti-oxidant and lubricantproperties [17].

Suman *et al.,* 2013 found four bioactive compounds in the leaf's aqueous, hot extracts, with 4-OMethylmannose (70.12%) having antibacterial activity and 1,2,3-Benzenetriol (21.76%) having antioxidant, antibacterial, antiseptic, fungicide, antimutagenic, antidermatitic, pesticide, dye and candidicide properties. In contrast, the methanol extract contained significant amounts of thiophene (antimicrobial action), tetrahydro-2-methyl-myo-inositol (48.54%), 1,2,3-benzenetriol (7.51%) and Vitamin E (d -α-tocopherol) (6.52%). Higher concentrations of 4-O-methylmannose (Secondary messenger) and 5-Methyl-2-trimethylsilyloxy-aceto phenone (7.35%) were found in the ethanol extract. In the ethyl acetate extract, there were 15 compounds detected, the main ones being silane (Coupling Agent) and trimethyl [5-methyl-2-(1-methyl ethyl) phenoxy] anthracene (7.06%) [9].

Parasuraman *et al.*, 2009 reported 17 compounds, of which 14 are from fresh leaves and 5 are from dry leaves. 3-Omethyl-d-glucose (32.88%), Benzenetriol (22.43%), 1.6- Anhydro - â - Dglucopyranose (15.66%), Heptacosane (8.99%), 2-Hydroxy-7methoxy-4,5 diphenyl-5 Hindeno [1.2-d] pyrimidine (7.45%) and Eicosane (3.76%) were found in fresh leaves, whereas 3-O-methyl-d-glucose (41.61%), Benzenetriol (Pyrogallic acid, Pyrogallol) (25.06%), n- Hexadecanoic acid (10.60%), Heptacosane (4.41%) and 1,2-Benzenedicarboxylic acid, diisooctyl ester (3.54%) were present in dried leaves aqueous extracts [18]. Kazi M. and Gude A. *et al.*, 2022 summarized the phytoconstituents and discussed 46 compounds and their biological properties [19]. Only 1,2,3-Benzenetriole (35.95) and 3-O-methyl-d-glucose (25.33) were previously reported of the 9 compounds we found in leaf methanol extract; the other compounds were discovered for the first time. To the best of my knowledge, no studies on the GC-MS analysis of methanol extracts of *C. collinus* fruit and bark have been published yet. In contrast to earlier findings, we present the most recent analysis of the GC-MS profile of the methanolic extracts of leaves, bark and fruits in our investigations.

CONCLUSION: These findings have established a solid scientific foundation for the use of the plant *Cleistanthus collinus* in traditional medicine to treat fungal infections. Compared to chloroform extracts, methanol and ethyl acetate extracts showed high antifungal activity. In particular, *C. albicans* and *S. cerevisiae*, which displayed the strongest antifungal activity, excelled over other fungal strains examined. GC-MS study revealed 15 phytochemical components with antifungal, antibacterial, antioxidant, anti-inflammatory and anti-cancer properties. As far as I am aware, very little work has been done on the antifungal activity of *C. collinus*, as there is very little literature accessible on the antifungal activity of this plant species. We believe that more studies in this area will aid in developing novel antifungal and anticancer drugs.

ACKNOWLEDGMENT: The Department of Botany at Sri Venkateswara University provided the facilities and equipment for our research and also thankful to Prof. N. Savithramma, Department of Botany, Sri Venkateswara University, for helping in the identification of the plant. Dr. Ummidi Ravi Shankar of the Mic gene laboratory in Visakhapatnam is acknowledged by the first author for his assistance during various stages of this research.

Author Contributions: S. Prathamanjali assisted and conducted the experiment, calculations, and literature analysis and prepared the manuscript. Prof. T. Vijaya guided the co-authors and prepared the final version of the manuscript. Y.T. Rajesh Babu helped in conducting the experiments and preparation of the manuscript. All authors read the final version of the manuscript and accepted it.

CONFLICTS OF INTEREST: The authors declare that they hold no competing interests.

Nanoparticles are being constantly exploited through scientific community because of their multifaceted properties and applications. Production of biogenic silver nanoparticles (AgNPs) with plant material is extremely cost effective and environmentally non-hazardous. Plant extracts are wealth of various phytochemicals such as secondary metabolites and frequently act as reducing and capping agents in the synthesis of nanoparticles. The present study deals with the synthesis of silver nanoparticles by the aqueous leaf extract of *Endostemon viscosus (Roth)*. Synthesized silver nanoparticles characterized by different recent spectroscopic tools such as UV-Visible spectrophotometer, DLS-Zeta potential, FT-IR, TEM with EDS, and XRD (X-ray diffraction). UV-Vis showed that the peak at 414 nm. DLS-Zeta potential analysis revealed about stability and even size of the particles. FT-IR was studied to know what phyto-constituents are actually acting as capping and stabilization of the nanoparticles. TEM is used to find shape, size and agglomeration pattern of the nanoparticles. TEM image exhibited size range from 11.03 to 37.87 nm and average size of the EvL-AgNPs are 16.77 nm. Eventually green synthesized nanoparticles are evaluated for their efficacy on anti-bacterial, DPPH, and anti-cancer activities. Biologically synthesized EvL-AgNPs expressed excellent anti-bacterial, anti-oxidants, and anti-cancer activities. Hence, the bio-synthesized AgNPs could be considered as auspicious therapeutic option against infectious pathological situations.

Introduction

Nanomaterial improvement, especially of high quality, is a hot topic in nanoscience and technology these days. Metal techniques have sparked renewed attention due to its fascinating physical, thermodynamic and chemical properties, make great candidates for various applications such as optical electronics, catalysis, and biomedical applications (Azizi *et al.,* 2017; Mani *et al.,* 2021; Parasuraman *et al.,* 2019; Sathiyaraj *et al.,* 2021; Anju *et al.,* 2019). Nanoparticles are normally considered as particles with a maximum size of 100 nm and are produced from numerous non-metal and metal elements with exceptional topographies and widespread uses in

science and medicine due to their unique properties (Matei, 2008). Similarity in size of nanoparticles with biomolecules, i.e., proteins and poly-nucleic acids, makes them useful to interact and reduce in size during the synthesis of these nanoparticles' effects of unique physical and chemical properties of biomolecules (Yeo, 2003). Among the metal nanoparticles, silver nanoparticles (Ag-NPs) are one of the best, frequently used nanoparticles having features of very small size, high surface area and high dispersion (Mathew, 2013). They are known to have potent antioxidant and antibacterial activities (AbouEl-nour, 2010). Silver metal is highly toxic to the bacterial cells but nontoxic to animal cells in small concentration (Marambio-Jones, 2010). Nowadays, the Ag-NPs are broadly used as an active antibacterial tool against a broad spectrum of bacteria, including antibiotic-resistant strains (Percival, 2007).

Silver has various biological activities such as antimicrobial (Yugandhar and Savithramma, 2015) antihelmintic and wound healing activity (Garg *et al.,* 2014) anti-larvicidic (Sundaravadivelan *et al.,* 2013) antioxidant (Kumara *et al.,* 2015) anticancer (Vasanth *et al.,* 2014) anti-inflammatory (El-Rafie *et al.,* 2014) hepatoprotective (Bhuvaneswari *et al.,* 2014). Earlier the nanoparticles can be synthesized by using physical and chemical methods. However, the physical and chemical approaches are the most high-priced, time consuming, energy consumption, and more chemicals are needed for the production of nanoparticles and they cause threat to the environment and also inappropriateness for biological applications. Instead of these two Physical and chemical methods, researchers needed to develop another alternative method. The researchers developed the substitute biological method to reduce the abovementioned disadvantages and environmentally benign than the physical and biological methods.

This method overcame most of the problems through the synthesis of silver nanoparticles (AgNPs) by employing various biological agents like algae, bacteria, enzymes, fungi, oligosaccharides, polysaccharides, DNA, and human cell lines (Corciova *et al.,* 2018). In addition to different kinds of NPs have been prepared successfully i.e. Cadmium oxide nanoparticles through *Achillea wilhemsii* (Karimi Andeani, 2013) calcium nanoparticles from *Boswellia ovalifoliata* (Yugandhar and Savithramma, 2013). Copper Nanoparticles by the using *Magnolia Kobus* plant material (Lee, 2013) Gold nanoparticles from *Walsura trifoliata* (Venkata Subbaiah and Savithramma, 2022) Palladium nanoparticles from *Cinnamomum camphora* (Yang, 2010). Zinc oxide nanoparticles from *Catharanthus roseus* (Bhumi, 2014). Silver nanoparticles from *Adansonia digitata* (Kumar *et al.,* 2015).

Endostemon viscosus (Roth) M.R.Ashby also called as *Orthosiphon diffuses*; commonly called as Sticky Wild Basil (E) belongs to the family Lamiaceae, which is distribute in South Asian countries such as India, Thailand etc. This is a traditional medicinal plant perennial herb that is distributed in many of India especially Western and Eastern Ghats in South India. The plant is a subshrub, growing from a woody base. Branch lets are finely velvet-hairy, 4-angled, Leaves are decussate, elliptic to nearly round, up to 2 x 1.5 cm, base flat, leaf-stalk to 1 cm. Flowers are borne in whorls of 6, on a 3-chotomous raceme, flower-cluster-stalk are up to 9 cm, bracts ovate; flower-stalk 0.5 cm. Flowers are pinkish, hairy along throat. Stamens 4, didynamous, filaments 2 mm; anthers 2-celled. Disk anteriorly developed. Nut-lets are erect, enclosed in a crescent calyx (Okaiyeto *et al.,* 2018). The plant is used as treating hypertension, hepatitis/jaundice and fever by folk fore practitioners. The activity of the plant claimed by the tribal peoples in western and Eastern Ghats and was proven by different researchers too (Chin *et al.,* 2008).

Materials and Methods

Collection of Plant Material

The healthy leaves were gathered from Tirumala hills, Tirupati, Andhrapradesh, India. The collected material was cleaned thrice using with running tap water, as well as with distilled water for one time for the removal of admixtures on leaves surface and shade dried for 10-15 days and ground to a fine powder with the help of electrical blender.

Plant Extract Preparation

25 g of weighed plant material was taken into 250 ml conical flask 100 ml of milli-Q water added to this shaken well for 5 min. Then this is kept on water bath for 20 min at 100 ^{0} C and this was cooled at room temperature. Later extraction is done by the using Whatman No 1 filter paper. The extraction is stored in amber colour bottle until the synthesis at room temperature.

Preparation of Ag $(No_3)_2$ Solution

10 gram of silver nitrate purchased from Sigma Aldrich and prepared 1 mM silver nitrate solution with using 100 ml of milli-Q water in sterile Erlenmeyer conical flask. Then the solution was stored in amber colour bottle.

Synthesis of Silver Nanoparticles (AgNPs)

The leaves aqueous extract was added to prepare 1 mM AgNo3 solution. It was heated on water bath at 60-80^{0}C. The colour change of the solution from light yellow to thick brown indicated the silver nanoparticles were synthesized from the leaf extract, and then this is further used for the characterization and antibacterial, antioxidant and anticancer efficacy.

UV- Vis Spectra Analysis

The bio-reduction of silver ions was analysed by UV-Vis spectrophotometer Nano drop range from190-750 nm. The absorbance peak was recorded before 24 hours. It is the primary method to confirm the formation of bio-synthesized AgNPs in the prepared reaction mixture.

FT-IR Spectral analysis

Fourier Transform Infrared (FTIR) spectral analysis was carried out by using dried powder of silver nanoparticles (AgNPs). For the getting dry powder of AgNPs following protocol was applied. When mixing the plant extract to the 1 mM AgNo3 solution 1:9 ratio kept on water bath at 80^0 C for 15 minutes, the solution is changed into brown coloured AgNPs formed.

It was centrifuged at 20000 rpm for 15 minutes. Formed pellets were dispersed in distilled water. Again it was centrifuged and this process was repeated thrice. Then the pellet of AgNPs was dried and this was utilised for FTIR analysis.

DLS Particle Size and Zeta Potential

To determine the size of the particle and size distribution in aqueous AgNPs solution performed by the advanced equipment Dynamic Light Scattering (DLS) Malvern-Zeta analyzer. This is an advanced tool; it depends on the interaction of Brownian motion of spherical particles with the light passing by a colloidal solution (Saxena *et al.,* 2010).

Transmission Electron Microscopy (TEM)

TEM analysis is done by the using HF-3300 advanced 300 kV TEM from Hitachi. It is the valuable, frequently used and important technique for the characterization of nanoparticles, used to procure particle quantitative measure and /grain size, size distribution and morphology of nanoparticles. TEM has two advantages than SEM: it can be provide better spatial resolution and the capability for additional analytical measurements. The images were taken by coating the suspension of AgNPs on carbon- coated copper grid. The average size of the Bio-synthesized AgNPs was calculated with the help of Image J software through TEM images.

XRD Studies

X-ray diffraction (Shimazdu XRD-6000) was analysed to confirm the crystalline nature and average size, and measure the degree of crystallinity of the PmL-AgNPs. XRD is the powerful characterization tool for both qualitative and quantitative analysis of nanoparticles. Diffraction intensities were compared with the standard JCPDS files. The average crystalline size of the AgNPs was calculated by the Debye-Scherer equation.

$$D=k\,\lambda/\beta\cos\theta$$

Where D is diameter of NPs, k is the Scherrer constant, λ is the wave length of X-ray radiation source, β is full width half maximum value of XRD diffraction lines and θ is the half diffraction angle-Bragg angle.

X-ray diffraction patterns of EV-AgNPs peaks shows at

Anti-Bacterial Studies of Fm-F AgNPs

The anti- bacterial activity analysed by the bio-synthesized Ev-L AgNPs against two gram positive bacteria like *Bacillus subtilis* (MTCC-441), *Staphylococcus aureus* (MTCC-731) and two gram negative bacteria species like *Escheria coli* (MTCC-443), *Klebsiella pneumonia* (MTCC-741). Disc diffusion method was executed by using standard protocol Anonymous (1996). 20 µl of $Ag(No_3)_2$, plant extract, AgNPs and Streptomycin was applied on separated sterile filter paper discs (Whatman No. 1 filter paper discs with 6 mm diameter), and allowed to dry before being placed on nutrient agar medium. The activity is examined by triplicate of each solution of above

mentioned and incubated at 37^0 C for 24 h in inoculation chamber. Diameter of zone of inhibition (ZOI) was measured with the help of scale and the results were tabulated.

Antioxidants Activity

Antioxidant activity of Ev-L -AgNPs was assessed by DPPH- (2, 2-Diphenyl-1-picry Hydrazyl radical Scavenging activity). For the assay, 1mM DPPH stock solution was prepared by adding 4 mg DPPH in 100 mL of methanol. 2 mL of DPPH stock solution was added to 1 mL of methanolic solution of Ev-L -AgNPs consisting vary concentrations of Ev-L -AgNPs (25, 50, 75 and 100 µg). The reaction solution was incubated for 45 min in the dark room at room temperature. Later incubation absorbance values were recorded at 518 nm. DPPH activity of the Ev-L -AgNPs was calculated using with the following formula % of inhibition= ((Absorbance of control- Absorbance sample)/ Absorbance of control) X 100. And the concentration of inhibition of 50% free radicals (IC_{50}) was calculated by regression coefficient (R_2=0.9).

Anticancer Studies (Cell proliferation Assay using SRB (Sulforhodomine-B)

Different human cancer Cell lines (MDA-MB-231,SK-OV-3,PC3,PANC-1, and HeLa) purchased from the American Type Culture Collection. For this SRB assay is a quantitative colorimetric method used for determination of cell survival and proliferation based on the measurement of cellular protein content. Cell were grown in Dulbecco's modified Eagle's medium (containing non-essential amino acids and 10% FBS). PC-3 was grown in RPMI with glutamine containing non-essential amino acids. Cell lines were maintained in humidified atmosphere of 5% CO_2 at 37°C.Cells were trypsinized when sub-confluent from 90mm dishes and seeded in 96 well plates at a concentration of 1×10^4 cells/mL in complete medium a day before treatments. Cells were incubated with different concentrations of Ag NPs (12.5-100µg/ml) for 48h for potent compounds; entire process was executed in triplicates.

Results and Discussion

The reduction biologically synthesized silver nanoparticles (AgNPs) was primarily observed by visualization method of colour change pattern of the reaction mixture and it was changed brown into deep brown colour, after process of synthesis; then this solution was performed by the using of UV-Vis Spectroscopy range from 190 to 750 nm Nano drop. The absorbance peak was recorded at 414 nm which was further confirmation the reduction nanoparticles are silver (AgNPs) (Fig.1). This respective peak shown because of the Surface Plasmon Resonance (SPR) of electrons present on the surface of the synthesized nanoparticles. Similar type of results was observed in the AgNPs synthesized from the leaf source aqueous extract of *Odontonema strictum* (Luhata *et al.,* 2022). For this Fourier transform infra-red (FT-IR) spectral analysis with scan range of 4000-500 cm^{-1}(ALPHA interfero meter ECO-ATR, Bruker Ettlingen, Karlsruhe Germany) was used. Here the FT-IR revealed broad peaks 3300.20 assigned for O-H bond phenols, 1587.42 belongs to the strong C=O amide, 1382.96 assigned for medium stretch CH3 bend aliphatic group, 1261.45 indicates strong stretching C-O alkyl aryl ether, 1114.86 assigned strong C-O starching ester, 1047.35 belongs to strong broad CO-O-CO stretching anhydride, 810.10 assigned for strong C-H bending 1, 4-disubstituted, 597.93 and 520.78 assigned to strong C-I stretching halo compound.

All these constituents interacting with silver nanoparticles (AgNPs) as reducing agents (Fig.2). The DLS method revealed average size 5.3 nm and the zeta potential negatively charged with -3.5 mV, which proved that the particles are dispersed in the reaction mixture (Fig.3a & b). A higher magnification analysis was carried out through TEM to find out the size, shape and agglomeration pattern of AgNPs. TEM analysis shows higher magnification due to these green synthesized nanoparticles and exhibited interface between two lattice fringes with small-sized nanoparticles belonging to attachment of AgNPs between the surface sheets of the TEM micrographs. TEM micrographs disclosed about size range between 11.03- 37.87 nm at 50 nm scale bar, Average size of the AgNPs 16.77 nm.

At 5 nm scale bar revealed 0.24 nm as well as no seen any agglomeration between the particles (Fig.4). Such type of results observed in synthesized AgNPs by the using Leaf extract of the *Uvaria narum* (Ajaykumar *et al.,* 2023). The peaks obtained at 2θ of X-axis 38.11^0,44.27^0, 64.42^0, 77.47^0 and 81.53^0corresponds to 222,111, 200, 220 and 311 Bragg reflections of Y- axis respectively which may be indexed based on the end-centred monocrystalline structure of AgNPs. Based on the X-ray diffraction reports clearly indicates that the formed particles are AgNPs (Fig.5).

Table.1 Antimicrobial activity of *Endostemon viscous* aqueous leaf extract biologically synthesized EvL-AgNPs, Ag $(No_3)_2$ solution and antibiotic Streptomycin.

Bacteria	Extract	$AgNo_3$	EVAgNP	Streptomycin

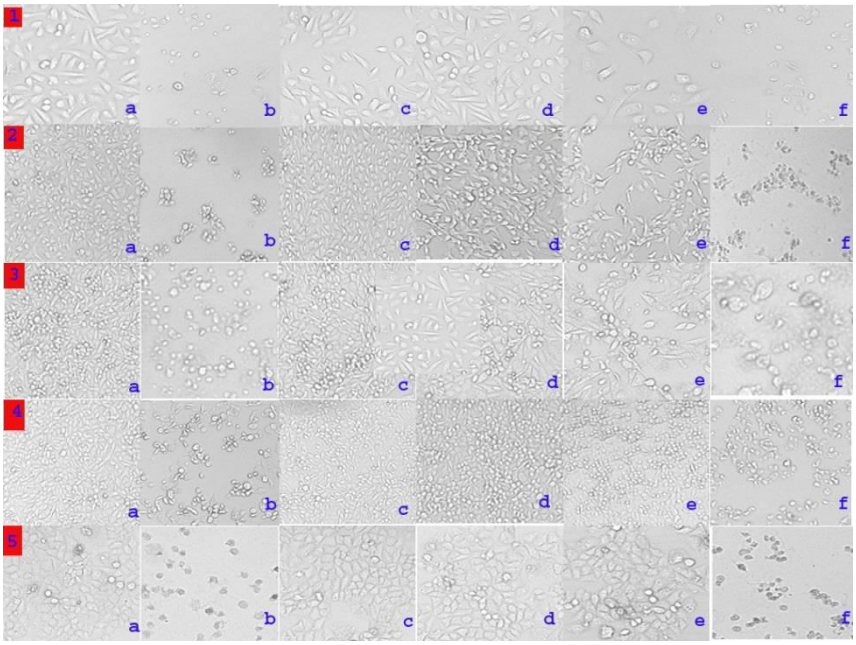

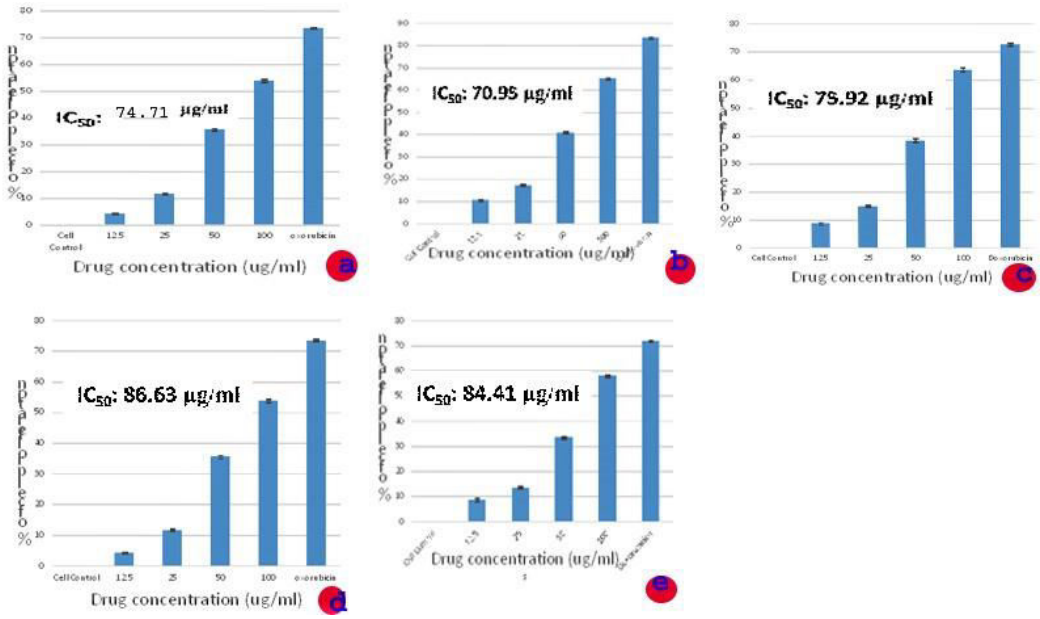

Figure.10 Graphical representation of anticancer activity by using EvL-AgNPs against five selected human cancer cell lines a). PC-3 b). MDA-MB-231 c). SK-OV-3 d). PANC-1 e). HeLa

Biologically synthesized AgNPs showed excellent bacterial activity on selected two gram positive (*B. subtilis* and *S. aureus*) and two gram negative (*K.pneumoniae* and *E.coli*). Synthesized EvL- AgNPs exhibited a maximum zone of inhibition on two gram negative bacteria than positive bacteria. This is due to Gram positive bacteria contain a thick layer that is made up of peptidoglycan when compared to Gram negative

bacteria and penetration of AgNPs by the cell membrane is easy in case of Gram negative bacteria but also inhibition of growth is possible. Among the activity suggesting that the clearly highest activity was seen on *E.coli* (Fig.6 & 7 Graph; Table.1). These types results find in bio-fabrication of AgNPs with leaf aqueous source of *Walsura trifoliolata* (Venkata Subbaiah and Savithramma, 2022). Biosynthesized EvL- AgNPs were tested with DPPH method. The activity depends on the reduction of DPPH radical from DPPH to DPPH-H, where anti-oxidant donated by hydrogen. Among the activity exhibited concentration depends on the dependant scavenging activity against DPPH scavenging. In which concentration of EvL- AgNPs is increased from 50 µg/ml -100 µg/ml. Therefore, the activity was exhibited by increased from 46.07 ± 0.34µg/ml - 64.83±0.31 µg/ml. IC_{50} values 77.54 ± 0.4 clearly suggested that EvL- AgNPs are magnificently showed anti-oxidants activity at 100 µg/ml. The DPPH activity showed excellent activity with WT-AgNPs than a plant extract and 1mM Ag $(NO_3)_2$ solution. (Fig. 8 Table). These kind of results observed in AgNPs synthesized from leaves extract of *Sauropus androgynous* (L.) Merr (Anu Abhimannue and Ashwathi Menon, 2021). Green synthesized EvL-AgNPs furtherly evaluated on various selected five human cancer cell lines such as MDA-MB-231, SK-OV-3, PC3, PANC-1, and HeLa. Experiment was carried out as cell proliferation assessment using SRB (Sulforhodomine-B) colorimetric method.

Diverse concentrations of EvL- AgNPs (12.5 µg/ml, 25.0 µg/ml, 50 µg/ml, and 100 µg/ml) and Doxorubicin as standard control applied to the growing cell lines like dose dependant process. The cytotoxic results demonstrated that the small sized nanoparticles were easily penetrates the cell membrane damaging the DNA, ultimately causing cell death with the reactive oxygen species (ROS) mechanism in cell (Alvur *et al.,* 2022; Ko *et al.,* 2022). EvL-AgNPs exhibited excellent activity on five selected human cancer cell lines. The activity was manifested magnificently on five selected human cancer cell lines, highest activity was seen in PANC-1 73.43 percent at 100 µg/ml, and higher IC50 was seen in PANC-1 (86.63 percent) when comparing the remaining selected human cell lines (Fig. 9 & 10). These kinds of results accordance with *Cucumis prophetarum* leaf extract AgNPs evaluated on different human cancer cell lines (Hemalata *et al.,* 2020).

The present work on synthesis of EvL-NPs leaf aqueous extract of *Endostemon viscous* was utilised as a capping agent for thr stabilization of the biological synthesized nanoparticles. For the preparation of the AgNPs we followed facile, cost-effective, eco-friendly method. Here, less chemicals were used and environmentally safer approach. This is a most effective way of synthesis which involves non-toxic and very conventional method which leads to find out for further directions of environmentally amiable nanoparticles. UV-Vis (scan range from 190 to 750 nm.) spectra analysis is an initial technique to notice of formation of EvL-AgNPs in the synthesized solution, through this instrument at 414 nm we found peak. FT-IR results suggested about phenols, amide, aliphatic group, alkyl aryl ether, ester, anhydride, and halo compound were interfered to form of nanoparticles and these compounds act as capping and stabilization agents to prevent agglomeration in the reaction mixture.

The crystallinity of the synthesized nanoparticles was proven from XRD analysis. The morphology, shape, size and agglomeration pattern of the EvL-AgNPs was performed by HR-TEM. The average size of the bio-synthesized AgNPs was 16.77 nm, sherical shaped, without any agglometation was observed and EDAX was results exhibited about 60.78 % weight percentage in the reaction mixture. The green synthesized EvL-Ag NPs was showed remarkable antimicrobial activity against both gram negative (*K.pneumoniae and E.coli*) and gram positive bacteria (*Bacillus subtilis*, *Staphylococcus aureus*). Hence the highest bacterial growth zone of inhibition (ZOI) was recorded towards gram negative bacteria when compare the gram positive bacteria by the small sized bio-synthesized nanoparticles. Different concentrations of aqueous leaf extract of EvL-AgNPs exhibited strong anti-oxidant activity. Anti-cancer activity was expressed notable with the using diverse human cell lines such as MDA-MB-231, SK-OV-3, PC3, PANC-1, and HeLa. The bio-synthesized AgNPs showed promising Anti-bacterial, anti-oxidants and anti-cancer activities, suggesting their capability utilize in different bio-medical applications.

Acknowledgements

Practical design and manuscript preparation was carried out by our research supervisor Prof. T. Vijaya, Department of Botany, Srivenkateswara University, Tirupati. The first author N. Jayachandra has done field work and practical work performance and assisted to our research supervisor Prof. T. Vijaya. The First Author highly Thanks to DST-PURSE Sri Venkateswara University, Tirupati providing characterization facility.

ABSTRACT

The present work was focused on the anti-bacterial and anti-fungal activity of various solvent extracts of *Achyranthes aspera* Linn. The acetone, chloroform, methanol and diethyl ether solvent extracts of plants leaves were screened for anti-microbial activity. The screening was done by disc diffusion method against *Bacillus Subtilis, Escherichia coli, Klebsiella pnemoniae, Pseudomonas vulgaris, salmonella typhi* and *Streptococcus aureus*. The present study revealed that diethyl ether extracts showed significant antibacterial activity against *B.subtilis*, methanol extract showed significant anti-bacterial activity against *K.pnemoniae, E.coli, and S.typhi*. All extracts of *Achyranthus aspera* showed significant anti fungal activity towards *A.niger, A.flavus, and R.stolinifer*.

Key words: Phytochemical analysis, *Achyranthus aspera,* Anti-bacterial activity, Anti-fungal activity, Different solvent extracts.

INTRODUCTION

Achyranthes aspera common name chaff – flower the plant is used for medicinal purposes.It can be found in many places growing as an introduced species and a common weed it is an invasive species in some areas, including many pacific island environments[1]. It is an erect, branched herb under shrubs up to 15 cm high it was waste land herb everywhere .Leaves are opposite or rounded at apex. Its seeds rich in protein, these are cooked and eaten. *Achyranthes aspera* is one of the powerful ayurvedic herb, it is used to prepare to special medicine called kshara, used extensively in surgical procedures to treat fistula and as oral medicine for obesity.Medicinal plants have been used for human diseases because they contain components of therapeutic value. Some of them are also used for prophylactic purposes[2]. An increasing interest in herbal remedies has been observed in several parts of the world and many of the herbal remedies have been incorporated into orthodox medicinal plant practice[3]. Diseases that have been managed traditionally using medicinal plant include malaria, epilepsy, infantile convulsion, diarrhea, and dysentery, fungal and bacterial infections[4]. Medicinal herb is considered to be a chemical factor as it contains multiple of chemical compounds like alkaloids, glycosides, saponins, resins, oleoresins, sesquiterpene, lactones and oils[4]. India has one of the oldest, richest and most diverse cultural traditions associated with the use of medicinal plants. According to an estimate, 120 or plant-based drugs prescribed for use through the world come from just 95 plant species. Natural anti microbials can be derived from plants, animal tissues and microorganisms. The short comings of the drugs available today for the discovery of new pharmaco therapeutic agents from medicinal plant research[5]. The amount of phytochemical substances varies considerably from

species to species and even from plant to plant, depending on the age and various ecological and climatic factors. Most of the natural products are secondary metabolites and about 12,000 of such products have been isolated so far. These products serve as plant defense mechanisms against predation by microorganisms, insects and herbivorous plant (leaves, flowers, stems, roots, seeds, bark etc.) may be used as herbal drugs in particular or in combinations of each other. Today there is growing interest in chemical composition of plant-based medicines[6]. Several bioactive constituents have been isolated and studied for pharmacological activity. During the last two decades, the pharmaceutical industry has made massive investment in pharmacological and chemical researches all over the world in an effort to discover much more potent drugs, rather a few new drugs. Plants have successfully passed the tests of commercial screenings. Phytochemicals can be classified into two groups. Primary and secondary according to their functions in the plant body[7]. Primary metabolites (sugars, amino acids, proteins, lipids, chlorophyll….) are required for growth while secondary metabolites (alkaloids, essential oils, flavonoids, tannins, terpenoids, saponins, phenolic compounds, cardiac glycosides.).Plants have limit less ability to synthesize aromatic substances, mostly phenols or their oxygen-substituted derivatives.

Materials & Methods

Collection of Plant materials:

The leaves of the plant species were collected from the local areas of Sri Padmavathi Mahila University, Tirupati, Chittoor district, the collected plants were identified at the department of botany, Sri Padmavathi MahilaUniversity, Tirupati, India.

Preparation of extracts:

First, the plant material was collected (which is free from disease) in which the leaves are disease free,then the leaves were washed thoroughly with running water for about 2-3 times. After washing with running water, wash once with distilled water, Air dried the given material for 5 days on sterile blotter under shade (the given leaves were powdered with blender for about 25 grams dried powder was filled in the thimble and extract successively with methanol solvent in soxhlet apparatus for 48 hrs). 5 grams of dried powdered was mixed with 50ml of methanol solvent and allow it to stand for 3 days, then above solvent was filtered with the help of filter paper. The solvent extract was concentrated under reduced pressure and preserved at 5°C in air tight bottle for further use.

Microorganisms used:

The invitro antimicrobial activity was examined for Acetone, Chloroform, Methanol and Diethyl ether extracts of the medicinal plants against bacterial cultures of *Escherichia coli, Pseudomonas vulgaris, Klebsiella pneumonia, Salmonella typhi, Streptococcus aureus,* and Fungal cultures of *Aspergillus niger, Aspergillus flavus, Rhizopus stolonifer*. The cultures were collected from the department of microbiology were used for antimicrobial test organisms. The bacteria were maintained on nutrient broth (NB) at 37ºC and fungal were maintained on potato dextrose agar (PDA) at 28ºC.

Anti- bacterial activity:

Acetone, Chloroform, Methanol and Diethyl ether extract was tested by disc diffusion method[8]with 100 µg concentrations. The test organism was seeded into respective medium by spread plate method with the 24hrs bacterial culture growth in nutrient broth. After solidification the filter paper discs (5mm in diameter) impregnated with the extracts were placed on test organism seeded plates. Gentamycin used as positive control and DMSO solvent used as negative control. The anti-bacterial assay plates were incubated at 37°C for 24hrs .The diameter of the inhibition zone was measured in mm.

Antifungal activity:

The anti-fungal activity was tested by disc diffusion method[9]. Inoculation with each fungal culture in PDA plates by point inoculation. The filter paper discs (5mm in diameter) impregnated with 100 µg concentration of the extracts were placed on test organisms seeded plates. DMSO was used to dissolve the extract and was completely evaporated before application on test organism seeded plate followed by impregnated blank disk by drying was used as negative blank. Nystatin act as antifungal agent (10 mg) used as positive control. The activity was determined after 72 hrs of incubation at 28°C. The diameter of the inhibition zone was measured in mm.

PHYTOCHEMICAL SCREENING FOR DIFFERENT COMPOUNDS:

The Plant extracts obtained by using different solvent extraction process and it is subjected to different phytochemical tests to identify the plant constituents by using following standard methods[10].

Test for Flavonoids: 0.5 g of various extract was shaken with petroleum ether to remove the fatty materials (lipid layer). The defatted residue was dissolved in 20 ml of 80% ethanol and filtered. The filtrate was used for the following tests: (a) 3 ml of the filtrate was mixed with 4 ml of 1% aluminium chloride in methanol in a test tube and the colour was observed. Formation of yellow colour indicated the presence of flavonols, flavones and chalcones. (b) 3 ml of the filtrate was mixed with 4 ml of 1% potassium hydroxide in a test tube and the colour was observed. A dark yellow colour indicated the presence of Flavonoids. (c) 5 ml of the dilute ammonia solution was added to the portion of the aqueous filtrate of each plant

extract followed by the addition of concentrated H2SO4. The appearance of the yellow colouration indicated the presence of flavonoids.

Test for alkaloids: 0.5 to 0.6 g of various extract was mixed in 8 ml of 1% HCl, warmed and filtered. 2 ml of the filtrate were treated separately with both reagents (Mayer's and Dragendorff's), after which it was observed whether the alkaloids were present or absent in the turbidity or precipitate formation.

Test for Glycosides: Five ml each of various extract were hydrolysed separately with 5 ml each of conc. HCl and boiled for few hours on a water bath and hydrolysates were subjected to the following test. A small amount of alcoholic extract of samples was dissolved in 1ml water and then aqueous 10% sodium hydroxide was added. Formation of a yellow colour indicated the presence of glycosides.

Test for steroids: 0.5 g of the various solvent extract fraction of each plant was mixed with 2 ml of acetic anhydride followed by 2 ml of sulphuric acid. The colour changed from violet to blue or green in some samples indicated the presence of steroids.

Test for Phenols: To 1ml of various solvent extracts of sample, 2ml of distilled water followed by a few drops of 10% aqueous ferric chloride solution were added. Formation of blue or green colour indicated the presence of phenols.

Test for Terpenoids (Salkowski test): 5 ml of various solvent extract was mixed in 2 ml of chloroform followed by the careful addition of 3 ml concentrated (H2SO4). A layer of the reddish brown colouration was formed at the interface thus indicating a positive result for the presence of terpenoids.

Test for Saponins: 0.5 g of various solvent extract was dissolved in boiling water in a test tube. Test cooling aqueous extracts were mixed vigorously to froth and the height of the froth was measured to determine the saponin contents in the sample. 2.0 g of the powdered plant material was boiled in distilled water in a test tube in boiling water bath and filtered. 10 ml of the filtrate was mixed with 5 ml of distilled water and was shaken vigorously to the formation of stable persistent froth. The frothing was mixed with 3 drops of olive oil and shaken vigorously for the formation of emulsion thus a characteristic of saponins.

Test for Resins: One ml of various solvent extract were treated with few drops of acetic anhydride solution followed by one ml of conc. H2SO4. Resins give colouration ranging from orange to yellow.

Test for Tannins:0.25 g of various solvent extract was dissolved in 10 ml distilled water and filtered. 1% aqueous Iron chloride (FeCl3) solution was added to the filtrate. The appearance of intense green, purple, blue or black colour indicated the presence of tannins in the test samples.

Test for Cardiac glycosides (Keller-Killani test): 5 ml of various solvent extract was mixed with 2 ml of glacial acetic acid containing one drop of ferric chloride (FeCl3) solution, followed by the addition of 1 ml concentrated sulphuric acid. Brown ring was formed at the interface which indicated the presence of deoxysugar of cardenoloides. A violet ring may appear beneath the brown ring, while in the acetic acid layer, a greenish ring may also form just gradually throughout the layer.

Test for Carboxylic acid: One ml of the various extracts was separately treated with a few ml of sodium bicarbonate solution. Effervescence (due to liberation of carbon dioxide) indicates the presence of carboxylic acid.

Test for Coumarins: 0.5 g of the moistened various extracts was taken in a test tube. The mouth of the tube was covered with filter paper treated with 1 N NaOH solution. Test tube was placed for few minutes in boiling water and then the filter paper was removed and examined under the UV light for yellow fluorescence indicated the presence of coumarins.

Test for Quinones: One ml of each of the various extracts was treated separately with alcoholic potassium hydroxide solution. Quinines give coloration ranging from red to blue.

Test for Xanthoproteins: One ml each of the various extracts were treated separately with few drops of conc. HNO3 and NH3 solution. Formation of reddish orange precipitate indicates the presence of xanthoproteins.

Results&Discussion

The phytochemical analysis of different extracts of *Achyranthus aspera* was shown in Table 1. Among all the tested plant extracts methanol extract was found to be most effective. All the solvent extracts were inactive compared to methanolic extract.

Phytochemical constituents	Acetone	Chloroform	Methanol	Di ethyl ether

PRODUCTION OF BIO-FABRICATED SILVER NANOPARTICLES; CHARACTERIZATION AND EVALUATION OF BIOLOGICAL APPLICATIONS EFFICACY USING AQUEOUS LEAF EXTRACT OF *POGOSTEMON MYOSUROIDES (ROTH) KUNTZE*

Jayachandra N* and Vijaya T

Department of Botany, SVU College of Sciences,Sri Venkateswara University,

Tirupati, Andhra Pradesh, India -517502.

ABSTRACT: The huge demand for metallic nanoparticles synthesized by green protocols has increased because of their therapeutic clinical and different applications. The present work, aimed to synthesize and evaluate the potential of AgNPs synthesized from Pogostemon myosuroides (Roth) kuntze by a cost-effective way. Synthesized AgNPs with the leaf aqueous extract further characterization was done by recent spectroscopic tools like UV-Vis Spectrophotometer, DLS-Zeta potential, FT-IR (Fourier transform infra-red) spectra, Transmission Electron Microscopy, and X-ray Diffraction. The AgNPs formation was primarily confirmed through UV-Vis scan range from 190 to 750 nm acquired intensive peak at 445 nm. The DLS particle size and zeta potential analysis revealed the size and stability of the nanoparticle around 8.5 nm and -4.4 mV zeta potential values. The FT-IR was used to validate the presence of different functional groups accountable for stabilization and capping agents. TEM was used to find the morphology, size, and agglomeration pattern of the nanoparticles. TEM images exhibited an average size of the nanoparticles of about 22.16 nm size ranging between 10 to 38 nm. XRD was used to crystalline nature and size of the synthesized nanoparticles. Biologically synthesized nanoparticles from leaf extract of the Pogostemon myosuroides (Roth) kuntze had shown significant anti-bacterial activity on selected two gram-positive Bacillus subtilis (MTTC-441) and Staphylococcus aureus (MTTC -731); two gram-negative bacteria Klebsiella pneumonae (MTTC-741) and Escherichia coli (MTTC-443) bacteria; and anti-oxidants activities. PmL-AgNPs also evaluated on five selected human cancer cell lines (MDA-MB-231, SK-OV-3, PC3, PANC- 1, and HeLa); exhibited magnificent activity.

Keywords: Characterization, AgNPs, anti-bacterial activity, anti-oxidants, and human cancer cell lines.

1. INTRODUCTION

The revolution in nanotechnology has marked a magnificent turning point in history. Nanotechnology involves the manufacturing, manipulation, and imaging of nanostructures with sizes ranging from 1 to 100 nm [1]. Nanoparticles have a plethora of applications in the fields of health care and cosmetics, food and feed, environmental health, mechanics, space industries, energy science, and photo-electrochemical field [2]. Metallic nanoparticles mainly consist of gold, silver, copper, magnetic (cobalt, nickel), and semiconducting materials. In contrast, non-metallic nanoparticles are primarily composed of carbon-based materials. Intensive research has been conducted on metallic nanoparticles because they possess distinctive electrical, optical, and catalytic properties [3]. Silver nanoparticles (AgNPs), among other nanoparticles; have received extensive attention because of their unique properties s [4-7]. AgNPs are essential nanomaterials studied extensively because of their electrical, optical, and biological properties. Consequently, these nanoparticles have been used for numerous applications, including bio-sensing, drug delivery, Nano device fabrication, and medicine [8]. Silver nanoparticles have different natural applications significantly antimicrobial, antimalarial, anti-inflammatory, wound recuperating, chemo preventive agent, and so on [9-10]. Silver-NPs and silver-based materials are exceptionally harmful to microorganisms. Silver is known for inhibiting a wide range of bacterial strains and pathogens commonly seen in clinical and mechanical settings [11]. Since Silver NPs have antibacterial and antifungal characteristics, they have a wide range of uses in medication development, burn infection prevention, and disinfection [12]. For the amalgamation of Silver-NPs, a variety of approaches are available, including chemical, physical, and bio-reduction procedures [13-14]. Physical and chemical techniques are rather hazardous and expensive, while biological techniques are eco-friendly, secure, and less difficult for nanoparticle synthesis [15]. Synthesizing of nanoparticles using plant extracts offers several advantages compared with other green synthesis methods because plants are eco-friendly and easy to handle [16]. Moreover, it offers energy efficiency, low toxicity, high yield, time-, cost-effectiveness, and availability. Further, plants are a good and easily available source of bioactive plant secondary metabolites such as polysaccharides, proteins, polyphenols, flavonoids, terpenoids, tannins, alkaloids, amines, ketones, and aldehydes, which act as reducing, stabilizing, and capping agents in the conversion of metal ions to metal nanoparticles, leading to the production of desirable nanoparticles with predefined characteristics [17]. In recent years different types of nanoparticles have been synthesized successfully by the greener approach using plant materials like Indium oxide nanoparticles from Aloe vera [18], Iron oxide nanoparticles from Medicago sativa [19], Palladium nanoparticles from Cinnamomum camphora [20], Copper nanoparticles from Magnolia kobus [21], Cadmium Oxide Nanoparticles from Achillea wilhelmsii [22]. Calcium nanoparticles from Boswellia ovalifoliolata [23], Zinc oxide nanoparticles from Vitex negundo [24], Silver nanoparticles from Flemingia wightiana [25]. Pogostemon myosuroides (Roth) kuntze is an herb, that belongs to the Lamiaceae family. The plant species contains the following synonyms i.e. Dysophylla myosuroides (Roth) Benth.exWall., Dysophylla myosuroides (Roth) Benth., Dysophylla myosuroides Benth., Eusteralis myosuroides (Benth.) M.R. Almeida, Mentha myosuroides Roth, Pogostemon myosurodes Kuntze, Pogostemon myosuroides (Roth) El Gazzar & L. Watson. Rootstock woody, stem terete, pale tawny or white silky tomentose. Leaves are thick and wrinkled. Flowers are very small, whorls close and compact. Calyx minute is 1.2 to 1.5 mm and the corolla 1.5 mm long. Pogostemon myosuroides (Roth) kuntze is common to open rocky crevices on hill slopes of Tirumala [26], the local healers and tribal peoples use to cure ailments of leaf extract is used to relieve anxiety and stimulation of brain [27].

2. MATERIALS AND METHODS

Pogostemon myosuroides (Roth) kuntze Plant leaves were collected from Japaliteertham, Tirumala Hills of the Eastern Ghats, Chittoor district, A.P., INDIA. Healthy and mature leaves were cleaned by running tap water and followed by distilled water. Then all leaves were wiped with tissue paper, later cut into 1.0x1.0 cm pieces, and dried up for 10 to 14 days under shade dried to evaporate moisture content and made ground fine powder with an electric blender and it was stored in the amber colour bottle until further work.

Preparation of plant extract

25 g. of powder was taken into 500 ml sterile Erlenmeyer conical flask and 250 ml of sterile Milli-Q water was added and boiled for 15 min at 100oC. After that the leaf extract was collected in a separate sterile conical flask through a standard filtration procedure, this filtrate was utilized for the characterization, antibacterial, anti-oxidants, and anti-cancer activities.

Chemicals and preparation of the 1 mM Ag $(No_3)_2$ solution

10 grams of Silver nitrate was purchased by Hi-media Company, and then 1 mM silver nitrate solution was prepared by sterile double distilled water, later this was taken into the amber-coloured bottle until the process of synthesis.

Synthesis of silver nanoparticles (AgNPs)

Synthesis of AgNPs was performed by the leaf aqueous extract of Pogostemon myosuroides (Roth) kuntze was added to 1 mM of Ag (No3)2. 20 ml of leaf aqueous extract were taken into a 250 ml sterile conical flask and it was titrated by 200 ml of 1 mM of Ag (No3)2 solution with heating at 600C to 800C for 30 min. Later it was centrifuged at 20,000 rpm for 15 min to remove the presence of biological admixture, and this was utilized for characterization and evaluation of its antimicrobial antioxidant, and anti-cancer activities.

Characterization of the Nanoparticles

Synthesized silver nanoparticles (PmL-AgNPs) were analyzed by the advanced tools. AgNPs of Pogostemon myosuroides (Roth) kuntze were performed by the UV-Vis spectrophotometer Nanodrop scan range from 190 to 750 nm to know which nanoparticles interfered in decreasing the nanoparticles by Surface Plasmon Resonance (SPR) Mechanism. To determine the size of the particle and size distribution in aqueous AgNPs solution carried out by the advanced tool Dynamic Light Scattering (DLS) Malvern-Zeta analyzer. To comprehend which phyto-constituents interacted in the capping and stabilization of the nanoparticles was analyzed by the Fourier Transform Infra-Red (FT-IR, EC ART), Bruker, Ettlingen, Karlsruhe, Germany by KBr pellet procedure. The crystalline nature and to calculation of the average size of nanoparticles was done by the XRD (Shimadzu, XRD-6000). To find out the nanoparticle's shape and size was performed with the Hr-TEM H-3300 advanced 300 kV from Hitachi.

Antibacterial activity

The antibacterial study was evaluated by using standard protocol followed by the disc diffusion assay [28]. Clinically isolated bacterial strains were acquired from the Department of Microbiology, Sri Venkateswara University, Tirupati. Biologically synthesized PmL-AgNPs were experimented for antibacterial activity against selected two gram-positive (Bacillus subtilis and Staphylococcus aureus) and two gram-negative bacteria (Klebsiella pneumonae and Escherichia coli). For this 20 µl of plant extract, Ag (No3)2, AgNPs, and streptomycin were applied on separate sterile Whatman No.1 filter paper discs (7 mm diameter) and allowed to dry before being put on nutrient agar medium. The total process was done in triplicates and incubated at 370C for 24 hours. The results were tabulated after measuring the zone diameter in centimetres.

DPPH activity of (PmL-AgNPs)

The antioxidant activity of PmL-AgNPs was tested by DPPH- (2, 2-Diphenyl-1-picry Hydrazyl radical Scavenging activity) [29]. For this, 1mM DPPH stock solution was prepared by adding 4 mg DPPH in 100 mL of methanol. 2 mL of DPPH stock solution was added to 1 mL of methanolic solution of PmL-AgNPs consisting of two different concentrations of PmL- AgNPs (50and 100 µg/ml). Following 30 minutes of incubation time at room temperature, we recognize the absorbance (RSA) against blank at 517 nm. The DPPH assay expressed IC50 values. The assay was performed in triplicates. DPPH activity of the PmL-AgNPs was calculated by the following bellow mentioned formula.

% of formula = [(Absorbance of control - Absorbance of sample)/ Absorbance of control] X100.

Anticancer studies (Cell proliferation assay using SRB (Sulforhodomine-B)

Different human cancer Cell lines (MDA-MB-231, SK-OV-3, PC3, PANC- 1, and HeLa) were purchased from the American Type Culture Collection. SRB assay is a quantitative colorimetric method used for the determination of cell survival and proliferation based on the measurement of cellular protein content. Cells were grown in Dulbecco's modified Eagle's medium (containing non-essential amino acids and 10%FBS). PC-3 was grown in RPMI with glutamine containing non-essential amino acids. Cell lines were maintained in a humidified atmosphere of 5% CO2 at 37°C. Cells were trypsinized when sub-confluent from T75 flasks/90mm dishes and seeded in 96 well plates at a concentration of 1×104 cells/mL in complete medium a day before treatments. Cells were incubated with different concentrations of Ag NPs (12.5-100µg/ml) in triplicates for 48h for potent compounds.

3. RESULTS AND DISCUSSIONS

Ultraviolet- Vissible (UV-Vis) Spectroscopy analysis PmL-AgNPs

The aqueous leaf extract of P. myosuroides mixed with the 1 mMof Ag(No3)2 solution, the color turned into deep brown from transparent yellow, which is the primary and valuable technique to confirm that the synthesized nanoparticles are silver. UV spectra analysis revealed that the broad peak at 445 nm (Fig.1), was due to the SPR Surface Plasmon Resonance mechanism of the AgNPs in the prepared samples. SPR is a collection of oscillations in the conduction of electrons on the material's surface. Obtained UV-Vis spectroscopic results indicate that the stability of the green synthesized AgNPs can be maintained for several months [30]. These types of results were in accordance with the previous reports. [31].

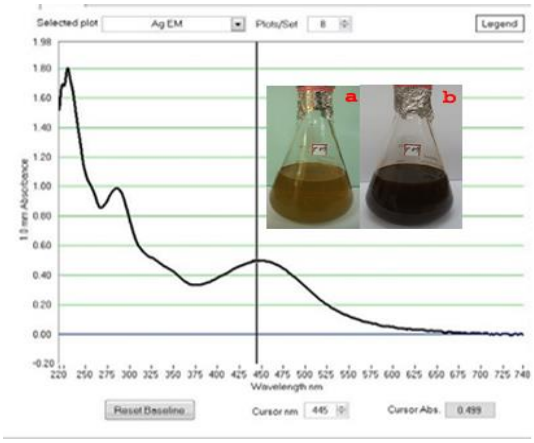

Figure.1 UV-Vis spectra analysis spectrum using aqueous leaf extract of *Pogostemon myosuroides* AgNPs

DLS and Zeta potential

DLS (Dynamic Light Scattering) can be used to scrutinize the surface charge, size, and size distribution of the nanoparticles. This is an advanced tool; it depends on the interaction of the Brownian motion of spherical particles with the light passing by a colloidal solution [32]. The Zeta potential is utilized to estimate the stability, dissemination, and aggregation levels of biologically synthesized nanoparticles through repulsion effects around through fluctuations in charge densities. The PmL-AgNPs in this work expressed about average size is 8.5 nm and negatively charged zeta potential value of -4.4 mV, and 0.165 of the polydispersity index. The results PmL-AgNPs are elucidated in the figure (Fig.2 a &b). This type of result was monitored in the Biosynthesis of silver nanoparticles of Syzigium cumini leaves extract [33].

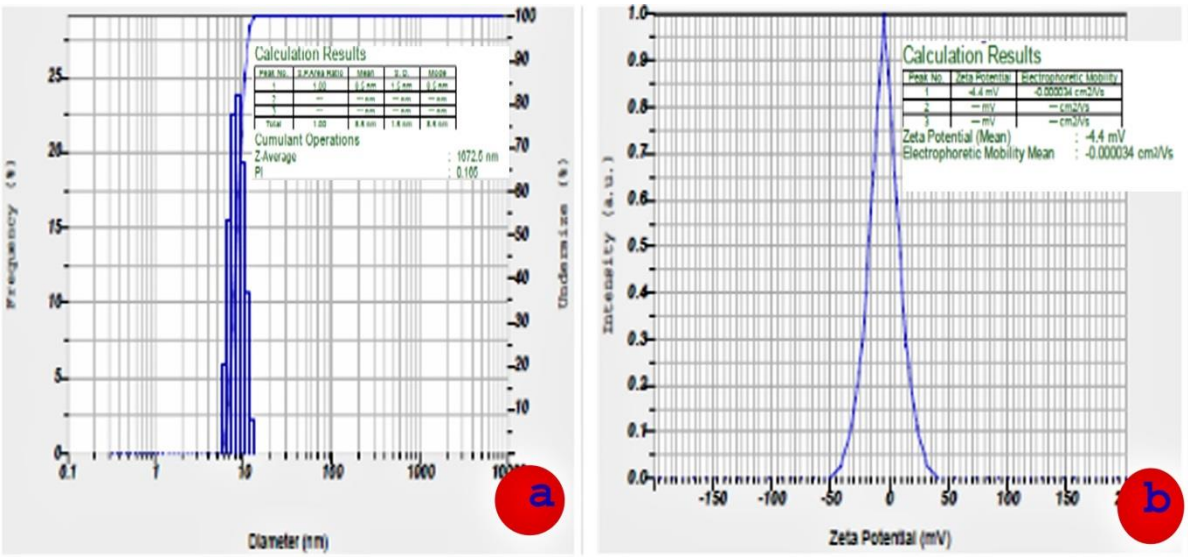

Figure.2 a). Particle size and b). Zeta potential *studies of Pogostemon myosuroides* AgNPs

FT-IR

Green synthesized nanoparticles were analyzed by FT-IR (Fourier transform infra-red) spectra with a scan range of 4000-500 cm-1 (ALPHA interfero meter ECO-ATR, Bruker Ettlingen, Karlsruhe Germany) was used to find the expedient phytochemicals responsible for capping and stabilization. By the FT-IR spectrum broad peaks obtained from leaf aqueous extract of PmL-AgNPs exhibited at 3282 – corresponds to O-H Stretch H Bonded Alcohol, Phenol, 1635 – assigned for N-C Stretch Alkenes and 514 – belongs to C-Br Stretch Alkyl halides (Fig.3). Based on these results cleared that the phytochemicals in the plant extract were essentially accountable for capping and stabilization of pmL-AgNPs. Therefore, FT-IR spectroscopy is a valuable and economical tool to determine the role of biomolecules in the synthesis and stabilization of biosynthesized AgNPs. These results accordance with previous results [34].

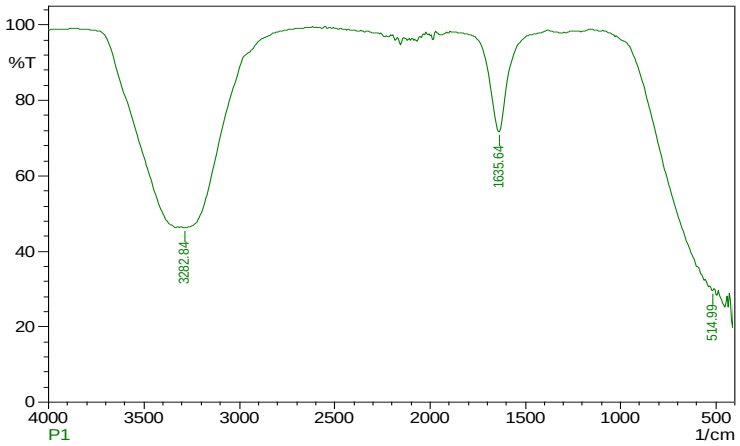

Figure.3 Frourier- Transform Infra-Red (FT-IR) spectra of bio-synthesized AgNPs from *Pogostemon myosuroides*

XRD

X-ray diffraction (Shimazdu XRD-6000) was analyzed to confirm the crystalline nature and average size, and measure the degree of crystallinity of the PmL-AgNPs. XRD is a powerful characterization technique for both qualitative and quantitative analysis of nanoparticles. The peaks obtained at 2θ of X-axis 27.500, 37.890, 46.50, 63.770, and 76.270corresponds to 222,111, 200, 220, and 311 Bragg reflections of Y- axis respectively which may be indexed based on the end- centred monocrystalline structure of AgNPs (Fig. 4). Based on the X-ray diffraction reports indicates that the formed particles are AgNPs. The highest Bragg reflection was obtained at 2θ of 37.89 to predict FWHM (Full Width Half Maxima) value, i.e. 10 and 38 nm average sizes of the nanoparticles by using the Debye-Scherrer equation:

1.1. $D=k\,\lambda/\beta\cos\theta$

Where D is the diameter of NPs, k is the Scherrer constant, λ is the wavelength of X-ray radiation source, β is full-width half maximum value of XRD diffraction lines and θ is the half diffraction angle-Bragg angle.

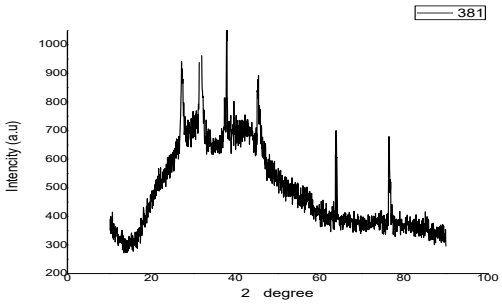

Figure.4 XRD pattern analysis of leaf sourced biologically synthesized AgNPs *Pogostemon myosuroides*

TEM

Nanoparticles can also be characterized by TEM (Transmission Electron Microscope). Quantitative measurements of the synthesized nanoparticles i.e. size of the particle, size distribution, and morphology of the nanoparticles can be acquired by TEM. TEM conducts imaging by passing an electron beam by a sample and the carbon copper grids must coat a single drop of the reaction mixture. TEM is an advanced tool and provides improved special resolution when compared with SEM and enables a much more in-depth analysis of nanoparticles. HR-TEM showed at 50 nm scale micrograph very small sized, spherical in shape and size range from 10 to 38 nm; Average size of the AgNPs 22.16 nm. These tiny-sized nanoparticles showed no physical contact and did not see any agglomeration between them (fig.5). Such type of results were seen in silver nanoparticles synthesized from plant extracts of Wrightia tinctoria and Acacia chundra [35].

Antibacterial studies

The bio-fabricated PmL-AgNPs efficacy was evaluated against two selected two-gram-positive Bacillus subtilis MTTC-441 and Staphylococcus aureus MTTC -731; two-gram negative bacteria Klebsiella pneumonae MTTC-741 and Escherichia coli MTTC-443. To do this Streptomycin standard drug was used as a positive control, Ag solution as a negative control, and plant extract served as a control for comparison. The results showed significant anti-bacterial activity against gram-negative bacteria; sufficient activity was seen against gram-positive bacteria. The zone of inhibition was exhibited in the table (Figure 6). The activity revealed that the highest zone of inhibition was observed with PmL-AgNPs in Escherichia coli (Fig. 6 & 7). These kinds of results were found in synthesized AgNPs with leaf aqueous extract of Walsura trifoliata [36].

Antioxidant activity (DPPH)

reduction of DPPH radical from DPPH-H, a hydrogen-donating anti-oxidant. The IC 50 values of in-vitro Pogostemon myosuroides leaf aqueous extract, sourced biosynthesized AgNPs anti-oxidant activity described in the table.The results divulged that the DPPH anti-oxidant activity was done by the increased concentrations of the test samples. Plants possess a wealth of bio-active compounds i.e. Flavonoids, tannins belong to the phenolic compounds along with other polyphenols, which are a significant group of phytochemicals that act as primary anti-oxidants of free radical scavengers [37-38]. The maximum free radical scavenging activity was monitored in the PmL- AgNPs with 58.78 % at 100 µg/mL concentrations and the lowest activity was seen 41.04 % at 50 µg/mL respectively (Fig.8; Table.1). Similar results were seen in earlier work AgNPs synthesized from Plantago lanceolata leaf extract [39].

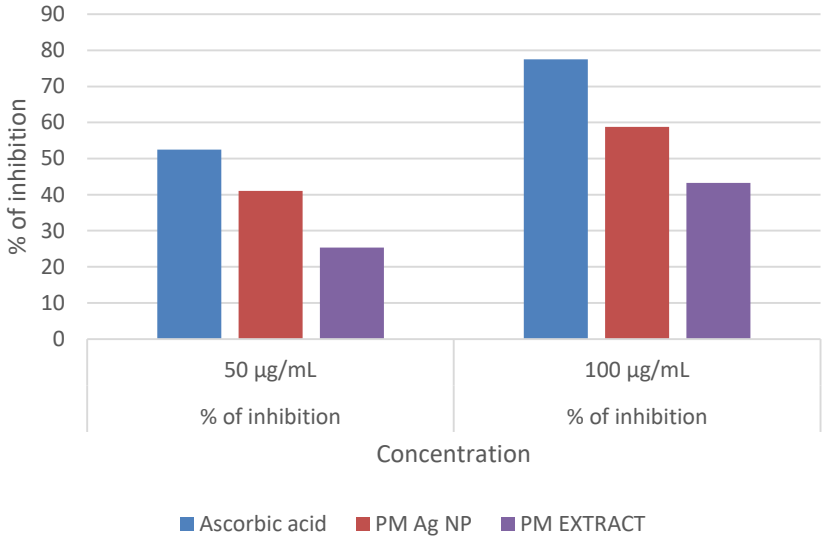

Figure.8 Graphical representation of anti-oxidants activity by synthesized PmL-AgNPs

Anti-cancer studies

Biologically synthesized PmL-AgNPs were screened out against diverse selected human cancer cell lines i.e. MDA-MB-231 an epithelial, human breast cancer cell line, SK-OV-3 -is an ovarian cancer, PC3 -human prostate cancer, PANC-1 -human pancreatic cancer, and HeLa -human epithelial cervical cancer cell lines. The experiment was done as a cell proliferation assay using SRB (Sulforhodomine-B) colorimetric method. Here served cell control, standard control Doxorubicin, and different concentrations of plant-mediated nanoparticles (i.e. 12.5 µg/ml, 25 µg/ml, 50 µg/ml, and 100 µg/ml) to the growing cell lines, in the dose dependant manner. The cytotoxic results suggested the improvement of the aqueous leaves extract AgNPs of Pogostemon myosuroides (Roth) kuntze. Above mentioned assay clearly explained that the tiny-sized nanoparticles allow them to enter cells more easily through endocytosis. Not only do they enter cells, but also they interact with the functioning of cellular proteins, causing changes in cellular structure and chemistry. However, due to these nanoparticles are small and non-aggregated, they are also efficient in producing reactive oxygen species (ROS) in cells. Moreover, ROS can cause stress by damaging DN and causing morphological changes in cells, ultimately leading to cell death [37-38]. Among the activity on five selected human cancer cell lines (MDA-MB-231, SK-OV-3, PC3, PANC- 1, and HeLa) significant activity was noticed in all, lesser activity was seen 4.8 µg/ml in PANC- 1 and PC3 exhibited 4.83 µg/ml at lower concentration (12.5 µg/ml); whereas highest activity was observed in MDA-MB-231 (64.46 µg/ml) and SK-OV-3 (59 µg/ml) at 100 µg/ml than remaining cell lines. The highest IC50 values were monitored PANC- 1 (87.08 µg/ml) and HeLa (85.61 µg/ml) (Fig. 9 & 10). Similar types of results were observed in the Anti-cancer

4. CONCLUSION

The greener way is adapted rather than the heavy toxic synthesizing methods of synthesis of nanoparticles. This is a novel method to form nanoparticles in the reaction mixture. Our present work is intended for the easy synthesis of nanoparticles using a very small amount of chemicals and a small volume of aqueous plant leaves extract of Pogostemon myosuroides (Roth) kuntze by the green method. The synthesized PmL-AgNPs were characterized by advanced techniques i.e. UV-Visible spectroscopy, FT-IR, DLS: Zeta potential, TEM and XRD. Primarily, colorless Ag (No3)2 solution added to the aqueous leaf sourced extract got the deep brown color from transparent yellow; this indicates the formation of nanoparticles. Then these were observed through the UV-visible spectroscopy, acquired peak at 445 nm, this confirmed that the formed nanoparticles are silver in the solution. The DLS zeta potential study revealed about stability, dissemination, and aggregation levels of bio-synthesized nanoparticles and the size of the nanoparticles around 8.5 nm evenly distributed and -4.4 mV zeta potential values. The FT-IR analysis results expressed that the phyto-constituents in the plant extract help in the oxidation of silver nitrate solution into silver nanoparticles. TEM micrographs confirmed that the shape of the nanoparticle is spherical, and the average size of the particle was 22.16 nm size ranging from 10 to 38 nm in the reaction mixture. The EDS study done along with the TEM revealed that silver is a major element in the nanoparticles. X-ray diffraction suggests the crystalline nature and average size of the PmL-AgNPs. All the above studies regarding the synthesized nanoparticles are spherical with small size. The anti-bacterial studies of the PmL-AgNPs on selected two gram-positive Bacillus subtilis (MTTC-441) and Staphylococcus aureus (MTTC -731); two gram-negative bacteria Klebsiella pneumonae (MTTC-741) and Escherichia coli (MTTC-443) showed significant activity, PmL-AgNPs also expressed effective DPPH activity with dose dependant manner. Anti-cancer activity was evaluated on five selected human cancer cell lines (MDA-MB-231, SK-OV-3, PC3, PANC- 1, and HeLa), showing remarkable activity through increasing concentration levels. Above mentioned biological properties were evaluated, and AgNPs were found to have potent anti-bacterial, anti-oxidant, and anti-cancer action. The advantages of this method to synthesis from plant extracts are a clean working environment, a healthy, and non-hazardous atmosphere, lesser wastage, and most stable products. The work suggests that the plant-assisted nanoparticles can be employed in the forthcoming days for the treatment of diseases. The green synthesized nanoparticles from PmL-AgNPs will help to develop into efficacious drug delivery systems as they are smaller in size. The nanoparticles exhibited their correct capability as a pharmaceutical drug.

ABSTRACT

The amazing papaya fruit contains enzymes and compounds that can prevent cancer, ageing and can promote healthier heart. The collected two different plant leaf materials were used to prepare an extract. silver nanoparticles were synthesized and within 30 min of incubation period nanoparticles were rapidly synthesized, the aqueous silver nitrate solution was turned to brown color by the addition of plant extract. The intensity of brown color increased with direct proportion to the incubation period. It may be due to the excitation of Surface Plasmon resonance (SPR) effect and reduction of AgNO3.FTIR analysis of *H.indicus* extract having peaks at 3423, 2425, 1629, 1077 and 664cm-1. The wave numbers due to the presence of phenols at high concentration, alkynes (C=C) and alcohol.The wave numbers due to the presence of phenols at high concentration, alkynes (C=C) andalcohol,and also indicates the high contents of flavonoids in *Carica papaya*.Zeta potential of AgNps of *H.indicus* leaf extract was done (fig 9) and observed that Zeta potential of synthesized nanoparticle shows the stability of the compound having low stability of 3.4mV.Zeta potential of AgNps of *C.papaya* leaf extract was done and observed that Zeta potential of synthesized nanoparticle of *C.papaya* shows the stability of the compound having low stability of 3.4mV.Antibacterial activity of green synthesized water extract of *H.indicus*and *Carica papaya* leaf extract at different concentrations were taken and observed that they are active against *Staphylococcus aureus* and *Bacillussubtilis*.

KEY WORDS

Silver Nanoparticles,FTIR, Zeta Potential,and Bioactivity

INTRODUCTION

Disease causing microbial organisms such as virus, bacteria and fungi cause disease and lead to decrease the quality of human life. Identification of effective, safe and natural drug can help in protects from dreadful diseases. Medicinal plants are the natural resources and are used to treat various diseases caused by bacteria, fungi and viruses. Medicinal plants have secondary metabolites such as alkaloids, carbohydrates, flavonoids, glycosides, sterols, saponins, terpenoids, coumarins, quinones and tannins (Cowan, 1999). Only one third of the infectious diseases have been treated by these synthetic products (Manish Kumar et.al., 2014). Usage of natural drugs are more efficient then chemical drugs and no side effects. There is an increasing need to search for new compounds with antibacterial and antifungal activity to microbial infections. Nowadays, an increasing number of infectious agents are becoming more resistant to commercial antimicrobial (Ranjani Ramakrishnan, 2013; 2018).

Medicinal plants have served as the starting point for more number of drugs on the market today. These plant-based traditional medicine systems continue to play an essential role in health care, about 80% of the world's inhabitants relying mainly on traditional medicines for their primary health care. World's plant species have been examined for the presence of bioactive compounds (Myers 1984). Researchers generally say that natural products from plants and other organisms have been the source for ideas for new drugs (Mukesh R. Jangra*et al*.,2018, NagarajanArumugam *et al* ., 2107, Reshma S. Konjari*et al*.,2015,Gayathri. M. and K. Kannabiran. 2009, (RanjaniRamakrishnan, 2013; 2018).

The advancement of green syntheses of nanoparticles is progressing as a key branch of nanotechnology; where the use of biological entities like microorganisms, plant extract or plant biomass for the production of nanoparticles could be an alternative to chemical and physical methods in an eco-friendlymanner (Reddy et al., 2012). Silver is commonly used in cooking procedure to prevent contamination, to prevent water contamination, food spoilage, and also used in the development of antibiotics, and prophylaxis against gonocaccal infection. For gonococcal infection it is used as standard care in many countries in 20th century (Hoyme 1993).

Plant profile: Hemidesmus indicus:

The botanical name of the plant is *Hemidesmusindicus*. It belongs to the family Apocyanaceae. *Hemidesmusindicus* or Anantmool is a semi-erect and sometimes prostrate shrub with woody aromatic roots. The slender, numerous stem is thick nodes. The leaves are very variable, opposite, and short-petioled. They are oblong-elliptic to linear lanceolate. The flowers are green on the outside and purplish inside.

The stem and branches of the plant twine anticlockwise and the roots have a camphor-like smell. Flowers may be greenish-yellow to greenish purple on the outside and yellow to light purple on the inside. It has fused corolla that numbers twice that of the calyx. Pistil is bicarpellary with free ovaries many ovuled and having distinct styles.

Carica papaya

Papaya enjoys a rich history, and has been used since very long for medicinal uses in day to day life. The Mayans used to worship papaya trees and called it the “Tree of Life”.Papaya (*Carica papaya*) is an evergreen flowering tree that is valued for its buttery fruit that is believed to offer many health benefits. The amazing papaya fruit contains enzymes and compounds that can prevent cancer, ageing and can promote healthier heart.

MATERIALS AND METHODS

Collection of plant Material:

Two medicinal plants *Hemidesmus indicus*(*H.indicus*)and*Carica papaya*(*C.papaya*)were collected during the growing season of January to March from different places of surroundings of Tirupathi and Tirumala hills in Chittoor district, Andhra Pradesh. Collected plants were identified with plant taxonomist, Dept. of Botany, S V University, Tirupathi, Andhra Pradesh, India. Among all, thetwo important plants were identified and selected for further studies (Annapoorna and Ranjani 2013).

Preparation of plant extract:

Preparation of extractions prepared according to the method of AlamSher (2009). The collected two different plant leaf materials were used to prepare an extract. Leaf materials and water were used to prepare extracts with selected plant materials. The samples were prepared and tested in triplicate.

Synthesis of silver nanoparticle (AgNPs) from leaf aqueous extract - of *Hemidesmus indicus* (*H. indicus*) and *Carica papaya* (*C.papaya*)and their characterization:

Silver nanoparticles were synthesized by using aerial parts extraction of *H.indicus*and*C.papaya*. Within 30 min of incubation period silver nanoparticles were rapidly synthesized, the aqueous silver nitrate,(AgNO3) solution was turned to brown color by the addition of plant extract. The intensity of brown color increased with direct proportion to the incubation period (Annapoorna and Ranjani 2013, Venkatasubbaiah *et al*., 2013).

Characterization of nanoparticles:

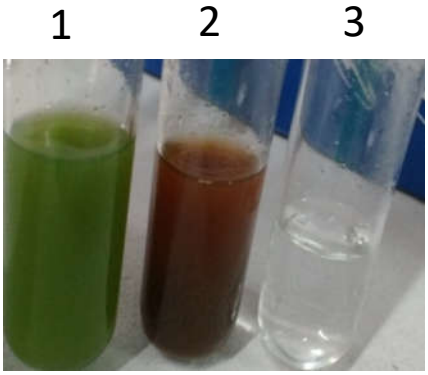
Zeta potential:

Particle size and Zeta potential measurement experiments were carried out using a Nanopartical SZ-100 (HORIBA) according to Kotakadi*et al*.,(2014).Higher zeta potential indicates greater stability of the synthesized silver nanoparticles.

Fourier Transform Infrared Spectroscopy (FTIR) analysis:

The FTIR spectrum was obtained in the range of 500–4000 cm-1 with the resolution of 2 cm-1 by employing alpha interferometer FTIR to detect the functional groups were determined by the method Bozanic *et al.,* (2010).Solid samples can be milled with potassium bromide (KBr) to and then compressed into a thin pellet which can be analyzed(Annapoornaand Ranjani (2016).

Test microorganisms (Microbial pathogens):



Bacterial species like: *Staphylococcus aureus, Bacillus subtilis*cultures were obtained from SVIMS,Tirupati.

Antibacterial activity:

Antibacterial activities are tested nutrient agar well diffusion method (Annapoornaand Ranjani, 2013). The nutrient agar was taken for culturing of bacteria. Minimum Bacterial concentrations (MBC) and Minimum inhibitory Concentrations (MIC) are determined. The different concentrations of plant samples are added in to the wells then the plates were incubated zone of inhibition is calculated by subtracting control zone with test sample zone of inhibition. Resultant zone is taken as final as zone of inhibition of test sample (Annapoorna and Ranjani 2013, Venkatasubbaiah*et al*., 2013).

Results and Discussion

Green synthesis of silver nanoparticles (AgNps) was carriedout using of *H.indicus* and *Carica papaya* leaf material of *H.indicus.* In the present study silver nanoparticles were synthesized and within 30 min of incubation period silver nanoparticles are rapidly synthesized, the aqueous silver nitrate solution was turned to brown color by the addition of plant extract. The intensity of brown color increased with direct proportion to the incubation period. It may be due to the excitation of Surface Plasmon resonance (SPR) effect and reduction of AgNO3. (Ranjani, 201, 2018, Venkatasubbaiah *et al*., 2013,Annapoorna and Ranjani,2013, Mukesh R. Jangra *et al*.,2018, Nagarajan Arumugam *et al* ., 2107, Reshma S. Konjari*et al.*,2015,Gayathri. M. and K. Kannabiran. 2009).

Fig 13: Antibacterial activity of AgNps of *Carica papaya*leaf extract.

Antibacterial activity of green synthesized water extract of *H.indicus*and*Carica*papayaleaf extractat different concentrations were taken and observed that they are active against a) *Streptococcus*and b) *Bacillus*and a). control also maintained. Concentration of AgNps(50, 100, 150 µl) of *H.indicus*leaf extract*Streptococcus*.(2.6, 0.6,1.8 cm ;fig 14) and *Bacillus*(2,2.1,2.1 cm; fig 14) respectively (Table 1; chart 1).

Antibacterial activity of green synthesized water extract of *Carica papaya* leaf extract at different concentrations were taken and observed that they are active against a) *Streptococcus* and b) *Bacillus*and a). control also maintained. *Staphylococcus*and *Bacillus*. Concentration of

AgNps (50, 100, 150 µl) of *H.indicus*and*Carica papaya*leaf extractwere used against Streptococcus. And observed inhibition zone in(1.7, 1.8, 2.1 cm ;fig 15) and *Bacillus*(0,6,0.7, 0.7 cm) respectively. (Ranjani, 2013, 2018.Venkatasubbaiah*et al.,* 2013Annapoorna and Ranjani,2013, Mukesh R. Jangra*et al.,*2018, NagarajanArumugam*et al .,* 2107, Reshma S. Konjari*et al*.,2015,Gayathri. M. and K. Kannabiran. 2009).

Conclusion:

With the help of obtained results following conclusions are made the preliminarily study made with AgNPs synthesized from*Hemidesmusindicus* (*H.indicus*) and *Carica papaya* (*C.papaya*)water extracts were used to check, the biological activity like antibacterial activity with different concentrations (50, 100, 150 µl).Nanoparticle is synthesized from the *H.indicus* and *C.papaya*, characterized by particle size, zeta potential, FTIR, and tested for antimicrobial activity and exhibited the antibacterial activity. In the present study, conclude that AgNPs are more effective than some of the antibioticdrug compound.

A TREASURE TROVE OF NOVEL ANTICANCER COMPOUNDS: ENDOPHYTIC FUNGI

Dandu Anitha
Department of Biotechnology,S.V University, Tirupati

Tartte Vijaya
Department of Botany,S.V Univerty Tirupati

D.S Vani Sri
Department of Microbiology,S.K.University,Anantapur

Abstract

Endophytic fungi are microorganisms that exist almost ubiquitously inside the various tissues of living plants where they act as an important reservoir of diverse bioactive compounds. Recently, endophytic fungi have drawn incredible attention from researchers; their isolation, culture, purification, and characterization have revealed the presence of around 200 important and diverse compounds including anticancer agents, antibiotics, antifungals, antivirals, immunosuppressants, and antimycotics. Many of these anticancer compounds, such as paclitaxel, camptothecin, vinblastine, vincristine, podophyllotoxin, and their derivatives, are currently being used clinically for the treatment of various cancers (e.g., ovarian, breast, prostate, lung cancers, and leukemias). By increasing the yield of specific compounds with genetic engineering and other biotechnologies, endophytic fungi could be a promising, creative source of anticancer drugs. In the future, compounds derived from endophytic fungi could increase treatment availability and cost effectiveness. This chapter will assist readers in better comprehending bioactive chemicals and the beneficial interaction between the fungal endophytes and medicinal plants.

Introduction

Cancer, which is the combined name for a variety of related diseases, is the cells whose division and growth are uncontrolled after mutation. Cancer cells can attack and destroy adjacent tissues and organs. Moreover, it can pass through the tumor and enter the blood, lymphatic system or other organs to form new tumors. In 2012, The WHO's GLOBOCAN estimated approximately 14.1 million new cancer cases and 8.2 million deaths worldwide, which are expected to rise to 22 million in the next two decades [1]. Current methods for treating cancer including chemotherapy, g-radiation, immunotherapy or suicide gene therapy, which mainly mediated through triggering apoptosis [2]. Among them, chemotherapy is the most effective method for treating metastatic tumors. However, the multidrug resistance characteristics of cancer cells and the side effects of drugs are still major obstacles to successful treatment duringa the process of chemotherapy [3,4]. Thus, research on the sources of new drugs indicates that natural products continue to play an vital role in drug discovery and development for the treatment of some human diseases [5].

BIOSYNTHESIS OF NANOPARTICLES AND THEIR APPLICATIONS AND FUTURE PROSPECTS

Abstract:

Green nanoparticle (NP) synthesis is a new field of nanotechnology that stands out in physical and chemical applications based on cost- effectiveness, biocompatibility, environmental friendliness and scalability. Nanotechnology plays an important role in our daily life, from biomedicine to energy. There are many physicochemical and biological methods to synthesize nanoparticles for various applications. This review explores the biosynthetic processes of nanoparticles processed by organisms such as bacteria, fungi and algae and their applications. The possibility of controlling the size and shape of nanoparticles by changing the antibody has been demonstrated in many studies. Traditionally, nanoparticles are produced by chemical and physicochemical methods using various chemicals that cause many dangers later due to their chemical properties, thus referring to the intended use. Chemicals have emerged to fill these gaps. The plant-mediated synthesis process goes through a very controlled approach, which makes it suitable for metal nanoparticle synthesis. In addition, biosynthesis of metal nanoparticles is an inexpensive, one-step and environmentally friendly method. Due to their biosynthetic process, they can reduce the salt into corresponding nanoparticles. This review covers some of the biological fields that scientists use to synthesize nanoparticles and their applications.

Introduction

Nanoparticles - one or more small particles 100 nanometers or smaller - have attracted attention for their unusual and attractive properties as well as applications that have the advantage of big things (Daniel and Astruc, 2004). There are many methods for the combination of physical, chemical, biological and different types of nanoparticles (Liu et al., 2011). Although physical and chemical methods are more popular in the synthesis of nanoparticles, the use of chemicals greatly limits their biomedical use, especially in the field of medicine.

Therefore, the development of reliable, non-toxic and environmentally friendly methods for the synthesis of nanoparticles is essential to expand their biomedical applications. One option to achieve this goal is to use bacteria to synthesize nanoparticles. In addition to the traditional, physical and chemical methods of nanoparticle synthesis, nanoparticle biogenesis has also attracted researchers due to some advantages of using biological materials to produce NPs. Physics (Ayyub et al., 2001; Kalishwaralal et al., 2010) nd chemical methods (Murray et al., 2002), which are expensive and involve the use of hemical products and reagents, such as gel-sol synthesis, chemical reduction, aerosol chnology, photolithography, laser ablation, will harm the environment. Use them to talk out big things. Nature has created many methods for the synthesis of nano- and micro-

THERAPEUTIC APPLICATIONS OF *BOSWELLIA SERRATA* - AN IMPORTANT MEDICINAL PLANT OF ANDHRA PRADESH

Abstract

One of Ayurveda's oldest and most prized herbs is Boswellia serrata. Pharmacological, aesthetic, and nutritive businesses all rely heavily on medicinal plants. B. serrata is one such plant that is utilised for a multitude of purposes in the medicament and cosmetic sector. This therapeutic tree is part of the family Burseraceae and is also referred in english as Indian Olibanum and in telugu as Guggilamu. The plant's unique characteristic is its oleo-gum resin, a complex mixture of various medicinally important phytoconstituents like boswellic acids. This plant possesses anti-viral, anti-microbial, anti-oxidant, anti-inflammatory, anti-cancer, anti-diabetic, anti-obesity, anti-arthritic nephroprotective, hepatoprotective, immuno-modulatory, analgesic, diuretic, and other beneficial properties. B. serrata has traditionally been used to treat juvenile, soft tissue fibrosis, rheumatoid arthritis, osteoarthritis, and spondilytis with no negative effects. Present review focuses on various therapeutic activities and medicinal worth of B. serrata Roxb.

Keywords: Boswellia serrata, ayurveda, therapeutic, anti-inflammatory, anti-cancer

Introduction

Since the Vedic era, plants that have therapeutic properties have been used. For thousands of years, they have been used to treat and prevent a wide range of ailments and outbreaks. Certain medical herbs are employed as tasty seasoning, to flavour, to colour, to preserve food, and so on. Almost each and every portion of the plant has therapeutic benefits by itself. Secondary metabolic products discovered in medicinal plants that have a crucial part in many illnesses and are also employed in the manufacture of medications. Many of the plants are also known to have anti-parasitic, anti-oxidant, antibiotic, anti-inflammatory, anti-hemolytic and anti-insecticidal effects and are frequently utilised by tribal individuals all over the entire globe. There are around 4.5 million species of plants in India, but only an approximated 250,000-500,000 species have been examined phytochemically for biological or pharmacological activity (1). While it is hard to assign a single definition to the vast range of qualities and elements of folk medicine, the World Health Organization (WHO) believes that a practical concept seems to be necessary. As a result, it concludes that therapeutic agents include "multiple health strategies, methods, ideals and facts assimilating plant-based, animal-based, and/or mineral-based medicinal products, transcendental treatments, manual approaches and workouts used singly or else in amalgamation to sustain wellbeing, also to treat, detect or else boost immunity". In accord with WHO, a therapeutic plant is "a plant that contains chemical that can be administered for treatment reasons or that is a precursor for cytotoxic drugs semi-

ABSTRACT
Seed dormancy is a common problem in most of the perennial herbs for the population size increase, though it is needed in the case of most of the drought escaping plants as a part of ecological adaptability. *Rhynchosia suaveolens* (L.f.) D.C. is a perennial herbaceous plant of ethnobotanical and medicinal importance. Due to hard seed coats the plants are exhibiting seed dormancy and the scarification treatments are showing better results in the breaking of dormancy. Before performing different scarification treatments, the seeds are chemically tested for seed viability with TTC and good viability is noticed. Various seed germination parameters are calculated for each scarification treatment. Studies may help in the field of conservation biology of the species as the propagation by means of seed is a method to increase the population size.

Key words: Seed dormancy, *Rhynchosia suaveolens* (L.f.) D.C., scarification, seed viability.

INTRODUCTION

The genus *Rhynchosia* belongs to Fabaceae is having a species diversity of 22 species in our India. Some plant species of the genus are found to have bacterial nodules that enrich the soil denotes the ecological significance of these plants (Allen et al. 1981). Phytochemical studies on the members of the species revealing that these are rich in flavones, specifically glycosyl flavones (Rao et al. 1991). According to ILDIS (International Legume Database and Information Service), *Rhynchosia suaveolens* (L.f.) D.C. is the native of India and reported an extinct species in Sri Lanka. *R. suaveolens* is ethnobotanically used for treating general weakness in Seshachalam hill range of Andhra Pradesh (Sudhakar Reddy et al. 2009).

The seed is a vital stage in the life cycle of higher plant with respect to its survival as an established species. One of the most significant aspects deciding the rise of a progeny in their respective habitats is most presumably changes in dormancy levels of the seeds. The connection between the dormancy of seeds and the accomplishment of a plant as a widely propagated species is extensively established (Ali et al. 2011). The seeds differ broadly as for degree, span, and reason for dormancy. Endurance of a huge number of seeds with fluctuating dormancy degrees is the fundamental driving factor for some plant population issues each year (Ali et al. 2012). It was reported that among 260 examined *Leguminoseae* seeds, about 85% had tegument or seed coat impermeable to water. It is noted that, seed coat impermeability is associated with the presence of palisade cells. So, this kind of primary dormancy could be overcome by weakening the seed coat by allowing water to pass and that triggers germination (Cavalheiro et al. 2007). This process can also occur through the action of acids during seed digestion by zoochorous animals (Goddard et al. 2009).

Seed dormancy inferable from the existence of impenetrable layers of the seed wall cells could be discharged by debilitating the covering, along these lines permitting water to go through the layers and empower the germination of the seeds (Cavalheiro et al. 2007). Under natural conditions, the arrival of dormancy forced by the seed coat layers require the methodologies of breaking of various biological and physiological dormancy (Kelly et al. 1992).

As per the classification system for seed dormancy, there are five classes of seed dormancy were noticed viz. physiological (PD), morphological (MD), morphophysiological (MPD), physical (PY), and combinational (PY + PD). PD is expected to be caused by a physiological state of the embryo and possibly a decreased gas permeability of seed

covering structures. MD is observed in seeds with embryos that are underdeveloped, especially in terms of size, but differentiated. MPD is also evident in seeds with underdeveloped embryos, but in addition they have a physiological component to their dormancy. PY is caused by water impermeable layers of palisade cells in the seed or fruit coat that control water movement. This form of dormancy is common in the members of Fabaceae family. PY + PD is evident in seeds with water-impermeable coats combined with physiological embryo dormancy (Baskin et al. 2004).

Dormant seeds which unable to grow under favourable ecological circumstances stay hard and ungerminated for a while (Koornneef et al. 2002). The coat-forced seed torpidity (hard seededness) is because of either the impermeability of the coat to water and gases, the mechanical counteraction of radicle augmentation, or the seed coat keeping inhibitory substances leaving from the undeveloped embryo or by providing inhibitors to the incipient embryo (Baskin et. al. 2000). The presence of a hard and impermeable seed coat is viewed as a boundless reason for seed dormancy in a few significant legume groups, such as, lentil, faba bean, normal bean, soybean, cowpea, Lupinus and Trifolium and that can be eradicated by scarification methods (Tiryaki et al. 2014).

Different types of mineral acids like Conc. HCl, HNO_3, and H_2SO_4 have been in use widely for eradicating seed dormancy of many species with hard seed coat, such as the species of *Astragalus* and *Medicago* (Patane et al. 2006).

The seed dormancy characteristics of *R. suaveolens*, with its hard seed coat is not known. Hence, the present study was conducted to assess the effects of mechanical (non-chemical) and chemical scarification on the release of dormancy in *R. suaveolens* seeds. Various seed germination parameters are calculated for analysis to each scarification treatment.

MATERIALS AND METHODS

Pods of *R. suaveolens* are collected‘ from the forest area of Seshachalam hill range of Tirumala and separated seeds. The seeds are stored in sealed bags for further use. Healthy and similar type of seeds are selected for the experimentation. The mature and dry pods of *R. suaveolens* exhibiting explosive dehiscence to eject the seed with bi-valvate configuration. The seeds are shiny, striate, reniform and pigmented with greyish brown or black appearance and measures 4.3 ± 0.3 mm long, 3.2 ± 0.3 mm wide strophiolate.

Chemical seed viability testing

The TTC Test (Tetrazolium test) originally developed by Lakon (1949) used to assess seed viability, prior to scarification treatments performed with the application of TTC (2,3,5-tryphenyl tetrazolium chloride) on cut single seeds as a rapid method. The test relies on the reduction of the colourless and water soluble TTC to an insoluble red Formazan compound. This reduction occurs as a result of hydrogen ions donated to the TTC upon dehydrogenase activity in metabolically active embryonic tissues.

Consequently, seed viability is usually determined by a visual observation of finding the characteristic pattern and intensity of formazan staining pattern for individual seed embryos. 1% aqueous solution of TTC is prepared and the soaked seeds are placed after removing the seed coats and making the seeds into two parts along the cleavage of the cotyledons (Verma et al. 2013). The total set up is left for the incubation of time period about 24 hrs. in the dark condition so as to prohibit the photooxidation.

Scarification treatments

Seeds are taken in 25 number in total and 5 seeds for each petri plate to perform each scarification test. Scarification treatments include the physical scarification with the sand paper and chemical scarification, includes the treatment of seeds with Concentrated acids H_2SO_4, HCl and HNO_3. The chemical scarification methods are adopted for a standard time period of 25 minutes. Seeds are kept in hot water of 70^0 C and left the container at the room temperature allowing it for cooling. It is one of the non-chemical alternatives used for scarification of seeds.

After the treatments, the seeds are placed on wetted filter papers in petri plates and kept for observation for 15 days in the laboratory at room temperature and humidity conditions. The results are

noted every day and the data is analyzed for various germination parameters statistically by One-way ANOVA of SSS online package.

Seed germination parameters

Six different parameters related to seed germination were assessed according to the standard formulae. Final germination percentage (G), mean germination time (MGT), coefficient of velocity of germination (CVG) and germination rate index (GRI) were estimated as suggested by Al Mudaris (1998) and mean germination rate (MGR) following the method suggested by Ranal et al. (2009). Timson's germination index was calculated using the formula reported by Khan et al. (1984).

RESULTS AND DISCUSSION

Seed viability test turned the cotyledons into frozen red colouration after the incubation period, giving the inference that the selected seeds are 98% (±2.739) viable. This indicates that the seeds are viable and having the capacity to germinate but the problem is seed dormancy conferred by the impermeable seed coat.

Many species of the Fabaceae, such as *Lupinus* species seeds exhibit dormancy that is primarily due to water impermeability of the outer seed coat. Seed dormancy, an apparently inert or resting state of the seed, stops seed germination of plant species over a prolonged stretch of time periods. Seeds with dormancy permit the plants to overcome the unfavorable conditions (Ali et al. 2011). Scarification of *L. texensis* seeds with conc. Sulfuric acid for 30 to 60 min improved seedling emergence. It was reported that the acid scarification did not reduce thickness or strength of the seed coat, but created several small pores in the seed coat which likely facilitated imbibition. The experimental results showing that seed exhibits Physical dormancy conferred by the impermeability of seed coat, that is making the seed to be remain in dormant condition. The values of G% and T50 denoting that, the conc. H_2SO_4 treatment is found to be the best method out of all treatments for the eradication of the dormancy of seeds in *R. suaveolens*. Similar value of G% is attained in the physical scarification method also but T50 is high denoting the delayed response for the treatment. Hot water treatment is also promoting seed germination but it is not as much as the Conc. H_2SO_4 treatment and Physical scarification. The scarification with HCl and HNO_3 are found to be negative effect in the results showing no effect on the seed coat permeability (Table 1).

Seed germination is the main process that triggers the growth of the seedlings that are responsible for the increase in the population of the species. *Rhynchosia suaveolens* seeds are hard and impermeable, scarification is suggestable method for the removal of dormancy as the process increases the permeability by weakening the seed wall layers. Mechanical scarification and treatment with Conc. H_2SO_4 are found to be the best methods. There are certain inferences we can made from the measured seed germination parameters. With the increase of the FGP values increase in the seed germination can be observed (Scott et al. 1984). The lower values of MGT indicate the faster germination (Orchard 1977). The CVG indicates the speedy germination of the seeds. If the value increases the required time for

PHYSICAL	98.4±219	3.7±0.27	4.68±0.1	0.21±0.004	21.37±0.49	21.37±0.49	16.39±0.36

G% : Final Germination Percentage (FGP); MGT: Mean Germination Time; MGR: Mean Germination Rate; CV: Coefficient of Velocity of Germination; GRI: Germination Rate Index; TGI: Timson's Germination Index

the germination process decreases. The highest possible value of CVG is 100 which can be attained if the total germination of the selected sample takes place on the first day itself (Jones et al. 1987). The GRI value stands for the germination percentage on each day during the germination span. High GRI indicates the high and fast germination. Probable natural release of physical dormancy is seeds to be exposed to the specific environmental conditions. For some species of Fabaceae, moist conditions in the environment are required for the breaking of Physical dormancy (Rodrigues-Junior et al. 2018).

Abrasing with sandpaper is reported as a very effective method in breaking seed dormancy in *Rhynchosia capitata*, and germination to 100% as compared to HCl treatments. The probable mechanism of increase in seed germination influenced by Conc. H_2SO_4 is due to its capability to weakening the seed coat that leads to water intake and seed imbibition (Ali et al. 2011). As per the reports available, in case of forage legume tree species, the most efficient seed dormancy eradication method was immersion in Conc. H_2SO_4, while in the case of forage herbaceous legumes, the most efficient seed dormancy eradication treatments were immersion in concentrated sulfuric acid, sandpapering (physical or mechanical method) and hot water. In general, the scarification methods signified with the positive results in dormancy eradication resulted in significantly higher total germination percentages. As in the case of present study, the other relevant works associated with the some of the examples are, the use of immersion of seeds in H_2SO_4 for five minutes of *Neonotonia wightii* and *Pueraria phaseoloides* was reported as the most suitable method of dormancy removal and scarification with sandpaper stands good with the dormancy removal of the seeds of *Calopogonium mucunoides* (Morais et al. 2014). Sulfuric acid scarification generates many cracks and cavities in the seed coat that may help in water absorption and O_2 diffusion required for the embryo. Increased water absorption is known to overcome seed dormancy in many tree species (Tanaka-Oda et al. 2009). Similarly, the results of the experiments conducted on *R. capitata* seeds showed that Mechanical scarification was the best method to overcome this coat-imposed dormancy, apart from softening of the seed coat by soaking in conc. H_2SO_4, HCl, and HNO_3 that significantly increased seed germination (Ali et al. 2011).

Considering the results of the present study, it is possible that the mechanical forces of seeds and sand may be weakening of seed coat. Better results of scarification with HCl and HNO_3 in *R. capitata* (Morais et al. 2014) might be due to the prolonged leaching treatment and the varied composition of seed coat material when compared to *R. suaveolens*. No remarkable results are observed in the present study for the scarification treatments with HCl and HNO_3 may be due to the scarification for short time period.

CONCLUSIONS

In general, the results of these experiments showed that seeds of *R. suaveolens* exhibited hard seed coat dormancy. Softening the seed coat by soaking the seeds in H_2SO_4 significantly increased seed germination. Mechanical scarification was found to be the best nonchemical treatment to overcome this coat-imposed dormancy in the seeds of this species. It can be concluded that the seed coat was the major barrier to *R. suaveolens* seed germination that imparts dormancy to seed.

ABSTRACT: India is the home to the familiar plant *Cleistanthus collinus* (Roxb.) Benth. ex Hook. F (Euphorbiaceae) has great ethnomedicinal and therapeutic applications. The present study was designed to assess the phytochemical profile and investigate the antifungal effectiveness of leaf, bark and fruit extracts by using the agar well diffusion method. All crude extracts from leaf, bark, fruit and fractions derived also demonstrated significant antifungal activity (20-80%), but the methanol extracts showed a remarkable antifungal spectrum; as a result, GC-MS analysis was performed on it. From this GC-MS analysis, 14 chemicals, including alkanes, glycosides, phenols, flavonoids and steroids were identified, while leaf methanol extract has high phytochemical diversity with 9 compounds than bark with 6 compounds and fruit with 5 compounds. 1, 2, 3-Benzenetriol, 3-O-Methyl-d-glucose and Undecane are a few significant molecules with larger area percentages that demonstrated biological value. These compounds have been linked to anti-cancer, anti-inflammatory, anti-microbial and antioxidant properties. The current results collectively highlight the appreciable antimicrobial potential of *C. collinus* and its numerous chemical compounds that are physiologically active and offer a thorough understanding of the phytochemical profile, which could be exploited to create plant-based medications.

INTRODUCTION: Rising antibiotic resistance has emerged as a serious hazard to human well-being worldwide [1]. The rising prevalence of drug-resistant diseases necessitates identifying and isolating novel bioactive components from medicinal plant species utilizing standardized contemporary scientific techniques. Medicinal compounds obtained from plants might provide innovative and accessible techniques to pathogenic organisms.

According to the World Health Organisation (WHO), conventional drugs produced from plants with medicinal properties continue to assist 80% of poor countries. WHO has also documented a list of over 20,000 therapeutic plant species and identified these plants as a possible driver of new medications [2].

The antibiotic era, which has lasted barely 80 years, has recently entered a time of gradual and extensive appearance of drug-resist microbes, threatening to end this era. Microbial diseases, especially fungus, have quick reproductive rates, malleable genes, and the capacity to adapt to environmental conditions containing a high concentration of possible hazardous substances that apply significant selective stresses.

Fungi's eukaryotic chemistry makes them particularly dangerous infections due to a smaller range of selective therapeutic targets over which inhibitors not hazardous to human, animal, and plant hosts may be created. Moreover, there do not exist medicinal vaccination or supplementary immune-mediated therapies present to assist people in their health care, necessitating dependence on a restricted arsenal of antifungal medication classes to combat an increasing wave of fungal diseases [3]. The worldwide stress of fungus-related infections is escalating. Over 150 million severe instances concerning fungal illnesses occur each year worldwide, leading to nearly 1.7 million fatalities. The aforementioned numbers are rapidly increasing, owing to a variety of societal and medical advances in recent decades that have aided the proliferation of fungal diseases [4]. To settle this problem, novel antifungal drugs are required and plants are the main wellsprings of novel drugs.

Due to their vast and varied organic components, which may have an important physiological influence on the human body, medicinal plants have been used to treat human ailments for centuries. Natural assets, such as plants with medicinal properties, which possess a wide range of phytocompounds potential as traditional medicine for treating chronic and infectious illnesses, have long been seen as safer and more efficient options with fewer adverse effects than synthetic drugs [5]. Owing due to their diverse pharmaceutical qualities, plants high in bioactive phytomedicine components such as alkaloids, flavonoids, tannins, and polyphenols have been utilised to treat diseases [6].

Around 25% of the active ingredients of medicinal plants that have been used as legal drugs have been discovered [7]. *Cleistanthus collinus* is an essential medicinal tree that has piqued the interest of researchers owing to its potential for medication development. *C. collinus*, a member of the Euphorbiaceae family, is a small tree featuring ellipse foliage and its silken villous spike. It tends to occur in South Indian deciduous dry highland forests, Sri Lanka and Malaysia [8]. Cleistanthus A and Cleistanthus B, diphyllin glycosides, are cytotoxic to a variety of cancerous cell lines [9]. Because of its unique pharmacological active principles, the isolation of independent bioactive chemicals of *C. collinus* might be widely exploited in the pharmaceutical industry. Despite being a toxic plant, its active constituents have been investigated for medicinal qualities such as antihypertensive, diuretic, and anticancer properties. Active compounds in *C. collinus* that show ability will have a good probability of being developed into drug use [10]. The plant's stem bark can be used as an antiseptic in skin illnesses and to treat bovine hoof sores [11]. A detailed examination of the literature reveals that two have been discovered in the assay of anti-bacterial activity reports [12, 13] and one in antifungal activity [14] from this plant. The primary goal of this study was to appraise the GC-MS analysis study and examine the antifungal potentiality of diverse plant solvent extracts.

MATERIALS AND METHODS:

Sample Collection: The plant *C. collinus* was handpicked from the vicinity of Gopavaram village, Andhra Pradesh, India (17˚22’09.16” N 81˚47’48.42” E), in January 2022 and authenticated by Prof. N. Savithramma, Sri Venkateswara University, Botany Department, Tirupati, Andhra Pradesh, India, with accession number SVUH: 1226.

Extraction of Plant Material: Plant parts were harvested, dried in the shade at 32^{o}C and ground into a fine powder. The powder was then sieved through a 0.5 mm sieve to maintain consistent molecule size and stored in sterile containers until usage. For the extractions of leaves, bark and fruit, the following solvents were selected: methanol, ethyl acetate and chloroform in the ascending order of polarity. Using a soxhlet extractor, the phytochemicals from the plant material were isolated using the aforementioned solvents, which were then stored for 72 hours in sealed jars. A thick concentration was generated when the extracts were collected in a rotary evaporator at 45°C under reduced pressure. The crude extracts were kept in a 4°C refrigerator for future usage.

Collection of Test Pathogens: Four test fungal species; two non-filamentous human pathogens *Saccharomyces cerevisiae* (MTCC 4742), *Candida albicans* (MTCC 227) and two filamentous plant pathogens *Aspergillus niger* (MTCC 282) and *Aspergillus flavus* (MTCC 277) were utilized in

this work; they were acquired from the Microbial Type Culture Collection (MTCC), IMTECH, Chandigarh, India.

Preparation of Test Sample: The methanol, ethyl acetate and chloroform extracts were dissolved in 10% aqueous DMSO (Himedia) to get different concentrations (10 mg, 5 mg and 2.5 mg per 20µL). 10% aqueous DMSO was utilized as the negative control (solvent control). As positive reference standards, Fluconazole (Central Drug House P. Ltd., India) was employed for fungal strains at a dosage of 30µg/mL.

Antifungal Activity Assay: The agar well diffusion method was used to assess the antifungal potentialities of plant extracts in a Potato Dextrose Agar (PDA) medium. A sterilized L-shaped bent rod was used to disperse the 100 µL fungal inoculums evenly and allowed it to harden in the Petri plates.

With the aid of a sterile cork borer, 5mm-diameter wells were made on the plates and filled with various solvent extracts (10 mg, 5 mg and 2.5 mg per 20µL in 10% aqueous DMSO) positive and negative controls of 20 µL each.

After a 48-hour incubation period at 26°C, the inhibitory zone's diameter was determined. The usual positive and negative controls were fluconazole 30 µg/mL and DMSO (10%) and the results of each test were averaged after being repeated three times. A strict aseptic environment was maintained during the entire microbiological experiment.

GC-MS Analysis: The extracts were examined using the Agilent Technologies GC-MS (GC-8890, GC/MS 5977 MSD). With an 18 mL/min split flow and a 3 mL/min purge flow in the injection mode. The temperature of the oven was programmed to range from 75°C to a maximum of 360°C.

The column was a Polar Columns (DB-WAX) & HP-5 MS UI with a 1.21 mL/min flow rate and helium gas (99.99%) as the carrier gas. A temperature range of 60°C to 325^{o}C was set for the column. The GC-MS lasts for a total of 53.5 minutes. The sample pieces were ionized using the EI mode (70 eV). The spectra of the unknown components were compared to the spectrum of the known components using the Spectral Library and Database (licensed NIST 2017 Library; Software: Open Lab CDS 2.5 version).

RESULTS AND DISCUSSION:

Anti-fungal Activity: The antifungal bioassay findings against pathogens using crude extracts of the *C. collinus* plant (10 mg, 5 mg, and 2.5 mg of each) were described regarding the zone of inhibition's diameter. According to the observed inhibitory zones, which were also correlated with their tested doses, the entire extract and various fractions of *C. collinus* displayed strong antifungal activity against *C. albicans*, considerable anti-yeast ability against *S. cerevisiae* and moderate activity against *A. flavus* and *A. niger* **Table 1**.

The majority of the studied substances had strong inhibitory effects on *C. albicans*, among them fruit methanol crude extract showing the highest activity (25mm), followed by leaf methanol extract (21mm), bark ethyl acetate (19mm) and bark methanol (17.3mm). Methanol and ethyl acetate extracts showed high to moderate activity against test fungal pathogens while chloroform extracts had the lowest activity.

Here, *A. flavus* shows the strongest resistance to crude extracts of *C. collinus*, whereas *C. albicans* is the most vulnerable. It was discovered that the fractions containing the highest secondary metabolites concentration had higher levels of antifungal activity.

Moreover, the highest inhibitory properties against *A. flavus* were exhibited by the fruit methanol extract (12.3mm) followed by bark ethyl acetate (10.3mm) and bark methanol (10mm) extracts.

Whereas both ethylacetate and chloroform extracts of leaf and fruit did not show any activity. Contrary to *A. flavus*, *A. niger* was more susceptible to bark methanol extract (14mm) followed by fruit methanol extract (11.3mm).

The effectiveness of fluconazole has consistently outperformed that of plant solvent extracts, which has made it a recognized measure for comparing their effects. The DMSO containing well (negative control) exhibited no bioactivity.

TABLE 1: ANTIFUNGAL ACTIVITY OF DIFFERENT EXTRACTS (ME, EA &CH) AT THE DOSAGES OF 10mg, 5mg, AND 2.5mg

Plant part	Extract	*S. cerevisiae*			*C. albicans*			*A. flavus*			*A. niger*		
		10mg	5mg	2.5mg	10mg	5mg	2.5mg	10mg	5mg	2.5mg	10mg	5mg	2.5mg

Values represent mean ± standard deviations; ME stands for methanol extract, EA for ethyl acetate, CH for chloroform, and "-" for no zone of inhibition. A zone of inhibition with a diameter of less than 6 mm was considered inactive. Source: authors.

Furthermore, the antifungal activities of higher concentration (10mg) plant extracts were compared to the positive control fluconazole's inhibition capacity **Fig. 1**.

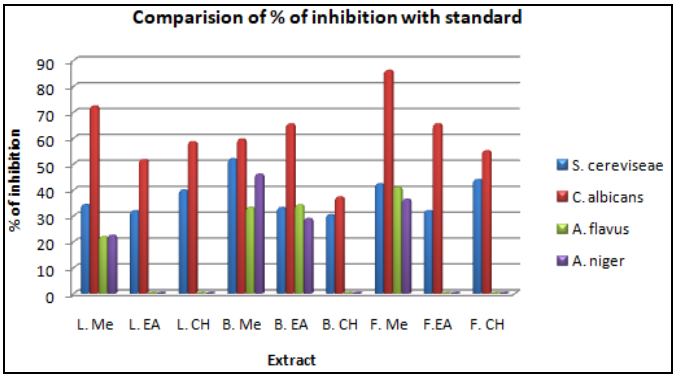

FIG 1: ANTIFUNGAL ACTIVITY (% OF INHIBITION) WITH RESPECT TO +' VE CONTROL

The highest percentage of inhibition (86.2%) against *C. albicans* was found in the fruit methanol extract *of C. collinus*, followed by leaf methanol (72.4%) and bark ethyl acetate (65.5%). The remaining eight plant extracts, except bark chloroform extract, demonstrated more than 50% inhibitory effect against *C. albicans* compared to the standard. All plant extracts inhibited *S. cerevisiae* growth in a medium-to-high range (30-55%). *S. cerevisiae* and *C. albicans* were more susceptible and all plant extracts tested inhibited their growth, whereas *A. flavus* and *A. niger* were more resistant and only methanol extracts with moderate activity, i.e., 20-45% when compared to standard, inhibited their growth. The antifungal activity of leaf acetone, water and benzene extracts from *C. collinus* studied by Majiet al., 2010 against *C.albicans* ranged from 13 to 8 mm[12] however in my study Methanol, Ethyl acetate and chloroform extracts of leaves showed higher activity ranged from 21 to 15 mm. Previous research employed aqueous and ethyl acetate solvent-based *C. collinus* leaf extracts against *C. albicans*, *C. tropicalis*, and *C. glabrata*, in which the ethyl acetate extract only showing action against *C. albicans* and other species being resistant [15]. In addition to previous data, the current investigation demonstrates that *C. collinus* methanol and ethyl acetate extracts are more efficacious than the chloroform extract. This might be because the kind of solvent utilized in the extraction technique substantially influences the subsequent characterization of phytochemicals. 1,2,3 Benzenetriole has strong antimicrobial properties [25, 26] and GC-MS analysis revealed that it was found in higher concentrations in all leaf, bark, and fruit methanol extracts; this may be a reason behind the results obtained in antifungal assays.

The antifungal screening supports *C. collinus* potentiality as a traditional cure for several fungal illnesses, including its usage as an antiseptic.

GC-MS Chemical Profiling: Methanol extracts were chosen for gas chromatography and mass spectrometry (GC-MS) analysis to examine the phytochemical composition because they displayed the highest antifungal efficacy compared to the other solvent extracts. This study demonstrates that a variety of physiologically active compounds are present in leaf, bark and fruit methanol extracts at various concentrations and also offers a thorough understanding of the phytochemical profile that may be exploited to create plant-based therapeutics.

GC/MS spectrum data of the methanol extracts showed several peaks **Fig. 2, 3** & **4** that indicated the presence of 14 different chemicals (9 from leaf, 6 from bark and 5 from fruit). Each of these chemicals was recognized and described using the mass fragmentation patterns and retention indices from the Spectral Library and Database (NIST 2017 Library). In **Table 1**, the active ingredients are listed in chronological order of retention durations, their peak area percentage, molecular formula, molecular weight, structural features and biological activities. To look at the biological effects of important substances, a review of the literature was conducted.

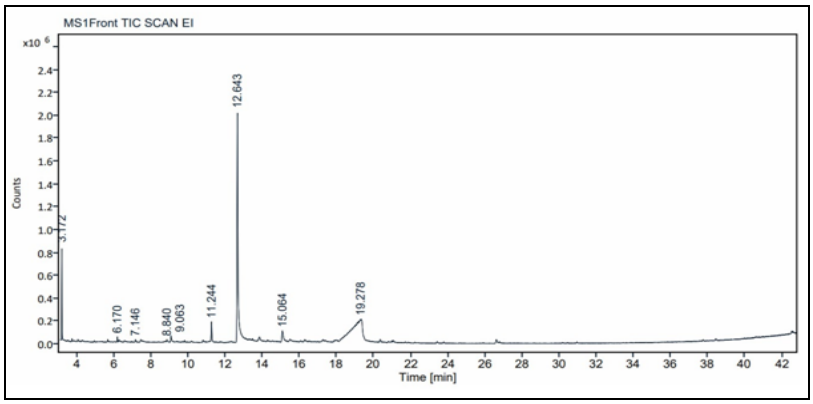

FIG. 2: GC-MS CHROMATOGRAM OF *C. COLLINUS* LEAF METHANOL EXTRACT

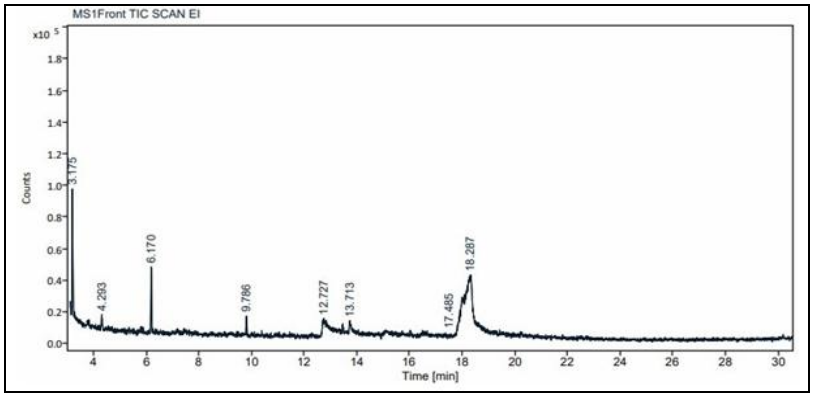

FIG. 3: GC-MS CHROMATOGRAM OF *C. COLLINUS* BARK METHANOL EXTRACT

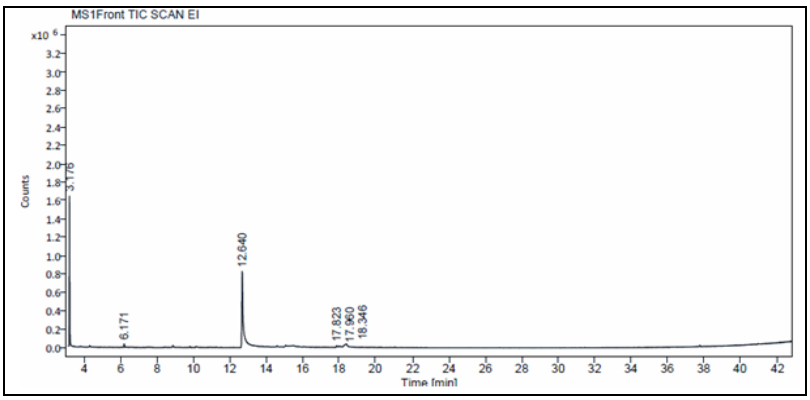

FIG. 4: GC-MS CHROMATOGRAM OF *C. COLLINUS* FRUIT METHANOL EXTRACT

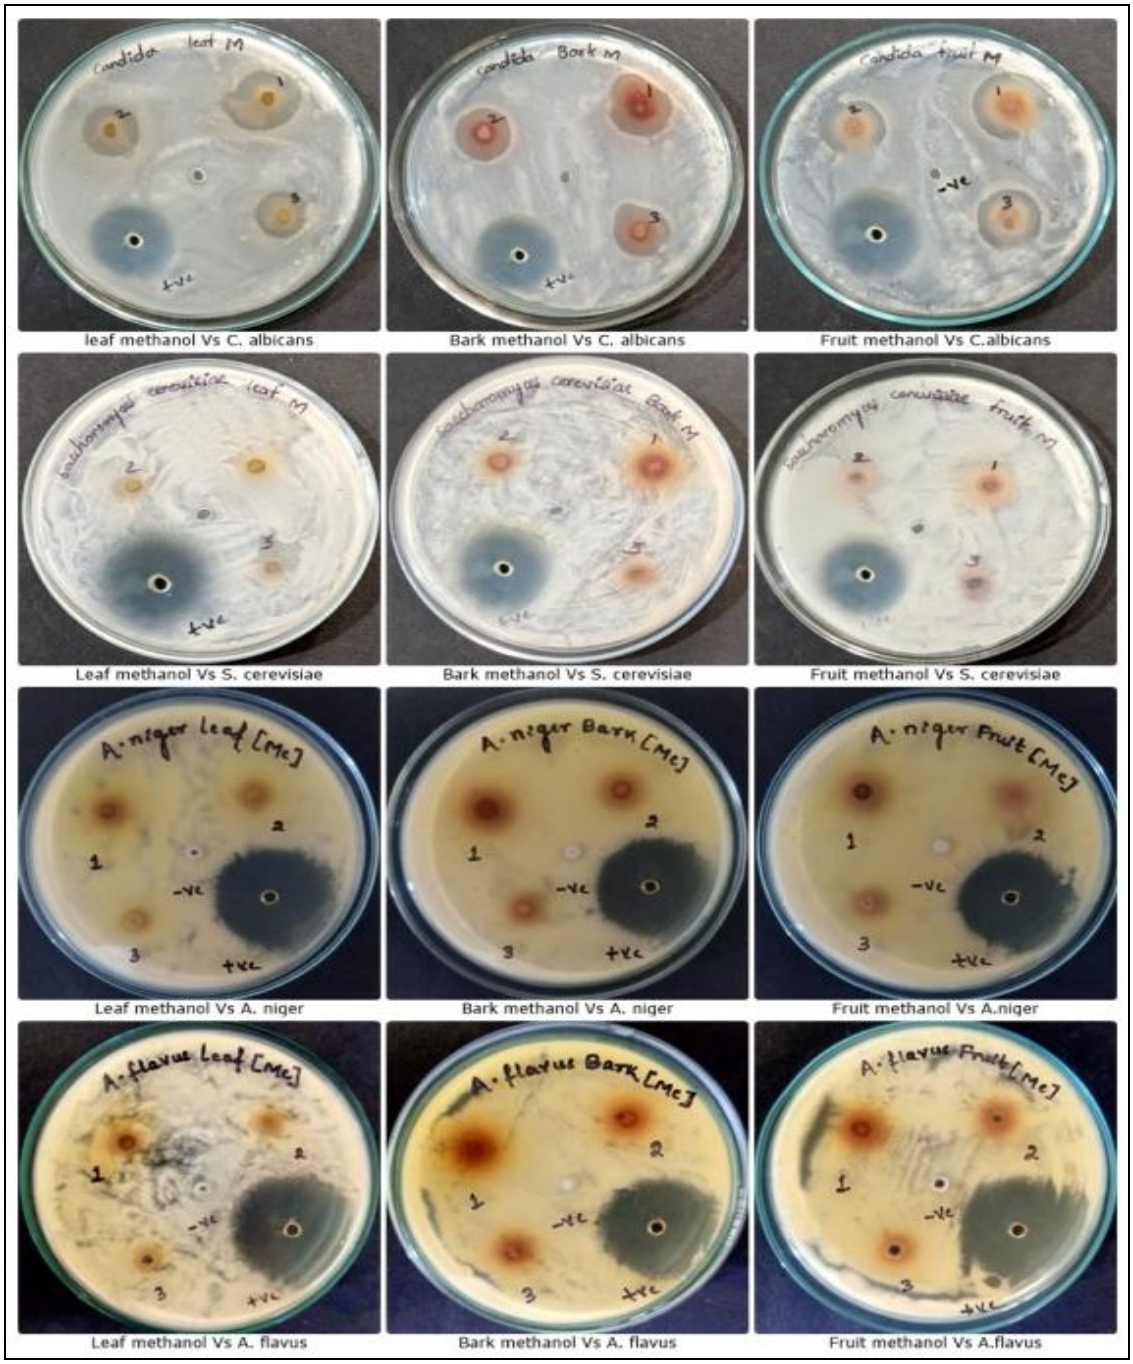
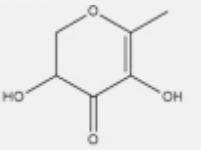
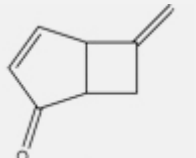
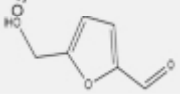
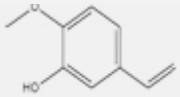
We discovered that most of the constituents in the *C. collinus* leaf methanol extract exhibit a variety of advantageous pharmacological and therapeutic activities. The leaf methanol extract provides a rich source of significant bioactive molecules. Ten different chemicals, including hydrocarbons, phenols, terpenes and glucose derivatives, were found to be present. Undecane, 1, 2, 3-Benzenetriol and 3-O-Methyl-d-glucose were discovered in all three plant sections, whereas fruit and bark extracts contained N-[3-[N-Aziridyl] propylidene] hexylamine. A little amount of the following compounds were detected only in the leaf methanol extract: 4H-Pyran-4-one, 2, 3-dihydro - 3, 5 – dihydroxy – 6 - methyl, 6-Methyl-enebicyclo [3.2.0] hept-3-en-2-one, 5-Hydroxymethylfurfural, Phenol, 5-ethenyl-2-methoxy and D-Allose. Only bark extracts included decane, 4(3H)-Pteridinone, 2-amino-7, 8-dihydro-8-methyl-6, 7-diphenyl and fruit extracts had trace amounts of phthalic acid, 5-methylhex-2-yl heptadecyl ester.

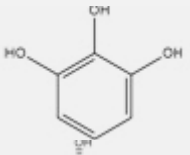


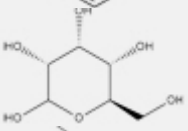


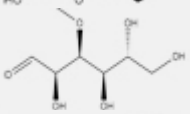


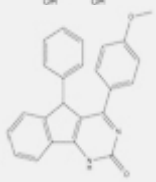


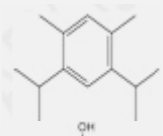


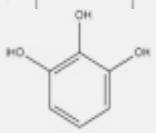


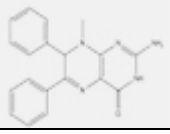


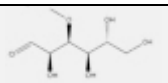


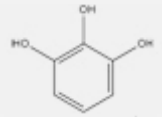












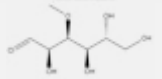


FIG 5: PICTORIAL DATA OF ANTIFUNGAL ACTIVITY OF *C. COLLINUS* (LEAF, BARK & FRUIT) METHANOL EXTRACTS

TABLE 2: BIOACTIVE CHEMICAL PROFILE OF *C. COLLINUS* THROUGH GC-MS

S. no.	Name of the compound	RT minutes	Mol. weight	Mol. formula	Area %	Structure	Importance
				Leaf			
1	Undecane	6.169	156.31	$C_{11}H_{24}$	0.55		Mild sex attractant[20]anti-inflammatory and antioxidant effects[21]
2	4H-Pyran-4-one, 2,3-dihydro-3,5-dihydroxy-6-methyl-	7.144	144.12	$C_6H_8O_4$	0.35		Antimicrobial, anti-inflammatory, Anti-proliferative[22]
3	6-Methylenebicyclo[3.2.0]hept-3-en-2-one	8.838	120.15	C_8H_8O	0.19		Bacteriostatic, fungistatic, anti-parasitic activity[23]
4	5-Hydroxymethylfurfural	9.063	126.11	$C_6H_6O_3$	0.43		Anti-oxidant activity[24]
5	Phenol, 5-ethenyl-2-methoxy-	11.245	150.17	$C_9H_{10}O_2$	2.00		Aromatic, flavoring, cytotoxic, anti-inflammatory, germination inhibitor, insect repellent[19]
6	1,2,3-Benzenetriol	12.645	126.1100	$C_6H_6O_3$	35.95		Anti-microbial, Antibiofilm and Antivirulence activity[25,26]
7	D-Allose	15.064	180.16	$C_6H_{12}O_6$	1.72		Anti-oxidant, Anti-tumour activity[27,28]
8	3-O-Methyl-d-glucose	19.277	194.18	$C_7H_{14}O_6$	25.33		Anti-tumor activity[29]

				Bark			
1	Decane	4.294	142.28	$C_{10}H_{22}$	2.09		cocarcinogenic and tumor-promoting activities[30]
2	Undecane	6.169	156.31	$C_{11}H_{24}$	7.42		Mild sex attractant[20]anti-oxidant and anti-inflammatory activities [21]
3	Benzene, 1,5-dimethyl-2,4-bis(1-methylethyl)-	9.788	190.32	$C_{14}H_{22}$	2.89		-
4	1,2,3-Benzenetriol	12.726	126.1100	$C_6H_6O_3$	5.10		Anti-microbial, Apoptosis, Antibiofilm and Antivirulence activity[25, 26]
5	4(3H)-Pteridinone, 2-amino-7,8-dihydro-8-methyl-6,7-diphenyl-	13.714	331.4	$C_{19}H_{17}N_5O$	1.84		-

6	3-O-Methyl-d-glucose	18.290	194.18	$C_7H_{14}O_6$	67.88		Anti-tumor activity[29]
				Fruit			
1	Undecane	6.169	156.31	$C_{11}H_{24}$	0.95		Mild sex attractant[20]anti-oxidant and anti-inflammatory activities[21]
2	1,2,3-Benzenetriol	12.639	126.1100	$C_6H_6O_3$	63.09		Anti-microbial, Apoptosis, Antibiofilm and Antivirulence activity[25,26]
3	N-[3-[N-Aziridyl]propylidene] hexylamine	17.821	182.31	$C_{11}H_{22}N_2$	0.69		Anti-viral activity[31]
4	Phthalic acid, 5-methylhex-2-yl heptadecyl ester	17.959	502.8	$C_{32}H_{54}O_4$	0.17		Aminoglycoside antibiotic, Neuroprotective[32]
5	3-O-Methyl-d-glucose	18.346	194.18	$C_7H_{14}O_6$	4.03		Anti-tumor activity[29]

The chemicals found in this study were mostly stated to have anti-cancer, antibacterial, anti-virulence, anti-inflammatory, neuro-protecting, and antioxidant effects according to the reported biological activities. 1, 2, 3-Benzenetriol is a phenolic molecule that is most abundantly present in fruit extracts (63.09%), leaf extracts (35.95%) and bark extracts (5.1%). It is an effective anti-microbial and antiviral agent and leads to the death of cancer cells by apoptosis. The highest concentration of 3-O-Methyl-d-Glucose, a glucose derivative with good anti-cancer capabilities, was identified in the bark extract (67.88), followed by the leaf (25.33) and the fruit extract (4.03). Undecane is a hydrocarbon compound that is present in fruit and bark extracts in low amounts and high concentrations in bark extract (7.42).

It possesses anti-inflammatory and antioxidant activities. Decane contains co-carcinogenic and tumor-promoting properties but is reported only in bark extract. 2-Oxo-5-phenyl-4-(4-methoxyphenyl)-1, 2-dihydro-5H-indeno [1, 2-d] pyrimidine reported in leaf extract in high concentration (27.54), although its bioactivities have not been studied. Earlier work by Pratheepa M. *et al.,* 2012 revealed the GC-MS analysis of the plant leaf acetone extract which showed 8 different bioactive compounds from which the novel chemical dioctyl phthalate observed at a peak area of 95.23% which may operate as a very promising medicinal agent for persons suffering from cancer or afflicted with fatal diseases, *etc* [16]. Arulmanickam P. and Chitra T. *et al.,* 2020 studied leaf powder ethanolic extract and revealed 13 different types of bioactive compounds, but only six of them can carry out specific biological functions. These include alpha-methyl mannofuranoside (36.25%) for its antibacterial and antifungal activity, undecanoic acid (1.88%) for its cytotoxic, anticancer, and anti-microbe properties, 5-O-methyl-D-gluconic acid dimethylamide (4.86%) for its antioxidant and anti-microbial properties, Cyclopropanetetradecanoic acid, 2-Octyl-, Methyl ester (3.20) for its anti-microbial activity and Pentanoic acid, 2 (Aminooxy) (3.59%) for its Anti-oxidant and lubricantproperties [17].

Suman *et al.,* 2013 found four bioactive compounds in the leaf's aqueous, hot extracts, with 4-OMethylmannose (70.12%) having antibacterial activity and 1,2,3-Benzenetriol (21.76%) having antioxidant, antibacterial, antiseptic, fungicide, antimutagenic, antidermatitic, pesticide, dye and candidicide properties. In contrast, the methanol extract contained significant amounts of thiophene (antimicrobial action), tetrahydro-2-methyl-myo-inositol (48.54%), 1,2,3-benzenetriol (7.51%) and Vitamin E (d -α-tocopherol) (6.52%). Higher concentrations of 4-O-methylmannose (Secondary messenger) and 5-Methyl-2-trimethylsilyloxy-aceto phenone (7.35%) were found in the ethanol extract. In the ethyl acetate extract, there were 15 compounds detected, the main ones being silane (Coupling Agent) and trimethyl [5-methyl-2-(1-methyl ethyl) phenoxy] anthracene (7.06%) [9].

Parasuraman *et al.*, 2009 reported 17 compounds, of which 14 are from fresh leaves and 5 are from dry leaves. 3-Omethyl-d-glucose (32.88%), Benzenetriol (22.43%), 1.6- Anhydro - â - Dglucopyranose (15.66%), Heptacosane (8.99%), 2-Hydroxy-7methoxy-4,5 diphenyl-5 Hindeno [1.2-d] pyrimidine (7.45%) and Eicosane (3.76%) were found in fresh leaves, whereas 3-O-methyl-d-glucose (41.61%), Benzenetriol (Pyrogallic acid, Pyrogallol) (25.06%), n- Hexadecanoic acid (10.60%), Heptacosane (4.41%) and 1,2-Benzenedicarboxylic acid, diisooctyl ester (3.54%) were present in dried leaves aqueous extracts [18]. Kazi M. and Gude A. *et al.*, 2022 summarized the phytoconstituents and discussed 46 compounds and their biological properties [19]. Only 1,2,3-Benzenetriole (35.95) and 3-O-methyl-d-glucose (25.33) were previously reported of the 9 compounds we found in leaf methanol extract; the other compounds were discovered for the first time. To the best of my knowledge, no studies on the GC-MS analysis of methanol extracts of *C. collinus* fruit and bark have been published yet. In contrast to earlier findings, we present the most recent analysis of the GC-MS profile of the methanolic extracts of leaves, bark and fruits in our investigations.

CONCLUSION: These findings have established a solid scientific foundation for the use of the plant *Cleistanthus collinus* in traditional medicine to treat fungal infections. Compared to chloroform extracts, methanol and ethyl acetate extracts showed high antifungal activity. In particular, *C. albicans* and *S. cerevisiae*, which displayed the strongest antifungal activity, excelled over other fungal strains examined. GC-MS study revealed 15 phytochemical components with antifungal, antibacterial, antioxidant, anti-inflammatory and anti-cancer properties. As far as I am aware, very little work has been done on the antifungal activity of *C. collinus*, as there is very little literature accessible on the antifungal activity of this plant species. We believe that more studies in this area will aid in developing novel antifungal and anticancer drugs.

ACKNOWLEDGMENT: The Department of Botany at Sri Venkateswara University provided the facilities and equipment for our research and also thankful to Prof. N. Savithramma, Department of Botany, Sri Venkateswara University, for helping in the identification of the plant. Dr. Ummidi Ravi Shankar of the Mic gene laboratory in Visakhapatnam is acknowledged by the first author for his assistance during various stages of this research.

Author Contributions: S. Prathamanjali assisted and conducted the experiment, calculations, and literature analysis and prepared the manuscript. Prof. T. Vijaya guided the co-authors and prepared the final version of the manuscript. Y.T. Rajesh Babu helped in conducting the experiments and preparation of the manuscript. All authors read the final version of the manuscript and accepted it.

CONFLICTS OF INTEREST: The authors declare that they hold no competing interests.

ABSTRACT In India, *Plumbago zeylanica* is a beneficial medicinal herb. The current study examines the antibacterial, and antifungal properties and phytochemical analysis of *Plumbago zeylanica* leaf extract. Using the well diffusion technique, the antibacterial activity was evaluated against gram-positive and gram-negative microorganisms. the antifungal activity was carried on *Aspergillus niger*. The study's findings imply that the plant leaf extract possesses an inhibitory effect on both gram-positive and gram-negative bacteria and fungi and it could be used as phytomedicine for bacterial and fungal diseases

KEYWORDS :

INTRODUCTION:

Plumbago zeylanica is an herbaceous plant with ascending, prostrate, or erect glabrous stems. Additionally, the ovate petiolate or sessile leaves have leaves. It belongs to the *Plumbago* genus and the family *Plumbaginaceae*. Tropical and subtropical areas across the world support the growth of the native *Plumbago zeylanica* plant. Deciduous woodland in (Australia, and India). The herb has a variety of therapeutic benefits [1-4]. Chitrak, chitramoolam, plumbago, Ceylon leadwort, doctor bush, or wild leadwort are some of the native names for the plant. Chitra is the name in Hindi, while Chitramoolam is the name in Tamil [5,6]. Molubda scandens (L.) Raf., Plumbagidium scandens (L.) Spach, Plumbago scandens L., and Plumbago zeylanica var. glaucescens Boiss are some synonyms for the plant [7,8].

The *P. zeylanica* plant grows to a height of 0.5-2 meters. The leaves are simple, alternating, elliptic, or oblong, 0.5–12 cm long, with a tapering base, and sometimes have a hairy edge. They can also be ovate or ovate-lanceolate. Young leaves lack stipules and have a thin petiole with tiny auricles. The inflorescence has numerous flowers and is of the terminal raceme type, measuring 6 to 30 cm in length [4-7]. White flowers are produced in terminal and axillary elongated spikes. They are pentamerous, pedicellate, bisexual, regular, and sweet-scented. Free and included are the stamens. The ovary is superior and single-celled, and the style is filiform with five elongated stigma lobes. The flowers also have a tubular calyx with glandular trichomes (hairs) that secrete gooey mucilage, which is another distinguishing feature [3]. The plant blooms all year round, and insects are the main pollinators. The mucilaginous glands facilitate animal fruit distribution and insect capture. The plant's fruit is a single-seeded, oblong capsule with five ridges. Each seed has an oblong shape, is 5–6 mm long, and ranges in color from reddish-brown to dark brown. Roots are at least 30 cm long, smooth, branching, or unbranched, with or without secondary roots, and 6 cm in diameter. When they are young, they are light yellow, and as they dry, they turn reddish-brown. The roots taste caustic and bitter and have a potent, distinctive smell [7].

Description:

The generic name comes from the Latin words plumbum, which means lead since this plant was thought to be able to treat lead poisoning and eye illness. The particular plant comes from Sri Lanka and is known as Ceylon. In India, the plant *Plumbago zeylanica* is also known as Chitrak, and it has several conventional and effective medical applications. The plant's blossoms may be eaten and are used to adorn salads, desserts, and cold beverages. The plant thrives in West Bengal, Madhya Pradesh, and Chhattisgarh. It also grows in a variety of soil types, including deep soil, deep black soil, and red literate soil. It may be quickly propagated via stem cuttings [8].

including cardiotoxicity, atherogenicity prevention, and cardiotonic neuroprotection. It may also be used to lower blood cholesterol levels and improve the poor density of lipoproteins. Diabetes, cancer, skin infections, rheumatoid arthritis, constipation, asthma, and muscle discomfort are all treated with this herb [9].

Growth and Development:

The plant *Plumbago zeylanica* is a wild species that grows in many locations and has a variety of medicinal uses. The plants are cultivated in tropical and subtropical areas where it rains throughout the rainy season [10]. To identify the numerous bioactive substances that are significant from a pharmacological standpoint, including alkaloids, steroids, flavonoids, phenolic compounds, and many more, a phytochemical examination was carried out. The plant's bioactive components are a source for making medicines [11]. The bioactive substances are known to behave as microbial inhibitors [12]. The hunt for novel structural medications to replace synthetic antioxidants that are reportedly harmful has led researchers to explore plants in the present [13].

MATERIALS AND METHODS:

Collection of plant material:

The plant *Plumbago zeylanica* was harvested from the Nallamala forest in the Kurnool district, Andhra Pradesh, India. The gathered plant leaves are divided into bits, let to air dry for 10 days, and then ground into a fine powder for use in further research.

Preparation of plant leaf extract:

Up to 10 gms of the dried leaf powder were used, and 100 ml of distilled water was used to dissolve it. The leaf extract that had been dissolved was utilized to analyze phytochemicals and test the antibacterial and antifungal activities.

Phytochemical analysis of leaf extract of *Plumbago zeylanica*:

The phytochemical examination of the *Plumbago zeylanica* leaf extract was used to identify the bioactive components, such as alkaloids, flavonoids, tannins, phenolic compounds, and saponins [14].

Test for carbohydrates:

Molisch's test:

Plant leaf extract (2ml) was mixed with 1ml of Molisch's reagent and a few drops of concentrated H_2SO_4: the production of a violet color at the intersection of the two layers shows the presence of carbohydrates.

Test for reducing sugars:

Benedict's test:

Ecofriendly Dyes: Extraction, Characterization and Potential Applications

M.Sankari

M. Reshma Anjum

B. Sravya

S. Sowmika

S. Ilakkia

G. Narasimha

DOI: https://doi.org/10.53555/jaz.v45i1.3590

Keywords: Natural Dyes, Extraction, Characterization, Dyeing, Synthetic chemical dyes

Abstract

Indians were thought to be forerunners in the technique of natural dyeing. Although indigenous knowledge systems have been practiced for many years, the usage of natural dyes has declined over generations owing to a lack of documentation and accurate understanding of the extraction and dyeing processes. As a result, natural dyes aren't commercially viable. Currently, all ecologically hazardous synthetic chemical dyes are utilized to colour textile fabrics. They are nonbiodegradable, carcinogenic, and cause water contamination and waste disposal issues. Natural colours provide a viable answer to these issues. Natural dyes are used to colour textiles, meals, medicines, and cosmetics. Dyes are also used in small amounts to colour paper, leather, shoe polish, wood, cane, candles, and other materials. Historically, dyes were obtained only from natural sources. Natural dyes, on the other hand, suffer from the inherent limitations of uniform application and dye standardization, since dyes obtained from comparable plants or natural sources are impacted and exposed to the vagaries of climate, soil, cultivation practices, and so on. As a result, standardization procedures play a critical and essential role for natural dyes to be ir[illegible]ialized and compete with synthetic dyes. This study is all about natural dyes, their extraction, characterization, applications, and their uses.

PMID: 37937248 PMCID: PMC10626518 DOI: 10.5599/admet.1793

Abstract

Background and purpose: Metal nanoparticles are essential due to their unique catalytic, electrical, magnetic, and optical characteristics, as well as their prospective use in sensing, catalysis, and biological research. In recent years, researchers have focused on developing cost-effective and eco-friendly biogenic practices using the green synthesis of metal nanoparticles (AgNP).

Experimental approach: In the present study, the aqueous extracts prepared from the leaf, stem, bark, and flower of *Neolamarkia cadamba* were used for the synthesis of silver nanoparticles. Synthesized silver nanoparticles were characterized using UV-Visible spectroscopy, zeta potential, dynamic light scattering, scanning electron microscope (SEM), and EDAX.

Key results: The current study showed absorption of synthesized AgNPs at 425, 423, 410, and 400 nm. Dynamic light scattering of AgNPs Showed size distribution of AgNPs synthesized from leaf, stem, and flower aqueous extracts ranges from 80-200 nm and AgNPs prepared from bark extract ranges from 100-700 nm. Zeta-potential of the biosynthesized AgNPs was found as a sharp peak at -23.1 mV for the leaf, -27.0 mV for the stem, -34.1 mV for the bark, and -20.2 mV for the flower. Silver nanoparticles and crude extracts of *Neolamarkia cadamba* showed effective antibacterial, antifungal, and antioxidant activities.

Conclusion: Silver nanoparticles have substantial antibacterial activity against Gram-positive bacteria and also exhibit the utmost antifungal activity against *Aspergillus niger*. The study concludes that the green synthesis of silver nanoparticles from *N. cadamba* leaf, stem, bark, and flower extract is a reliable and eco-friendly technique.

Keywords: Antibacterial activity; antifungal activity; antioxidant activity; electron microscopy.

EXPLORING AI TOOL AWARENESS AMONG LIBRARY AND INFORMATION SCIENCE PROFESSIONALS IN ANDHRA PRADESH: A STUDY

Dr. M. PRASANTHA KUMARI Associate Professor, DLIS, Sri Venkateswara University, Tirupati

Abstract

This paper discusses on the exploration of AI tool awareness among LIS Professionals in selected districts of Andhra Pradesh. An online questionnaire was designed for this purpose and circulated to 182 LIS professionals working in academic libraries. 164 responses received out of 182 total. The overall user response rate 90.10.%. The results revealed that majority of the respondents are strongly agreed with their awareness on AI tools, all the areas of AI applications in libraries, advantages and motivating factors, whereas some of the respondents are disagreed with the same factors. However, LIS professionals should understand their user needs and also the importance of Artificial Intelligence by learning and updating their knowledge with the latest technological developments.

Keywords:

Artificial Intelligence (AI), LIS, Andhra Pradesh, Areas of AI, Challenges of AI

Introduction

Artificial intelligence (AI) is a branch of computational science focused on solving complex problems in a manner similar to human thought processes. It involves integrating human cognitive traits into algorithms that computers can understand and process to generate outputs. AI functions as a neural network, resembling the organization of human neural activities, and has evolved since the 1950s, with applications in various sectors including libraries since the 1990s. In libraries, AI encompasses a range of techniques enabling machines to detect, understand, learn, and perform administrative tasks, thereby providing libraries with advanced technologies. This integration of AI represents a significant advancement for information-driven fields such as law, healthcare, commerce, and automotive industries. In libraries, AI applications span various functions including acquisition, cataloging, management, circulation of serials, information retrieval and dissemination, inter-library loan services, cooperative acquisition, and forming library consortiums.

Review of the Literature

Huang (2022)[1] discovered the diverse artificial intelligence (AI) applications used in academic libraries and the key factors and obstacles related to their implementation. The author adopted quantitative research methods in the form of a questionnaire, using both open and closed questions. A total of 472 questionnaires were received from academic librarians. The author found that the librarians recognized that AI applications are predictable, but showed that that the problems of in execution have hindered the adoption of AI. This study found that the two most important elements affecting the implementation of AI applications were finance and implementation costs. A number of the obstacles to the adoption of AI applications are related to technical issues. Instead of initially decreasing and cutting down on human resources, a number of librarians recommended that managers invest additional resources early on.

Cox (2023)[2] stated that the application of artificial intelligence to knowledge discovery is the paper's primary topic. Eleven alternative strategies that libraries might use for these AI applications are examined, and their chances are assessed. The impact of various internal and external factors on the adoption of AI is then examined. The study offers a new perspective of librarians as hybrids in addition to discussing the potential effects of AI on librarianship and how to integrate the research on competences with professional philosophy.

Subaveerapandiyan(2023)[3] examined the understanding and impression of artificial intelligence among library and information science workers in Zambia. The findings indicate that although library and information science professionals had a positive and upbeat view of AI, they were also concerned about AI taking over the role of librarians and about the obstacles to AI technology adoption in Zambian libraries. Before deploying artificial intelligence, the article recommends libraries take into

BUILDING INFORMATION MODELLING OF AN EARTHQUAKE RESISTANT STRUCTURE

T. Venkata Pravinay [*1], Dr. D.V. Prasada Rao [*2]

[*1] PG Student, Department of Civil Engineering, Sri Venkateswara University College of Engineering, Tirupati, Andhra Pradesh, India

[*2] Professor, Department of Civil Engineering, Sri Venkateswara University College of Engineering, Tirupati, Andhra Pradesh, India

ABSTRACT

Constructing a structure that minimizes earthquake damage can be challenging due to the unpredictable nature of seismic events, making it seem impractical. However, this study focuses on developing earthquake-resistant structure by incorporating Building Information Modelling (BIM) in the design and detailing process. The primary focus is on a G+5 apartment building designed to withstand seismic forces and prioritize occupant safety during earthquakes. BIM technology, using software such as Revit, ETABS, SAFE, SketchUp, AutoCAD, etc., is employed to enhance the structural design. Starting with creating a detailed architectural plan for the G+5 structure and rendered different architectural 3d views by creating models in Blender software. Then the detailed seismic analysis and design is done in ETABS & SAFE as per seismic design code (IS:1893-2016). BIM tools generate a dynamic 3D model, facilitating the visualization and simulation of seismic responses. The project encompasses comprehensive Structural, Architectural, and MEP (Mechanical-Electrical-Plumbing) BIM. The BIM model serves as a central information repository, allowing for precise quantity take-offs and cost assessments. The study's outcomes contribute significantly to the advancement of earthquake-resistant building design, highlighting the efficiency of BIM in optimizing structural performance and cost-effectiveness. These findings hold relevance for professionals in structural engineering, architecture, and construction management, underscoring the pivotal role of integrating BIM in earthquake-resistant designs. Furthermore, the detailed cost estimation for the entire G+5 building is also included.

Keywords: Building Information Modelling (BIM), seismic resilience, G+5 apartment building, earthquake-resistant structure, cost estimation, architectural, MEP BIM.

I. INTRODUCTION

1.1 General

Designing earthquake-resistant structures is crucial in civil engineering, particularly in earthquake-prone areas. Building design must consider hindrances to earthquake forces and ensure adequate support to prevent collapse. In this G+5 project, advanced BIM tools like AutoCAD, ETABS, Revit, and SAFE are employed. These tools help as digital assistants, enhance the design process, provide detailed information, and optimize the building's resilience to both routine and seismic challenges.

In India the earthquake prone area is divided into 4 zones based upon their vulnerability to earthquakes. So, for designing any type of structure in these zones, there are some design codes (see in 1.2). Following these codes will ensure that our constructions are not only safe but also capable of withstanding earthquakes.

Design Guidelines: Structural designers must adhere to key standards for earthquake-resistant design:

- IS 1893: 2016: Criteria for Earthquake Resistant Design.
- IS 13920: 1993: Ductile Detailing of Reinforced Concrete Structures subjected to seismic forces.
- IS: 456-2000: Indian Standard Plain Reinforced Concrete Code of Practice (Fourth Revision).
- IS 875 (Part 1-5): 1987: Code of Practice for Design Loads (excluding earthquake) for Buildings and Structures (Second Revision), encompassing dead loads, live loads, wind loads, snow loads, and special loads.

These streamlined guidelines ensure structures are resilient to seismic challenges in their respective zones, promoting safety and structural integrity.

1.2 Building Information Modelling (BIM)

'BIM' stands for 'Building Information Modeling,' a dynamic process that encompasses the creation and management of construction project information across its entire life cycle. BIM includes the development of detailed 3D models, each representing a distinct construction phase. This project specifically focuses on 5D BIM within the broader spectrum of eight dimensions.

Key Dimensions in BIM:

- 1D: Process and Brief Preparation
- 2D: + 2-Dimensional Views
- 3D: + 3-Dimensional Model
- 4D: + Time Schedule
- 5D: + Budget (Cost)
- 6D: + Facilities Management (Maintenance)
- 7D: + Sustainability (Life Cycle)
- 8D: + Occupational Safety and Health

BIM plays a pivotal role in simplifying difficult construction tasks through advanced 3D modeling software, reducing costs, and expediting project completion.

Essential Requirements for Successful BIM Implementation:

- Powerful PC with Required Software: Necessary for effective BIM execution.
- Coordination and Collaborations: Imperative for seamless project stakeholder interaction.
- Sound Subject Knowledge: Essential for leveraging BIM's potential in construction.
- 3D Modeling Experience: Prerequisite for navigating BIM intricacies.
- Literature Study and Exploration: Critical for staying current with evolving BIM methodologies.

Software Used in BIM:

- Autodesk AutoCAD
- Google SketchUp
- Bentley Staad-Pro
- CSI ETABS, SAFE, Detail
- Autodesk Revit
- Autodesk Navisworks, etc.

Advantages of BIM Implementation:

- Improve Onsite Collaboration and Communication.
- Model-Based Cost Estimation.
- Visualize Projects in Preconstruction.
- Better Coordination and Clash Detection.
- Mitigate Risk and Reduce Cost.
- Improved Scheduling/Sequencing.
- Increase Productivity with Prefabrication.

While offering substantial benefits, BIM necessitates significant investment in robust hardware and ongoing staff training and education to fully harness its potential. BIM integration represents a strategic approach to enhance efficiency, reduce costs, and ensure project success in construction endeavors.

1.3 Objectives

- Analysis and Design of a G+5 Apartment building to resist earthquake forces.
- Architectural, Structural and MEP Building Information Modelling.
- Arriving cost estimation of the G+5 Apartment building.

II. LITERATURE REVIEW

Syed Usam Ali, Nazeer Ahmed, Mohammed Khaja Zaheruddin (2021): Their study explores the comprehensive process of constructing a G+4 residential building in Aramgarh, Hyderabad. Employing AutoCAD and STAAD Pro, it covers layout, design, analysis, planning, and cost estimation. The 150' x 90' plot includes a ground floor for parking and 4 residential floors, each with 8 apartments. AutoCAD drawings, serving as the foundation for structural analysis, offer insights into forces, schedules, concrete take-off, and reinforcement weights. Foundation design utilizes STAAD

Foundation's isolated footings. Primavera P6 aids in project planning, and cost estimation is facilitated by the Centre Line Method in Microsoft Excel.

Arti, Sanjay Kumar Sharma (2020): This study employs STAAD Pro. software to analyze a multi-storied (G+5) building in accordance with IS1893:2002 part 1. Parameters such as seismic zone (IV), response reduction factor (R), and importance factor (I) are considered, along with properties like soil type, structure type, and damping ratio. STAAD Pro. provides detailed results, including joint displacements, support reactions, member forces, base shear, and lateral load, facilitating an economic analysis and design approach for the structure. The paper illustrates this methodology using a practical example of a multi-story building, showcasing detailed numerical results in the generated output file.

Mr. Saurabh N. Ugale, Mr. Sachin U. Pagar (2023): The study delves into the intricate art of planning and designing an eight-storey (G+8) apartment building, emphasizing safety, serviceability, durability, and economy. Utilizing AutoCAD for plan and elevation and E-Tabs for analysis, the research follows building by-laws and design codes like IS: 456-2000 and IS: 875. The focus remains on the balance between aesthetics, addressed by architects, and technical considerations, overseen by structural engineers.

III. METHODOLOGY

3.1 Problem Statement

An earthquake resistant analysis & design of a G+5 apartment building consisting of 4 No. of 3BHK (2400 sft.) flats in each floor is carried out first and then all the architectural, structural and MEP building information modelling is done. Finally, the total cost estimation of this G+5 apartment building is carried out.

3.2 Methodology adopted for this project:

- First, a G+5 3BHK APARTMENT Plan was prepared. (Using AutoCAD).
- Then Architectural 3D model of the building was prepared. (Using REVIT & Blender).
- Next, Structural Modeling and Design has been done. (Using ETABS & SAFE).
- Then, Structural Detailing was done (Using Revit & CSI Detail).
- Then, MEP Detailing was done showing Plumbing & Electrical layouts (Using Revit & AutoCAD).
- Finally, Complete cost estimation was done (Using Revit & other sources).

IV. ARCHITECTURAL BIM

The Architectural Building Information Modeling generated in this project is provided below:

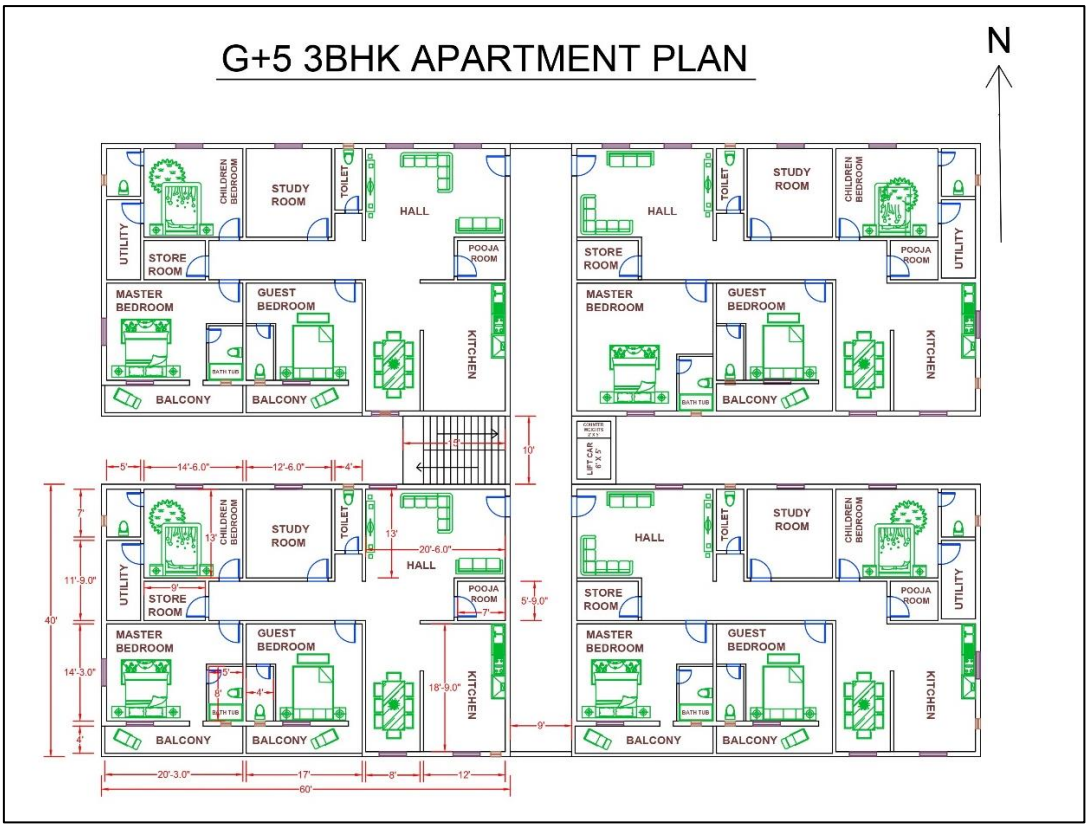

Figure 1: Full Plan of G+5 Apartment building.

Figure 2: Interior architectural renderings of Living room & kitchen.

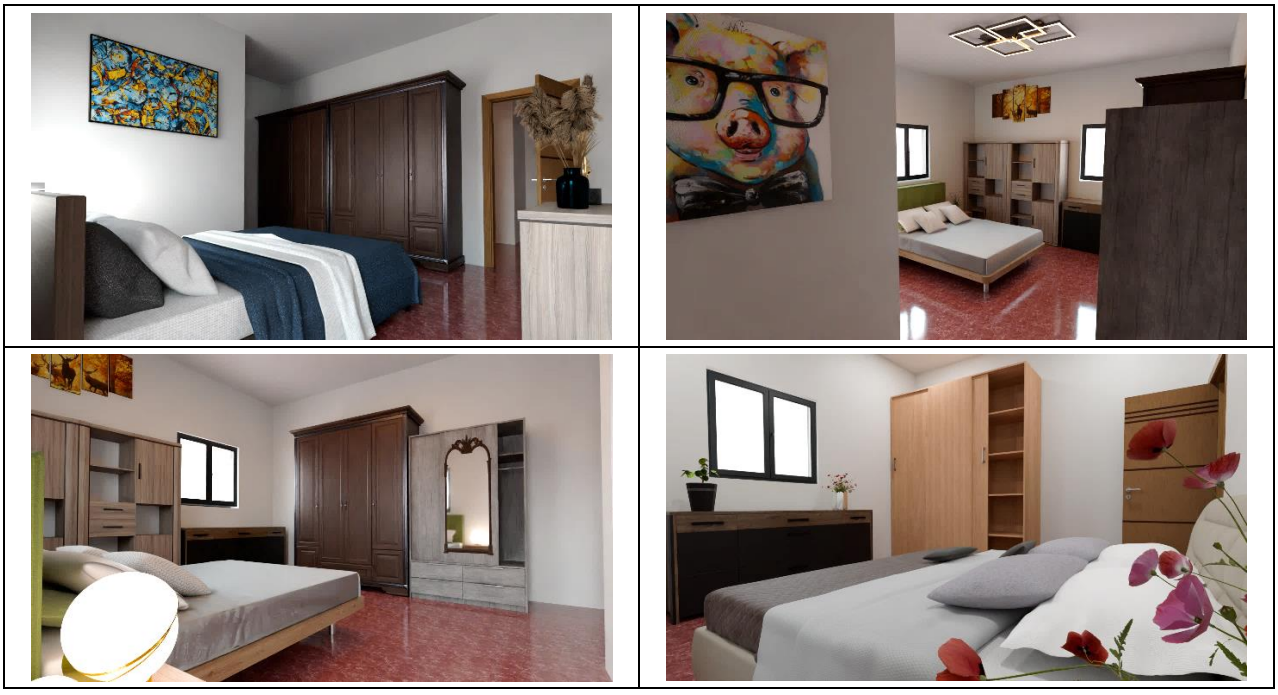

Figure 3: Interior architectural renderings of all 3 bedrooms.

Figure 4: Architectural renderings of toilets, balcony & utility rooms.

Figure 5: Exterior renderings of G+5 apartment building.

V. STRUCTURAL BIM

Structural Data of G+5 Apartment building:

No. of storeys	G+5
No. of flats	4 on each floor = 4x5 = 20
Ground Floor	Left for parking
Flat details	3BHK – 2400 sft. area
Slab thickness	150 mm
Storey height	3200 mm
Walls thickness	External – 230 mm Internal – 150 mm
Lift & Staircase	Provided
No. of columns on each floor	92 columns

Size of flat	60 ft x 40 ft (see fig.2)
No. of bays in X-Dir.	14
No. of bays in Y-Dir.	10
Support conditions	Fixed
Seismic Zone	Zone III – (0.16)
Soil type	Type – II (Medium Stiff)
Column sizes adopted	230 x 450 – 300 x 400 300 x 450 – 350 x 450
Beam sizes adopted	300 x 400 – 300 x 450 350 x 450 – 400 x 450
Materials	Concrete – M30 Grade Steel – Fe415 Grade

Analysis & Design Results:

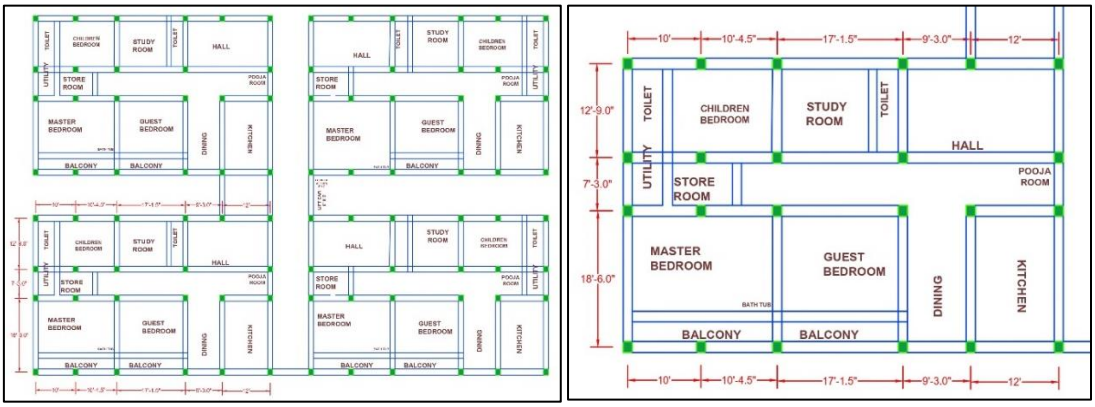

Figure 6: Beams & Columns layout plan.

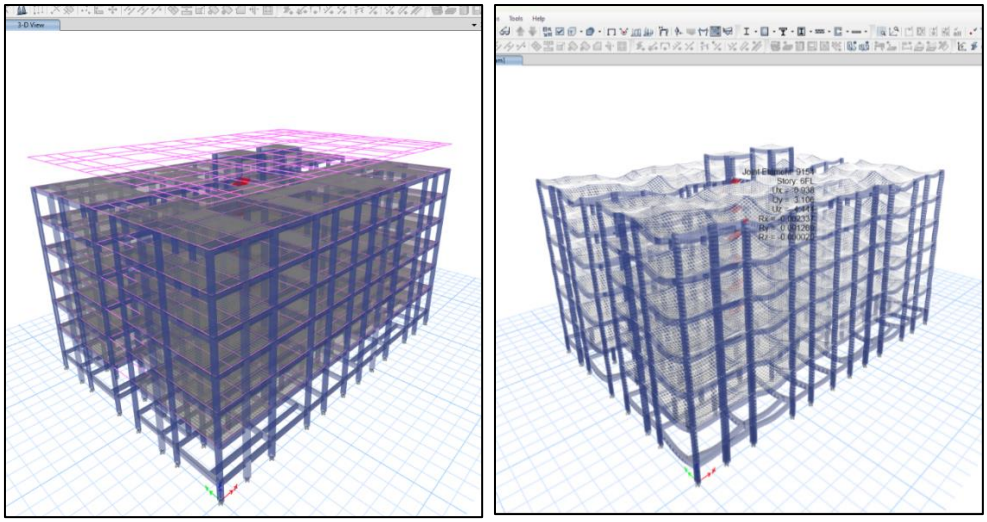

Figure 7: Structural 3D models in ETABS before and after analysis.

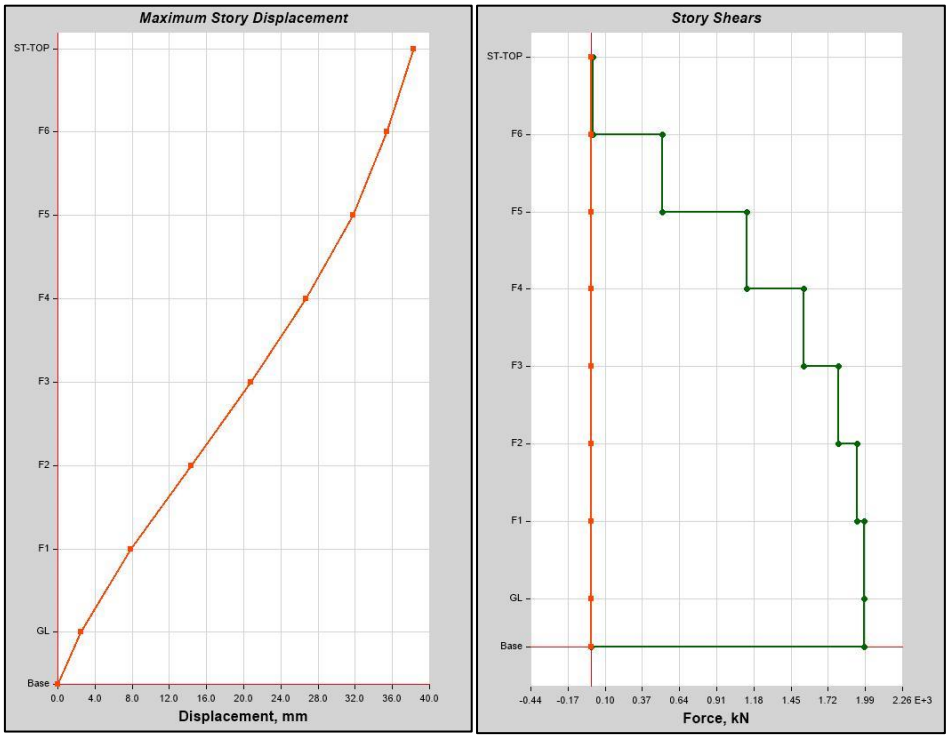

Figure 8: Maximum Story Displacements & Story Shears obtained in ETABS.

VI. MECHANICAL-ELECTRICAL-PLUMBING(MEP) BIM

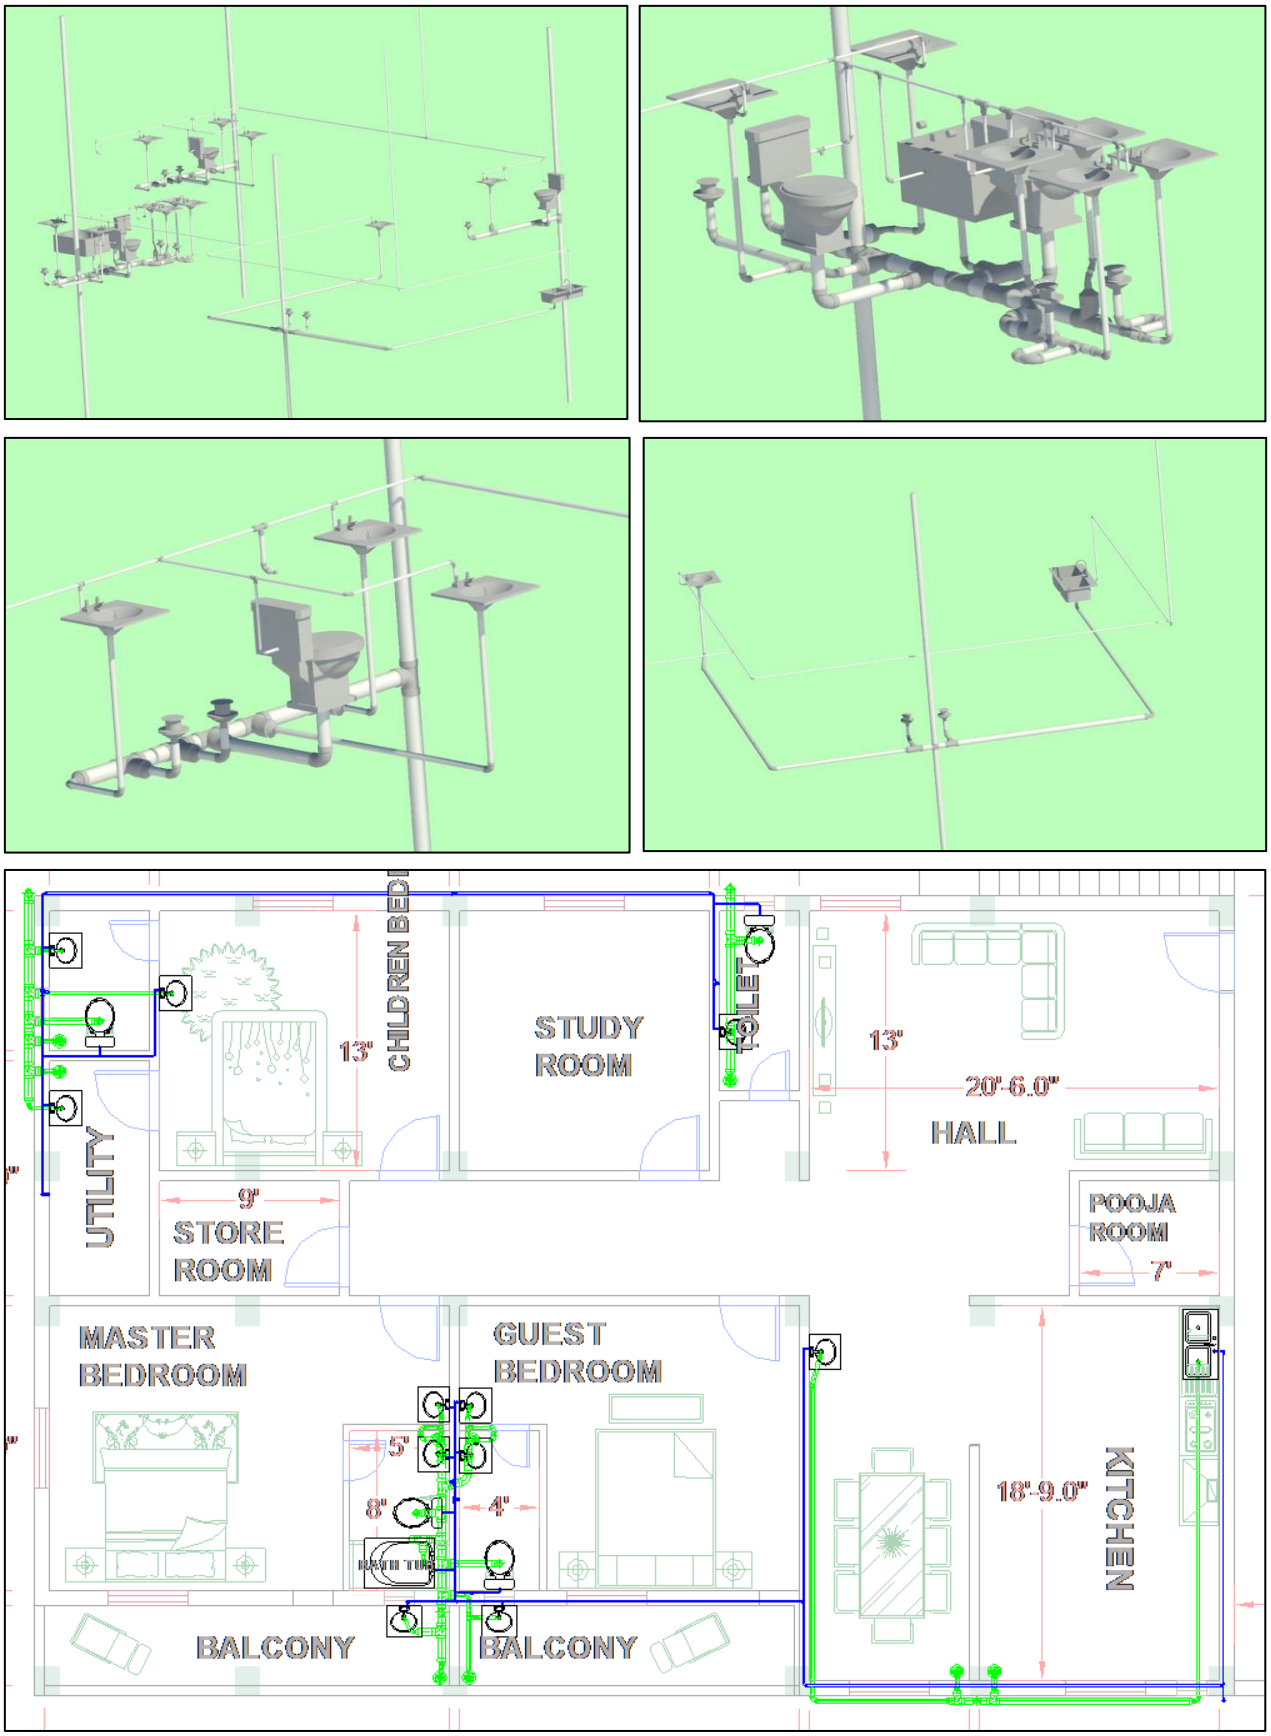

Figure 9: Plumbing Detailing of G+5 Apartment building with 3D models.

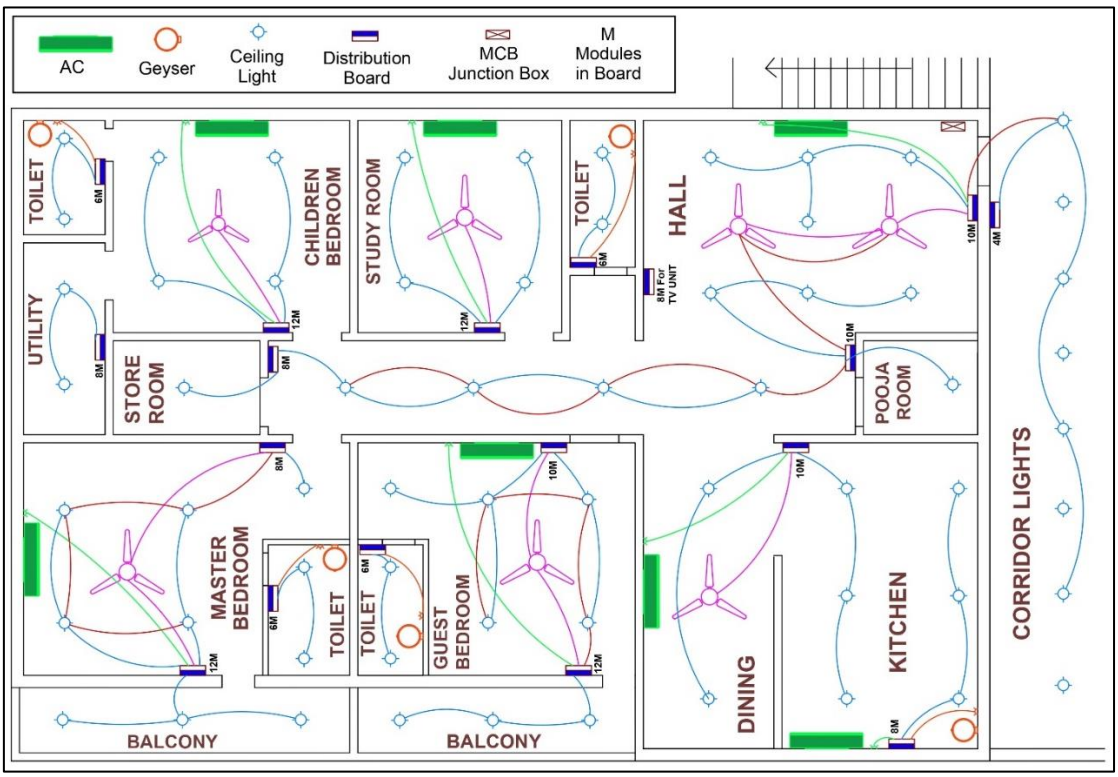

Figure 10: Electrical Detailing Layout of G+5 Apartment building.

VII. COST ESTIMATION

Table.1: Complete Cost Estimation of G+5 Apartment Building

SITE CLEARANCE CHARGES FOR JCB = 30Hr × 1000 = Rs.30000/-
DESIGN FEE = Rs.100/sft. × 11000 = Rs.1100000/-
BORE CHARGES = 150000 × 4 = Rs.600000/-
EARTHWORK CHARGES = Rs.100000/-
BASEMENT FILLING = Rs.1000000/-
ELECTRIC WORKS (M+L) = Rs.100/sft. × 10630 × 5 = Rs.5315000/-
PLUMBING WORKS (M+L) = Rs.110/sft. × 10630 × 5 = Rs.5846500/-
PAINTING COST + POP = Rs. 160/sft. × 10630 × 5 = Rs.8500000/-
FLOOR TILES = Rs.75/sft. 10630 × 5 = Rs.3986250/-
WALL TILES = Rs.65/sft. × (10630/3) × 5 = Rs.1151583/-
GRANITE = Rs. 120/sft. × (0.05 × 10630) × 5 = Rs.318900/-
TOTAL WALLS COST = 1491 m^3 × Rs.8500/m^3 = 12673500/- + (300 × 8391 m^2) = Rs.1,51,90,800/-
TOTAL COST FOR FOOTINGS = 23,92,000 + 10,50,000 + (10630 × 60) = Rs.40,79,800/-
WINDOWS COST = 6500/No. × 170 = Rs.1105000/-
MAIN DOORS = 85000/No. × 20 = Rs.1700000/-
BEDROOM DOORS = 15000/No. × 80 = Rs.1200000/-
BATHROOM DOORS = 3000/No. × 175 = Rs.525000/-
TOTAL CONCRETE VOLUME FOR SLABS = 846.863 m^3
TOTAL STEEL WEIGHT FOR SLABS = 36.239 TONNES
TOTAL BEAMS CONCRETE VOLUME = 542.168 m^3
TOTAL STEEL FOR BEAMS = 84.954 TONNES
TOTAL CONCRETE VOLUME FOR COLUMNS = 387.746 m^3
TOTAL STEEL FOR COLUMNS = 134.142 TONNES

TOTAL COST OF CONCRETE FOR SLABS, BEAMS, COLUMNS = Rs.88,83,885/-
TOTAL COST OF STEEL FOR SLABS, BEAMS, COLUMNS = Rs.2,04,26,800/-
TOTAL COST OF LABOUR FOR LAYING SLABS, BEAMS = (6 × 10630 × 130) = Rs.82,91,400/-
TOTAL COST OF LABOUR FOR LAYING COLUMNS = (96 × 3000 × 6) = Rs.17,28,000/-
WATER TANKS & PUMPS COST = Rs.15000/No. × 20 = Rs. 3,00,000/-
LIFT COST FOR G+5 BUILDING = Rs.8,50,000/-
TOTAL BUILDING COST = Rs.9,21,09,918/-
HOUSE PERMISSION CHARGES = 1-3% OF BUILDING COST = Rs.27,63,300/-
CONTRACTORS PROFIT = 10% OF BUILDING COST = Rs.92,10,990/-
FINAL COST OF G+5 APARTMENT BUILDING = **Rs. 10,40,84,208 /-**
COST PER SFT = Rs.10,40,84,208 / (10630 × 5) sft. = **Rs.1960/-** per sft.

VIII. CONCLUSION

As the design of a building to resist an earthquake force especially in earthquake prone areas is challenging, and cost of structure also will be increased compared to conventional design. So, to optimize the overall cost of structure and to maintain stability and integrity of the structure, proper methodology should be adopted in the design process. So, in this project, adopted Building Information Modelling (BIM) process for the complete design of structure using some important BIM software tools to design the selected G+5 Apartment building. And here are the conclusions:

- With the help of AutoCAD tool, it can be easily drafted any kind of building plan and architectural details.
- The interior and exterior architectural renderings based on 3D models from different views of different rooms like bedrooms, living room, kitchen, utility, etc. are prepared in Sketchup and Blender software.
- For the most important part, i.e., Analysis and Design, CSI ETABS and SAFE were used for design and all design criteria of Earthquake Design is based on IS Code – IS:1893-2016.
- The analysis and design results achieved are very optimal and cost-effective without unnecessary sections and ductile design detailing of every structural element is provided in the results and discussions section.
- Plumbing and Electrical layouts of the G+5 Building along with some typical 3D models have also prepared.
- Finally, the overall cost estimation of the structure, G+5 Apartment Building, is prepared by using Revit and some other sources manually and the results came out very optimistically and economically.

AWARENESS AND UTILISATION OF E-PG PATHSHALA AMONG PG STUDENTS OF SRI VENKATESWARA UNIVERSITY, TIRUPATI: A STUDY

Dr. M. Prasantha Kumari, Associate Professor, Dept., of Library and Information Science, Sri Venkateswara University, Tirupathi, Andhra Pradesh

Abstract

This study discusses about the awareness and utilisation of e-PG Pathshala among students of Sri Venketeswara University, Tirupati. Online questionnaire was prepared in Google Forms and distributed to 182 students and received responses from 178 students of Arts. Findings revealed that students were aware of e-PG Pathshala and utilised the e-content to the maximum extent. Moreover, awareness and utilisation need to be increased among the students of university.

INTRODUCTION

The development and impact of technology has transformed people's lives in different ways, as technology is impacting every aspect of our lives. Technological advancements such as computers, the internet etc. have fundamentally altered the way we work with, access, retrieve, share and process data or information. This has made information processing easier, faster and more efficient, and has taken information processing to a whole new level, making it an essential part of ICT.

INFLIBNET AS LEARNING RESOURCE

INFLIBNET is an Information and Library Network (IUC) centre of the UGC in India. It is a fully funded autonomous body of the UGC. It was set up by UGC under MHRD to develop higher education in India. It started as a project of IUCAA in 1991 and became an independent IUC centre in 1996. Its main objective is to modernize and promote infrastructure to connect different university libraries through high-speed data for the sharing of information resources between different academic or research institutions. It is based in the city of Gandhinagar in Gujarat. Technology is the driving force in modern education system. The UGC has taken many initiatives for the betterment of the academic community in the universities under its jurisdiction. These initiatives include Shodhganga, Shodhgangotri, OJAS, INFLIBNET, Open-Source Software Research and Development, Infoportal e-PG Pathshala is one of the initiatives projects under INFLIBNET.

e-PG Pathshala

e PG Pathshala (e-PG) is an online platform which is hosted and managed by the Institute of Postgraduate Education (INFLIBNET). The primary purpose of this platform is to meet and deliver course content according to the NME-ICT curriculum for each postgraduate learner. All the resources have been developed by the selected experts from various Institutions and Universities. The aim is to provide e-content to the students and peers through various delivery modes for formal and non-formal education, to complement and enhance the teaching and learning process in higher education, and to encourage the usage of e-content among students and peers. This e-content is available in open access and it is being accessed across the globe. The total no of visitors was 21639248 as on February 22nd 2024. Even on YouTube the videos are being viewed in large numbers with students, teachers, researchers and other stakeholders providing constant feedback. HRD Minister Pokhriyal on the Twitter urged all Post Graduate students in the country to take benefit of the superior content available on this platform during the lockdown.

REVIEW OF THE LITERATURE

Subhajit (2020)[1] conducted a study to observe the usage pattern of e-PG Pathshala in respect to topographical coverage and subject areas. Data was collected from 20 countries, states and cities in

Self compacting Geopolymer concrete
Fresh Properties
NaOH solution Molarity
Mechanical Properties

ABSTRACT

The concrete industry has consistently pushed for sustainable development. This investigation aims to examine the characteristics of flyash-based self-compacting geopolymer concrete (SCGPC) made with varying NaOH molarities both while it is fresh and when it has hardened. The NaOH molarity is varied from 8 M to 16 M at an interval of 2 M. Sodium silicate (Na_2SiO_3) to sodium Hydroxide (NaOH) is kept at a constant ratio of 2. For the geopolymer process, the alkaline solution to Binder ratio (L/B) was kept at 0.45. Fresh properties like Slump flow, T_{50cm} slump flow, L-Box and V-funnel have been done to assess the fresh properties of flyash based SCGPC confirming to EFNARC guidelines. Mechanical Strength properties such as Compressive, split-tensile, and flexural strength of the flyash based SCGPC were also determined at various ages. Prior to testing, all specimens are cured under ambient curing. Results indicate that the hardened properties of flyash based SCGPC are enhanced by the increase in molarity from 8 M to 16 M. Furthermore, as the molarity tends to rise, it is shown that the fresh properties slightly decrease.

1. Introduction

Concrete is one of the most widely utilised building materials in the globe. It is the next commonest used resource in communities worldwide after water [1]. It is normally produced using ordinary Portland cement (OPC), that consumes a lot of energy and releases an equal amount of carbon dioxide (CO_2) into the atmosphere [2]. As a result of this carbon dioxide emission, the greenhouse effect increases, causing global warming. Davidovits developed geopolymer concrete, which totally replaces cement with industrial by-products [3]. Industrial waste materials possessing a high alumina and silica content, such as flyash, metakaolin, GGBS, etc., are polymerized to manufacture geopolymer concrete. Through polycondensation, these aluminosilicate compounds become a dimensionally stable structure at low temperatures [4 5]. Fresh concrete must be compacted and placed in the formwork by skilled workers. To achieve a uniform mix with no voids (honey-comb), this compaction principally attempts to reduce the entrapped air within freshly laid concrete. Normal vibrating concrete might not be able to display the necessary fresh and hardened qualities once the concrete is being poured and compacted at the construction area. Skilled work is necessary to achieve proper compaction in freshly mixed concrete. Introducing self-compacting concrete (SCC) stands one way to solve this issue [6 7]. Modern concrete that could compact under its own weight in deep, narrow segments that are heavily reinforced to fill the formwork is known as self-compacting concrete (SCC)[8]. This study examines how the properties of flyash-based SCGPC are influenced by the molarity of sodium hydroxide in both the fresh and hardening states.

2. Materials

2.1. Flyash

In the present investigation, Class – F flyash is used which is collected from Rayalaseema Thermal Power Plant (RTTP), Kadapa, India. Flyash is confirming to IS: 3812:2003 [9]. The flyash has a specific gravity of 2.24. It has Blaine's fineness about 310 m^2/kg. Table 1 provides information on the chemical composition of fly ash.

Table 1
Chemical Composition of Flyash.

Component	SiO_2	Al_2O_3	Fe_2O_3	CaO	MgO	TiO_2	SO_3	L.O. I	K_2O	Na_2O
Flyash (%)	65.60	20.86	4.98	1.0	0.55	0.5	0.2	0.16	0.82	0.20

2.2. Alkaline activation solution

In the current investigation, sodium hydroxide and sodium silicate solutions are employed to produce alkaline activators. While the ratios of sodium silicate to sodium hydroxide (Na_2SiO_3/NaOH) was kept at 2, the sodium hydroxide solution molarity (NaOH) is altered from 8 M to 16 M. To reduce the amount of heat created during the mixing procedure, the prepared alkaline solution is given 24 h to cool and mature.

2.3. Aggregates

In the current study, all of these flyash-based SCGPC mixtures contained fine aggregate made of natural river sand from the Tungabhadra River bed and a coarse aggregate of 12.5 mm downsize. Both the jelly and river sand are available locally. The used fine aggregate and coarse aggregate had specific gravities of 2.60 and 2.64, respectively. In accordance with the results of the sieve analysis, the fine and coarse aggregates utilised in this work both meet the requirements of IS: 383–1970 [10 11].

2.4. Superplasticizer

The Master Glenium series superplasticizer was utilised in the current investigation. It is a modified polycarboxilic ether-based admixture. It was created to improve the qualities of newly-poured and hardened high performance concrete. Given that it is free of chlorides and alkalis, it is suitable with all types of cement. Since it is devoid of chlorides and alkali, it can be used with any type of cement. Its relative density is approximately 1.09, in accordance with IS 9103:1999 [12].

3. Mix design of flyash based self compacting geopolymer concrete

Flyash based SCGPC mix design is solely distinct from cement concrete. The trial-and-error process was employed to produce flyash based SCGPC mix. Five flyash based SCGPC mixes were made by raising the molarity of Sodium Hydroxide (NaOH) solution from 8 M until16M. The total binder content was fixed at 496.55 kg/m^3, and the Liquid-to-binder (L/B) mass ratio was kept at 0.45. In line with the binder's molarities by mass, as stated in Table 2, a superplasticizer (S.P.) content of 1.5% and additional water content were used.

3.1. Mixing, casting and curing

In the pan mixer, the dry components of flyash based SCGPC i.e., fine aggregate, coarse aggregate and flyash were mixed about 2–3 mins. Then the liquid portion of the mixture i.e., The NaOH along with Na_2SiO_3 solution is mixed in the proportion of 1:2 (by weight) to produce alkali activator fluid. Super Plasticizer and Water are added at last for the perfect blending of flyash based SCGPC[5]. These all materials are allowed to mix for another 2–3 min. The newly mixed fresh concrete was examined for fresh flowability properties before being placed into the moulds. Prior to testing, all specimens are stored at room temperature (27 ± 2 °C).

3.2. Testing methods

3.2.1. Fresh properties

The fresh properties of flyash-based SCGPC mixes are assessed using slump flow, T_{50cm} slump flow, L-box, and V-funnel tests. The filling capacity of new concrete was determined by using slump flow test. The T_{50cm} slump flow test was used to determine a mixture's filling capacity by measuring how long it took for the mixture to expand to a diameter of 50 cm. The L-box test was used to determine whether concrete could withstand the reinforcement. The concrete heights at the horizontal component's (H_2) and the vertical section's (H_1) leading ends are measured for the L-box test. The viscosity and filling capacity of the concrete were evaluated using the V-funnel test. Each test was performed in compliance with the recommendations of the EFNARC [13].

3.2.2. Mechanical properties

Using the IS 516 (1959), IS 5816 (1999), and IS 516 (1959) standards, the compressive strength, split tensile strength, and flexure strength were assessed [14 15]. The cube compression, flexural strength and splitting tensile strengths of the flyash-based SCGPC were evaluated using three 150 mm × 150 mm cubes, three 500 mm × 150 mm prisms and three 150 mm × 300 mm cylinders.

4. Results and discussion

4.1. Slump flow and T_{50cm} slump flow test

Table 3, Fig. 1 and Fig. 2 clearly show the values for the rheological properties (slump flow values and T_{50cm} slump flow) of flyash based SCGPC mixes. The slump flow values and T_{50cm} slump flow for flyash based SCGPC mixes were in the ranging of 690 to 720 mm and 2.3 to 3.51 sec, respectively. At 8 M the maximum slump was measured, and the lowest slump was measured at 16 M. When the level of NaOH concentration was increased from

3	M3	12 M	710	3.06	7.9	0.89
4	M4	14 M	695	3.2	8.2	0.86
5	M5	16 M	690	3.51	8.4	0.84

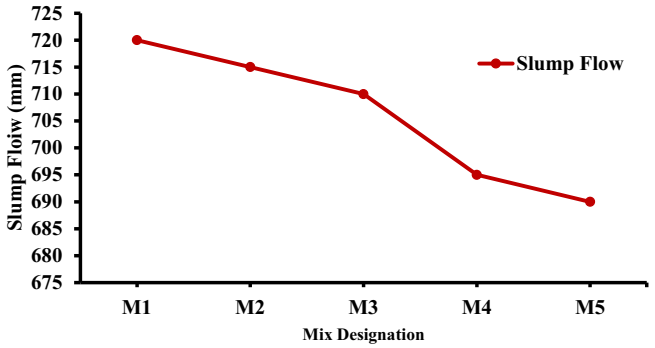

Fig. 1. Variation of Slump flow with different Sodium Hydroxide solution molarities.

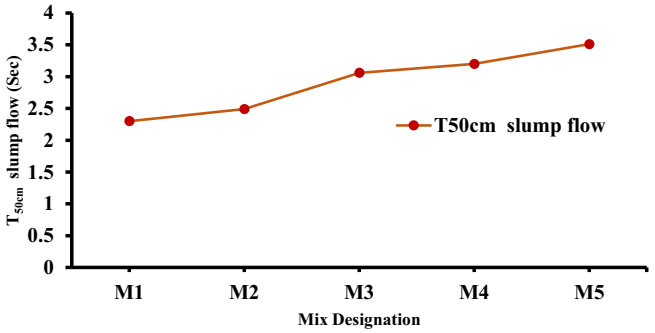

Fig. 2. Variation of T_{50cm} slump flow with different Sodium Hydroxide solution molarities.

8 M to 16 M, the slump flow was found to be reduced. All of the mixes constituted with higher molarity concentrations had lower slump flows. High T_{50cm} slump flow readings were also a result of a higher NaOH molar content. It has been observed that as the NaOH concentration rises, the slump value gradually decreases. This might be caused by the alkaline activator solution's high viscosity [16 17]. All mixes, however, conformed with the EFNARC, 2002[13].

4.2. V-funnel test

Table 3 tabulates the time taken for the V-funnel test and presented in Fig. 3, which shows that the time rose from 7.5 to 8.4 sec. As the concentration of NaOH rose from 8 M to 16 M, All V-funnel values were found to be less than 12 s and within the range of EFNARC, 2002.[13].As the amount of sodium hydroxide in the solution rises, so does its viscosity. Flyash-based self-compacting geopolymer concrete's flowability reduced as sodium concentration rose. As a result, the flow period of the V-funnel was extended.

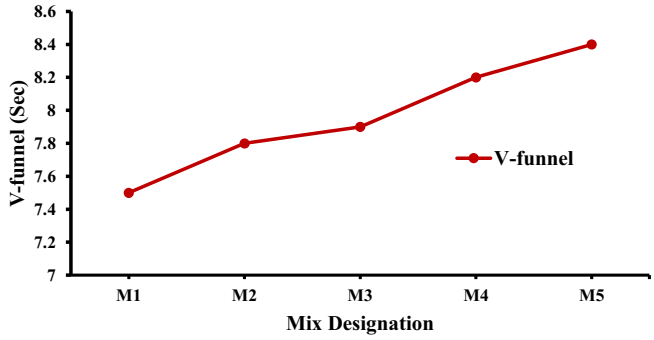

Fig. 3. Variation of V-funnel with different Sodium Hydroxide solution molarities.

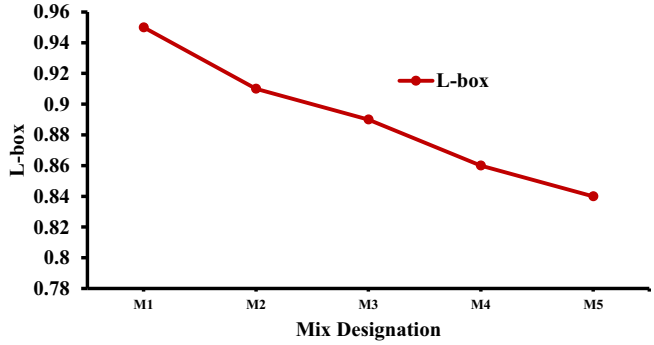

Fig. 4. Variation of L-Box with different Sodium Hydroxide solution molarities.

4.3. L-box test

The passing-ability (L-box) values are presented in Table 3 and Fig. 4. The results indicate that, regardless of the sodium hydroxide concentration, all flyash-based SCGPC mixes satisfied the L-Box ratio requirements of EFNARC [13]. The ratio of L-box dramatically declines with increased sodium hydroxide solution concentrations, as indicated in Table 3. For different concentrations of Sodium Hydroxide between 8 M and 16 M, the L-Box values varied from 0.95 to 0.84, respectively. The L-Box test results from the previous researchers' studies of three different sodium hydroxide solution concentrations (8 M, 10 M, and 12 M) in SCGPC combinations were very similar [16]. It was noticed that the L-Box values significantly decreased when sodium hydroxide concentration and molarity increased.

4.4. Compressive strength test

The results of the compressive strength test are listed in Table 4 and Fig. 5 shows how, after 7,28 days, the molarity of the NaOH solution influenced the compressive strength of the flyash-based SCGPC. The test findings demonstrated that the molarity of the sodium hydroxide solution has a significant impact on the flyash-based self-compacting geopolymer concrete. The flyash-based

Table 4
Hardened Properties of flyash based SCGPC mixes.

S.No.	Mix Designation	Molarity	Compressive Strength (MPa)		Split Tensile Strength (MPa)	Flexural Strength (MPa)
			7 days	28 days		
1	M1	8 M	17.15	25.74	2.56	3.22
2	M2	10 M	19.34	28.56	2.79	3.52
3	M3	12 M	22.34	31.94	3.12	4.05
4	M4	14 M	22.84	33.63	3.29	4.12
5	M5	16 M	23.33	34.9	3.42	4.22

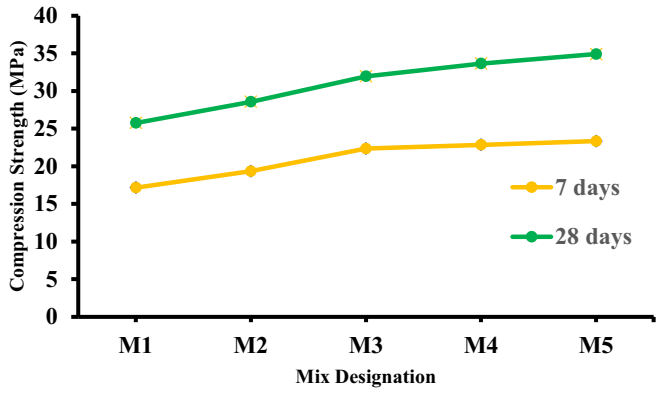

Fig. 5. Effect of NaOH solution molarity on Compressive Strength of SCGPC.

SCGPC gets harder when NaOH molar concentration rises from 8 Molarity to 16 Molarity. At 28 days, the combination with 16 M showed the highest compressive strength (34.9 MPa). When compared to flyash based SCGPC mix of 8 M, compressive strength increased by 10.95%, 24.08%, 30.65%, and 35.58%, respectively, for flyash based SCGPC mixes of 10 M, 12 M, 14 M, and 16 M. This might be the case because raising the molarity of NaOH enhances the pace at which aluminosilicate minerals dissolve, which enhances the geopolymerization process. This improvement in compressive strength characteristics is consistent with a number of previous research [18].

4.5. Split tensile strength test

Fig. 6 and Table 4 depicts the flyash-based SCGPC's split tensile strength test outcomes after 28 days. This graph clearly illustrates that as the molarity of the sodium hydroxide solution increases, the split tensile strength of the flyash-based SCGPC also increases. When compared to flyash-based SCGPC mix of 8 M, the improvement in split tensile strength is approximately 8.98%, 21.87%, 28.51%, and 33.59% for mixtures of 10 M, 12 M, 14 M, and 16 M, respectively. The split tensile test results validate the behaviour of the compressive strength test results.

4.6. Flexure strength test

At 28 days after casting, the results of the flexural strength test for the flyash-based SCGPC are displayed in Fig. 7 and Table 4. This graph unequivocally demonstrates that the flyash-based SCGPC's flexural strength increases as the molarity of the sodium hydroxide solution rises. Flyash-based SCGPC mixes of 10 M, 12 M, 14 M, and 16 M each had an increase in flexural strength of about 9.31%, 25.77%, 27.95%, and 31.05% when compared to flyash-based SCGPC mixes of 8 M. The behaviour of the compressive strength test findings is complemented by the flexural strength test results.

4.7. Effect of NaOH solution molarity

The workability of the mixture is found to be significantly reduced by a molarity rise. This is due to the alkaline activators (NaOH and Na_2SiO_3) greater viscosity in comparison to water. The viscosity of the NaOH solution increased as the molarity of NaOH increased. Additionally, the decrease in water levels caused by raising the molarity of NaOH lowers the workability of SCGPC. Increased sodium hydroxide solution concentrations hasten the polymeric reaction, which decreases workability by expediting the setting and hardening process [19]. This may also be because flyash based SCGPC that was sticky and cohesive was produced when the little fly ash particles were combined with viscous alkaline activators. Similar findings were reported by the previous researchers [20,21].

5. Conclusions

1. Flyash based SCGPC blends made by varying NaOH solution concentrations varying from 8 M to 16 M has achieved the desired fresh properties confirming to EFNARC guidelines[13].

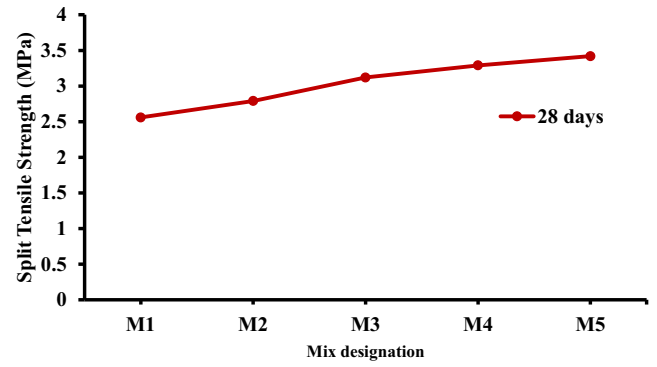

Fig. 6. Variation of Split Tensile Strength w.r.t different Molarities.

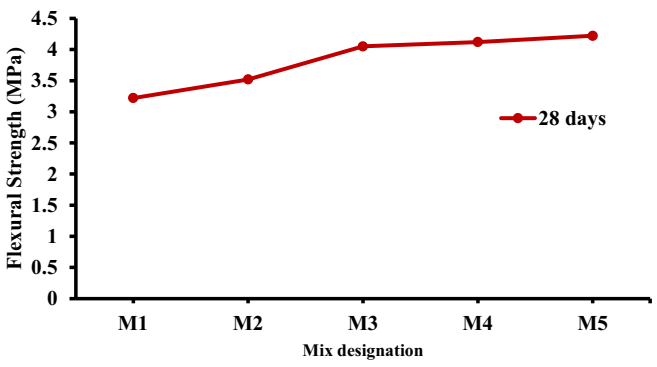

Fig. 7. Variation of Flexural Strength w.r.t different Molarities.

2. The molarity of the NaOH solution had a substantial impact on the strength of flyash-based SCGPC that was cured at room temperature.
3. The compressive strength of flyash based SCGPC increased by approximately 35.58% when the molar concentration of the NaOH was rose from 8 M to 16 M.
4. However, as the molar concentration of NaOH rose from 8 M to 16 M, the splitting tensile strength and flexural strength of flyash-based SCGPC improved by around 33.59% and 31.05%, respectively.

Role of Hard and Soft Skills in the Library Profession and Identifying Opportunities forImprovement and Growth: A Study

Dr. M. Prasantha Kumari
Associate Professor
Dept., of Library and Information Science
SVU College of Arts, Tirupati

Abstract

This study was conducted to explain the role of hard skills and soft skills in the Library Profession. An online questionnaire was designed for this purpose and circulated to 185 LIS professionals working in various libraries of Andhra Pradesh.165 responses received out of 185 total. The overall user response rate 89.18%. The information is presented in the form of tables and evaluated using a basic measurement process. A good number of Librarians are implementing soft skills to meet the information needs of their users as well as to satisfy them with their service. Though they are facing some challenges in implementing sift skills, they do not underestimate the value of all skills and try to practice by avoiding all challenges.

Keywords: *Hard Skills, Soft Skills, Intrapersonal Soft Skills, Interpersonal Soft Skills, Library Profession*

Introduction

The fundamental hard and soft skills that librarians need to effectively carry out their duties are known as librarian skills. Hard skills include role-specific competencies like using library software, managing digital databases for cataloguing, and other technical skills. Librarians can enhance and broaden their hard skills through webinars, online courses, and training programs. Soft skills are the actions and personal qualities that librarians employ to build positive relationships with their clients, colleagues, and other staff members.Sorting and organizing information in various formats for easy access is the art and science of librarianship.The 21st century's information and communication technology breakthroughs, along with the ever-changing information habits of library users, need library staff to provide state-of-the-art services that are customized to match user needs. These days, a highly

.

Abstract
This study aims to assess soil erosion risk within the small-watershed of Nandivargam in Nandyal district, India, utilizing the Revised Universal Soil Loss Equation (RUSLE) model along with a remote sensing and Geographic Information System (GIS) approach. The RUSLE model, widely recognized for estimating soil loss and serving as the basis for global soil loss models, has undergone numerous modifications over time. The specific focus of this study is on estimating yearly soil loss in the Nandivargam small-watershed. The researchers utilized GIS and remote sensing technologies, along with the RUSLE model, to accomplish this objective. To do this, they incorporated various GIS data layers, such as rainfall erosivity (R), slope length and steepness (LS), land cover management (C), soil erodibility (K), and conservation practice (P), to analyze their respective impacts on soil loss. The findings of the study revealed an estimated annual potential soil loss of approximately 3974.7 t/yr (240.0244 km^2) within the Nandivargam small-watershed. This information provides valuable insights into the extent of soil erosion in the area and can contribute to the development of effective soil conservation strategies and land management practices to mitigate erosion impacts.

Keywords: Revised Universal Soil Loss Equation (RUSLE), Geographic Information System (GIS), remote sensing (RS), Nandivargam watershed; Soil erosion.

I. Introduction

Soil erosion is one of the major issues with land degradation in agriculture and is now recognised as a serious environmental threat [18]. Soil erosion also contributes to the degradation of land resources globally. A danger to regional water quality and sustainable agricultural output, soil erosion is typically linked to agricultural practices in tropical and semi-arid countries. It causes a reduction in soil fertility and a host of other detrimental effects on the environment. 5334 million tons of soil are reportedly removed from India each year for a variety of causes [16], [17]. In recent years, as part of the environment and land degradation assessment policy for sustainable agriculture and development, soil erosion is increasingly more being diagnosed as a threat that's more serious in mountain regions [14], [2], [1], [4], and [24]. To ensure effective management strategies, a quantitative assessment is essential for determining the scope and severity of soil erosion issues. However, the intricate nature of the variables involved makes it challenging to accurately estimate or predict erosion. Fortunately, recent advancements in spatial information technology have enhanced existing methods and provided efficient approaches for monitoring, analyzing, and managing Earth's resources. By leveraging tools such as digital elevation models (DEMs), along with remote sensing data and geographic information systems (GIS), it is possible to swiftly and comprehensively assess erosion hazards, enabling both rapid and detailed evaluations. [7], [22], [10]. Spatial and quantitative data regarding soil erosion at a small-watershed level play a significant role in the development of plans for soil conservation, erosion control, and overall management of the watershed environment. The outcomes of the estimation of soil loss in the small-watersheds had been done on an experimental foundation in lots of tropical regions the usage of unique techniques of prediction [21], [5], [27]. In this scope of study, the Revised

Universal Soil Loss Equation (RUSLE) was applied within a Geographic Information System (GIS) framework to predict potential annual soil losses in the Nandivargam small-watershed in Nandyal district, India. The utilization of remote sensing and GIS techniques has proven to be invaluable, particularly when evaluating erosion on a larger scale, due to the extensive data requirements and broader area coverage involved. For this reason use of these techniques have been widely adopted and currently there are several studies that show the potential of remote sensing techniques integrated with GIS in soil erosion mapping. The primary aim of this study was to estimate soil loss by employing the Revised Universal Soil Loss Equation (RUSLE) model, utilizing input parameters generated through remote sensing and GIS techniques. These input parameters encompassed factors such as soil erodibility, topography, land use practices, and crop management.

II. Geographical of the Study Area

The study area selected for assessing soil erosion vulnerability is the Nandivargam small-watershed shown in (Fig-01), which is part Nandyal district, India. The study area extends between latitudes 15°22' 30"N to 15°32'30"N and longitudes 78° 7' 30"E to 78°25'0"E, the covering an area of 240.72 km^2. The mean elevation of the study area is 425 meters above mean sea level. It experiences a dry climate with an annual & annual average rainfall of 1273mm and 902mm respectively. The mean minimum and maximum temperatures are 21.9 ºC and 38.5 ºC, respectively. Located in the Kundu river basin, also known as Kunderu, Kumurdruthi, it is a tributary of the Penna River in the Rayalaseema region of India. The Kundu valley, known as Renadu, is associated with the term "Renati Pourusham." The Kundu River's flood plains cover an area of around 6,000 acres (24 km^2). The study area encompasses the Kunderu river valley, situated between the Erramala and Nallamala hills, forming the western and eastern boundaries, respectively. It includes the entire Koilakuntla and parts of Nandikotkur, Nandyal, Allagadda, and Banaganapalle. The Kunderu River, a tributary of the River Penner, flows southward through the central part of the region. The Madduleru and Jurreru rivers in the west, and the Galeru and Vakkileru Rivers in the east, are the main tributaries of the Kunderu River [11]. The region has an average slope ranging between 200 and 300 meters.

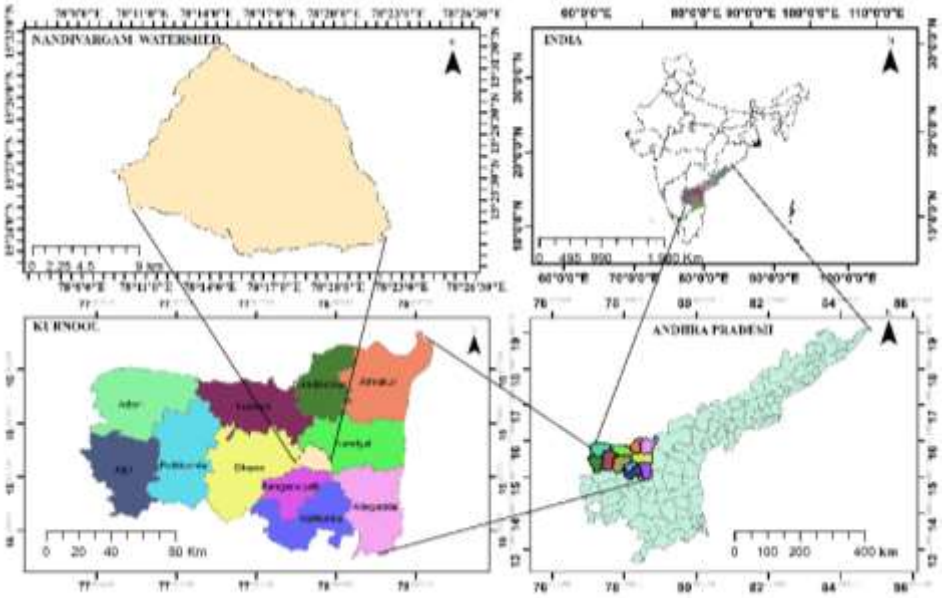

Figure 01: Location map of the study area of

The main objective of this research is to investigate the specific form of land degradation that has occurred within the designated study region. To investigate the changes in vegetation resulting from mining activities within the area, to evaluate the endeavours made by the inhabitants in restoring and reclaiming the mined areas, and to investigate additional modifications induced by mining activities on the physical environment.

III. Materials & Methodology

3.1 Annual soil loss estimation method

The source of organisation of data for study area shown in (Table -01) to estimate the soil erosion in the small- watershed

S.No.	Source	Map	Description

5	Satellite imagery -10m Sentinel – 2 LA2 Thematic	Land use / land cover (LULC)	LULC map was used for calculation of P-factor and C-factor

Table 1: Data collected to estimate soil erosion using from source.

3.2. The generation of RUSLE factors through the processing of data.

Data processing and generation of Revised Universal Soil Loss Equation (RUSLE) factors (Fig-02) were carried out using a combination of high-resolution (ASTER) Global Digital Elevation Model (GDEM) data with a 30 m resolution and various techniques for extracting topographic information of hydrological interest directly from the Digital Elevation Model (DEM). These techniques, based on established studies by [8], [12], [15], [13], encompassed the extraction of slope properties, catchment areas, drainage divides, and channel networks. To calculate the soil erodibility (K-factor), the FAO Digital Soil Map of the World (DSMW) was utilized. Rainfall data from the Indian Meteorological Department (IMD) were used to determine the rainfall erosivity (R-factor). Base map delineation of the watershed boundary and processing of Landsat-8 data enabled the acquisition of land use and land cover (LULC) information. The Survey of India (SOI) topographic maps at a scale of 1:50,000 were utilized for the georeferencing of satellite data, ensuring spatial alignment of the satellite imagery. The coverage of the image corresponded to an area of 240.03 Km^2. GIS software version 10.8 was employed for generating the digital coverage of input parameters required for the erosion model. The Revised Universal Soil Loss Equation (RUSLE) was applied to determine the soil loss of the watershed. Certain modifications were made to the parameter estimation process of the RUSLE

equation to better align with Indian conditions. The Revised Universal Soil Loss Equation (1) (RUSLE) is as follows:

$$A=R\times K\times LS\times C\times P \quad \text{---------- (1)}$$

Where, A is average annual soil loss ((t ha^{-1} yr^{-1}), R is the Rainfall and Runoff erosivity factor in MJ·mm·ha^{-1} ·h^{-1} ·y^{-1}, K is the soil Erodibility factor (t h $MJ^{-1}mm^{-1}$. LS is the Slope and Length of Slope Factor; C is the dimensionless Cropping Management (range between 0 and1) Factor; P is the supporting conservation practice factor (range between 0 and1).

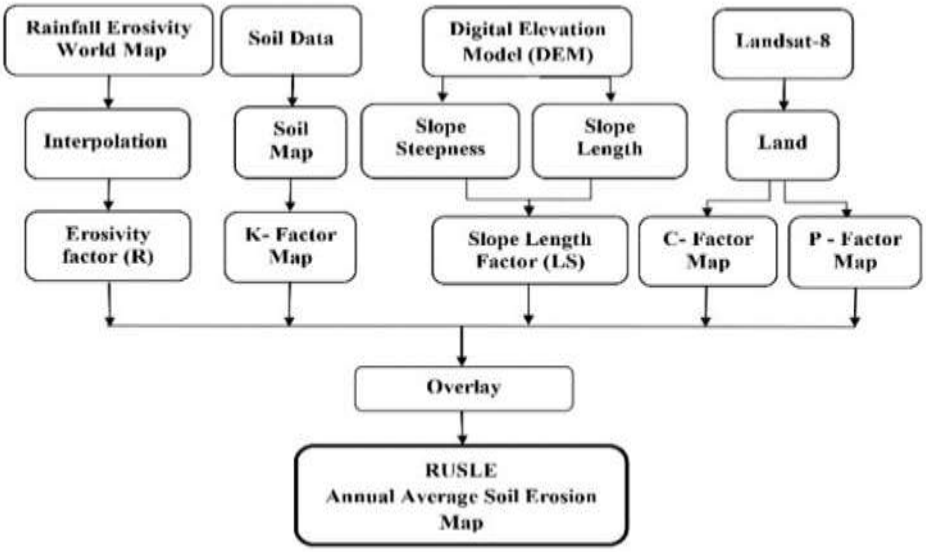

Figure 02: Factors for evaluating erosion in an incorporated integrated assessment framework.

3.2.1. Rainfall erosivity (R):

The rainfall factor, an index unit, is a measure of the erosive force of a specific rainfall. This is determined as a function of the volume, intensity and duration of rainfall and can be computed from a single storm, or a series of storms to include cumulative erosivity from any time period. Raindrop/splash erosion is the dominant type of erosion in barren soil surfaces. Rainfall data of 40 years (1982-2021) collected from Indian Meteorological Department (IMD) were used for calculating R-factor using the following relationship developed by [28] and modified by [3], this modified formula incorporates only annual and monthly precipitation data to calculate the R factor. The Global Rainfall Erosivity Database, named hereafter as GloRED a, contains erosivity values were used for calculating R-factor using the following relationship equation (2) provided below.

$$R = \sum_{i=1}^{12} 1.735 \times 10\,(1.5 \times log_{10}\left(\frac{p_i^2}{p}\right) - 0.08188\Big) \quad \text{---------- (2)}$$

Here R is the rainfall erosivity factor (MJ mm ha^{-1} h^{-1} yr^{-1}), P_i is the monthly rainfall (mm), and P is the annual rainfall (mm). For the present analysis, R-factor for the Nandivargam small-watershed was computed from available gridded rainfall data, because the watershed has no record of daily rainfall intensity. For assessing the spatial variability in rainfall, the ArcGIS software was utilized employing spatial interpolation techniques. While assessing the R-factor, it was found that, the variation of R-factor among the rain gauge stations were in the limit of ±3. To enhance the reliability of the R-factor

value, the spatial distribution of R was computed based on the available rainfall data. The average R value obtained from this calculation was then utilized for further analysis. The highest value (946.743 MJ mm ha^{-1} h^{-1} yr^{-1}) of R-factor was observed and the lowest value (758.87 MJ mm ha^{-1} h^{-1} yr^{-1}) (Fig-03). Factors for evaluating erosion in an incorporated integrated assessment framework.

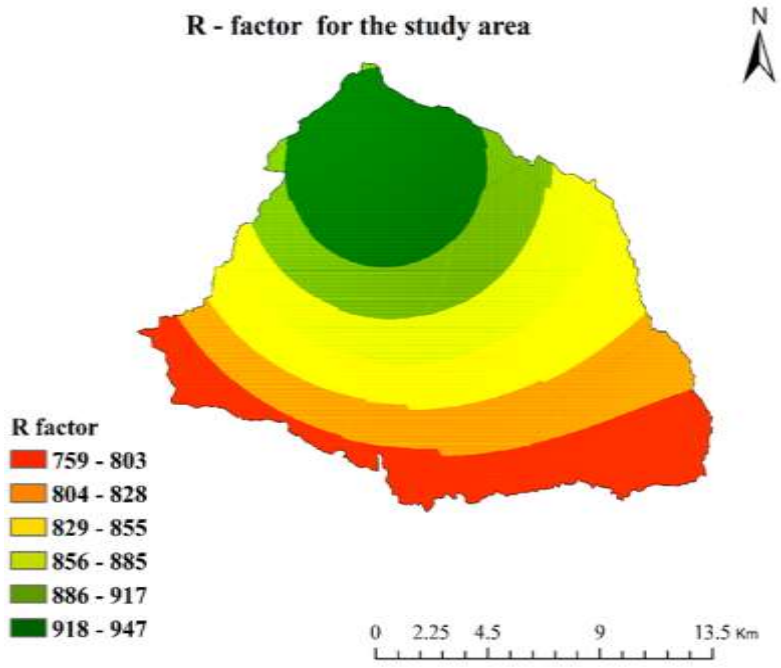

Figure 03: R - Factor for the study area (Rainfall erosivity)

3.4 Soil Erodibility Factor (K)

K is the soil erodibility factor is the average soil loss in tons/hectare for a particular soil in cultivated, continuous fallow with an arbitrarily selected slope length of 22.13 m and slope steepness of 9 %. K is a measure of the susceptibility of soil particles to detachment and transport by rainfall and runoff. Texture is the principal factor affecting K, but structure, organic matter and permeability also contribute [23]. The soil erodibility value typically falls within the range of 0 to 1, where 0 represents low sensitivity to erosion for a soil class, while 1 indicates a high susceptibility of the soil class to water erosion (Fig-04). The K factor value was derived by applying a formula adapted from existing published literature, with the FAO systematized digital soil map as follows [26]. The calculation of this factor is made as follows according to [27] equation (3–7).

$$K_{USLE} = K_W = F_{csand} \text{ X } F_{cl\text{-}si} \text{ X } F_{orgc} \text{ X } F_{hisand} \quad \text{----- (3)}$$

$$F_{csand} = \left(0.2 + 0.3 \times \exp\left[-0.256 \times m_s \times \left(1 - \frac{m_{silt}}{100}\right)\right]\right) \quad \text{----- (4)}$$

$$F_{cl-si} = \left(\frac{m_{silt}}{(m_c + m_{silt})}\right) \quad \text{----- (5)}$$

Industrial Engineering Journal
ISSN: 0970-2555
Volume : 52, Issue 7, No. 1, July : 2023

$$F_{orgc} = \left(1 - \frac{0.25 oegC}{orgC + \exp[3.72 - 2.95 \times orgC}\right) \quad \text{----- (6)}$$

$$\mathrm{F_{hisand}} = \left(1 - \frac{0.7 \times \left(1 - \frac{m_s}{100}\right)}{\left(1 - \frac{m_s}{100}\right) + exp[\,-5.51 + 22.9\left(1 - \frac{m_s}{100}\right)}\right) \quad \text{---- (7)}$$

FAO Digital Soil Map of the World (DSMW) in ESRI shape file format was utilized to create a K factor map. The estimated K values for the different textural groups range from 0.13 t hMJ^{-1} mm^{-1} for sandy clay loam to 0.14 t hMJ^{-1} mm^{-1} sandy clay soil.

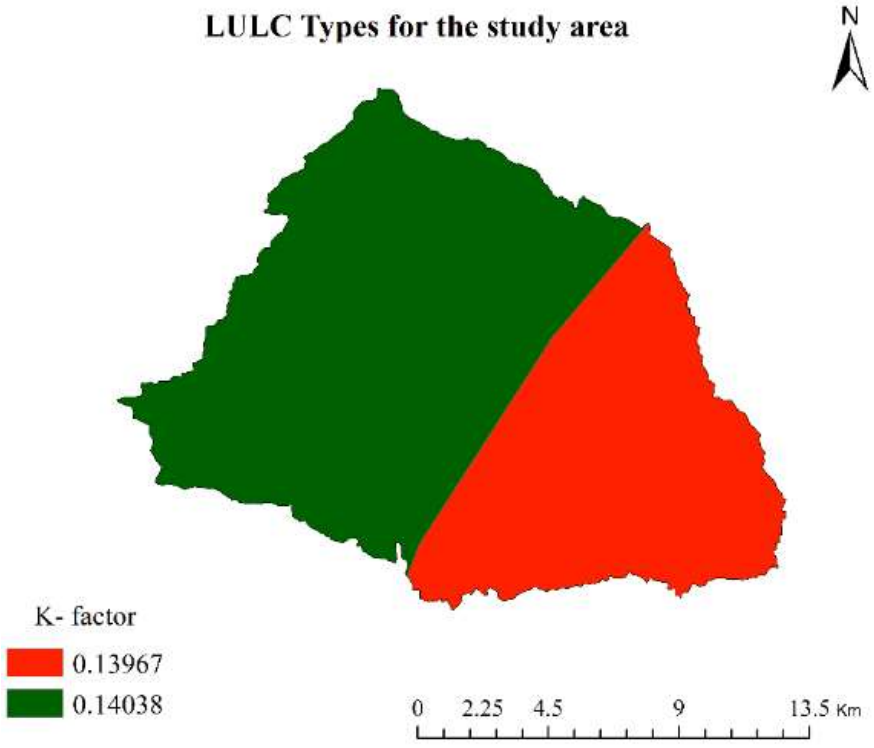

Figure 2: K – Factor for Study Area (Soil Erodibility)

3.5 Slope length and steepness factor (LS):

Slope Length and Steepness Factor (LS) LS-factor symbolizes the impact of slope length (L) and its steepness (S) on the soil erosion. The LS-factor in the Revised Universal Soil Loss Equation (RUSLE) represents the ratio of soil loss on a specific slope length and steepness to the overall soil loss [19], [25]. In this study, we used a digital elevation model (DEM) with 30 m resolution obtained from the Advanced Space borne Thermal Emission and Reflection Radiometer Global. Digital Elevation Model ASTER-GDEM was utilized within the ArcGIS 10.8, compute the LS-factor in the model maker. The LS-factor was calculated using equation (8) as follows:

$$\mathrm{LS} = \left[\frac{Flow\ accumulation \times Cell\ size}{22.13}\right]^{0.4} \times \left[\frac{(sinslope)}{0.0896}\right]^{1.3} \quad \text{----- (9)}$$

Industrial Engineering Journal
ISSN: 0970-2555
Volume : 52, Issue 7, No. 1, July : 2023

Where flow accumulation denotes the accumulated upslope contributing area for a given cell and was derived from DEM having cell size 30 m and sin slope is nothing but sin of slope angle in degrees. LS = combined slope length and slope steepness factor, cell size = size of grid cell (for this study 30 m) and sin slope = slope degree value in sin. The LS factor value in the study area varies from 0 to 155 (Fig-05). The Majority of the study area has LS value ranges between 0 and 15.2.

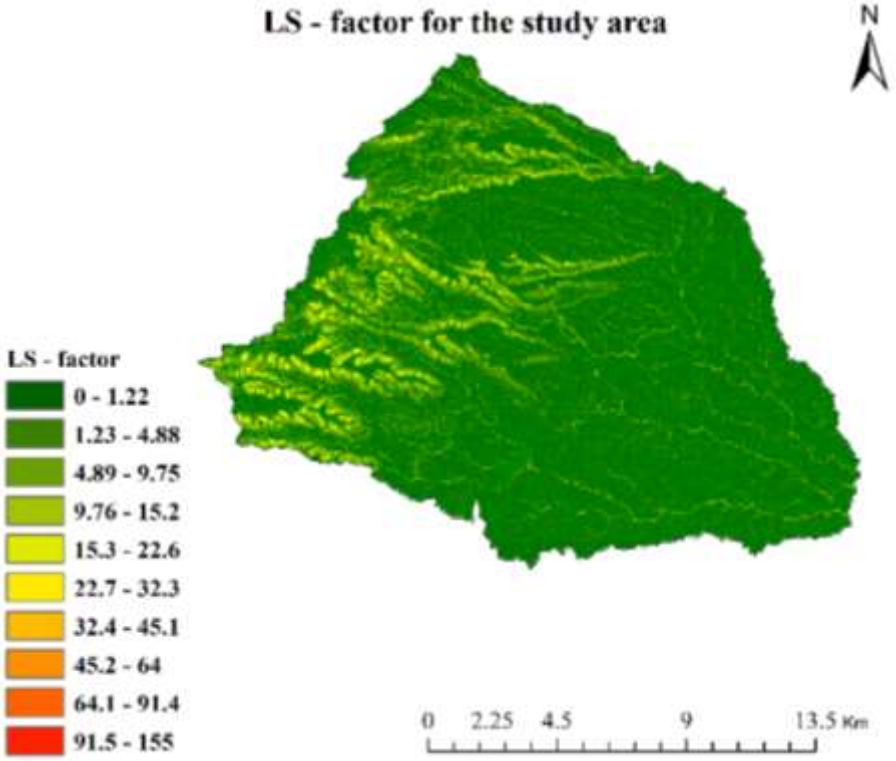

Figure 05: LS- Factor for the study area (Slope length)

3.6 Cropping Management Factor (C)

The C-factor is the most significant parameter for crop management but is not present for all Indian crops. Thus, C-factor founded [9], was used to estimate the rate of soil erosion in agricultural fields. The ground covered by vegetation canopy reduces the rate of soil erosion in the forested area. According to [6], crop cover is a potent tool for reducing the direct effect of rainfall on soil erosion, and he suggested that through the use of appropriate land reclamation techniques, bare land should be turned into agricultural land or a forest plantation. The values of the C-factor depend on seasonal changes as it varies with different parameters, such as crop types, rainfall, agriculture practice, etc. The C-factor was calculated based on the study area's LULC classification (Table-02). The overall accuracy of the classification Nandivargam watershed was classified into five LULC classes: built-up area, forest area, water body, agriculture lands, and land with and without scrubs, (Fig-06). Landsat 8 image was classified using supervised classification technique in GIS 10.8 software. The supervised classification technique requires ground truth information for each LULC.

Industrial Engineering Journal
ISSN: 0970-2555
Volume : 52, Issue 7, No. 1, July : 2023

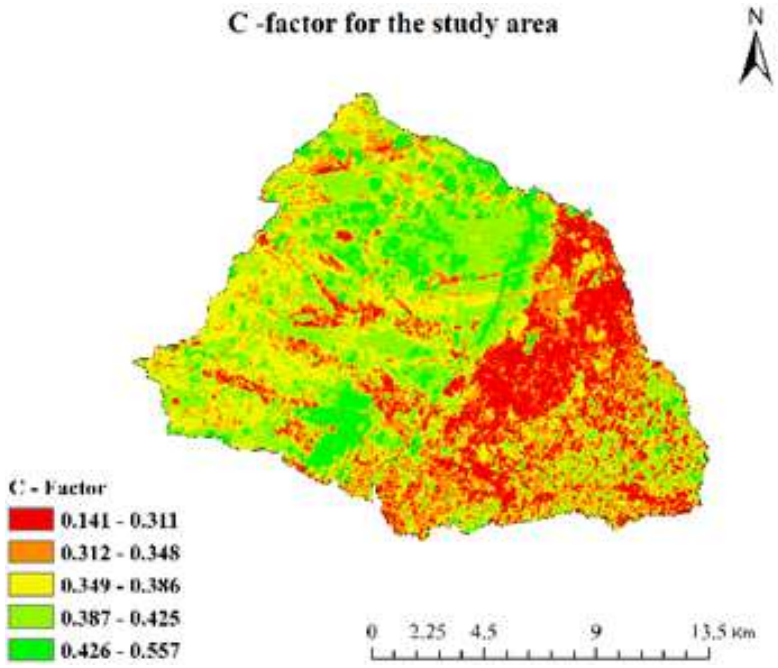

Figure 06: C- Factor for the study area

3.7 Conservation Practice Factor (P)

The P factor represents the ratio of soil loss with a specific support practice to the corresponding soil loss without support measures, specifically considering tillage practices on upslope and downslope areas [20].

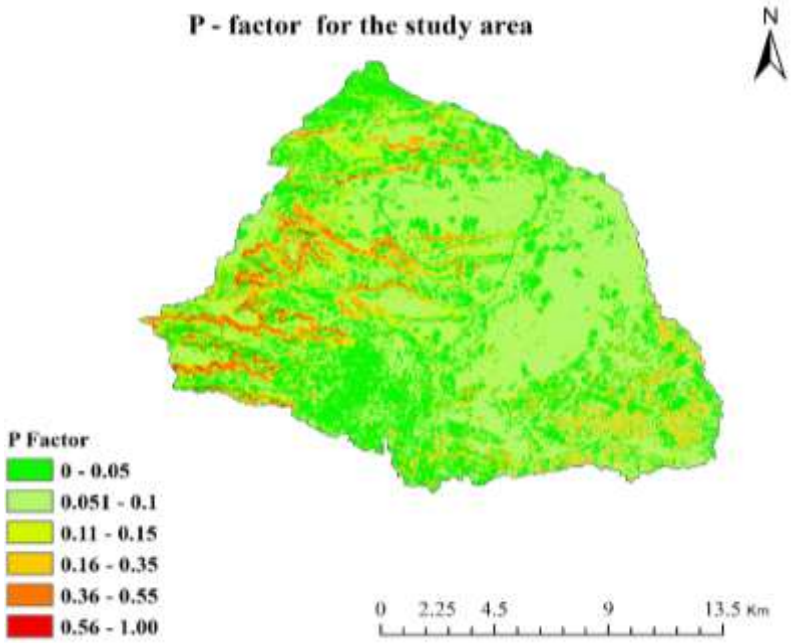

Figure 07: P- Factor for the study area (Conservation Practice)

Typically, the conservation practice factor adjusts the estimation of the Revised Universal Soil Loss Equation (RUSLE) to account for management and tillage practices that protect the soil from erosion. The P factor accounts for control practices that reduce the erosion potential of the runoff by their influence on drainage patterns, runoff concentration, runoff velocity, and hydraulic forces exerted by runoff on soil. The value of P factor ranges from 0 to 1, the value approaching to 0 indicates good conservation practice and the value approaching to 1 indicates poor conservation practice. In this study, the P factor map was generated based on land use/land cover and support factors. The values of the P factor range from 0.05 to 1, as depicted in (Fig-07). Higher values are assigned to areas where no conservation practices are implemented, while lower values correspond to built-up areas and plantations employing strip and contour cropping techniques.

4. Results and Discussion:

Average Annual Soil Loss the data layers (Maps) extracted for the R, K, LS, C, and P factors of the RUSLE model was performed using Equation (1) within the raster calculator option of the ArcGIS spatial analyst. This process allowed for the quantification, evaluation, and generation of maps depicting soil erosion risk and severity within the Nandivargam Small-watershed. The estimated (A) values obtained indicate the rate of sediment yield, with higher values representing a higher rate and lower values indicating a lower rate. Based on the analysis, the Nandivargam small-watershed was classified into five soil erosion risk categories, as shown in (Fig-08). The distribution and proportion of soil erosion risk classes are presented in (Table 3). The minimum and maximum soil losses were found to be approximately 31.17 $t \cdot ha^{-1} \cdot y^{-1}$ and 3974.7 $t \cdot ha^{-1} \cdot y^{-1}$, respectively. Approximately 94.11% (226.544 km^2) of the watershed falls within the range of 0 $t \cdot ha^{-1} \cdot y^{-1}$ and 31.17 $t \cdot ha^{-1} \cdot y^{-1}$, indicating varying degrees of soil erosion within the study area. The results presented in show that about 94.11% of the study area is classified as medium potential erosion risk (31.17t h^{-1} y^{-1}) erosion risk levels. The spatial pattern of classified soil erosion risk zones indicates that the areas with high and severe erosion risk are located (Table-04).

Table 3. Classification of soil loss of sub - watershed according to area of Nandivargam

Soil Loss ($t \cdot ha^{-1} \cdot y^{-1}$)	**Area (km^2)**	**Area (%)**
0 - 31.17	226.54	94.11
31.18 - 124.7	9.008	3.74
124.71 - 249.39	4.149	1.72
249.4 - 405.26	0.090	0.038
> 405.27	0.002	0.02
Total	**240.72**	**100**

Table 4. Classification of erosion risk

Erosion Rick Class	Soil loss ($t.ha^{-1}.y^{-1}$)
Medium	0-31.12
High	31.18-124.70
Very High	124.71 - 249.39
Very High	249.4 - 405.26
Very High	>405.27

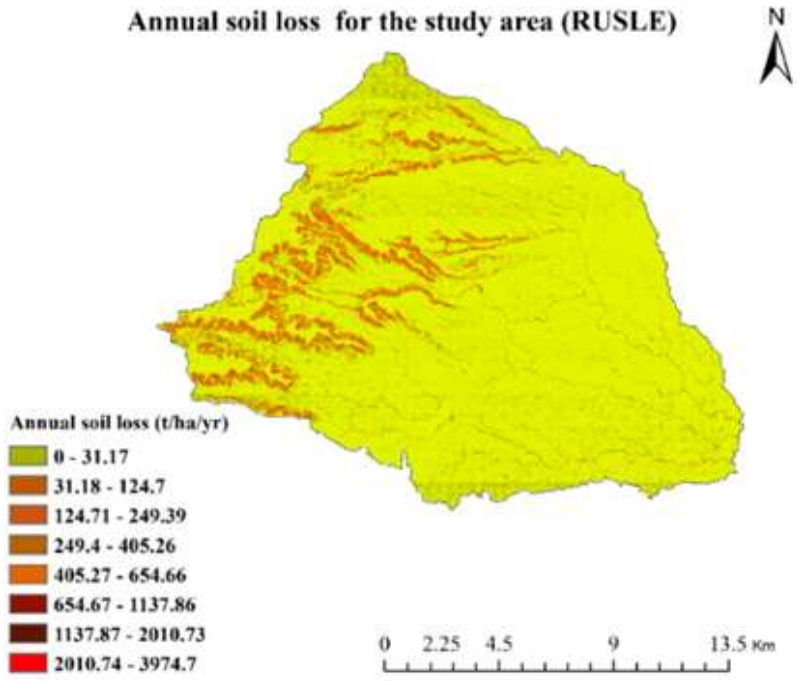

Figure 08: Soil erosion

5. Conclusion:

This study successfully utilized the Revised Universal Soil Loss Equation (RUSLE) and GIS to assess soil erosion in the Nandivargam small-watershed. Key factors driving erosion were identified as steep slopes, slope morphology, soil erodibility, and plant cover. Rainfall and runoff played significant roles in soil detachment and erosion. To mitigate soil loss and restore the watershed's functionality, comprehensive measures are required. GIS effectively managed and analyzed land degradation data, providing a comprehensive understanding of erosion processes. Medium land degradation affected 94.11% (226.54 km^2) of the study area due to rainfall, while mining activities degraded 5.89% (14.18 km^2). Mining led to land disturbance, pits, overburden dumps, altered drainage, and waterway obstruction. Deforestation, gully erosion, and drainage alteration were observed, reflecting the community's response to economic expansion and environmental challenges. This highlights the interconnectedness between human activities and soil degradation, emphasizing the importance of sustainable land management. The study demonstrates the effectiveness of GIS in simulating and mapping soil erosion, supporting decision-making and erosion control strategies. To address soil

erosion in the Nandivargam small-watershed, the following measures are recommended: prioritize soil conservation in erosion-prone areas through measures like terraces, contour plowing, and vegetative strategies such as cover crops and grass strips; improve plant cover through reforestation, afforestation, and sustainable agricultural practices; encourage responsible mining techniques that minimize land disturbance, ensure proper waste disposal, and rehabilitate mined areas; implement effective water management practices, including drainage systems, retention ponds, and sedimentation prevention measures; conduct educational programs, workshops, and outreach activities to raise awareness and involve communities in soil conservation; establish a monitoring system to assess the effectiveness of measures and track changes in soil erosion patterns; foster collaboration among government agencies, local communities, researchers, and NGOs to achieve coordinated erosion control efforts.

AN EXPERIMENTAL INVESTIGATION ON POLYPROPYLENE FIBER REINFORCED CONCRETE BY PARTIAL REPLACEMENT OF CEMENT WITH ALCCOFINE

Vadde Venkata Harish[1], Dr. D. V. Prasada Rao[2]

PG Student, Department of Civil Engineering, Sri Venkateswara University College of Engineering, Tirupati, India[1]

Professor, Department of Civil Engineering, Sri Venkateswara University College of Engineering, Tirupati, India[2]

ABSTRACT: *In this experimental investigation an attempt was made to study the feasibility and effectiveness of integrating Alccofine as a supplementary material in Polypropylene Fiber Reinforced Concrete of grade M25. Various concrete mixes with Alccofine substitution (5%, 10%, and 15%) were examined to determine the optimal percentage. The addition of Polypropylene fibers to concrete at 0.1%, 0.2%, 0.3%, and 0.4% by weight of concrete were prepared to determine the optimum dosage of Polypropylene fibres in concrete which is replaced with optimum Alccofine percentage. These fibers help control cracking from plastic and drying shrinkage, reduce concrete permeability, and enhance impact strength. Addition of Polypropylene fibres transforms the material from brittle to ductile. The study includes determination of compressive strength, split tensile strength, flexural strength and impact characteristics. The findings reveal that a combination of 10% Alccofine substitution along with 0.3% Polypropylene fibers leads to notable enhancement 45.3%, 35.6%, 16.67%, and 191% in compressive, split tensile, flexural, and impact strength, respectively, compared to control concrete. Based on the results it can be concluded that the combination of 10% Alccofine and 0.3% Polypropylene fibers in concrete significantly improves both the strength properties and impact strength of the concrete in comparison to control concrete.*

Keywords: ***Polypropylene Fiber Reinforced concrete, Alccofine, impact characteristics, impact strength***

1. Introduction

The modern construction constantly evolves to meet the demands of sustainable development and enhanced performance. Conventional concrete compositions often rely heavily on Portland cement, a material associated with significant carbon emissions during its production. To address environmental concerns and improve concrete properties, innovative solutions such as Alccofine as partial replacement for cement offers multifaceted benefits. By reducing the cement content, these materials help lower carbon emissions associated with concrete production, aligning with sustainability objectives. Moreover, to enhance the mechanical properties and Impact characteristics of concrete, resulting in structures that exhibit superior performance and longevity. Polypropylene fibers, derived from a thermoplastic polymer, is increasingly recognized for its ability to enhance the impact strength of concrete. When dispersed within the concrete matrix, these fibers act as reinforcement, improving tensile strength, crack resistance, and Impact characteristics. Additionally, Polypropylene fibers mitigate plastic shrinkage cracking and improve Impact strength, making them invaluable in various construction applications. Alccofine, a supplementary cementitious material, offers a sustainable alternative to conventional cement. Produced from finely ground aluminosilicate materials, Alccofine possesses pozzolanic properties that react with calcium hydroxide forming additional calcium silicate hydrate (C-S-H) gel. This reaction not only contributes to the densification of the concrete matrix but also enhances long-term strength of the concrete. Furthermore, Alccofine reduces the heat of hydration and mitigates alkali-silica reaction, thus improving the overall sustainability and performance of concrete structures. In this investigation the effects of incorporating Polypropylene fibers and Alccofine

in concrete. The research highlights the impact of these materials on concrete properties and their role in advancing sustainable construction practice.

2. Objectives

The main objective of the present experimental investigation is to obtain the influence of the combined application of Alccofine and Polypropylene fiber on various strength properties and impact characteristics of M25 grade concrete. It consists of following:

I. To find the optimum percentage of partial replacement of cement with Alccofine and.

II. To prepare Fiber Reinforced Concrete with addition of Polypropylene fibres at 0.1%, 0.2%, 0.3%, and 0.4% by weight of concrete to determine the optimum dosage of Polypropylene fibres in concrete which is replaced by optimum percentage of Alccofine.

3. Materials

The following materials were used in the experimental investigation:

3.1 Cement

The cement used in this experimental investigation is OPC 53 grade conforming to IS:269-2015. The specific gravity of the cement is 3.14.

3.2 Alccofine - 1203

Alccofine - 1203 is a specially processed product based on high glass content with high reactivity obtained through the process of controlled granulation. The raw materials are composed primary of low calcium silicates. The processing with other select ingredients results in controlled particle size distribution. Alccofine-1203 is a new generation, micro fine material of particle size much finer than materials like cement, fly ash, silica etc. Alccofine-1203 has unique characteristics to enhance performance of concrete in fresh and hardened stages due to its optimized particle size distribution. which is being manufactured in India. The chemical properties of Alccofine-1203 are shown in Table 1.

Table 1 Chemical Properties of Alccofine - 1203

S. No.	Chemical compound	Value
1	Alumina as Al_2O_3, % by mass	22.4
2	Silicon dioxide as SiO_2, % by mass	35.1
3	Magnesium Oxide as MgO, % by mass	6.1
4	Total Sulphur as SO_3, % by mass	0.15
5	CaO, % by mass	33.1

3.3 Fine Aggregate

Locally available river sand confirming to IS 383-2016 specifications was used as the fine aggregate in the concrete. Fine aggregate is an accumulation of grains of mineral matter derived from the disintegration of rocks. The physical properties of Fine aggregate are shown in Table 2.

Table 2 Physical properties of Fine aggregate

S. No.	PROPERTIES	VALUES
1	Specific gravity	2.55
2	Fineness modulus	3.79
3	Water absorption (%)	0.9
4	Dry Rodded Unit Weight(kg/m^3)	1486

3.4 Coarse Aggregate

Coarse aggregate of nominal size 20 mm, obtained from the local quarry confirming to IS 383 -2016 specifications were used. Proportion of coarse aggregate was used 20mm (60%) and 12.5mm (40%). Machine crushed granite broken stone angular in shape was used as coarse aggregate. The maximum size of coarse aggregate was 20 mm. The properties of coarse aggregate are shown in Table 3.

Table 3 Properties of coarse aggregate 20mm and 12mm

S. No.	PROPERTIES	20mm size of aggregate	12mm size of aggregate
1	Bulk density	1.50	1.45
2	Specific gravity	2.66	2.68
3	Apparent Specific gravity	2.63	2.65
4	Water Absorption	0.32%	0.35%
5	Impact value	15.51	15.57

3.5 Polypropylene Fibre

In this Project Polypropylene fibres used are available with brand name as FIBERCRETE. FIBERCRETE MF is a Synthetic monofilament fiber for concrete reinforcement that complies with standard specification for Fiber Reinforced Concrete and Shotcrete, and is specifically designed to help mitigate the formation of shrinkage cracking in concrete. The properties of Polypropylene fibers are given in Table 4.

Table 4 Properties of Polypropylene Fiber

Specification	Value
Material	100% Virgin Polypropylene
Specific gravity	0.91
Diameter / thickness	20 Microns
Fiber length	36mm
Aspect ratio	>300
Tensile strength	1000 MPa
Youngs modulus	4GPa
Water absorption	Nil

3.6 Water

In this experimental investigation tap water is used for both concrete mixing and curing purposes.

4. Experimental Program

4.1 Concrete Mix Design

Bureau of Indian standards recommended a set of procedures for design of concrete mix mainly based on the work done in national laboratories. The mix design procedures are covered in IS10262-2019. Their methods can be applied for both medium and high strength concrete.

4.2 Mix Proportioning for Concrete of M25 Grade:

Cement : 325 kg/m^3

Water : 163 liters

Fine aggregate : 699 kg

Coarse aggregate : 1179 kg

Water – cement ratio : 0.50

In the present experimental investigation, initially M25 grade controlled concrete mix was prepared using cement. Then the cement has been replaced by Alccofine at 5%, 10% and 15%. To find the optimum percentage of Alccofine as mentioned in the Table 5.

Table 5 percentage replacement of alccofine with cement

Mix ID / Materials	AL0	AL5	AL10	AL15
Cement %	100	95	90	85
Alccofine %	-	5	10	15

There after addition of Polypropylene fibers by weight of concrete in varying percentages of 0.1%, 0.2%, 0.3% and 0.4% (termed as PF0.1, PF0.2, PF0.3 and PF0.4 respectively) which is replaced by optimum percentage Alccofine.

4.3 Impact Characteristics

Impact Characteristics of concrete is assessed usually by the ability of a concrete specimen to withstand repeated blows and to absorb energy. Impact strength of Portland cement concrete (PCC) is an essential property in various applications of PCC, such as industrial floors, hydraulic structures, and explosion-proof structures.

Impact strength: Resistance to sudden shock or load.

4.3.1 Drop-Weight Impact Strength Test

This test yields the number of blows necessary to cause prescribed levels of distress in the test specimen. This number serves as a qualitative estimate of the energy absorbed by the specimen at the levels of distress specified. The test can be used to compare the relative merits of different fibre-concrete mixtures and to demonstrate the improved performance of FRC compared to conventional concrete. It can also be adapted to show the relative impact resistance of different material thicknesses.

4.3.1.1 Equipment

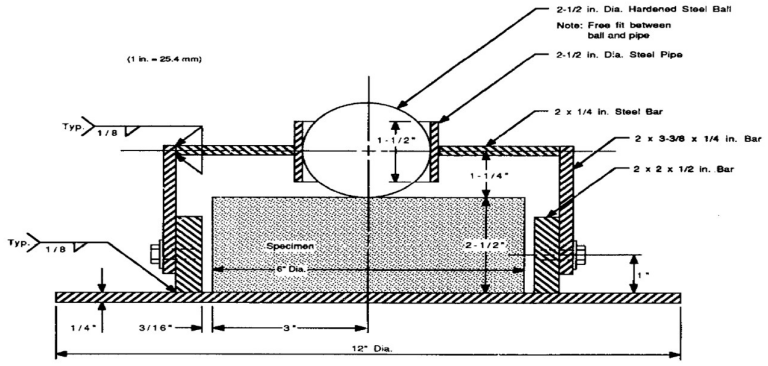

Fig.1 schematical diagram of the drop weight impact test on concrete.

Referring to Fig. 1 the equipment for the drop-weight impact test consists of:

1. A standard, manually operated 10 lb (4.54 kg) compaction hammer with an 18-in. (457-mm) drop (ASTM),
2. A 21/2 in. (63.5 mm) diameter hardened steel ball,
3. A flat baseplate with positioning bracket similar to that shown in fig.1

In addition to this equipment, a mold to cast 6 in. (152 mm) diameter by 21/2 in. (63.5 mm) thick [±1/8 in., ± (3 mm)] concrete specimens are needed. This can be accomplished by using standard ASTM C 31 or C 470 molds or the concrete test specimens can be cut of 64mm from a cylindrical mold oh height 300mm as shown in fig. 2.

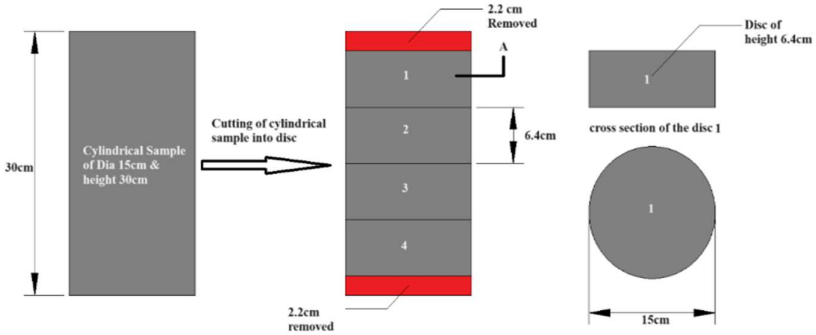

Fig.2 Cutting Process of Cylindrical Disc From Whole Cylindrical Specimen

4.3.1.2 Procedure

The 21/2 in. (63.5 mm) thick by 6 in. (152 mm) diameter concrete samples are made in molds according to procedures recommended for compressive cylinders but using only one layer. The molds can be filled partially to the 21/2 in. (63.5 mm) depth and float finished, or they can be sawn from full-size cylinders to yield a specimen size of the proper thickness. Specimens cut from full-size cylinders are preferred. If fibres longer than 0.80 in. (20 mm) are used, the test specimen should be cut from a full-size cylinder to minimize preferential fiber alignment. Specimens should be tested at 7, 28, and (if desired) 90 days of age. Curing and handling of the specimens should be similar to that used for compressive cylinders. Accelerated curing is not desirable. The thickness of the specimens should be recorded to the nearest 1/16 in. (1.5 mm).

The positioning bracket is then bolted in place, and the hardened steel ball is placed on top of the specimen within the bracket. Foamed elastomer pieces are placed between the specimen and positioning

lugs to restrict movement of the specimen during testing to the first visible crack. The drop hammer is placed with its base upon the steel ball and held there with just enough down pressure to keep it from bouncing off the ball during the test. The baseplate should be bolted to a rigid base, such as a concrete floor or cast concrete block. An automated system with a counter may also be used. The hammer is dropped repeatedly, and the number of blows required to cause the first visible crack on the top and to cause ultimate failure are both recorded.

5. Results and Discussion

5.1 Compressive Strength

The cube compressive strength of concrete at 3 days, 7 days and 28 days for different mixes are mentioned in Table 6. The development of compressive strength with their age for different mixes was plotted as shown in Fig.3 From the results obtained, the maximum cube compressive strength of 53.81 MPa was observed in AL10PF0.3 mix. Which is the optimal combination of both Alccofine and Polypropylene fibers, results in significant increases of 45.3% in compressive strength compared to control concrete.

Table 6 Compressive Strength of all mixes

Age / Concrete mix	3 days strength (MPa)	7 days strength (MPa)	28 days strength (MPa)
AL0	24.4	29.57	37.03
AL5	29.38	34.97	41.08
AL10	29.88	38.99	50.04
AL15	27.69	38.58	46.45
AL10PF0.1	31.54	39.87	51.68
AL10PF0.2	33.68	41.96	53.45
AL10PF0.3	35.92	43.71	53.81
AL10PF0.4	32.17	41.08	52.71

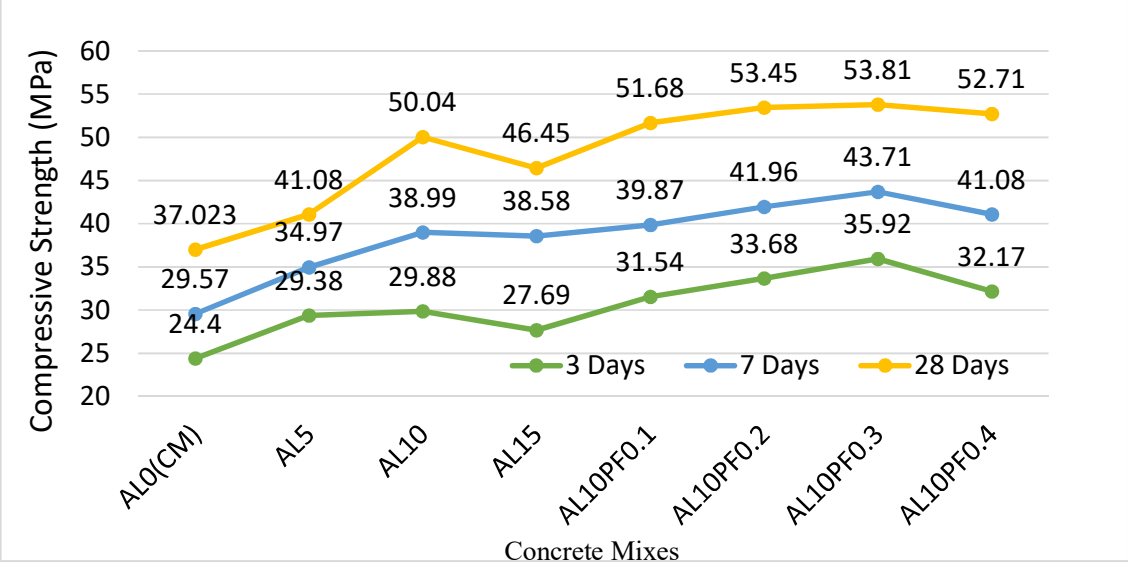

Fig. 3 Variation of Compressive Strength of Various Mix Proportions

5.2 Split Tensile Strength

The Split Tensile Strength of concrete at 28 days for different replacement and addition fibres for different mixes was plotted as shown in Fig.4. The maximum cylinder split tensile strength of 3.39 MPa was observed in AL10PF0.3 mix. Which is the optimal combination of both Alccofine and Polypropylene fibers, results in significant increases of 35.6% in split tensile strength compared to control concrete.

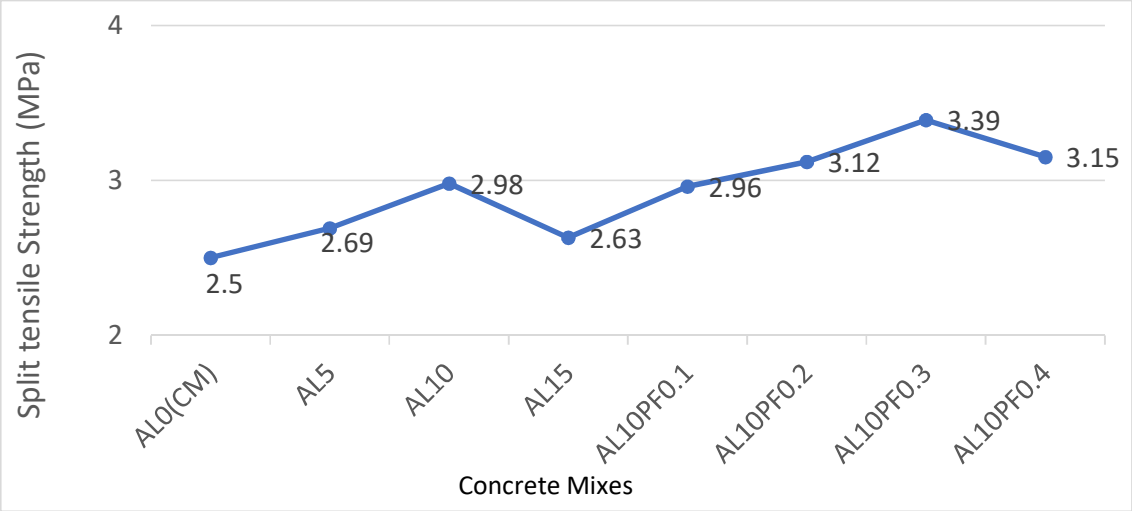

Fig.4 Variation of Split Tensile Strength of Concrete with Various Mix Proportions

5.3 Flexural Strength

The development of flexural strength at 28 days for different mixes was plotted as shown in Fig.5. The maximum flexural strength of 6.79 MPa was observed in AL10PF0.3 mix. Which is the optimal combination of both Alccofine and Polypropylene fibers, results in significant increases of 16.67% in flexural strength compared to control concrete.

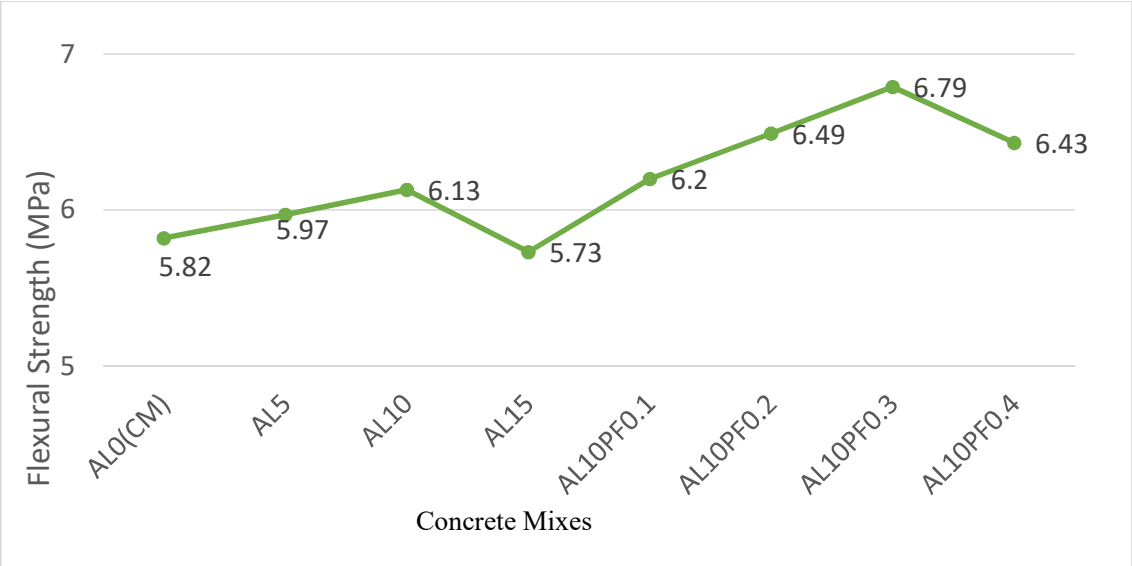

Fig. 5 Variation of Flexural Strength of Concrete with Various Mix Proportions

5.4 Impact Strength

For each mixture and 28 days curing condition, 3 discs were cut from whole cylinder and tested for the drop-weight impact load. The number of blows required for the appearance of the first crack and for the final failure was determined in the tests.

5.4.1 Impact test on control mix concrete AL0

Table 7 no. of blows taken by the concrete specimen of control mix concrete

Sample	Sample 1	Sample 2	Sample 3	Average
No. of blows	112	118	105	112

5.4.2 10% replacement of cement with Alccofine AL10

Table 8 no. of blows taken by the concrete specimen of 10% replacement of cement with Alccofine

Sample	Sample 1	Sample 2	Sample 3	Average
No. of blows	142	138	141	141

5.4.3 Impact test on concrete containing 0.3% Polypropylene fibers & 10% replacement of cement with Alccofine AL10PF0.3

Table 9 no. of blows taken by the concrete specimen containing 0.3% Polypropylene fibers & 10% replacement of cement with Alccofine

Sample	Sample 1	Sample 2	Sample 3	Average
No. of blows for 1st visible crack	290	338	274	301
No. of blows for failure of sample	311	366	306	327

5.4.4 Crack Pattren

It is very important to understand the characteristics of cracks of Polypropylene fiber reinforced concrete under impact loads for practical applications. Base on the test results, it can be concluded that the formation of a common type of radial crack pattern, initiated from the point of impact and extend toward outer periphery of the test specimens. These cracks form due to the development of tensile stress caused by the impact force. Radial cracks of brittle nature were observed in case of control concrete which possess low tensile/flexural strength. Additionally, spalling of concrete of the test specimens was also observed which indicates the detachment of fragments of concrete from the point of impact. It can also be observed that the radial cracks propagate very fast, leading to failure with very less number of blows after initiation of cracks in control concrete as shown in Fig. 6.

But, in case of Polypropylene fibre reinforced concrete specimen prepared with 0.3% Polypropylene fibers and 10% replacement of cement with Alccofines absorbs higher number of blows and absorb more impact energy before failure after the initiation of radial crack as shown in Fig. 7. This can be

attributed to the Polypropylene fibre reinforced concrete with enhanced resistance to crack propagation and failure compared to the control concrete specimen.

Fig. 6 Failure of AL0 (control concrete) specimens **Fig.7 Failure of AL10PF0.3 specimens**

5.4.5 Impact Energy (J)

The impact resistance of the specimen was determined after 28 days. The impact energy delivered to the specimen is calculated by Energy absorbed = NMgh

where,

N - number of blows
M - mass of the drop hammer (kg) = 4.5 kg
g - gravity acceleration (m/s2) = 9.81
h - height of drop hammer = 0.457 m

Table 10 impact energy absorbed by the various mixes

Type of concrete mix	Avg. No of blows for failure of specimen	Avg. Total energy absorbed by the concrete specimen Joule (KJ)
Control mix concrete	112	2.2
10% replacement of cement with Alccofine	141	2.8
Addition of 0.3% of Polypropylene fibers & 10% replacement of cement with Alccofine	327	6.6

It is observed that the addition of Polypropylene fibers significantly increases the absorption of impact energy. The optimal combination, Alccofine and Polypropylene fibers, results in significant increases of 191% in impact strength compared to control concrete.

6. Conclusions

The Conclusions from the present research work are summarized below:

1. This study explores enhancing the strength properties of M25 grade concrete with Polypropylene fibers and Alccofine as partial cement replacement.
2. Addition of Polypropylene fibers enhances its impact strength.

3. A 10% replacement of cement with Alccofine improves the compressive, split tensile, flexural, and impact strengths by 35%, 19.2%, 5.3%, and 25%, respectively, compared to the control concrete.
4. Addition of 0.3% Polypropylene fibers along with the 10% Alccofine cement concrete further improves compressive, split tensile, flexural, and impact strengths with increases of 7.5%, 13.7%, 10.7%, and 131%, respectively.
5. The optimal combination, Alccofine and Polypropylene fibers, results in significant increases of 45.3%, 35.6%, 16.67%, and 191% in compressive, split tensile, flexural, and impact strengths compared to control concrete.
6. Polypropylene fibers delay crack initiation and propagation, enhancing impact energy absorption.
7. Alccofine proves effective as a supplementary material, enhancing both mechanical properties and impact characteristics of Polypropylene fiber concrete.

Overall, this research demonstrates the potential of Alccofine as a sustainable additive in Polypropylene fiber concrete.

An Experimental Investigation on Glass Fiber Concrete by Partial Replacement of Cement with Alccofine

B.Girinath Naik[1], Dr. D. V. Prasada Rao[2]

PG Student, Department of Civil Engineering, Sri Venkateswara University College of Engineering, Tirupati, India[1]

Professor, Department of Civil Engineering, Sri Venkateswara University College of Engineering, Tirupati, India[2]

Abstract: Concrete is the most widely used construction material due to its strength, durability, and versatility. However, the production of cement, which is a key component of concrete, is a major contributor to greenhouse gas emission. The use of supplementary Cementitious materials (SCMs) can improve the properties of concrete, reduce use on natural resources and CO_2 emissions. The present study is directed to investigate the effect of Alccofine-1203 (AL) as partial replacement of cement on Glass Fibers (GF) reinforced M30 grade concrete. Different types of concrete mixes were prepared by replacing cement with Alccofine-1203 of 5%, 10% and 15%, respectively, then it is found to be the optimum percentage of replacement of cement with Alccofine-1203 is 10%. Further, the effect of Alccofine and Glass Fiber with different combinations, such as, 10%AL+0.1%GF, 10%AL+0.2%GF, and 10%AL+0.3%GF was also carried out. Based on the test results of Mechanical properties of concrete the optimum dosage is found to be 10% AL and 0.2% GF.

Keywords: Alccofine-1203, Glass fibre, Compressive strength, Split tensile strength, Flexural strength, Modulus of Elasticity .

1. INTRODUCTION

Cement is the most prevalent kind of concrete binder. At present sustainable development of the cement and concrete industry requires the utilization of industrial and agricultural by-products. At present, for a variety of reasons, the concrete construction industry is not sustainable. It consumes huge quantities of virgin materials and the principal binder in concrete is Portland cement, the production of which is a major contributor to greenhouse gas emissions that are implicated in global warming and climate change. So, finding a solution to substitute for part of the cement seems to be desirable for sustainable development. In the present investigation applications ofAlccofine-1203 as partial replacement of Cement for the Glass fibers reinforced concrete is adopted.

OBJECTIVES

The main objective of the present experimental investigation is to obtain the influence of Alccofine-1203 and Glass fibre on various Mechanical properties of M30 grade concrete.

It consists of following:

- To find out optimum replacement percentage of Alccofine-1203 .
- To determine the mechanical properties such as Compressive Strength, Split Tensile Strength, Flexural Strength and Modulus of elasticity of concrete prepared using alccofine-1203 and Glass fibers and to compare with conventional concrete.

2. MATERIALS

In this experimental investigation the following materials are used

2.1 Cement:

Ordinary Portland Cement (OPC) of 53 grade confirming to IS 12269:2013 was used. The specific gravity is 3.15

2.2 Alccofine-1203:

Alccofine-1203 is a micro fine substance with a much finer particle size than other hydraulic materials developed in India, such as cement and fly ash. Alccofine-1203 is a specifically processed product made from slag with a high glass content and high reactivity achieved through the controlled granulation process. Alccofine-1203 is well-known for its capacity to improve the strength and durability of concrete, as well as minimize permeability and improve the workability of fresh concrete. The chemical properties of Alccofine-1203 as given in Table 1.

Table1:Chemical Properties of Alccofine-1203

Chemical contents	Values
CaO%	>30
SiO_2%	>30
Al_2O_3%	>20

2.3Fine Aggregate:

As per IS: 383, the river sand is conforming to Zone-I and was used as the fine aggregate in the concrete. The physical properties of Fine aggregate as given Table 2.

Table2:Properties of Fine Aggregate

S. No	Property	Value
1	Fineness modulus	2.94
2	Specific Gravity	2.50
3	Zone	I
4	Water Absorption	0.90%

2.4 Coarse aggregate:

Coarse aggregate obtained from local quarry has been used for this study, conforming to IS: 383 is used. Coarse aggregate used is of 12 mm and 20 mm size. The physical properties of Coarse aggregate are shown in Table3.

Table 3: Physical Properties of Coarse Aggregate

S. No.	Property	Value (20 mm)	Value (12 mm)
1	Fineness Modulus	7.12	6.9
2	Specific Gravity	2.65	2.81
3	Water Absorption	0.45%	0.65%

2.5 Chemical Admixture:

Polycarboxylate ether (PCE) based superplasticizers confirming IS 9001-1999(2007) with a specific gravity of 1.06 was used to get the workable concrete.

2.6 Glass Fibre:

Glass fiber is a material consisting of numerous extremely fine fibers of glass. It is formed when thin strands of silica-based or other formulation fibers of smaller diameter. It is widely accepted within the concrete industry that traditional concrete mixes are prone to plastic shrinkage during the setting phase and this can often lead to cracking. The addition of relatively small amounts of these glass fibers as reinforcement can effectively reduce this problem by controlling this early-age plastic shrinkage cracking. The Physical and Chemical properties of Glass fiber are given Table 4 and Table 5 respectively.

Table 4: Physical Properties of Glass Fiber

Properties	Values
Density	910 kg/m^3
Length	12mm
Diameter	20 microns
Aspect ratio	600
Modulus of Elasticity	72GPa
Tensile strength	1000 N/mm^2

Table 5 :Chemical Properties of Glass Fibers

Composition	Values(%)
SiO_2	65
Al_2O_3	25
MgO	10

2.7 Water:

Concrete is typically made with potable water. Water should be free of acids, oils, alkalis, vegetables, and other organic impurities. This experimental project locally available potable water for mixing and curing.

3. CONCRETE MIX DESIGN:

In the present experimental investigation M30 grade of concrete was designed in accordance with the Indian Standard code of practice IS 10262:2019. The concrete mix proportion is 1: 2.15: 3.5. with water-cement ratio as 0.45 and 330 kg of cement per 1m^3. The dosage of super plasticizer is 3.0 lit/m^3.

4. EXPERIMENTAL INVESTIGATION

4.1 Compressive Strength:

To assess the compressive strength of Concrete, test specimens of size 150 mm × 150 mm ×150mm were used. Testing of samples was carried out at 3,7 and 28 days with the help of a compressive testing machine (CTM) of 3000kN capacity as per IS 516:1959 as shown Fig 1a.

4.2Split Tensile Strength:

To assess the split tensile strength of Concrete, test specimens of size 150 mm diameter and 300 mm length were used. Testing of samples was carried out at 28 days with the help of compressive testing machine as per IS 5816:1999 as shown in Fig. 1b.

4.3 Flexural Strength:

To assess the Flexural strength of concrete, beam specimens of size 100 mm x 100 mm x 500 mm were used. Testing of samples at the age of 28 days as per IS 516:1991 as shown in Fig. 1c.

4.4 Modulus of Elasticity:

To find the Modulus of Elasticity of concrete, cylinders of size 150 mm diameter and 300 mm height were cast for each type of mix and tests were conducted on the specimens at the age of 28 days as per IS 516:1991 as shown in Fig. 1d. The load was applied gradually and the deformation was noted at regular intervals of loading. Stress and Strain curve was drawn and then the modulus of elasticity of concrete was determined.

Fig. 1a Compression test, 1b. Split tensile, 1c. Flexure test, 1d. Modulus of Elasticity

5 . RESULTS

5.1 Compressive strength :

Fig.2 shows the variation of compressive strength of different types of concrete mixes at 3, 7, and 28 days of curing. At 28 days of curing, 10%AL+0.2%GF concrete mix exhibits the compressive strength of 47.45 MPa. It can be observed that compressive strength of 10%AL+0.2%GF concrete mix is increased by 20% compared to the control concrete mix.

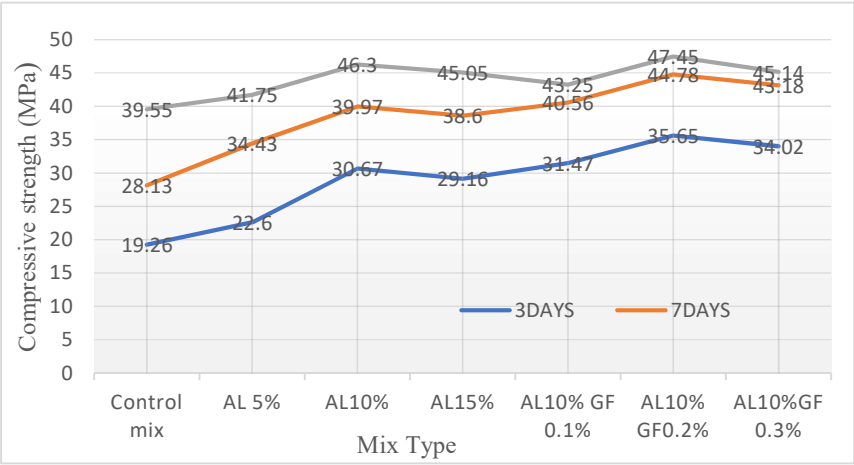

Fig.2:Variation of 3,7 and 28 Days Compressive Strength of Glass fibre Concrete using Alccofine

5.2 Split tensile strength :

Fig.3 shows the variation of split tensile strength of different mix proportions at 28 days of curing. It can be observed that the 10%AL+0.2%GF concrete mix exhibits the split tensile strength of 3.0 MPa. The split tensile strength of AL10%+GF0.2% mix is increased by 22.5% compared to the control concrete mix.

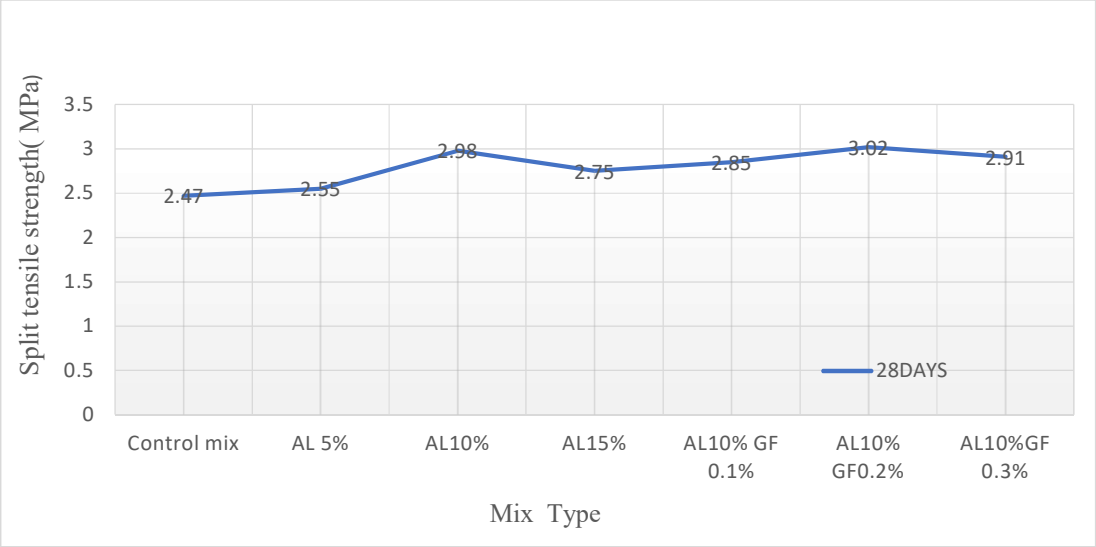

Fig.3:Variation of Split tensile strength of Glass fibre Concrete using Alccofine

5.3 Flexural strength :

Fig.4 shows the variation of flexural strength of different mix proportions at 28 days of curing. At 28 days of curing, 10%AL+0.2%GF concrete mix exhibits the flexural strength of 6.95MPa. It can be observed that Flexural strength of 10%AL+0.2%GF concrete mix is increased by 19.82% compared to the control concrete mix.

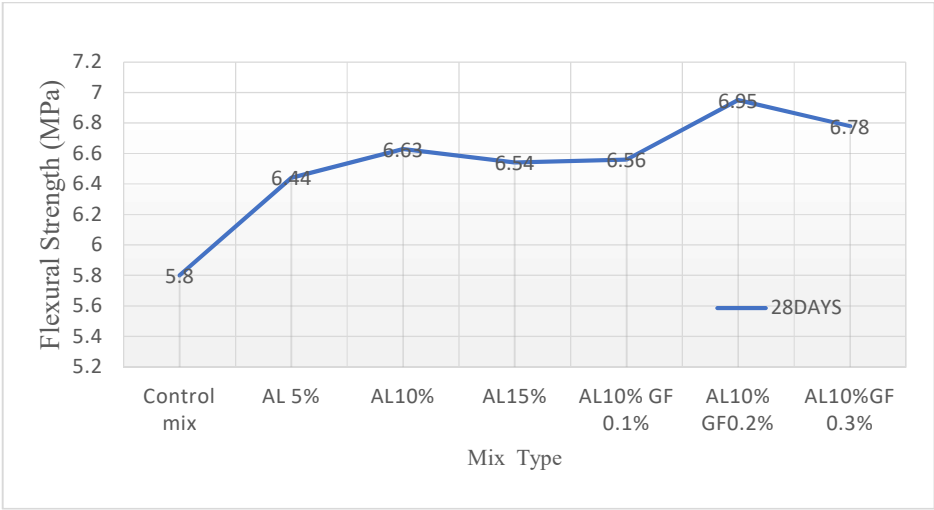

Fig.4:Variation of Flexural Strength of Glass Fibre Concrete using Alccofine

5.4 Modulus of Elasticity:

Fig.5 shows the variation of modulus of elasticity of different mix proportions at 28 days of curing. At 28 days of curing, 10%AL+0.2% GF concrete mix exhibits the modulus of elasticity of 40.34 GPa. It can be observed that Modulus of elasticity of 10%AL+0.2%GF concrete mix is increased by 37.2% compared to the control concrete mix.

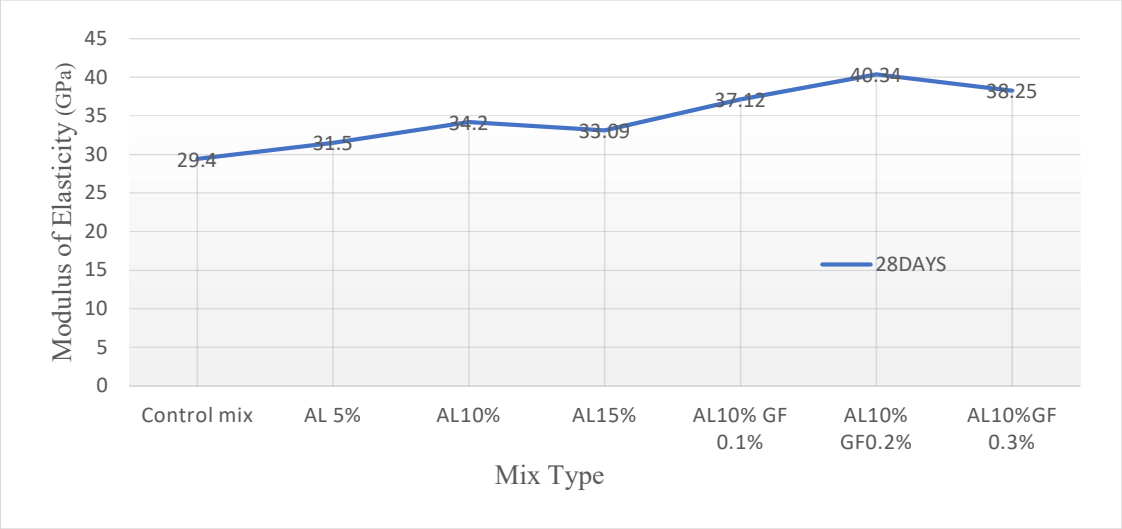

Fig.5: Variation of Modulus of Elasticity of Glass Fibre Concrete using Alccofine

6. CONCLUSIONS

In this experimental investigation, different types of concrete mixes prepared using Alccofine and Glass Fibres were considered and strength characteristics such as compressive strength, flexural strength, split tensile strength and modulus of elasticity were determined. The following are the conclusions based on the test results:

1. The compressive strength of M30 grade 0.2 % Glass Fiber concrete with replacement cement by 10% Alccofine is 47.5 MPa which is 20% more than the control concrete.

2. The Split tensile strength of M30 grade 0.2 % Glass Fiber concrete with replacement cement by 10% Alccofine is 3.0 MPa which is 22.3% more than the control concrete.

3. The flexural strength of M30 grade 0.2 % Glass Fiber concrete with replacement cement by 10% Alccofine is 6.95 MPa which is 20% more than the control concrete.

4. The percentage of increase in modulus of elasticity of M30 grade 0.2 % Glass Fiber concrete with replacement cement by 10% Alccofine is 40.34 MPa which is 37% more than the control concrete.

Based on the results of the experimental investigation, it can be concluded that the improved strength properties of M30 grade concrete is obtained with a combination of 10% replacement of cement with Alccofine and 0.2 % Glass Fibers and can be recommended for structural applications.

Abstract
The primary goal of the present research is to look into the rheological, mechanical as well as microstructural characteristics of flyash based self-compacting geopolymer concrete (SCGPC) comprised of the combination of fly ash and ground-granulated slag from blast furnaces (GGBS), that is cured at room temperature. GGBS is incorporated together with flyash from 0 to 50% with intervals of 10% binder concentration to make GGBS blended SCGPC. The rheological properties of GGBS blended SCGPC mixes which include slump flow, T_{50cm} slump flow, L-Box, and V-funnel are evaluated for various mixes in accordance with the EFNARC guidelines. For various GGBS blended SCGPC mixtures, mechanical characteristics such compressive strength test, split tensile strength test, and flexural strength test are also evaluated. The replacement of GGBS is optimised in accordance with the findings of mechanical and rheological characteristics. In compliance with the EFNARC guidelines, the outcomes revealed that each of the GGBS blended SCGPC mixes satisfied the fresh properties requirements, and that when GGBS was replaced with 40% of the binder, the resulting strength properties was superior to that of other GGBS blended SCGPC mixes. This article also discusses how X-ray diffraction (XRD), scanning electron microscopy (SEM) with EDAX, and Fourier Transform Infrared Spectroscopy (FTIR) techniques were carried out in order to assess the structural, morphological also mechanical characteristics of the SCGPCs. Findings show that replacement of GGBS enabled a greater degree of geopolymerization, which in turn caused the geopolymer matrix to become denser and enhance the attributes of GGBS blended SCGPC when compared to Flyash based control SCGPC.

1 Introduction

Concrete, which has become essential in the construction sector, is mostly made of cement [1]. Making cement emits greenhouse gases onto the earth's atmosphere [2]. Cement production harms the environment because it is a major source of greenhouse gases entering the atmosphere [3]. The production of one tonne of cement (OPC) results in the release of an equal amount of carbon dioxide into the atmosphere, which accounts for roughly between five and seven percent of the global emissions of carbon dioxide (CO_2) [4]. Because of the alarming situation, There was a critical need for the cement manufacturing industry to decrease emissions of carbon dioxide (CO_2) [5]. To combat global warming, many researchers have concentrated their research to replace cement with cementitious materials. Davidovits created Geopolymers, in which cement was entirely replaced by industrial by-products [6, 7]. Geopolymers are produced by polymerizing an alkaline solution with a silicon- and aluminum-based primary material, which has the same chemical makeup as zeolites but a different kind of internal structure [8]. For the production of alumina and silica-based binders, Green Geopolymers uses binders made from inexpensive ingredients or byproducts of certain industries which include fly ash, GGBS and

metakaolin [9]. These raw materials react with alkali-activating solvents to form a tri-alumino-silicate chain. Compounds like sodium aluminosilicate and calcium silicate hydrate are also formed during this geopolymerization which enhances mechanical characteristics, while sodium silicate hydrate creates a tetrahedral network with SiO_4 and AlO_4 [10, 11]. A shift from amorphous to semi-crystalline structures occurs as a result of a complicated chemical reaction involving binders and activators [12]. According to reports, the entire process is accelerated by curing at an elevated temperature [13, 14]. Fly ash is a type of industrial waste produced when thermal coal is burned in electricity-generating facilities [15]. Fly ash can lower carbon dioxide emissions in geopolymer concrete by a proportion of 25–45% as a result of the utilization of the combustion of coal waste [16, 17]. The majority of the byproduct material for GGBS comes from iron manufacturing facilities. CaO, MgO, SiO_2, and Al_2O_3 are all present in GGBS, a granular substance. During the activation of GGBS, the main reaction result is gel composed of calcium silicate hydrate (C-S–H gel) [18], This results in the development of adequate strength regardless of ambient curing conditions [19]. GGBS and fly ash have been extensively utilized as SCMs for research purposes due to their benefits to the mechanical characteristics of GPC, the environment, and the economy as a whole [20, 21]. The formwork must be compacted and filled with fresh concrete by trained personnel. To obtain a homogenous mixture without voids (honeycomb), The main goal of this compaction is to release the trapped air in freshly laid concrete. Normally, when being poured and consolidated at the construction location, normal vibrating concrete couldn't be capable demonstrate the appropriate fresh and toughened characteristics. In freshly mixed concrete, proper compaction requires skilled labour. One approach to resolving this problem is to use self-compacting concrete (SCC) [22, 23]. Self-compacted concrete (SCC) is an improved form of concrete owing to its own weight and can be entirely consolidated into frameworks corners. The main objective of SCC development is to achieve the best compaction and to make it easier to place concrete in crowded areas and small apertures [24–26]. The primary features of SCC is its mobility, fill and passage without any indication of separation and bleeding. Flyash based SCGPC is a pioneering concept in the building sector. As can be seen in Fig. 1, it is an upgraded form of concrete which combines all the advantages from both geopolymer concrete as well as SCC [27–29].

For instance, Flyash prolongs the time needed for the mix to set while GGBS slows down FA's development of strength. As a result, an investigation has been carried out on the control samples consisting of 100% flyash and blended mixes with FA replaced with GGBS at various percentages to a maximum of 50%. In this study, FA and GGBS will be combined in different amounts in order to produce GGBS blended SCGPC and analyse the synergistic effects of this combination. Initially, rheological and mechanical properties were assessed. Later, Microstructural experiments involving

XRD, SEM, and FTIR were conducted to investigate the structural and morphologies of the flyash based control SCGPC and GGBS blended SCGPC.

2 Materials

2.1 Flyash

In this study, flyash produced by the Rayalaseema Thermal Power Generating Station (RTTP) in Kadapa, India, and compliant with Indian Standard IS: 3812:2003 [30] was used. Its widespread availability causes disposal issues in many nations, necessitating the utilization of flyash in concrete with the objective to lower the amount of CO_2 in the atmosphere. In the creation of GGBS blended SCGPC, the present study replaces cement with Class F flyash. The physical and chemical attributes of the flyash employed in the current investigation can be found Table 1. The results demonstrate that the fly ash contains silicate glass with a significant silica concentration and considerable levels of the crystalline phases quartz, mullite, and magnetite. It may be used to create SCGPC due to its SiO_2 and Al_2O_3 composition. The XRD analysis was employed to identify the crystalline phase and composition of flyash, as illustrated in Fig. 2. In the Fig. 3a SEM micrograph was used to determine the morphological characteristics of Flyash.

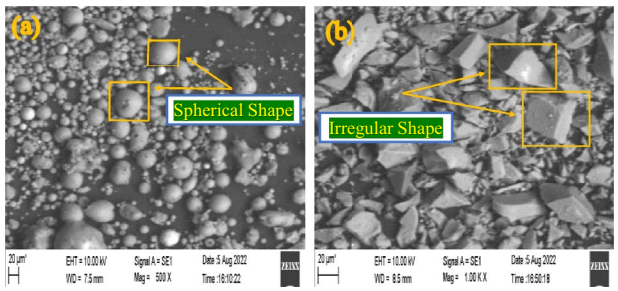

Fig. 3 SEM micrographs of **a** Flyash, **b** GGBS

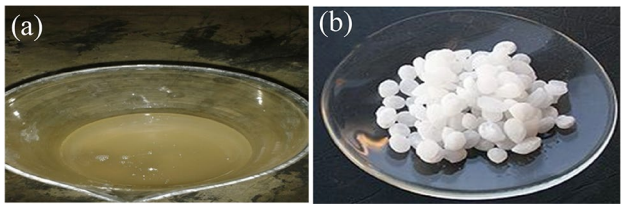

Fig. 4 **a** Sodium silicate, **b** Sodium hydroxide

2.2 GGBS

The by-product of the steel and iron processing sectors is known as GGBS. GGBS would be off-white and have better cementitious properties than other fillers. The supplier of GGBS was JSW Steel Ltd. in Bellary, Karnataka, India. It is referred to as ASTM C 989 and has high silicate and alumina content to improve the material's properties. The physical and chemical characteristics of the GGBFS provided by JSW Steel Ltd. are displayed in Table 1. As seen in Fig. 2 The crystalline structure and phase of the GGBS were determined using the XRD approach. The morphological characteristics of GGBS were determined by capturing micrographs using SEM, as illustrated in Fig. 3b.

2.3 Alkaline activator

In the current experiment, Sodium-based activators were used to produce alkaline activators, including sodium hydroxide (NaOH) and sodium silicate (Na_2SiO_3) solutions from a dealer of the chemical manufacturer Astrra Chemicals in Chennai as shown in Fig. 4. while maintaining a 2:1 ratio of Na_2SiO_3 to NaOH. To lessen the amount

of heat that is generated throughout the blending process, the prepared alkaline fluid is left for twenty-four hours to settle as well as cool.

2.4 Aggregates

All of these GGBS blended SCGPC mixtures in the present study included a fine aggregate consisting of naturally existing river sand collected from the Tungabhadra Riverbank as well as coarse aggregate with an average size of approximately 12.5 mm as shown in Fig. 5. Using the findings of a sieve examination, it was discovered that the coarse and fine aggregates looked to have specific gravities of 2.64 and 2.60, respectively, and that they complied with IS: 383–1970 [31, 32]. Local suppliers provided the fine and coarse aggregates.

2.5 Super plasticizer

In the current investigation, a superplasticizer from the Master Glenium series was used. It's an admixture made of polycarboxylic ether. This was intended to develop the characteristics of recently laid, extremely efficient concrete. It works effectively with any kind of cement since it doesn't include chlorides or alkalis. A superplasticizer is used to enhance the workability and fluidity of GGBS mixed SCGPC blends without reducing the final product's strength and durability. According to IS 9103:1999 [33], its relative density is roughly 1.09.

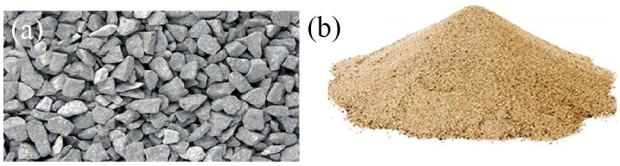

Fig. 5 **a** Coarse aggregate, **b** Fine aggregate

3 Mix proportioning

Six SCGPC blends with GGBS were created by raising the GGBS from 0 to 50%. Liquid to binder ratio was maintained at 0.45, and the total quantity of binder was maintained at 496.55 kg/m^3. In line with the mass of the binder, a superplasticizer (S.P.) with a dosage of 2% and additional water content was used can be seen in Table 2.

3.1 Blending, casting process and curing

Flyash, GGBS and aggregates were all the dry components of the flyash based SCGPC that were mixed together for two to three minutes in a pan mixer. Then, to create alkali activator fluid, the mixture's liquid component, consisting of NaOH and Na_2SiO_3 solution, is combined in a ratio of 1:2 (by weight). In order to complete the perfect blending of GGBS blended SCGPC, Super Plasticizer and Water were provided. For an additional two to three minutes, let these materials mix together. Before being placed onto the moulds, the freshly poured concrete was tested for its rheological characteristics. Before testing, each sample is kept at 27 °C, or room temperature.

3.2 Experimental program

3.2.1 Rheological properties

The rheological characteristics of the GGBS blended SCGPC blends were evaluated utilising slump flow, T_{50cm} slump flow, L-box, and V-funnel experiments. To ascertain the freshly poured concrete's capability for filling, a slump flow experiment was performed. The filling capacity of the mix was determined by timing how long it took the mix to reach a 50 cm diameter employing the T_{50cm} slump flow test. To ascertain if concrete could survive the reinforcing, the L-box test was performed. The vertical section (H_1) and horizontal component's (H_2) leading ends' concrete heights are taken into account for the L-box examination. The V-funnel

Table 2 Mix Proportions of GGBS blended SCGPC

Mix designation	Fly ash (Kg/m^3)	GGBS (Kg/m^3)	C.A (Kg/m^3)	F.A (Kg/m3)	NaOH (Kg/m^3)	Na_2SiO_3 (Kg/m^3)	SP (%)	Extra water added (%)

50FAG50	248.2	248.2	924	756	74.5	148.9	2	12

experiment was used to gauge the concrete's consistency and filling capacity. Each experiment was conducted in conformity with the guidelines provided by the EFNARC [34].

3.2.2 Mechanical properties

For mechanical characteristics of the GGBS blended SCGPC blends, compressive strength was assessed at 3, 7, and 28 days. Splitting tensile strength and strength in flexural were evaluated after 28 days. Three 150 mm × 150 mm × 150 mm cubes are utilised for the compression strength test in line with IS 516 (1959), and three 500 mm × 150 mm prisms and three 150 mm × 300 mm cylinders were employed for the splitting tensile and flexural strength examinations in compliance with IS 5816 (1999) and IS 516 (1959) standards, respectively [35, 36].

3.2.3 Micro Structural Studies

3.2.3.1 XRD analysis The method that is most frequently employed is X-ray diffraction analysis (XRD), which utilises diffraction patterns to identify the phases and structures of compounds present in a material. By using XRD analysis, the various mineral phases and compounds existing in both the source materials and hardened SCGPC samples were detected. Only the optimal hardened concrete samples (100FAG0and 60FAG40) were pulverised using an agate mortar and sieved using an IS 75-micron sieve prior to examination because the raw materials were already in powder form. Using the fifth-generation Rigaku Miniflex 600 and the programme X'Pert High Score Plus, the test and phase identification were carried out.

3.2.3.2 SEM Analysis For improved visibility and image clarity, several polishing cloths and papers were used to polish the broken GGBS blended SCGPC samples. The samples were then given a final polish with diamond polish before being coated with platinum. For this analysis, an EVO MA18 with Oxford EDS(X-act) was used. This piece of equipment is capable of operating from 100 V and 30 kV especially offers a resolution range of 1–4 nm.

3.2.3.3 FTIR Analysis Employing a Perkin Elmer Spectrometer 2000 in transmission mode having an operating frequency range about 4000 cm-1 to 400 cm-1 and a resolution of 4 cm-1, Fourier infrared spectroscopy analysis (FTIR) was utilised to detect the various functional groups of the developed GGBS blended SCGPC samples. The samples were assessed using pellets of potassium bromide (KBr).

4 Results and Discussion

4.1 Fresh SCGPC properties

Due to qualities including ability to pass, ability to fill, and ability to resist segregation, fresh SCGPC is a very workable concrete. Four tests—Slump flow, T_{50cm} Slump flow, V funnel test, U-box and L-box were performed in order to determine the qualities of fresh SCGPC [34]. Table 3 displays the test outcomes for the newly poured GGBS blended SCGPC characteristics.

4.2 Compressive strength

When evaluating the performance as well as the quality of almost any type of concrete, compressive strength is a key characteristic. Figure 6 illustrates the compressive strengths of the GGBS blended SCGPC samples after 7, 14, and 28 days. In the Fig. 6, The graph illustrates how the compressive strength rises as the percentage of GGBS rises. In comparison to the mixes without GGBS, the GGBS blended SCGPC composites with 10, 20, 30, 40, and 50% GGBS of the total binder, respectively, had compressive strengths that were 21, 33, 53, 65, and 49% higher at 28 days. This increase is in line with the prior research investigation [37]. This rise in strength is attributable to the synthesis of Calcium Alumino Silicate Hydrate gel (C-A-S–H gel) along with Sodium Alumino Silicate Hydrate gel (N-A-S–H gel), that increased the microstructure's compactness [38, 39]. The compressive strength graph demonstrates that mix with 40% GGBS, it increases from 35. 79 MPa at three days and then increases up to52.6 MPa at28 days of curing. This outcome

Table 3 Rheological Properties of GGBS blended SCGPC mixes

S.No	Mix designation	Slump flow (mm)	T_{50cm} slump flow (sec)	V-funnel (sec)	U-box (mm)	L-box (H_2/H_1)
Efnarc guidelines		650–800	2–5	6–12	0–30	0.80–1.0
1	100FAG0	720	3.06	7.9	10	0.89
2	90FAG10	700	3.20	8.1	14	0.91
3	80FAG20	695	3.50	8.4	18	0.93
4	70FAG30	690	3.80	9.4	20	0.94
5	60FAG40	685	3.98	9.8	22	0.95
6	50FAG50	680	4.23	10.3	25	0.97

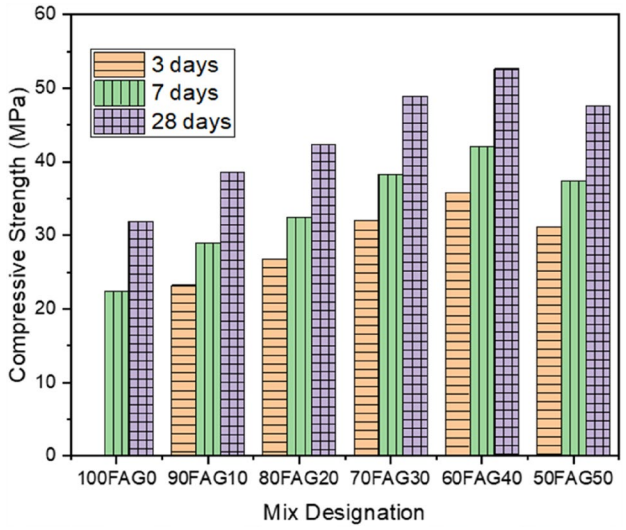

Fig. 6 Compressive strength of SCGPC mixes

is in line with the previous research investigation already in existence [40].

4.3 Split tensile strength

At 28 days, Fig. 7 depicts the outcomes of the splitting tensile strength tests conducted on the GGBS blended SCGPC. The splitting tensile strength of the GGBS blended SCGPC is shown in this graph to be directly proportional to the percentage of GGBS replacement up to 40%. The improvement in splitting tensile strength of GGBS-blend SCGPC mix over flyash-based control SCGPC is roughly 20, 27, 40, 58 and 50% for mixtures of replacement of 10, 20, 30, 40, and 50%, respectively. The outcomes of the splitting tensile assessment support the performance of the compressive strength assessment outcomes.

4.4 Flexure strength test

The outcomes of the flexural strength evaluation for the GGBS blended SCGPC after 28 days after casting are depicted in Fig. 8. The flexural strength of the GGBS blended SCGPC rises as the percentage of GGBS does, as this graph clearly shows. In comparison with the flyash-based control SCGPC mix (100FAG0), the flexural strength of GGBS blended SCGPC mixes of 10, 20, 30, 40, and 50% increased by roughly 16.36, 34.52, 40.47, and 48.21%, respectively. The behaviour of the compressive strength outcomes is enhanced by using the results of the flexural strength evaluation.

4.5 XRD analysis

By using XRD analysis, the mineralogical properties of fly-ash based control SCGPC (100FAG0) and GGBS blended SCGPC incorporated with 40% of GGBS (60FAG40) were inspected after 28 days of healing. Figure 9 displays the XRD pattern. Aluminosilicate substances with an amorphous structure are the primary polymerization products produced in geopolymer (N-A-S–H and C-A-S–H). Thus, a wide amorphous hump of aluminosilicate ($2\Theta = 25°–32°$) and a low crystalline C-S–H gel make up the majority of the 60FAG40 XRD pattern. In fly ash, It is also observed that only the glassy components will react and hence the primary crystalline peak found is quartz (SiO_2) and mullite ($3Al_2O_3$-SiO_2) [41]. Fly ash's reactive glassy fraction and

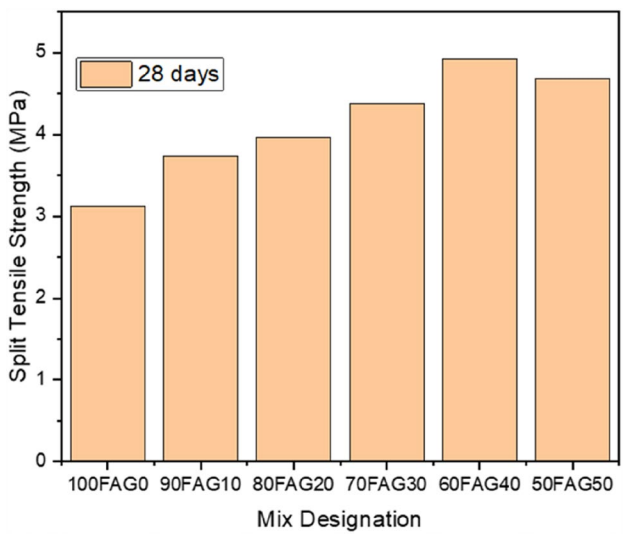

Fig. 7 Splitting tensile strength of SCGPC mixes

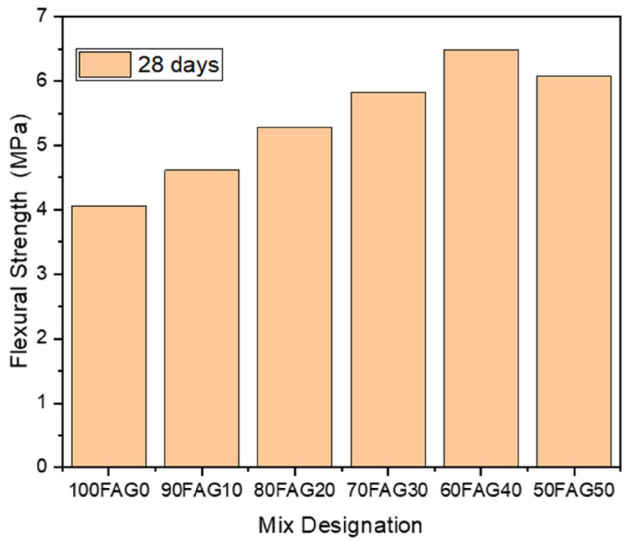

Fig. 8 Flexure strength of SCGPC mixes

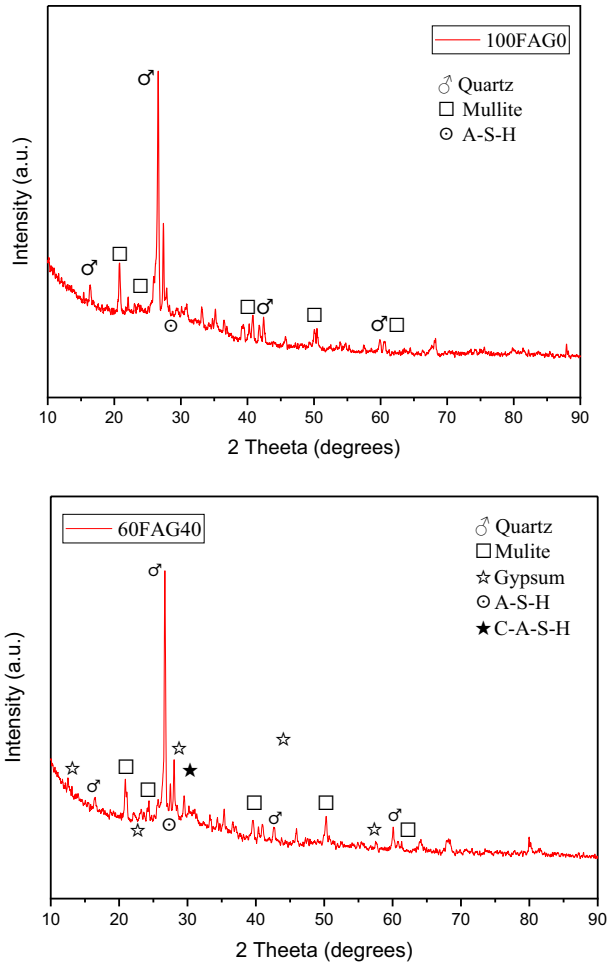

Fig. 9 XRD analysis of SCGPC samples

GGBS reacted to form reaction products that ranged from amorphous to imperfectly crystalline phases. It is crucial to note that only reactive glass participates in geopolymerization, while the fly ash's glass content also includes refractory glass. A wide and dispersed background peak with maximum of around 10° is produced by the hydrotalcite (Mg_6A_{l2}-$CO_3OH_{16}4H_2O$) short-range order which increases C-(N)-A-S–H gel polymerization and a reduction in the available Al element [42, 43].Each sample that included GGBS had detectable peaks at 30° and 50° that belonged to the A-S–H and C-S–H gels. It needs to be noticed that the Peak crystalline phase's intensity reduces as the GGBS increases [44].

4.6 SEM with EDS

Figure 10 displays the SEM images of the control flyash based SCGPC (100FAG0) and the GGBS blended SCGPC with 40% GGBS replacements (60FAG40). The images shown here clearly demonstrate that the mixture of 60% FA and 40% GGBS has a denser microstructure, a matrix that has almost completely reacted, and some cenosphere and plerosphere FA particles that have not yet completely reacted. According to a report, the unreacted particles in the combination did not function as filler but instead gradually increased the matrix's strength alternatively.This is in line with the compression outcomes and the prior literature-reported outcomes [45]. An aluminosilicate gel (N-A-S–H) gets formed when alkali-activation was applied to flyash based control SCGPC (100FAG0). On the other hand, the Calcium ions from GGBS take the place of sodium ions in GGBS mixed SCGPC (60FAG40) with a high pH (> 12), causing C-A-S–H or C-S–H to precipitate till the calcium ions have been used up. Thus, N-A-S–H, C-S–H, and C-A-S–H were identified within the GGBS blended SCGPC (60FAG40) sample [46].The reason why the fly ash particles in Fig. 10 have needle-like shapes is most likely due to the mixture's high activator solution content. This unreacted alkali solution precipitated during the geopolymerization process as minute needle particles in the mixture [47][47].

Based on EDS tests carried out on a selected area in both samples, the primary components of the SCGPC samples, which belong to the N–C-S–H, N-A-S–H, C-S–H, and Mg $(OH)_2$binders type, are Aluminium, silica magnesium, calcium, oxygen, and Sodium. As shoen in Table 5, Higher Si/Al ratios, especially Si/Al > 2.5, are necessary for the creation of 3D networked polysialate- siloxo and polysialatedisiloxo polymers. In addition to calcium and sodium, 3D networks (Ca,K) polysialate-sililoxane also need small quantities of silicon, oxygen, and aluminum. [49].

4.7 FTIR analysis

The FTIR spectra of the 100FAG0 and 60FAG40 mix sample are depicted in Fig. 11. The strong signals seen at 3369and 3432 cm^{-1} in the 100FAG0 and 60FAG40, respectively, are caused by symmetrical bending vibrations of water molecule-associated H–O-H bonds [50]. The C-H groups are responsible for the small bands at 2816 and 2882 cm^{-1} on the spectra of the 100FAG0 and 60FAG40, indicating an existence of organic molecules from super plasticizers [50]. The bands at a distance of 1637–1793 cm^{-1} are also attributable to the stretching and bending vibrations of O–H bonds, which show the water molecules attached to the geopolymer network [51].The efflorescence phenomenon [52], which results from the geopolymerization process between unreacted Na^+ and ambient CO_2, is linked to the splitting of absorption bands in the ranges of 1446–1476 cm^{-1} and 1422–1482 $cm^{-1}$is observed on the 100FAG0 and 60FAG40,respectively. This finding suggests that degenerescency caused by distortion has been eliminated [53]. It is possible that this area may be linked to the silica and

alumina connections (C-A-S–H and N-A-S–H) that drive polymerization during the geopolymerization process [54].

5 Conclusions

In this current research, the impact of GGBS on the flyash based SCGPC's performance in both the fresh, hardened phases and Microstructural properties were examined. The following Results were attained;

- The results showed that up to 40% FA was successfully substituted for GGBS as a precursor binder in SCGPC's producing outstanding fresh and mechanical qualities that satisfied the EFNARC standards for SCC.
- With an increase in GGBS quantity in the binder, the workability of the fresh GGBS blended SCGPC's reduced. The reason for this is mainly due to the calcium reacting more

quickly and to the angular shape of the slag in contrast to the spherical shape of the fly ash particles.

- As compared to control SCGPC (100FAG0), the mix with 40% GGBS blended SCGPC (60FAG40) which does not require heat curing, exhibits the highest compressive strength increased by 40.26 and 33.97%after 7 days and 28 days.
- However, when the GGBS grew from 0 to 50%, both the splitting tensile strength and flexural strength of the GGBS blended SCGPC enhanced by about 33.59 and 31.05%, respectively.
- The results of the XRD-based microstructural analysis of SCGPCs revealed a decrease in the number of crystalline phases when the GGBS content was raised as a partial substitute for Flyash. Consequently, the porosity decreased while the density and C, N-(A)-S–H gel were enhanced.
- As shown by SEM and EDAX analysis, the GGBS increased the degree of polymerization and polycondensation, which subsequently improved the densification of the entire system and increased its strength. Cristobalite and stishovite, which are unreacted FA/GGBS, function as fillers by saturating pore spaces, which raises the packing density of the binder phase.
- When the proportion of GGBS is raised, FTIR data revealed shifts in geopolymer process and the development of C-S–H gel, which enhance the strength qualities.

AN EXPERIMENTAL INVESTIGATION ON PROPERTIES OF GEOPOLYMER CONCRETE USING COMPOSITE FIBERS

Meghana Vinjamuri[1], Dr. B. Madhusudana Reddy[2]
[1]PG Student, [2]Professor
Department of Civil Engineering,
Sri Venkateswara University College of Engineering, Tirupati, Andhra Pradesh, India

ABSTRACT: Geopolymer technology represents a significant advancement in concrete production, especially in mitigating the environmental concerns that arise from the use of conventional cement materials that emit significant amounts of CO_2. By substituting cement with alternative ingredients such as Fly ash and Ground Granulated Blast Furnace slag (GGBFS), a more environmentally friendly approach is possible. Geopolymer concrete, utilizing a synthetic resin binder that reacts with alkaline solutions like sodium hydroxide and sodium silicate, emerges as a viable alternative. This project aims to enhance the properties of fly ash and slag-based Geopolymer concrete by incorporating composite fibers. It seeks to investigate the effects of Crimped steel, Polypropylene, and Glass fibers on the compressive, split tensile, and flexural strength of Geopolymer concrete. By introducing varying proportions of fibers, ranging from 0.5% to 1.5% of the concrete volume, the study intends to determine their impact on the mechanical properties of concrete. These investigative efforts hold significant potential for broadening the application of Geopolymer concrete, providing an efficient alternative to traditional cement concrete for a wide range of construction applications.

***Key words*: Crimped steel fibers, Fly ash, Geopolymer concrete, Ground Granulated Blast Furnace Slag (GGBFS), Glass fibers, Polypropylene fibers, Sodium silicate, Sodium hydroxide.**

I. INTRODUCTION

Concrete, a fundamental material in global construction, relies heavily on cement. However, cement production contributes significantly to greenhouse gas emissions. To address this, researchers have explored alternative binding materials, including non-crystalline alkali-aluminosilicate geopolymers. Geopolymer concrete, made from byproduct waste, reduces direct carbon dioxide emissions during production. Geopolymer concrete is an innovative alternative to traditional cement-based concrete, where pozzolanic materials rich in silica and alumina, such as fly ash or blast furnace slag, are activated by alkaline liquids to act as binders. This substitution reduces the carbon footprint of concrete production. Geopolymerization, the chemical process behind geopolymer concrete, involves exposing alumina-silicate materials to high-alkaline environments, typically sodium or potassium hydroxide solutions. This results in the formation of a strong binder characterized by a Si-O-Al structure. The reaction involves breaking valency bonds between silicon, aluminium, and oxygen atoms, leading to the formation of three-dimensional polymeric chains and ring structures. Alkaline cations like sodium and potassium compensate for charge imbalances caused by aluminium in the gel product. The rate of dissolution and the resulting properties of geopolymers are influenced by factors such as the quantity and content of materials used and the pH of the activating solution. Geopolymer concrete utilizes thermally activated natural resources or industrial by-products as sources of silicon and aluminium. Despite its advantages, geopolymer concrete exhibits brittleness. To overcome this limitation, we turn to fibers. By reinforcing geopolymer concrete with fibers, we aim to enhance its toughness, durability, and applicability across a wide range of construction scenarios. This review sheds light on the promising future of fibre-reinforced geopolymer concrete and emphasizes the need for standardized manufacturing processes.

The objective of this journal paper is to present the results of an experimental investigation on Geopolymer concrete, formulated using fly ash and Ground Granulated Blast Furnace Slag (GGBFS), along with sodium silicate, sodium hydroxide, crimped steel fibers, polypropylene fibers, glass fibers, and a chemical admixture. Specifically, the study utilizes the PCE-based super plasticizer AURAMIX 450 to achieve the desired properties of Geopolymer concrete. The chemical admixture is dosed at 1.4% by weight of binder content based on a trial method, while maintaining a constant water-to-binder ratio of 0.45. The mix design and proportioning of ingredients for the Geopolymer concrete involve maintaining a fixed ratio of 2 for sodium silicate and sodium hydroxide, along with the use of a 12M alkaline solution. The mechanical properties under investigation include compressive strength, split tensile strength, and flexural strength of the concrete specimens. To further enhance the mechanical properties and observe changes, crimped steel fibers, polypropylene fibers, and glass fibers are added in varying percentages (0%, 0.5%, 0.75%, and 1%) collectively. This addition aims to investigate the effects of fiber reinforcement on the Geopolymer concrete's performance. By systematically varying the fiber content and assessing the resulting mechanical properties, the study aims to provide insights into the optimization of Geopolymer concrete formulations for enhanced performance and durability in various engineering applications.

II. OBJECTIVES

The following are the objectives of this experimental investigation:

1. To find the optimum percentage of Steel fibers in developing the strength of the Geopolymer concrete and to mitigate the brittleness of GPC
2. To develop the strength of Geopolymer concrete using Steel fibers and Polypropylene fibers in various percentages from the optimum percentage of Steel fibers and to observe the changes in properties of GPC.
3. To develop the strength of Geopolymer concrete using Steel fibers and Glass fibers in various percentages from the optimum percentage of Steel fibers and to observe the changes in properties of GPC.
4. To determine the mechanical properties of Geopolymer concrete such as compressive strength, split tensile strength and flexural strength by the addition of various percentages of fibers in Geopolymer concrete.
5. To compare the properties of Geopolymer concrete with fibers and without fibers.

III. MATERIALS

In this experimental investigation the following materials are used

3.1 Fly Ash

Fly ash, derived from the combustion of pulverized coal in coal-fired thermal power plants, is a by-product extensively utilized in hydraulic-cement concrete. Class F fly ash, specifically chosen for this experimental investigation, possesses a specific gravity of 2.12.

3.2 Ground Granulated Blast Furnace Slag (GGBFS)

Ground Granulated Blast Furnace Slag (GGBS) is a by-product of the iron-making process in blast furnaces. With a specific gravity ranging between 2.80 and 3.00, slag holds the distinction of having the highest specific gravity among all mineral admixtures. As a processed material, its fineness can be finely adjusted to meet specific requirements. In numerous applications, the fineness of slag closely resembles that of cement. GGBS primarily consists of calcium silicates and alumino-silicates. Its specific gravity is measured at 2.9.

3.3 Fine Aggregate

River sand sourced locally, adhering to the IS: 383-1970 specifications, was utilized as the fine aggregate in the concrete mix. The sand particles pass through a 4.75mm sieve and are retained on a 75µm sieve. Table 3.1 provides details regarding the physical properties of the fine aggregate.

Table 3.1: Physical properties of Fine aggregate

Particulars	Values
Specific gravity	2.58
Fineness modulus	3.15
Grading	Zone II

3.4 Coarse aggregate

For this investigation, well-graded coarse aggregate consistent with the specifications outlined in IS: 383-2016 will be utilized. The coarse aggregate, sourced from local quarry units and conforming to IS: 383-1970 standards, has been selected for this study. The maximum size of the coarse aggregate employed is 12.5mm. The physical properties of the coarse aggregate are detailed in Table 3.2.

Table 3.2: Physical properties of Coarse aggregate

Particulars	Values
Specific gravity	2.60
Fineness modulus	6.30
Water absorption (%)	0.72

3.5 Sodium Hydroxide Flakes

Sodium hydroxide (NaOH) is commonly available in solid forms such as pellets or flakes. Its price varies based on purity. Solutions of NaOH are prepared by dissolving pellets in water to achieve different molarities. It is advised to prepare the NaOH solution at least 24 hours before use and to use it within 36 hours to prevent it from solidifying.

3.6 Sodium Silicate

Sodium metasilicate, also referred to as sodium silicate, is an industrial-grade compound containing 31.12% SiO_2 and 14.2% Na_2O by mass. Manufacturers commonly utilize it as a bonding agent in detergent and textile industries. Sodium silicate is typically found in liquid form.

3.7 Chemical Admixture

Polycarboxylate ether (PCE) based superplasticiser AURAMIX 450 was used.

3.8 Crimped steel fibers

In this study, crimped steel fibers with a length of 35mm and a diameter of 0.5mm are utilized, resulting in an aspect ratio of 70.

3.9 Polypropylene fiber

In this study, FIBERCRETE MF, a synthetic monofilament fiber is used. Polypropylene fibers with a length of 12mm and a diameter of 0.02 mm are utilized, resulting in an aspect ratio of 600.

3.10 Glass fibers

In this study, glass fibers with a length of 12mm and a diameter of 0.014mm are utilized, resulting in an aspect ratio of 857.

IV. EXPERIMENTAL INVESTIGATION

4.1 Mix proportions

In this experimental investigation, the binder content, obtained from a mix design referenced in prior literature, is 496 kg/m^3. This composition consists of 80% fly ash and 20% GGBFS. For the 12M solution, the NaOH content is measured at 74.5 kg/m^3, while the Na_2SiO_3 content is taken as 149 kg/m^3. To achieve the desired fresh properties of Geopolymer concrete, a water-to-binder ratio of 0.45 is selected, alongside a chemical admixture dosage of 1.4% by weight of the binder content, determined through trials. The study assesses the impact of crimped steel fibers on Geopolymer concrete, identifying the optimal percentage, and then explores substitutions with glass and polypropylene fibers at varying proportions of 0.5%, 0.75%, and 1% by weight of the binder content. Table 6 summarizes the concrete mixture proportions for Geopolymer concrete.

Table 6: Mix proportions of Geopolymer concrete addition with percentage of Crimped Steel fibers, Polypropylene fibers &Glass fibers

4.2 Mix procedure

For the experimental investigation, materials such as fly ash, GGBS, aggregates, sodium silicate, and sodium hydroxide are procured and tested to determine the properties such as specific gravity and water absorption. Mix design for Geopolymer concrete (GPC) is done, considering the desired proportions of the materials. Additionally, different volumes of fibers are incorporated into the mix to assess their impact on the concrete's performance. Following the mix design, concrete samples in the form of cubes, cylinders, and prisms are casted and cured for 24 hours before demolding. Subsequently, the specimens undergo an air-curing process at ambient temperature for durations of 7, 28, and 56 days to facilitate concrete strength development. Mechanical properties including compressive strength, split tensile strength, and flexural strength are then determined at the designated curing ages of 7, 28, and 56 days to analyze the performance of the Geopolymer concrete specimens.

4.3 Test procedure on Hardened concrete

The following tests are conducted to find the mechanical properties on hardened concrete:

Compressive Strength: The compressive strength of Geopolymer concrete is determined by casting the specimens of size 100*100*100mm. These samples undergo testing at ages of 7, 28, and 56 days using a compressive testing machine (CTM) with a capacity of 3000kN, as per IS 516:1959, as shown in Fig 1a.

Split Tensile Strength: The split tensile strength of Geopolymer concrete is determined by casting the cylinders of size 100*200mm. These samples undergo testing at 28 days using a compressive testing machine (CTM) with a capacity of 3000kN, as per IS 516:1959, as shown in Fig 1b.

Flexural Strength: The flexural strength of Geopolymer concrete is determined by casting the beam specimens of size 100*100*500mm. These samples undergo testing at 28 days, as per IS 516:1959, as shown in Fig 1c.

Fig. 1a Compression test

Fig. 1b Split tensile

Fig. 1c Flexure test

V. RESULTS AND DISCUSSION

5.1 Mechanical properties of Geopolymer concrete:

The following are the test results of compressive, split tensile and flexural strength tests to determine the mechanical properties of Geopolymer concrete.

5.1.1 Compressive strength test

Figure 2 illustrates the compressive strength variations of Geopolymer concrete mixes denoted as M1 to M9, each incorporating different types of fibers including crimped steel, polypropylene, and glass fibers. For the control mix (M1), the compressive strength at 7, 28, and 56 days was determined as 34.88, 39.15, and 40.8 N/mm^2, respectively. Upon introducing crimped steel fibers in mix M2, a notable increase in strength was observed compared to the control mix. Of note, mixes M2 and M8 exhibit nearly equal compressive strengths. This suggests that the combination of steel and glass fibers in mix M8 yields a compressive strength similar to that achieved with crimped steel fibers alone.

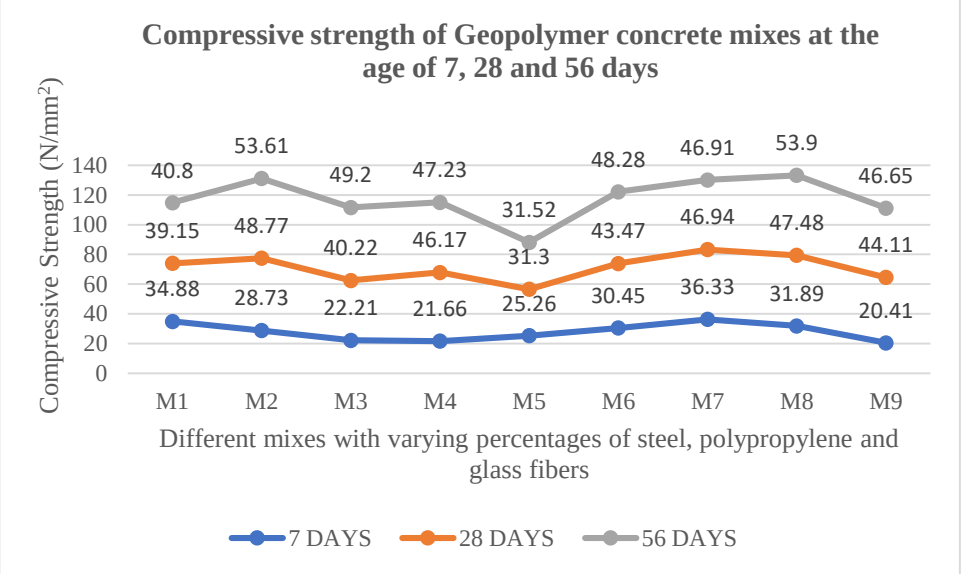

Fig. 2 Variation compressive strength of different mixes

5.1.2 Split tensile strength test

Figure 3 displays the split tensile strength variations of Geopolymer concrete mixes denoted as M1 to M9, incorporating different types of fibers such as crimped steel, polypropylene, and glass fibers. For the control mix, denoted as M1, the 28-day split tensile strength was recorded as 1.705N/mm^2. With the addition of 1.5% crimped steel fibers (the optimum percentage), this strength increased to 4.605 N/mm^2 in mix M2. Remarkably, mix M8 exhibits a split tensile strength similar to that of mix M2. This suggests that the combination of steel and glass fibers in mix M8 yields a split tensile strength comparable to that achieved with crimped steel fibers alone.

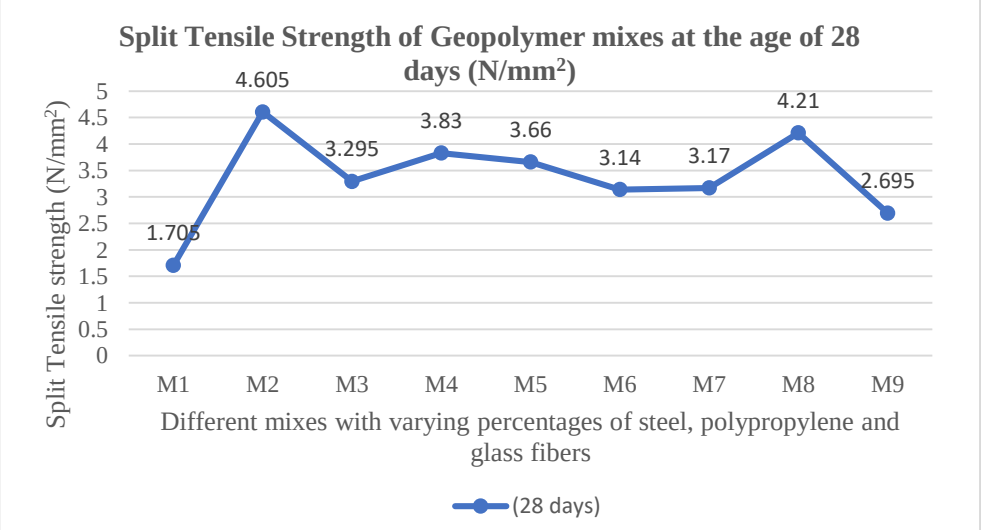

Fig. 3 Variation Split tensile strength of different mixes

5.1.3 Flexural strength test

Figure 4 displays the flexural strength variations of Geopolymer concrete mixes denoted as M1 to M9, incorporating different types of fibers such as crimped steel, polypropylene, and glass fibers. For the control mix, denoted as M1, the 28-day flexural strength was recorded as 4.27 N/mm^2. With the addition of 1.5% crimped steel fibers (the optimum percentage), this strength increased to 6.69 N/mm^2 in mix M2. Remarkably, mix M8 exhibits a flexural strength similar to that of mix M2. This suggests that the combination of steel and glass fibers in mix M8 yields a flexural strength comparable to that achieved with crimped steel fibers alone.

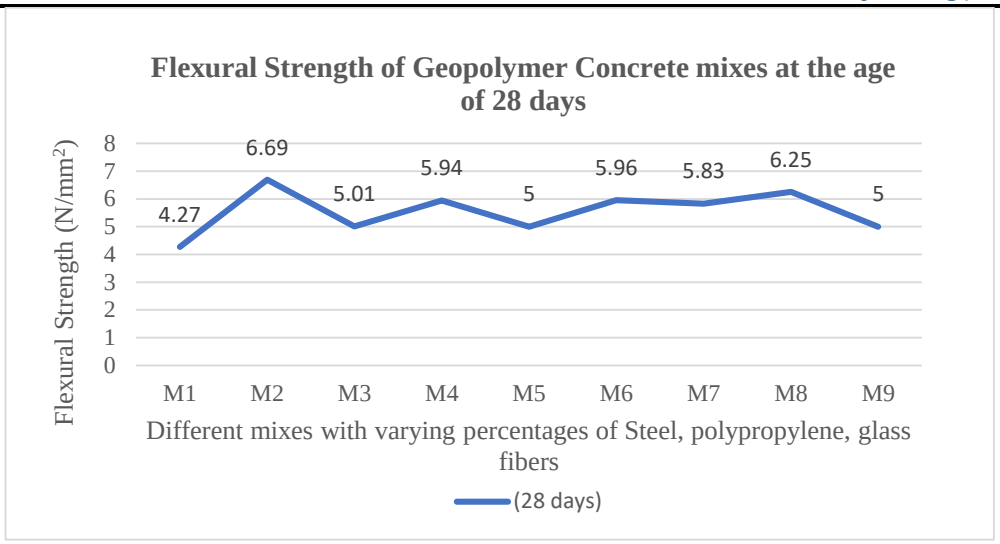

Fig. 4 Variation Flexural strength of different mixes

VI. CONCLUSIONS

In this research work, nine different mixes of Geopolymer concrete were considered to investigate their strength characteristics, including compressive strength, flexural strength, and split tensile strength, with the incorporation of various fiber types such as crimped steel, polypropylene, and glass fibers.

1. The partial replacement of 20% GGBFS in the Geopolymer concrete mixture effectively mitigates setting delays, particularly during air curing at ambient temperatures.
2. Through experimental analysis, a Geopolymer concrete mix design with a liquid binder ratio of 0.45 and an alkaline solution ratio of 2 was identified, exhibiting desirable strength properties and advantageous environmental and economic benefits.
3. Cube compressive strength assessments revealed that mixes M1 and M2, augmented with crimped steel fibers, demonstrated increased strength at 28 and 56 days, with values escalating from 39.15 MPa to 48.77 N/mm^2 and from 40.8 N/mm^2 to 53.69 N/mm^2, respectively. Optimal performance was achieved with a 1.5% addition of crimped steel fibers. Similar strength outcomes were observed in mix M8, which featured a combination of 0.5% crimped steel and 1% glass fibers.
4. Split tensile strength evaluations exhibited a similar trend, with mixes M1 and M2 registering enhancements from 1.705 N/mm^2 to 4.605 N/mm^2 at 28 days upon the incorporation of crimped steel fibers. The optimal mix again featured a 1.5% addition of these fibers, with mix M8 showing comparable results due to the combination of 0.5% crimped steel and 1% glass fibers.
5. Flexural strength assessments followed suit, with mixes M1 and M2 displaying increases from 4.27 N/mm^2 to 6.69 N/mm^2 at 28 days with the inclusion of crimped steel fibers. The optimal mix was identified at a 1.5% addition of crimped steel fibers, mirroring the results of mix M8, which combined 0.5% crimped steel and 1% glass fibers.
6. The overall analysis suggests that Geopolymer concrete incorporating 1.5% crimped steel fibers achieves optimal strength performance. Additionally, composite fiber mixes, particularly those combining steel and glass fibers, exhibit superior performance compared to combinations of steel and polypropylene fibers.
7. Despite the enhanced strength provided by steel fibers, their weight and cost implications prompt consideration of alternatives. Replacement of 1% steel fibers with glass fibers yields lighter, more cost-effective Geopolymer concrete with strength levels approaching those of Geopolymer concrete with optimal steel fiber content.

RESEARCH

Application and evaluation of ANN and other classification algorithms for identification of clays based on mineralogical composition: a comparative study

Siva Kumar Prasad Chebiyyam[1] · Mallikarjuna Rao Kattamuri[1]

Abstract
Mineralogical identification of clay minerals is essential as clays exhibit different degrees of expansivity based on the minerals present. Montmorillonite clays have high swelling and shrinkage characteristics, followed by Illite and Kaolinite. The presence of such clays affects the stability of the foundation and thus the structure as a whole. Therefore, the geotechnical engineer has to ascertained the presence of expansive clays before design foundation system. XRD and differential thermal analysis are intricate and expensive techniques for identifying clay minerals. Identifying the clay minerals with the help of their index properties is an indirect and inexpensive approach. In machine learning, classification is a predictive modelling problem. The current study examines the suitability of liquid limit and plastic limit/plasticity index as input features for eight classification models viz. Logistic Regression, K Nearest Neighbourhood, Support Vector Machine, Naive Byes, Decision Tree, Random Forest, XG Boost and Artificial Neural Networks. Scikit learning libraries are used for classification models in Python. K-fold cross-validation is used for each classification model to evaluate the training set and accuracy score, and ROC curves evaluate test data performance. The current study found that Montmorillonite clays can be classified with the highest degree of accuracy, followed by Kaolinite and Illite.

Keywords Kaolinite · Illite · Montmorillonite · Classification

Introduction

Majority of clays have Kaolinite, Illite and Montmorillonite as minerals in them. Swelling and shrinkage characteristic of clays are very much dependent on dominant clay minerals present. Expansive soil is typically defined as any soil whose volume variations are moisture sensitive. Due to their adverse effects on the stability of the buildings they support, expansive soils are viewed as problematic (Asuri & Keshavamurthy, 2016). The study of the physico-chemical behaviour of the soils has indicated that clays having Montmorillonite are more expansive followed by Illite and Kaolinite. X-ray diffraction, differential thermal analysis, scanning electron microscopy etc. are promising technics to establish clay minerology. However, for the purpose of soil investigation from geotechnical engineering applications these methods are unfeasible as not many geotechnical labs equipped with these facilities, also such investigations demand skilled workforce.

Many researchers and codes have come up with degree of expansivity of clays by experimental results of index properties such as liquid limit, plastic limit, shrinkage limit, free swelling index and free swelling ratio. Chen and Snethan et al. have suggested liquid limit ranges and the corresponding swelling potential. Holtz and Gibs and Chen have labelled four swelling potentials viz. Low, Medium, High and Very high based on plasticity index. Based on the shrinkage limit, Holtz and Gibbs and Altmeyer have recommended volume changes for expansive soils. Considering percent clay size fraction, Chen and Holtz and Gibbs have proposed four degrees of expansivity for clayey soils. Sridharan and Prakash have suggested clay type, swell potential and dominant clay mineral type based on free swell ratio. Cation exchange capacity, total surface area are also quite instrumental in identifying the clay minerals. Therefore, every clay mineral is a function of Atterberg limits,

percentage clay fraction, cation exchange capacity and total surface area. Identification of clay minerals can also be carried out with these test results with a reasonably good accuracy rather than more sophisticated tests such as X-Ray diffraction, scanning electron microscope etc. The most challenging part of identifying the clay minerals with the help of index properties is, there is no standard procedure established for this purpose.

Machine learning is a subset of artificial intelligence that focuses on the development of adaptive computing systems that can enhance their performance through the use of experience-based data. (Jasmina Dj et al., 2017). The three types of machine learning algorithms are supervised, unsupervised, and reinforcement learning. The task of developing a capacity from the prepared knowledge is referred to as supervised learning. The preparation information comprises of a lot of perceptions together with its result. Supervised learning can be further separated into classification and regression. Classification methods are utilized to foresee categorical values and Regression methods are utilized to anticipate numerical qualities (Johnson et al., 2019).

Medical research, medication design, astronomy, atmospheric science, agronomy, manufacturing, telecommunications, marketing, business decision making, image processing, traffic design, and road safety are all examples of where classification algorithms are applied.

In the present study, all the eight classification algorithms viz. (1) Logistic Regression (LR), (2) K Nearest Neighbourhood (KNN), (3) Support Vector Machine (SVM), (4) Naive Bayes (NB), (5) Decision Tree (DT), (6) Random Forest (RF), (7) XG Boost (XGB), (8) Artificial Neural Networks (ANN) are applied on the three types of clay sample data collected from various reputed journals viz. Kaolinite, Montmorillonite and Illite with input features liquid limit, plastic limit/plasticity index for the prediction of clay mineral present.

The two main objectives of present work are as follows:

1. To check suitability of liquid limit & plastic limit (also plasticity index) data for classifying clays based on mineralogical composition.
2. To identify appropriate classification model useful in identification clays minerals.

Collection of data

The soil property data of three types of clays considered in the current study viz. Kaolinite, Illite and Montmorillonite is obtained from 152 research articles published in more than 15 reputed journals and a couple of conferences. All the journals have substantiated their claims on mineralogical composition of clays with XRD and other investigation reports.

In the present study the 175 sample data of Kaolinite, 117 sample data of Illite and 192 sample data of Montmorillonite clays accounting to 484 are considered. Liquid limit and plastic limit values for the three types of clays considered are shown in the three independent plasticity charts as shown in the Figs. 1, 2, and 3.

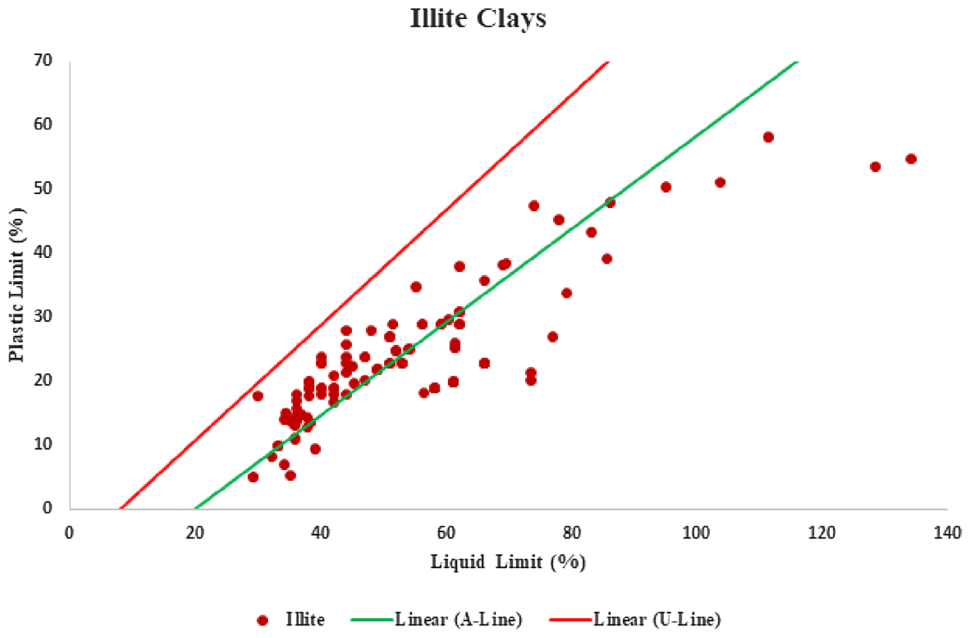

Fig. 2 Illite clay data on plasticity chart

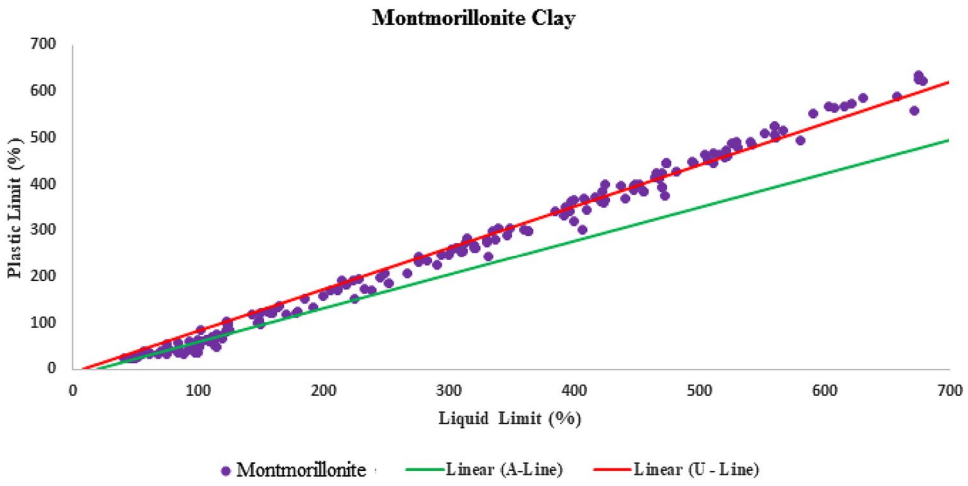

Fig. 3 Montmorillonite clay data on plasticity chart

Methodology

The data is organized into six binary and two multiclass (three class) datasets. Six binary datasets, out of which three have input features as liquid limit and plastic limit, and the remaining three have input features liquid limit and plasticity index. The three having liquid limit and plastic limit as input features are designated as 'A' group, and the remaining three having liquid limit and plasticity index as input features are designated as 'B' group. For '1A' and '1B' datasets, output variables are Kaolinite and Illite. For '2A' and '2B' datasets, the output variables are Illite and Montmorillonite. Similarly, the output variables are Kaolinite and Montmorillonite for '3A' and '3B' datasets. Two multiclass datasets have input features as liquid limit and plastic limit, and the other one has liquid limit and plasticity index and is designed as '4A' and '4B', respectively. For both '4A' and '4B', the output variables are Kaolinite, Illite and Montmorillonite. The details of datasets, input features, output variables and applied classification techniques are shown in Table 1.

In all the eight classification techniques applied on eight datasets, 80% of the data is used to train the model, and 20% is for testing. On each of the datasets, eight classification models are applied viz. (1) Logistic Regression, (2) K Nearest Neighbourhood, (3) Support Vector Machine, (4) Naive Bayes, (5) Decision Tree, (6) Random Forest, (7) XG Boost and (8) Artificial Neural Networks. K-Fold Cross-Validation is used to assess the model performance and is applied to training set data. Each classification model is

evaluated on test data with the help of matrices derived from the confusion matrix and by drawing Receiver Operating Characteristic (ROC) curve to measure the Area Under the Curve (AUC). The better model on each dataset is selected by comprehending K-Fold Cross-Validation, matrices from confusion matrix and AUC of ROC curve.

Implementation and results

Classification models

The eight classification techniques used the present study are briefed below:

Logistic regression

The process of modelling the likelihood of a discrete result given an input variable is called logistic regression. Binary outcomes, such as true/false, yes/no, and other outcomes with only two possible values, are most frequently modelled by logistic regression. Multiple discrete outcomes in a given scenario can be modelled using multinominal logistic regression. (Thomas & David, 2017).

K Nearest Neighbourhood

K Nearest Neighborhood is a classification method that classifies a given example based on the votes of its neighbours. The observation is put in the same category as its nearest K neighbours. The model's input data determines the value of K. In general, the bigger the value of K, the less impact noise or classification errors have. (Johnson et al., 2019).

Support vector machine

The goal of the support vector machine algorithm is to locate an N-dimensional hyperplane (where N is the number of features) that categorizes the data points. Numerous potential hyperplanes might be selected to divide the two classes of data points. The objective of an SVM is to locate a plane with the most significant margin or the most excellent separation between data points from both classes. (Rohith, 2018).

Naive Bayes

A probabilistic classifier called the Naive Bayes classifier, which is based on the Bayes theorem, assumes that each feature contributes equally and independently to the target class. The naive Bayes classifier assumes that each feature is separate from the others and does not interact; therefore, each feature independently and equally influences the likelihood that a sample belongs to a particular class.

For a binary classification problem having two features say, X1 and X2, the probability of a class yi is expressed as (Misra & Li, 2020)

$$P(yi|X1, X2) = \frac{P(X1|yi)P(X2|yi)}{P(X1)P(X2)}$$

Decision tree

A tree-like decision structure with a root node and numerous leaves is produced by the decision tree classifier after processing the training dataset. Internal nodes are all located between the root node and the leaves. Each node is divided into internal nodes and/or leaves so that the dataset becomes purer due to the division; specifically, each split should result in the dataset being divided into groups with samples predominately from one class (Misra & Li, 2020).

Random Forest

An ensemble technique called Random Forest classifier trains several decision trees concurrently with bootstrapping, aggregation, and bagging (Misra & Li, 2020).

XG Boost

XGBoost is a robust machine learning algorithm, specifically where speed and accuracy are concerned.

Content courtesy of Springer Nature, terms of use apply. Rights reserved.

XGBoost implements a gradient-based decision tree designed for speed and performance that dominates competitive machine learning.

Artificial neural networks

ANN stands for artificial neural network which is a computing system that works in parallel and is designed to emulate the human brain processes and analyzes the information. By utilizing data from past experiences, it can model, classify, recognize, and predict a wide range of problems (Kaveh & Iranmanesh, 1998). Typically, an ANN is made up of an input layer, one or more hidden layers, and an output layer. There are multiple layers of neurons, each connected to the other via a weighted connection to form a network of processing units (Kaveh et al., 2008). The input neurons receive information from the external environment and transmit it to the hidden neurons, which then process the information and reconstruct the input–output mapping based on the key features they extract (Kaveh & Servati, 2001; Kaveh et al., 2001). Lastly, the neurons of the output layer will provide the network predictions to the outside world (Kaveh et al., 2014).

In Fig. 4, inputs, weights, summation functions, activation functions, and outputs are shown. It is possible for neurons to receive input from external data or to receive output from neurons in previous layers. By calculating the weighted sum of all inputs, adding a bias, and passing this value through a nonlinear activation function, the neuron produces its output. A neuron's output feeds an input for the next neuron of the layer below to it (Nakkeeran & Krishnaraj, 2023).

The mathematical expression is

$$o_j = f\left(\sum_{i=1}^{n} w_{ij}x_i + b\right)$$

where o_j is the output of the jth neuron, w_{ij} the weight, x_i the input, b the bias, and f an activation function. Over-fitting may be avoided by normalizing the variables, which can be done using the equation below (Nakkeeran et al., 2023):

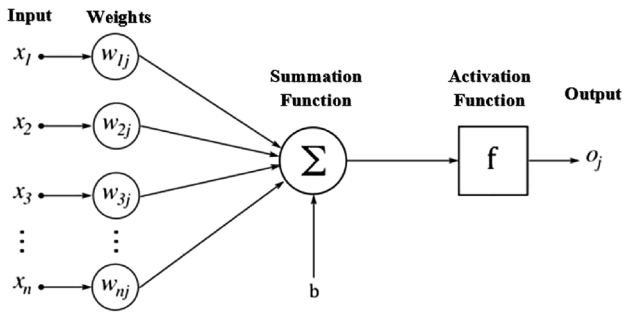

Fig. 4 ANN General Architecture

$$X_{norm} = \frac{(X_{max} - X_{min})(Y_i - Y_{min})}{(Y_{max} - Y_{min})} + Y_{min}$$

X_{norm} is the normalized parameter, X_{max} is the maximum and X_{min} is the minimum value of the scaling range, Y_i is the actual data to be scaled, Y_{max} and Y_{min} are the minimum and maximum values of the actual data, respectively.

Cross-validation

K fold cross-validation is applied to the training set to access the model performance. K fold cross-validation algorithm divides the training set into equal K parts. Out of the K parts, K-1 parts are used to train the model and left out 1 part is used for validating the model in one iteration. Similar iterations are performed by considering another 1 parts of data as test data and the remaining parts as training data. In all iterations, the accuracies are evaluated. The test reports the average of all the accuracies alongside standard deviation. In the current study, the K value is set as 10. The K fold cross-validation data for all the eight datasets are shown in the tables, and the corresponding statistical analysis of the data is shown in the

Evaluating classification models

In order to evaluate the classification model, two approaches are adopted in the current study. The first approach is evaluating the accuracy, precision, recall, and f1 score deduced from the confusion matrix for binary and multiclass classifications. The second approach is to draw the Receiver Operating Characteristic (ROC) curve and measure the Area

Under the Curve (AUC). Both the approaches and corresponding measured metrics are detailed in the following sections.

Confusion matrix

A confusion matrix is a square matrix formed between predicted values and actual values of the classes of a classification model. The structure and the various metrics calculated from the confusion matrix is explained with the help of a binary classification whose classes are 'Yes' & 'No' as shown in Fig. 13.

Here TP = Count of both predicted and actual positive; FP = Count of actual negative but predicted positive; TN = Count of both predicted and actual negative; FN = Count of actual positive but predicted negative.

The metrices calculated from confusion matrix for a binary classifier are as follows:

		Predicted	
		Yes	No
Actual	Yes	TP	FP
	No	FN	TN

Fig. 13 Confusion matrix for binary classification

$$Accuracy = \frac{TP+TN}{TP+FP+TN+FN}$$

$$Precision = \frac{TP}{TP+FP}$$

$$Recall\ or\ True\ Positive\ Rate\ (TPR) = \frac{TP}{TP+FN}$$

$$FalsevPositive\ Rate\ (FPR) = \frac{FP}{TN+FP}$$

$$f1\ Score = \frac{2xRecallxPrecision}{Recall+Precision}$$

Metrices calculated from confusion matrix Precision, Recall, Accuracy and f1 Score are calculated for the six binary datasets and two multiclass datasets on which eight classification algorithms viz (1) Logistic Regression, (2) K Nearest Neighbourhood, (3) Support Vector Machine, (4) Naive Bayes, (5) Decision Tree, (6) Random Forest (7) XG Boost and (8) Artificial Neural Networks is applied. The weighted averages of each metric obtained from the eight classification models are shown in column charts in Figs. 14, 15, 16, 17, 18, 19, 20, and 21 for better visualization.

ROC curve and AUC calculation

Receiver Operating Characteristic curve is a plot drawn between *True Positive Rate* on the vertical axis in function with *False Positive Rate* on the horizontal axis for different cut-off points. Each point on the ROC curve represents FPR, TPR pair corresponding to a particular decision threshold.

The area under the ROC curve is a valuable metric to evaluate the model's performance in the case of a binary classifier. For a truly accurate model, the AUC value is 1. When the AUC value is 0.5, the model cannot distinguish the positive and negative classes. Therefore, the higher the AUC value, the better the ability of the model to distinguish between positive and negative. The Sckit-Learn roc plot can be drawn for the binary classifier alone. With the help of roc_auc_score, AUC values can be calculated for multiclass classifiers. However, the plotting of multiclass ROC curves is not supported by all classification models directly in Sckit-Learn.

Yellowbrick's *ROCAUC* visualizer helps to plot multiclass classification curves containing ROC curves for each class with one-vs-rest (micro score) and one-vs-all (macro score) strategies on the same plot.

In the current study, Sckit-Learn *RocCurveDisplay* is used to draw ROC curves of different models of a binary classifier on the same plot. For drawing multiclass ROC curves, Yellowbrick's *ROCAUC* visualizer is used.

ROC curves for binary classification datasets On the binary datasets, the eight classification models are applied, and the corresponding ROC curves are plotted on a single graph along with their AUC values for better comparison, as shown in Fig. 22.

ROC curves for multiclass datasets With the help of Yellowbrick's library, ROC curves are drawn for the multiclass datasets. Yellowbrick's ROCAUC visualizer allows drawing ROC curves for one classification model, consisting of ROC curves for each class and their micro-average and macro-average ROC along with their AUC values. Figure 23 shows ROC plots for multiclass datasets namely 04A and 04B for different classification models in the sequence (a) 04A – LR (b) 04A – KNN (c) 04A – SVM (d) 04A – NB (e) 04A – DT (f) 04A – RF (g) 04A – XGB (h) 04B – LR (i) 04B – KNN (j) 04B – SVM (k) 04B – NB (l) 04B – DT (m) 04B – RF (n) 04B – XGB.

Conclusions and future scope

Following conclusions can be drawn from the extensive study on classification models:

- Artificial Neural Networks have better performed and evaluated out of 6 binary classification datasets and two

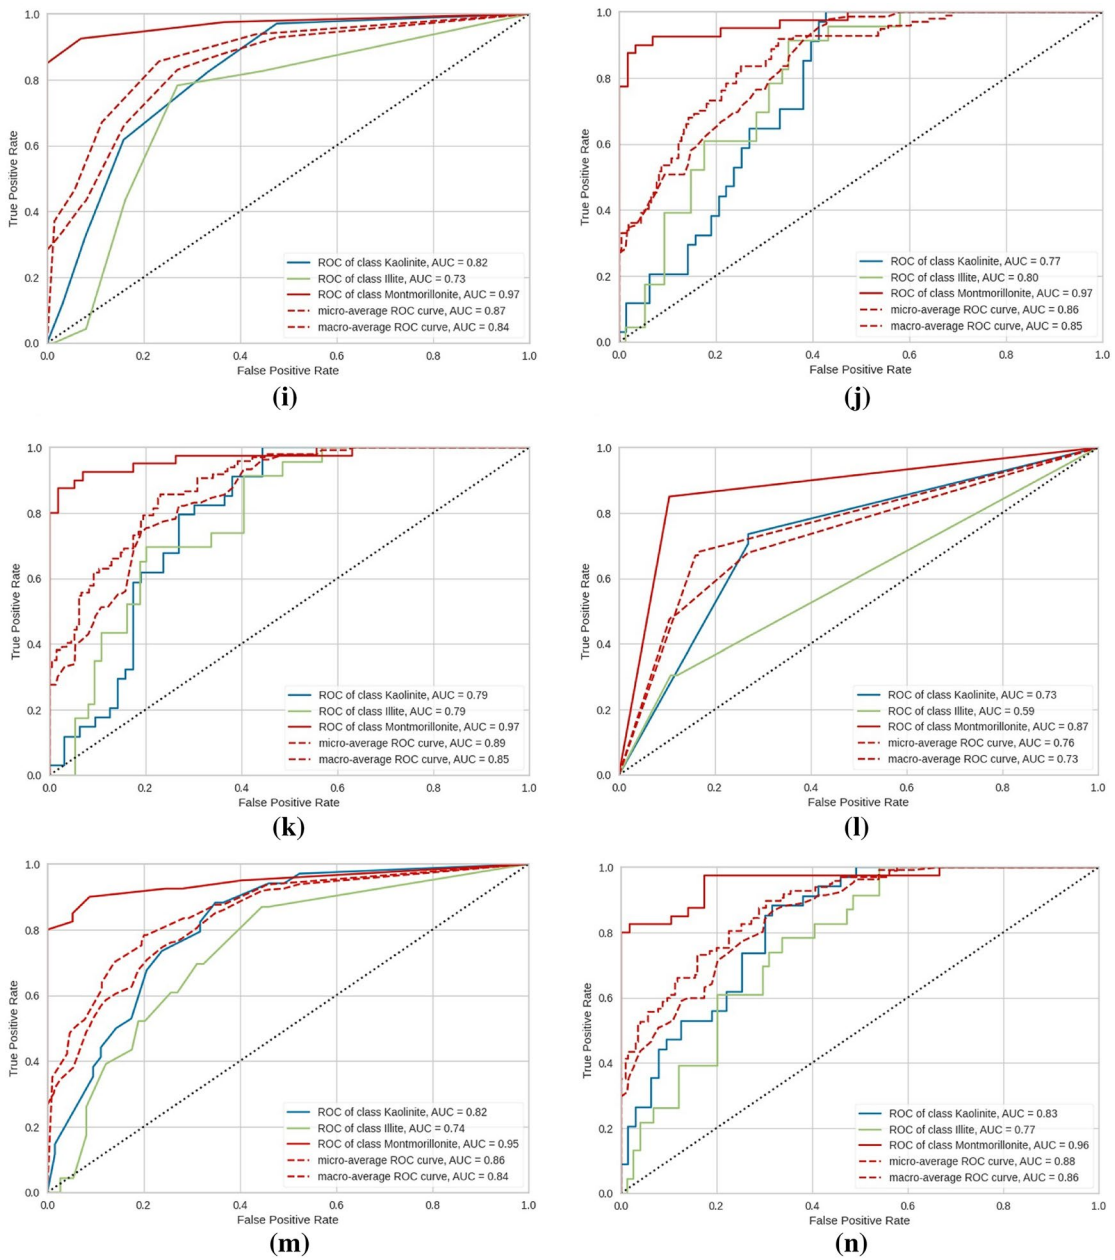

Fig. 23 (continued)

multiclass data sets. ANN proves to be a very effective classification model for multiclass datasets.

- In the 01A binary dataset, both ANN and Decision Tree have better accuracy; however, Decision Tree has consistent accuracy while cross-validating with the least standard deviation.
- For 01B, ANN was proved to be the only model which gave high and consistent accuracies, while K cross-validation was applied with a lower standard deviation.
- For the datasets 03A & 03B, though the Random Forest model gave slightly high accuracy, ANN produced better cross-validation accuracy with significantly less standard deviation proving to be better suitable for these datasets.
- The binary datasets having montmorillonite gave very high accuracy predictions, followed by Kaolinite.
- The plasticity index in place of plastic limit has not significantly contributed to the performance of predictions as an independent variable.

The current study establishes that Atterberg limits, namely liquid limit and plastic limit/plasticity index, are reliable input features for classifying clays based on the mineralogical

Content courtesy of Springer Nature, terms of use apply. Rights reserved.

composition. Montmorillonite can be predicted with the highest accuracy with these input features out of the three clay minerals. Next to Montmorillonite, Kaolinite can be predicted with reasonable accuracy; however, classifying Illites is quite challenging with these input features. Other features, namely shrinkage limit, percentage clay fraction, cation exchange capacity, and total surface area, can be examined to improve clays' predictions, especially Illite clays.

An Experimental Investigation on Glass Fiber Concrete by Partial Replacement of Cement with Alccofine

B.Girinath Naik[1], Dr. D. V. Prasada Rao[2]

PG Student, Department of Civil Engineering, Sri Venkateswara University College of Engineering, Tirupati, India[1]

Professor, Department of Civil Engineering, Sri Venkateswara University College of Engineering, Tirupati, India[2]

Abstract: Concrete is the most widely used construction material due to its strength, durability, and versatility. However, the production of cement, which is a key component of concrete, is a major contributor to greenhouse gas emission. The use of supplementary Cementitious materials (SCMs) can improve the properties of concrete, reduce use on natural resources and CO_2 emissions. The present study is directed to investigate the effect of Alccofine-1203 (AL) as partial replacement of cement on Glass Fibers (GF) reinforced M30 grade concrete. Different types of concrete mixes were prepared by replacing cement with Alccofine-1203 of 5%, 10% and 15%, respectively, then it is found to be the optimum percentage of replacement of cement with Alccofine-1203 is 10%. Further, the effect of Alccofine and Glass Fiber with different combinations, such as, 10%AL+0.1%GF, 10%AL+0.2%GF, and 10%AL+0.3%GF was also carried out. Based on the test results of Mechanical properties of concrete the optimum dosage is found to be 10% AL and 0.2% GF.

Keywords: Alccofine-1203, Glass fibre, Compressive strength, Split tensile strength, Flexural strength, Modulus of Elasticity .

1. INTRODUCTION

Cement is the most prevalent kind of concrete binder. At present sustainable development of the cement and concrete industry requires the utilization of industrial and agricultural by-products. At present, for a variety of reasons, the concrete construction industry is not sustainable. It consumes huge quantities of virgin materials and the principal binder in concrete is Portland cement, the production of which is a major contributor to greenhouse gas emissions that are implicated in global warming and climate change. So, finding a solution to substitute for part of the cement seems to be desirable for sustainable development. In the present investigation applications ofAlccofine-1203 as partial replacement of Cement for the Glass fibers reinforced concrete is adopted.

OBJECTIVES

The main objective of the present experimental investigation is to obtain the influence of Alccofine-1203 and Glass fibre on various Mechanical properties of M30 grade concrete.

It consists of following:

- To find out optimum replacement percentage of Alccofine-1203 .
- To determine the mechanical properties such as Compressive Strength, Split Tensile Strength, Flexural Strength and Modulus of elasticity of concrete prepared using alccofine-1203 and Glass fibers and to compare with conventional concrete.

BUILDING INFORMATION MODELLING OF AN EARTHQUAKE RESISTANT STRUCTURE

T. Venkata Pravinay *1, Dr. D.V. Prasada Rao *2

*1 PG Student, Department of Civil Engineering, Sri Venkateswara University College of Engineering, Tirupati, Andhra Pradesh, India

*2 Professor, Department of Civil Engineering, Sri Venkateswara University College of Engineering, Tirupati, Andhra Pradesh, India

ABSTRACT

Constructing a structure that minimizes earthquake damage can be challenging due to the unpredictable nature of seismic events, making it seem impractical. However, this study focuses on developing earthquake-resistant structure by incorporating Building Information Modelling (BIM) in the design and detailing process. The primary focus is on a G+5 apartment building designed to withstand seismic forces and prioritize occupant safety during earthquakes. BIM technology, using software such as Revit, ETABS, SAFE, SketchUp, AutoCAD, etc., is employed to enhance the structural design. Starting with creating a detailed architectural plan for the G+5 structure and rendered different architectural 3d views by creating models in Blender software. Then the detailed seismic analysis and design is done in ETABS & SAFE as per seismic design code (IS:1893-2016). BIM tools generate a dynamic 3D model, facilitating the visualization and simulation of seismic responses. The project encompasses comprehensive Structural, Architectural, and MEP (Mechanical-Electrical-Plumbing) BIM. The BIM model serves as a central information repository, allowing for precise quantity take-offs and cost assessments. The study's outcomes contribute significantly to the advancement of earthquake-resistant building design, highlighting the efficiency of BIM in optimizing structural performance and cost-effectiveness. These findings hold relevance for professionals in structural engineering, architecture, and construction management, underscoring the pivotal role of integrating BIM in earthquake-resistant designs. Furthermore, the detailed cost estimation for the entire G+5 building is also included.

Keywords: Building Information Modelling (BIM), seismic resilience, G+5 apartment building, earthquake-resistant structure, cost estimation, architectural, MEP BIM.

I. INTRODUCTION

1.1 General

Designing earthquake-resistant structures is crucial in civil engineering, particularly in earthquake-prone areas. Building design must consider hindrances to earthquake forces and ensure adequate support to prevent collapse. In this G+5 project, advanced BIM tools like AutoCAD, ETABS, Revit, and SAFE are employed. These tools help as digital assistants, enhance the design process, provide detailed information, and optimize the building's resilience to both routine and seismic challenges.

In India the earthquake prone area is divided into 4 zones based upon their vulnerability to earthquakes. So, for designing any type of structure in these zones, there are some design codes (see in 1.2). Following these codes will ensure that our constructions are not only safe but also capable of withstanding earthquakes.

Design Guidelines: Structural designers must adhere to key standards for earthquake-resistant design:

- IS 1893: 2016: Criteria for Earthquake Resistant Design.
- IS 13920: 1993: Ductile Detailing of Reinforced Concrete Structures subjected to seismic forces.
- IS: 456-2000: Indian Standard Plain Reinforced Concrete Code of Practice (Fourth Revision).
- IS 875 (Part 1-5): 1987: Code of Practice for Design Loads (excluding earthquake) for Buildings and Structures (Second Revision), encompassing dead loads, live loads, wind loads, snow loads, and special loads.

These streamlined guidelines ensure structures are resilient to seismic challenges in their respective zones, promoting safety and structural integrity.

AN EXPERIMENTAL INVESTIGATION ON POLYPROPYLENE FIBER REINFORCED CONCRETE BY PARTIAL REPLACEMENT OF CEMENT WITH ALCCOFINE

Vadde Venkata Harish[1], Dr. D. V. Prasada Rao[2]

PG Student, Department of Civil Engineering, Sri Venkateswara University College of Engineering, Tirupati, India[1]

Professor, Department of Civil Engineering, Sri Venkateswara University College of Engineering, Tirupati, India[2]

ABSTRACT: *In this experimental investigation an attempt was made to study the feasibility and effectiveness of integrating Alccofine as a supplementary material in Polypropylene Fiber Reinforced Concrete of grade M25. Various concrete mixes with Alccofine substitution (5%, 10%, and 15%) were examined to determine the optimal percentage. The addition of Polypropylene fibers to concrete at 0.1%, 0.2%, 0.3%, and 0.4% by weight of concrete were prepared to determine the optimum dosage of Polypropylene fibres in concrete which is replaced with optimum Alccofine percentage. These fibers help control cracking from plastic and drying shrinkage, reduce concrete permeability, and enhance impact strength. Addition of Polypropylene fibres transforms the material from brittle to ductile. The study includes determination of compressive strength, split tensile strength, flexural strength and impact characteristics. The findings reveal that a combination of 10% Alccofine substitution along with 0.3% Polypropylene fibers leads to notable enhancement 45.3%, 35.6%, 16.67%, and 191% in compressive, split tensile, flexural, and impact strength, respectively, compared to control concrete. Based on the results it can be concluded that the combination of 10% Alccofine and 0.3% Polypropylene fibers in concrete significantly improves both the strength properties and impact strength of the concrete in comparison to control concrete.*

Keywords: ***Polypropylene Fiber Reinforced concrete, Alccofine, impact characteristics, impact strength***

1. Introduction

The modern construction constantly evolves to meet the demands of sustainable development and enhanced performance. Conventional concrete compositions often rely heavily on Portland cement, a material associated with significant carbon emissions during its production. To address environmental concerns and improve concrete properties, innovative solutions such as Alccofine as partial replacement for cement offers multifaceted benefits. By reducing the cement content, these materials help lower carbon emissions associated with concrete production, aligning with sustainability objectives. Moreover, to enhance the mechanical properties and Impact characteristics of concrete, resulting in structures that exhibit superior performance and longevity. Polypropylene fibers, derived from a thermoplastic polymer, is increasingly recognized for its ability to enhance the impact strength of concrete. When dispersed within the concrete matrix, these fibers act as reinforcement, improving tensile strength, crack resistance, and Impact characteristics. Additionally, Polypropylene fibers mitigate plastic shrinkage cracking and improve Impact strength, making them invaluable in various construction applications. Alccofine, a supplementary cementitious material, offers a sustainable alternative to conventional cement. Produced from finely ground aluminosilicate materials, Alccofine possesses pozzolanic properties that react with calcium hydroxide forming additional calcium silicate hydrate (C-S-H) gel. This reaction not only contributes to the densification of the concrete matrix but also enhances long-term strength of the concrete. Furthermore, Alccofine reduces the heat of hydration and mitigates alkali-silica reaction, thus improving the overall sustainability and performance of concrete structures. In this investigation the effects of incorporating Polypropylene fibers and Alccofine

AN EXPERIMENTAL STUDY ON BULGING BEHAVIOUR OF RAMMED STONECOLUMNS

Abstract:

Stone columns enhance the functionality of foundations in soft clays by lowering settlements and raising load bearing capacities. After being loaded, the top of a stone column, where the overburden pressures are lowest, bulges outward. The performance of stone column is greatly influenced by partial resistance of surrounding soil to lateral bulging of stone column. There is stiffer and stronger filler material around the column than the original soil. Load transfer due to lateral bulging is reported predominantly than due to end bearing at the column base and skin friction along the column soil interface. The stability of the soil around it plays a major role in determining the extent of bulging. The maximum weight that a stone column can support is directly proportional to its height. Longer stone columns, beyond a length of around 4D to 6D, are not expected to significantly improve capacity. This study aims to learn how the Consistency Index (I_C), length to diameter ratio (L/D) of stone column, soil's liquid limit (LL), and their interaction all affect with load-carrying capacity of a stone column when penetrating soft clays. The capacity for bearing capacity and resulting bulging of stone columns used as footings in soft clay beds. The impact of LL and I_C on column length will also be investigated. Furthermore, it is planned to develop and empirical equations to predict load carrying capacity of stone columns and the extent of bulging, taking into account all of Relative effect of each of three factors, namely LL, I_C, and L/D, and their interaction effects on load carrying capacity, bulging length, and bulging width is quantified using principles of 2^3 factorial experimentation influencing factors, and validating the same with reported results.

Keywords Stone column, Liquid limit (LL), Consistency Index (I_C), length to diameter ratio (L/D), Factorial Experimentation

1.0. INTRODUCTION:

Whenever difficult sub soil conditions are encountered during the construction of a civil engineering structure, and the site cannot be changed, ground improvement becomes necessary. If weak soils are replaced with compacted vertical columns of stones, they may or may not completely penetrate the weak strata, but

AN EXPERIMENTAL PERFORMANCE OF STONE COLUMNS FILLED WITH REPURPOSING MATERIALS

N.V.Vamsi Krishna Togati[1], and K. Mallikarjuna Rao[2]

[1]Research Scholar, Dept of Civil Engineering, S.V.U. College of Engineering, S.V. University, Tirupati - 517502.

[2]Professor, Dept of Civil Engineering, S.V.U. College of Engineering, S.V. University, Tirupati - 517502.

ABSTARCT:

Soft soil is a worldwide issue that has caused substantial issues for Geotechnical engineers. Engineers have been endeavoring to improve the engineering characteristics of substandard soils owing to their detrimental effects on project efficacy. The utilization of stone columns for enhancing the bearing capacity and settling characteristics of soft soils has gained significant recognition and popularity due to its demonstrated effectiveness. Utilizing waste materials in civil engineering projects presents a dual advantage of promoting environmental sustainability and yielding economic benefits. Used scrap tyres and crushed bricks are two examples of waste items that have a useful purpose in civil engineering. This study describes the findings of load tests conducted in a laboratory setting on a scaled-down tank model with dimensions of 500 mm in length and 300 mm in diameter. The tank was supported by a stone column with a diameter of 50 mm. Aggregates, tyre chips, and crushed brick obtained from the local vicinity of Tirupati are utilized in our application. The load-bearing ability of the soil was seen to enhance subsequent to the introduction of these fill materials. The load carrying capacity of a clay bed has been enhanced by 40% to 110% through the construction of stone columns using aggregates, tyre chips, and crushed brick, with aspect ratios (L/D) of 5 and 8.

Key words: Stone column, Aggregates, Tyre chips, Crushed brick,

1.0. INTRODUCTION:

The global problem of soil softness has posed considerable challenges for geotechnical engineers. Engineers often encounter a prevalent challenge while constructing structures on or with soils, namely the insufficient strength of the soils to sustain the stresses exerted upon them, both during the construction phase and throughout the operational lifespan of the facility. The soils in the majority of the region exhibit low strength and possess inadequate carrying capacity. Efforts have been undertaken to improve the engineering qualities of these soils in response to their subpar performance in the field of engineering. There exist various ways that can potentially improve the efficiency of low-quality soils. The selection of an appropriate method is influenced by factors such as soil type, soil properties, and the specific objectives and scope of the desired improvement. The adoption of ground improvement techniques has the potential to increase the geotechnical qualities of soil. Numerous techniques are available for enhancing soil quality. The methods employed are contingent upon the properties of the strata and the objectives of the augmentation. Stone columns are a soil reinforcement technique that entails the installation of a network of compacted stone columns. The utilization of this technique was initially observed in France around the 1830s, and its adoption beyond Europe did not gain significant traction until the 1950s. Stone columns, similar to other techniques employed for soil improvement, function to fortify the soil, consequently augmenting its

Critical L/D ratio
Factorial Experimentation

ABSTRACT

The Stone columns are one of the main strategies for enhancing the behavior of engineering properties of soft clays. Stone columns are well known as vertical columns or inclusions of compacted, densely crushed stone piercing delicate clays. On the one hand, it acts as a drainage surface to accelerate consolidation, and on the other, it acts as a reinforcement to improve permissible bearing pressure. In this research two set of stone column capacities were determine by simultaneously varying the Mean particle size (D_{50}), L/D ratio, Density Index (I_D) and Consistency Index (I_c) of the stone columns, laboratory tests. Over a two levels, each one follows a principle of 2^4 factorial experimentation that permits quantifying relative effects of each factor and effects of interaction between four factors. An experimental programming shows that there's a critical L/D ratio beyond which there is no encourage increment in ultimate capacity due to L/D ratio. A regression empirical model was established to predict a capacity of stone columns. It was found to be a function of I_c, I_D, and interaction between I_D and I_c, L/D ratio, D_{50} interaction among the L/D ratio and I_c and interaction between D_{50} and I_c. The validity of all developed models is verified by using data from present study and the results of others from literature that was not utilized in the model development. These predictions are useful not only for design of stone columns but also for a research into reinforced stone columns.

1. Introduction

The advancement of structures such as buildings, storage tanks, warehouses, earthen dams, etc., built on weak soils is prone to excessive settlement or stability problems. Soil enhancement may solve or mitigate the problems encountered. This technology was first used in France in the 1830s, and since the 1950s, it has become widely popular throughout Europe. Because of their granular nature, stone columns are preferable over sand drains, which provide additional shear strength to the enclosed soils. They stabilize soft soils such as soft clays, silt, and silty sand.

This technique has an advantage in progressing the soil properties underneath a structure (raft and depth) and reducing irregular settlement. Bulging and general shear failures are the two basic types of failure for stone columns under compressive stresses. It has been recorded that many academics have devised hypothetical ways to estimate a bearing capacity and fortified settlement with stone columns. Impact methods, such as falling weight, or Vibro methods, such as Vibro float, can compact the stone. For a stone column installation in cohesive soils, a Vibro-replacement method is broadly utilized [ ]. A comparative method is employed in soft, relatively impenetrable soils, as well borehole steadiness needs to be fixed in locales with high groundwater tables.

Munkfakh et al. studied the influence of Vibro replacement stone columns on the stability of an embankment that simulated the actual design of a wharf structure [ ]. Madhav and Thiruselvam investigated the impact of the installation method on granular pile-reinforced soil behavior [ ]. The influence of moisture content in soft clay and the effect of column slenderness ratio (L/D) on a single column was studied experimentally by Narasimha Rao et al. [ ]. The work was continued (Rao et al., 1997) to study the effects on a group of columns consisting of 2, 3, and 4 columns in soft clay. Wood et al. conducted a model test to understand better the reaction mechanism of stone columns fortified clay beds

TITLE: HYDROLOGICAL INFERENCE ON THE NANDIVARGAM SUB - WATERSHED FOR WATER RESOURCE ANALYSIS AND MANAGEMENT THROUGH REMOTE SENSING AND GIS TECHNIQUES

Vidudala Ravi babu[1*], D V Satyanarayana Moorthy[2]

[1, 2] Department of Civil Engg., S.V.U college of Engg. S.V. University, Tirupati, Andhra Pradesh, India

Abstract:
The current study focuses on hydrological analysis for a sub-watershed in Nandivargam, within the Nandyal district, Andhra Pradesh. India. The drainage patterns and acquiring pertinent hydrological inferences related to the sub-watershed using digital elevation model STRM (DEM) imagery. Size, slope, soil type, land use, and vegetation, the drainage area, the length of water courses, hydrological model and morphometric analysis has been successfully accomplished through the integration of remote sensing and geographic information systems (GIS). The watershed's stream order, which travels from first order to fifth order and displays a dendritic type drainage network, it is an indication of the watershed's homogeneous texture. GIS-based watershed model has been developed for this study, Stream network, Stream order, Aspect, land use and land cover, Relief, Contours, Mean and Annual rainfall, the study area, and watershed borders were all generated as GIS layers. The watershed area's drainage density was found to be low to medium, which indicates the area has low relief and highly permeable soils. The bifurcation ratio varies from 1.30 to 2.53 and elongation ratio is 0.83 which reveals that the basin belongs to the oval shaped basin category the mean bifurcation ratio of the basin is 2.15 which indicates that the drainage pattern is not much influenced by geological structures. Mathematical or quantitative measurement helps us in analyzing the landforms accurately for any planning and development purposes. Morphometric Analysis is also very useful as it quantifies the landform features of evolutionary significance.

Key words: Watershed, Nandivargam, Remote sensing, Geographical Information system, Morphometric analysis,

1. Introduction.

The quantitative morphometric analysis of a watershed can yield valuable insights into the hydrological characteristics of the rocks present in the watershed. A drainage map of basin provides a reliable index of permeability of rocks and their relationship between rock type, structures and their hydrological status. Watershed characterization and management requires detail information for topography, drainage network, water divide, channel length, geomorphologic and geological setup of the area for proper watershed management and implementation plan for water conservation measures (Sreedevi et al., 2013). Remote sensing data, along with increased resolution from satellite platforms, makes these technologies appear poised to make a better impact on land resource management initiatives involved in monitoring LULC mapping and change detection at varying spatial ranges in semi-arid regions is undergoing severe stresses due to the combined effects of growing population and climate change. (Singh et al., 2012). Surface hydrological indications are one of the promising scientific tools for assessment and management of water resources. Drainage morphometric analyses are a prerequisite for selection of water recharge site, watershed modelling, runoff modelling, watershed delineation, groundwater prospect mapping and geotechnical investigation. (Magesh et al., 2011; Thomas et al., 2012). The drainage network analysis is generally performed to understand the prevailing geological variation, topographic information and structural set of a basin and their interrelationship. Remote sensing and GIS based drainage basin evaluation has been carried out by number of researchers for different terrains and it is proved to be a very scientific tool for generation of precise and updated information for characterization of drainage

basin parameters (Grohmann, 2004; Korkalainen et al., 2007; Hlaing et al., 2008; Javed et al., 2009; Pankaj and Kumar, 2009). Previously drainage morphometric parameters were extracted from topographical maps or field surveys. Drainage parameter extractions from last two decades are more popular from digital topographical information which is called as digital elevation models (DEM), which is more fast, precise, updated and inexpressive way of watershed analysis (Moore et al., 1991; Maathuis, 2006). One of the most recent near global elevation data sets recorded during the 11 day Shuttle Radar Topographic Mission is based on a C-band interferometric radar configuration. This information, representing the radar reflective surface (which may be vegetation, man-made features or bare earth), was collected in 2000 (Maathuis, 2006). Digital elevation models (DEMs), such as from the Shuttle Radar Topography Mission (SRTM), or the ASTER GDEM product (USGS, Denver, Colorado, USA), have been used to extract different geomorphological parameters of drainage basins, including drainage networks, catchment divides, slope gradient and aspect, and upstream flow contributing areas (e.g. Mark, 1984; Tarboton, 1997). GIS based watershed evaluation using Shuttle Radar Topographic Mission (SRTM) data have given a precise, fast, and an inexpensive way for analyzing hydrological systems (Farr and Kobrick, 2000; Grohmann et al., 2007; Panhalkar, 2014). Recently Bastawesy et al. (2013) utilized remote sensing data and digital elevation models to extract the catchment hydrological parameters to delineate storage areas for the Uganda Equatorial Lakes region. They concluded that digital elevation models (DEMs) are a very accurate tool for morphometrically parameter evaluation and watershed delineation for watershed management. In addition, low-intensity and erratic monsoons create further shortages of surface-water supply. As a result, the demand for groundwater resources has increased tremendously from year to year, causing a drastic decline of groundwater levels. Over-exploitation of groundwater has led to the drying up of the aquifer zones in several parts of the country. It is, therefore, essential to increase the recharge of the basin for the water management program at watershed level (Ellis and Revitt, 2010; subba Rao, 2008); Eyquem, 2007).

The current study focuses on a location where rainfall is the primary source of recharge. An integrated watershed-based morphometric study is essential to get insights into the region's physiographic features. The research analyzes sub-watersheds in Nandivargam, Nandyal, district, Andhra Pradesh, and analyzes their morphology. With the goal of helping in the management of water resources, this research makes use of STRM, satellite imagery, and GIS methods. With the objective to conserve and manage water resources sustainably, the primary objective is to explore and identify multiple drainage factors that might improve knowledge of the watershed's shape. The results of this research can help identify alternate approaches to water harvesting in the study region and can act as a scientific foundation for more in-depth hydrological investigations.

2. Geographical of the Study Area

The study area selected for evaluating morphometrical parameters and conducting watershed delineation for effective watershed management is the Nandivargam sub-watershed, as shown in (Fig-01). This sub-watershed is situated within the Nandyal district, Andhra Pradesh, of India and The watershed is located in between latitudes 15°22'30"N to 15°32'30"N and longitudes 78°7'30"E to 78°25'0"E, covering a total area of 240.80 km^2. The mean elevation of the study area is 425 meters above mean sea level. It experiences a dry climate with an annual average rainfall of 878mm. The mean minimum and maximum temperatures are 21.9 ºC and 38.5 ºC, respectively. Located in the Kundu river basin, also known as Kunderu, Kumurdruthi, it is a tributary of the Penna River in the Rayalaseema region of India. The Kundu valley, known as Renadu, is associated with the term "Renati Pourusham." The Kundu River's flood plains cover an area of around 6,000 acres (24km^2). The study area encompasses the Kunderu river valley, situated between the Erramala and Nallamala hills, forming the western and eastern boundaries, respectively. It includes the entire Koilakuntla and parts of Nandikotkur, Nandyal, Allagadda, and Banaganapalle. The Kunderu River, a tributary of the River Penner, flows southward through the central part of the region. The Madduleru and Jurreru rivers in the west, and the Galeru and Vakkileru Rivers in the east, are the main tributaries of the Kunderu River. The region has an average slope ranging between 200 and 300 meters

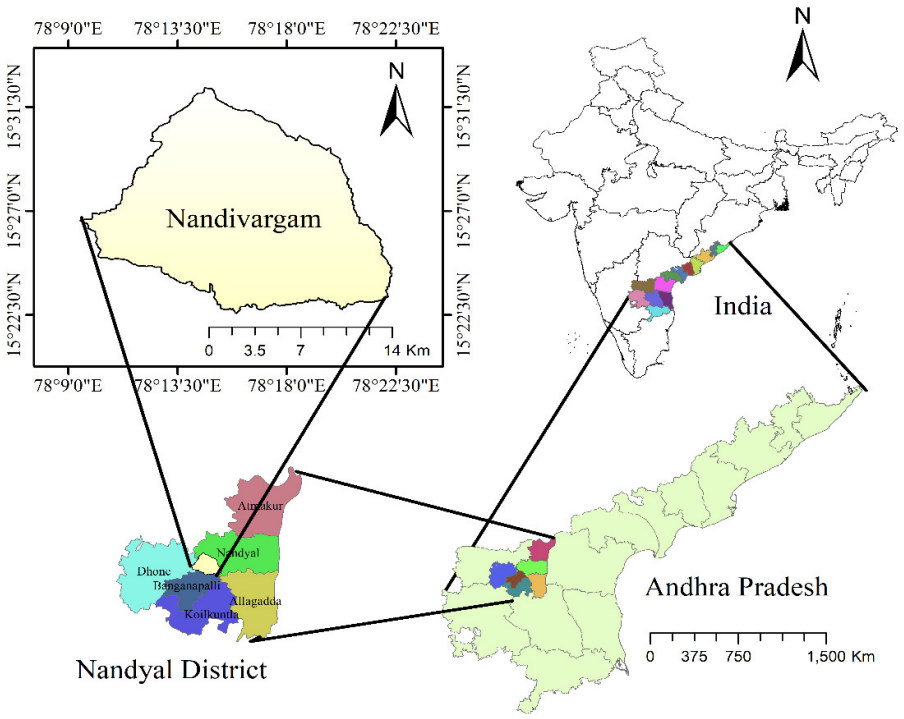

Fig-01: Location map of the study area

2.1 Objective

The primary aim of this study is to explore the morphometric analysis of the watershed in relation to its drainage pattern, utilizing multi-temporal satellite data to examine aspects such as drainage, surface water bodies, and the watershed.

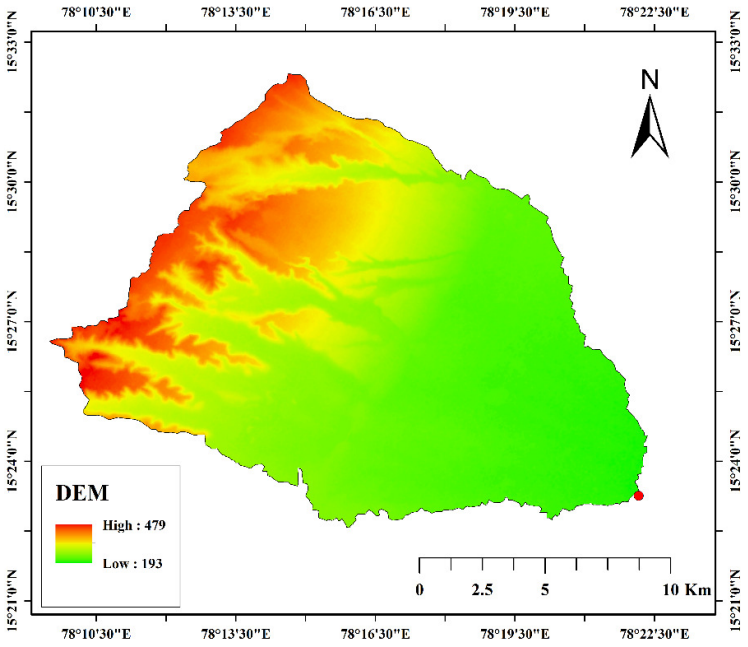

Fig-02: Digital Elevation map of the study area

3.0 Materials & Methodology

3.1 Materials

The source of organisation of data for study area shown in (Table -01) the generation of input parameters for explore the morphometric analysis has been successfully accomplished through the integration of remote sensing and geographic information systems (GIS).

Table -01 Data and resources utilized in the determination of geomorphic in the present area.

3.2 Methods

The present study adopts the following methodology and procedure to achieve its objectives. Collection of satellite data and Topographical maps. Rainfall and other collateral data within the study area. Drainage pattern , stream order, surface water bodies' Contour, Slope, Aspect, and Relief maps based on the Digital Elevation Model (DEM) as shown in (fig-02).Conducting preliminary pre-field interpretation of Hydro geomorphology using Satellite data for delineated sub-watersheds was exported in Arc GIS 10.8 software for used to morphometric analysis. Recommending a land and water resources development plan.

3.2.1 Drainage Morphometric Analysis

In a GIS environment, we conducted an assessment of the basins linear, aerial, and relief characteristics. Subsequently, we generated graphs and performed linear regression analysis to investigate the inter relationships among certain variables. These variables included a range of morphometric parameters of the basin, such as perimeter, stream order, stream length, bifurcation ratio, stream length ratio, basin length, drainage density, texture ratio, stream frequency, form factor, circularity ratio, elongation ratio, and length of overland flow. We thoroughly examined and provided detailed discussions on these parameters. For a comprehensive understanding of the morphometric analysis, refer to the various notations and methodologies outlined in (Table 02)

Table -02 "Methods and sources utilized for the computation of geomorphic parameters."

Stream Numbers:

The total number of streams in each order is called as the Stream Number. After Stream Order, the 2nd step in Morphometric analysis is to count the Stream Number. The Stream Number decreases with the increasing order of stream (as shown in Table 02). Stream number is inversely proportional to stream order. Horton has developed 'Law of Stream Number'. According to this Law, when Stream Number (taken in arithmetic scale) is plotted against Stream Order (taken in logarithmic scale), it gives a negative linear pattern. It means number of streams from highest to lowest order in a particular basin tend to give a Geometric Series. In the 5th order river basin shown in (Fig 04), the series is 19, 48, 121, 157, and 352 which is plotted on the logarithmic scale to the Fig-03.

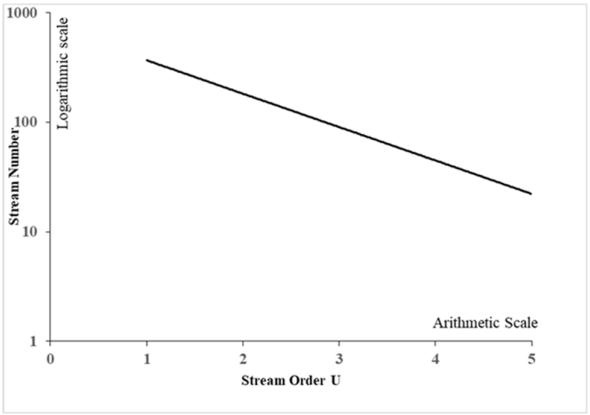

Fig-03: Stream order Vs Stream number (N_u)

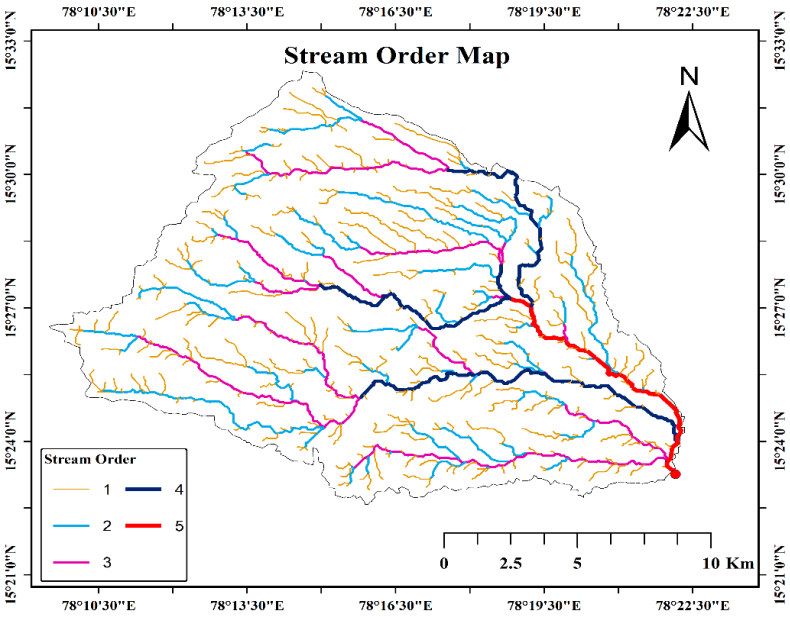

Fig-04: Drainage with stream network and order map of the study area

3.2.2 Stream Order (N_u):

Stream order, also referred to as water body order is a positive whole number utilized in the fields of geomorphology and hydrology to denote the extent of branching within a river system. Various techniques for stream ordering, such as those proposed by (Horton in 1945)[19] and (Strahler in 1952), exist. In this study, Strahler's method, which is a slightly modified version of Horton's approach, was employed to assess stream order. According to this system, the smallest streams, which have no branches, are classified as first order. When two first-order streams converge, they become second order, and two second-order streams joining together become third order, and so on. If streams of different orders merge, they retain the highest order. In the case of the Nandivargam basin, it is classified as a fifth-order stream. In total, 697 streams were identified in the study area, with 352 being first order, 157 second order, 121 third order, 48 fourth order, and 19 fifth order (as shown in Fig-05). The analysis of stream network characteristics is crucial for comprehending the hydrological processes within the basin. Stream magnitude is strongly linked to the portion of the entire basin area that contributes to runoff, making it a reliable indicator of relative stream discharge in smaller river systems. Strahler's stream order classification has been utilized in numerous river systems.

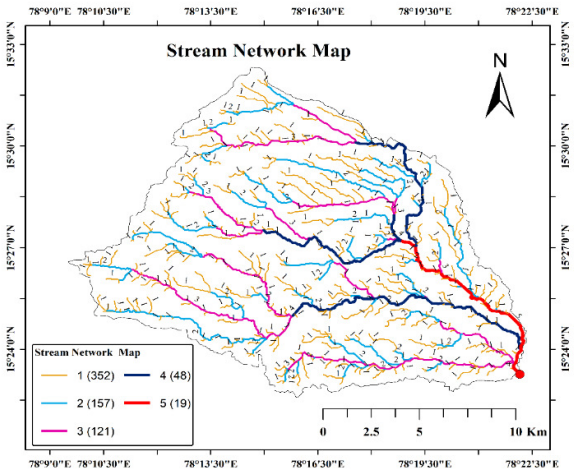

Fig-05: Drainage with stream network and order map of the study area

3.2.3 Stream length (L_u)

The research includes the assessment of the quantity of streams with varying orders inside a sub-watershed, along with the measurement of their lengths from their starting points to the point where they reach the drainage divided. The calculation of stream length (Lu) for 14.67km sub-watersheds has been computed on the proposed by (Horton's 1945) method, as indicated in (Table 2). and according to this law, the cumulative mean length of streams increase in geometrical progression with increase of stream order. If stream order is taken on X- axis on an arithmetic scale and cumulative mean length of stream on Y-axis a logarithmic scale, it gives a positive liner pattern. The relationship Stream length Vs Cumulative stream length which is follows. Stream Order and Total Stream Length exhibit an inverse correlation. Stream Order and Mean Stream Length display a direct correlation. Stream Order and Cumulative Mean Stream Length demonstrate a positive association. Furthermore, (Fig-06) besides, the latter increases geometrically with each successive higher order.

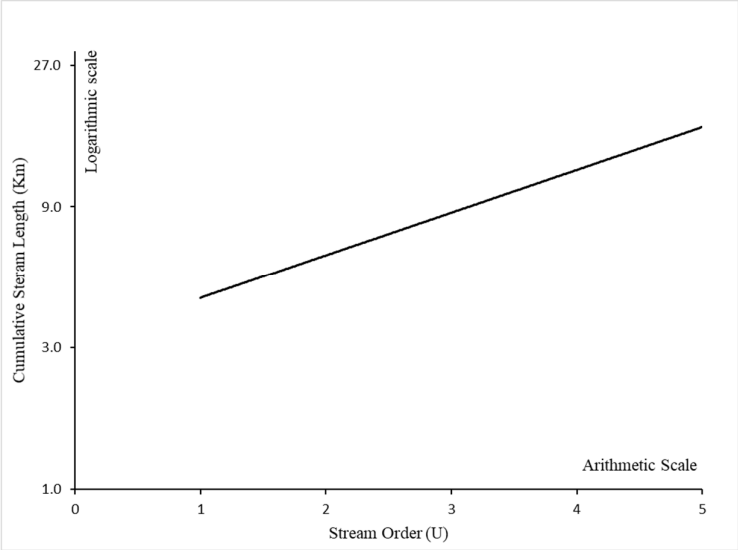

Fig-06: Stream order Vs Cumulative Stream length (L_u)

3.2.4 Mean stream length (L_{sm})

According to Strahler (1964), the mean stream length (Lsm) is an inherent property connected to the drainage network and its associated surfaces. To calculate the mean stream length (Lsm), the total stream length of order 'u' is divided by the number of streams of the same segment or order 'u' (Table 2).

3.2.5 Stream length ratio (RL)

The ratio of the mean length of one stream order to the next lower order of stream segment may be termed as the length ratio (RL). According to Horton's law (1945) of stream length, the mean stream length segments of successive orders in a basin tend to form a direct geometric series, with stream length increasing as the order of streams goes higher. The variation in stream orders within the research area demonstrates sub-basin, likely due to variations in topography, slope. And exhibit an increasing length ratio from lower to higher orders, suggesting a more advanced geomorphic stage. Conversely, the transition from one order to another in the remaining sub watershed indicates a youthful stage (Table-02).

3.2.6 Bifurcation ratio

The term bifurcation ratio (Rb) may be defined as the ratio of the number of the stream segments of given order to the number of segments of the next higher order (Schumn, 1956). Horton (1945) considered the

bifurcation ratio as an index of relief and dissections. Strahler (1957) demonstrated that bifurcation ratio shows a small range of variation for different regions or for different environment except where the powerful geological control dominates.

Table No.03 Liner aspect of the Nandivargam sub-watershed.

Sno.	Stream Order (W)	Number of Stream (Nu)	Bifuration ratio (Rb)	Mean Bifuration Ratio (Rbm)	Total Length of Stream (Km)	Mean length of streams (Km)	Length ratio (R_L)
1	I	352			3.73		
2	II	157	2.24		3.16		
3	III	121	1.30	2.15	3.22	2.93	1.02
4	IV	48	2.52		2.22		
5	V	19	2.53		2.33		
	Total	**697**		**Total**	**14.67**		

Based on the information presented in (Table 3), it can be observed that the bifurcation ratio (R_b) varies between different orders of the drainage system. These variations are influenced by the geological and lithological characteristics of the drainage basin, as explained by (Strahler, 1964). Lower R_b values are indicative of sub-watersheds that have experienced fewer structural disturbances, as noted by (Strahler, 1964) and where the drainage patterns have remained relatively undistorted due to such disturbances, as mentioned by (Nag. 1998). The mean bifurcation ratio (R_{bm}) can be defined as the average of the bifurcation ratios across all orders. In this particular case, R_{bm} ranges from 2.15 in the Nandivargam sub-watershed, classifying it within the normal basin category.

3.2.7 Drainage density

Horton (1932) has introduced drainage density (D_d) into American hydrologic literature as an expression to indicate the closeness of spacing of channels. It is defined as the total length of streams of all orders per drainage area. Langbein (1947) recognized the significance of D_d as a factor determining the time of travel by water and he also suggested a drainage density varying between 0.55 and 2.09 km/km^2 in humid region with an average density of 1.03 km / km^2. Density factor is related to climate, type of rocks, relief, infiltration capacity, vegetation cover, surface roughness and run-off intensity index. Of these only surface roughness has no significant correlation with drainage density. The amount and type of precipitation influences directly the quantity and character of surface run-off. An area with high precipitation such as thundershowers loses greater percentage of rainfall as run-off resulting in more surface drainage lines. Amount of vegetation and rainfall absorption capacity of soils, which influences the rate of surface run-off, affects the drainage texture of an area. The similar condition of lithology and geologic structures, semi-arid regions have finer drainage density texture than humid regions. According to Nag (1998), low drainage density generally results in the areas of highly resistant or permeable subsoil material, dense vegetation and low relief. High drainage density is the resultant of weak or impermeable subsurface material, sparse vegetation and mountainous relief. Low drainage density leads to coarse drainage texture while high drainage density leads to fine drainage texture. The average drainage density 1.82km/km^2 indicating low drainage density (Table 2). In the study area, the low drainage density indicates the region has highly permeable subsoil and thick vegetative cover. The drainage density map is shown in (Fig. 07)

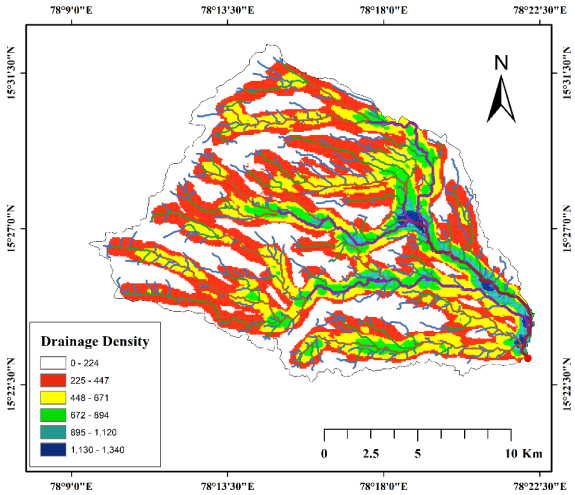

Fig-7: Drainage density map of the Nandivargam sub-watershed

3.2.8 Stream frequency

Horton (1932) introduced stream frequency (F_s) or channel frequency which is the total number of stream segments of all orders per unit area. Stream frequency, also known as channel frequency, refers to the overall count of stream segments of various orders within a given area 2.87(as shown in Table 02). In theory, it is conceivable for two basins with the same drainage density to have different stream frequencies, and conversely, two basins with the same stream frequency may exhibit varying drainage density. Table 2 provides data on stream frequency for the study area. It is noteworthy that there is a positive correlation between stream frequency (F_s) and the drainage density values of these sub-basins, signifying an increase in the number of streams relative to an increase in drainage density.

3.2.9 Drainage texture

Drainage texture (T) is a significant concept within geomorphology that pertains to the relative spacing of drainage lines. It's worth noting that drainage lines tend to be more abundant in impermeable areas compared to permeable ones. According to Horton (1945), "T" is defined as the total number of stream segments of all orders per unit perimeter of a particular area. Horton identified infiltration capacity as the primary factor influencing Rt and considered it as part of drainage texture, which encompasses both drainage density and stream frequency. Smith (1950) further categorized drainage density into five distinct textures. A drainage texture of less than 2 is classified as very coarse, between 2 and 4 as coarse, between 4 and 6 as moderate, between 6 and 8 as fine, and anything greater than 8 is considered very fine drainage texture. In Table 02, it is observed that the drainage texture from 5.22. For instance, sub-watershed exhibits a moderate course.

3.2.10 Form factor

According to Horton (1932), form factor (F_f) defined, as the ratio of basin area to square of the basin length (Table 2). The value of Form factor (F_f) is always less than 0.7854, which is for a perfectly circular basin (Strahler, 1964). The form factor values of the sub watershed in the study area of value 1.15. Basins of low form factor are elongated and have flatter peak flows for longer duration, while the basins with high form factors are circular and have high peak flows for shorter duration.

3.2.11 Circularity ratio

It represents the proportion of the basin's area to that of a circle with an equivalent perimeter as the basin (Miller 1953). Circular ratio (Rc) is affected by various factors such as the length and occurrence of

streams, geological formations, land usage, climate, terrain, and the slope within the basin. In this particular investigation, the Rc value is recorded as 0.49 (as shown in Table 2). The notable Rc value of 0.49 in the Nandivargam sub-watershed indicates that this particular sub-basin possesses a relatively circular shape. Moreover, it features a topography marked by substantial to moderate relief.

3.2.12 Elongation ratio

Elongation ratio (Re) is the ratio defined as the ratio of diameter of the circle of the same area as the drainage basin and the maximum length of the basin (Schumm, 1956). The values of "Re" generally numerical value varies from 0 to 1.0 over a wide variety of climatic and geo- logic conditions. Values close to 1.0 are typical of regions of very low relief, whereas values in the range 0.6–0.8 are usually associated with high relief and steep ground slope (Strahler, 1964). These values can be grouped as a three categories namely (a) Elongated (< 0.7), (b) Oval (0.9 -0.8) (c) Circular (> 0.9). The current research study area computed Re value of Re is 0.83, which is greater than 0.8, this sub watershed has a shape that is almost circular and typically belongs to regions of low relief areas (as shown in Table 2).

3.2.13 Length of overland flow

Surface water movement plays a significant role in triggering the formation of channels. "Overland flow" is the term employed to characterize the movement of water on the basin surface that occurs beyond the boundaries of a defined stream channel. Traditionally, the generation of overland flow is classified into two primary mechanisms: "infiltration excess," by Horton's work (1945). This factor basically relates inversely to the average slope of the channel. The length of overland flow (Lg) approximately equals, to half of the reciprocal of drainage density (Horton 1945). The current research study area calculated Lg value is 0.28.

3.2.14 Relief (R) and Relief Ratio of the Basin.

The term "total relief" refers to the difference in elevation between the highest and lowest points within a basin's valley floor. The "relief ratio," denoted as R_r and introduced by (Schumm 1956), quantifies the minimum relief relative to the horizontal distance along the longest axis of the basin, aligned with the primary drainage channel. This ratio serves as a metric for assessing the overall steepness of a drainage basin and provides insight into the level of erosion occurring on its slopes. the computed R value for the basin is 293, as presented in Table 2. This suggests that a substantial portion of the basin displays a pronounced slope.

3.2.15 Aspect Map

An aspect map typically refers to the orientation of a mountain slope, indicating the direction it faces. This aspect map holds significant importance in understanding the local climate's sensitivity to sunlight within the region. In general, slopes facing west tend to experience the hottest part of the day during the afternoon, and, in most cases, these west-facing slopes are warmer than their sheltered counterparts facing east. The aspect map plays a pivotal role in influencing the types of vegetation found in an area. When derived from SRTM DEM data, the aspect map indicates the compass direction of the slope's orientation, with 0 degrees denoting true north, and a 90-degree aspect pointing to the east (Fig. 8). In the case of the Nandivargam sub-watershed, it predominantly features east-facing slopes. Consequently, these east-facing slopes exhibit higher moisture levels and more abundant vegetation compared to their west-facing counterparts.

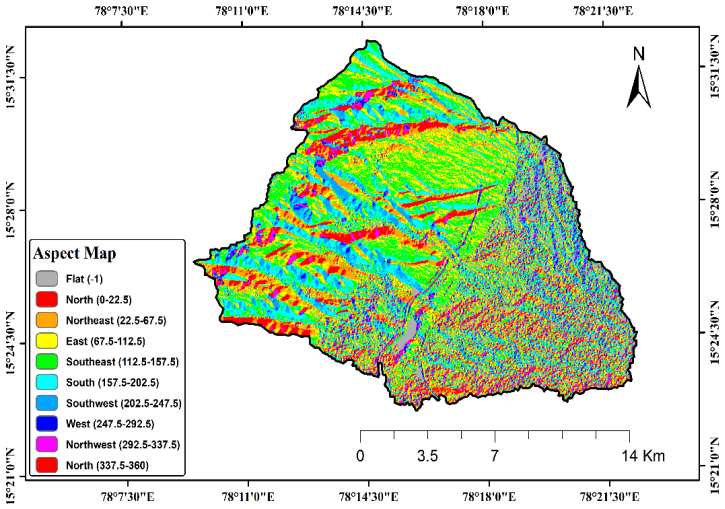

Fig-8: Aspect map of the Nandivargam sub-watershed

3.2.16 Slope Map

Slope is the measure of change in surface value over distance and can be expressed in degrees or as a percentage. In a raster format, the Digital Elevation Model (DEM) is a grid where each cell is a value referenced to a common datum. For extraction of elevation from remote sensing dedicated software packages are required but most GIS packages have routines for point or contour line interpolation. Any two points on the grid will be sufficient to ascertain a slope. Once the slopes have been calculated, then the maximum difference can be found and the gradient can be determined (Burrough and McDonnell, 1998; Maathuis, 2006; Jha et al. 2007). In the present paper topographical elevation map for the study area was developed by Digital Elevation Model (DEM) extracted from the Shuttle Radar Topography Mission (SRTM) data. For this, the DEM was subjected to two directional gradient filters (one in x-direction and another in y-direction).The resultant maps were used to generate a slope map of the study area using ARCGIS Spatial Analyst tools. The highest topographic elevations 395 m and lowest 102m exist in the western and northwestern portions of the area which induces highest runoff and hence less possibility rainfall infiltration. The slope map of the study area has grouped in five classes in degrees viz. 1°–3° (Gentle), 3°–5° (Moderate), 5°–10°(Steep) , 10°–35° (Very Steep) and >35° (Very Very Steep). The current study area observed that the gently slope 0-2.27%, moderate slope 2.28% to 6.28%, Steep 6.29% to12.2%, very steep 12.3% to 18.7%,very very steep 18.8% to34.1%. as shown Fig 09.

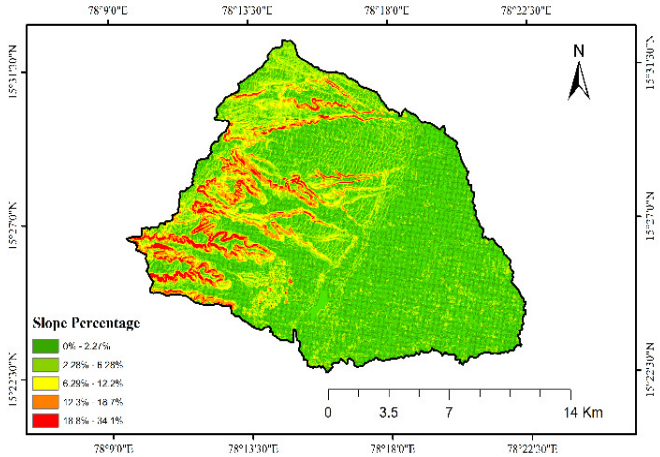

Fig-9: Slop map of the Nandivargam sub-watershed

4.0 Result and discussion

Assessment of watershed using quantitative morphometric analysis can provide information about the hydrological nature of the rocks exposed within the watershed. A drainage map of a basin provides a reliable index of permeability of the rocks and gives an indication of the yield of the basin. The DEM has been obtained with a pixel size of 90 m and furthermore, it has been used to calculate slope and aspect maps of the watershed. The development of drainage networks depends on geology, precipitation apart from exogamic and endogenic forces of the area. Shuttle Radar Topographic Mission (SRTM) Digital Elevation Model (DEM) data were used for preparing slope, aspect maps and morphometric analysis of the watershed. Linear, areal and relief aspects of the watershed were evaluated in GIS environment using Arc GIS software. Recent development in geospatial technology, the assessment of drainage basin has been more accurate and precise for morphometric parameter evaluation with better accuracy. Satellite data and GIS have been successfully utilized to generate data on the spatial deviations in drainage characteristics thus L providing an insight into hydrologic conditions necessary for developing watershed management strategies (Das and Mukherjee, 2005). Hydrogeological observations, integrated with drainage analysis, provide useful clues regarding broad relationships among the geological framework of the basin. Therefore, the results reveal different levels of agreement using morphometric analysis, which were supposed to be different from one region to another. Factors controlling groundwater storage are different in space and time, and the majority of these factors depend on the following parameters: (1) rainfall availability as the source of water; (2) drainage characteristics have a role in the distribution of runoff and indicate an infiltration scheme and it governs the behaviour of water flow on terrain surface vertically and horizontally; (3) rock type for which the lithologic character governs the flow and storage management; (4) slope is another influencing factor, and it controls water flow energy, which plays a role in facilitating water flow in the basin. The morphometric analysis can be achieved through measurements of linear, areal and relief aspects of basin.

5.0 Conclusion and Recommendation:

The hydrological analysis carried out for the Nandivargam sub- watershed confirms that the watershed is having low relief and circular shape. Drainage network of the basin exhibits as mainly dendritic type which indicates the homogeneity in texture and lack of structural control and helps understand various terrain parameters such as nature of the bedrock, infiltration capacity, runoff, etc. Lower drainage density and stream frequency indicate high permeability rate of the subsurface formation. The observed parameters reveal recharge-related measures and areas where surface-water augmentation measures can be undertaken for water resource management and soil conservation structures. Large scale watershed analysis using GIS, remote sensing data and Digital elevation Model (DEM) has efficient tools for understanding any terrain parameters such as nature of bedrock, infiltration capacity, surface run off etc., which helps in better understanding the status of land form and their processes, drainage management and evolution of groundwater potential for watershed planning and management. This work will be useful for natural resource management at the micro level of any terrain for sustainable development by planners and decision makers for sustainable watershed development programme. The results observed in the present work can be used for site suitability analysis of soil and water conservation structures in the area and subsequently, these parameters were integrated with other hydrological information viz., The study recommended that the watershed needs a hydrogeological and geophysical investigation in future for proper water management and selection

Application of Preformed Floc Adsorbents in the Removal of Acid Dye from an Aqueous Solution

Preformed flocs prepared by using coagulants, i.e. $Fe_2(SO_4)_3$, $MnSO_4.4H_2O$, and $MnCl_2.4H_2O$, were applied as adsorbents for the decolorization of an aqueous C.I. Acid Red 1 dye solution. In order to determine the decolorizing efficiency of different adsorbents, kinetic and equilibrium studies were carried out at the optimum pH. Excellent color removal of 87 % was obtained with $Fe_2(SO_4)_3$ at pH 4, good color removal of 65 % was achieved with manganese sulfate at pH 10, and moderate color removal of 58 % was obtained with manganese chloride at pH 10, at an optimum sorbent dose of 500 mg L^{-1} and an equilibrium contact time of 15 min. The sorption data of the equilibrium studies fitted well to the Langmuir isotherm, stating the occurrence of monolayer formation in the adsorption process of dye color removal. The maximum adsorption capacities of ferric sulfate and manganese sulfate are 47.619 and 23.474 mg g^{-1}, respectively. The data of the kinetic studies fitted well to the pseudo-second-order equation, stating that chemisorption is the rate-limiting step.

1 Introduction

Dyes are used in many industries, such as in textile, paper pulp, tannery, cosmetics, leather, plastics, printing, rubber, food, and pharmaceuticals production [1–5]. Dyes are aromatic amines with different types of organic functional groups and with heavy metals embodied in the basic structure, like chromium, copper, and cobalt [6]. The presence of such metals retards biological treatment. Their discharge into water bodies causes pollution due to their recalcitrant nature. The toxicity of dyes causes serious problems for the environment, aquatic life, and human and animal health [7].

The presence of coloring matter in significant quantities in receiving water would not only reduce light penetration and photosynthetic activity, but would also render their appearance unaesthetic [8, 9]. Furthermore dyes may impart toxicity to aquatic and plant biota and may be mutagenic and carcinogenic, causing severe damage to human life, such as misfunctioning of the kidneys, brain, liver, reproductive system, and central nervous system [10]. A majority of the used dyes are azo dyes, which are bright in color due to the presence of one or several azo (–N=N–) groups associated with substituted aromatic structures [11–13], and consist of more stable organic compounds that are carcinogenic, also causing allergic responses after exposure to them [7]. Therefore, it becomes mandatory that color should be removed from dye effluents before disposal of the effluent. Treatment processes such as physical, physicochemical, chemical, and biological methods have been investigated and proved to be effective, but to varying degrees of success [14]. Michaels and White [15] observed that treatment through biological methods cannot reduce the chemical oxygen demand (COD) and color, even though it reduces the biochemical oxygen demand (BOD). Chemical coagulation seems to be a very efficient method in the removal of color from dye wastewater [14, 16–19]. Coagulation and flocculation of the inorganic coagulants such as ferric sulfate, manganese sulfate, alum, and iron salts have been used in the decolorization of dye color over many years. But the main disadvantages of coagulation treatment are the process control and the sludge production, for which settling, dewatering, and converting to a cake for land filling is needed [20]. Among different methods, the adsorption process has good potential in removing dyes from effluents, due to its simplicity of design, ease of operation, wide adaptability, high efficiency, and economic viability [21]. The adsorption process produces good-quality effluent and it is

Abstract:
Nickel polluted wastewater is directly or indirectly discharged into the environment increasingly, especially in developing countries. It is difficult to remove nickel from wastewater using conventional methods. Efficient method like advanced oxidation process is an important breakthrough in the removal of nickel. This method is referred to as ultrasound assisted advanced oxidation process in the removal of nickel. This study investigated the use of Hydrogen peroxide, Fenton Reagent, ultrasound homogenously and heterogeneously. The removal efficiency of homogenous process and heterogenous process along with the process parameters like concentration of oxidant, effect of pH, Optimum dosage of Oxidants and time taken were investigated. Results indicated that removal efficiency is strongly dependent on the optimal pH and the dose of the oxidant. All the oxidants can removal nickel effectively from the wastewater but the maximum removal which provides desirable nickel quantity after treatment was obtained by heterogenous processes. At optimal pH:11Fenton reagent and Ultrasound process in combination with Hydrogen peroxide and Fenton reagent has shown 98%, 100% and 100% removal respectively.

I. Introduction

Growing industrial development is leading to the production of contaminants that are seriously threatening the ecosystem and the contamination of water resources has been a worldwide environment problem. Heavy metals are the elements having atomic weights between 63.5 and 200.6 and specific gravity greater than 5 which are non bio-degradable. Toxic heavy metals of particular concern in treatment of industrial wastewater include copper, zinc, nickel, mercury, cadmium, lead and chromium. Among these different heavy metals, nickel is extensively utilized in the modern industry.

The tolerance limit of nickel in drinking water is 0.01 mg/L, and for industrial wastewater it is 2.0 mg/L. However, effluents of different industries contain higher concentrations of nickel than its acceptable limit. Nickel is well known heavy metal pollutant, which is present in effluents of electroplating industries to the tune of 20 – 200 ppm (Piyush kant pandey et al., 2007).

The intake of nickel in considerable concentrations may cause formation of free radicals in body tissue which leads to various DNA complications, serious lung and kidney problems, gastrointestinal distress, pulmonary fibrosis, headache, dizziness, dry cough, vomiting, extreme weakness, and direct exposition to nickel cause skin dermatites. So it is very essential to remove Nickel from soil, industrial wastewater and effluents.

Generally, the nickel wastewater is amenable to physical, chemical and biological treatment but is inefficient and involves high cost in removal of nickel. In this sense, procedure known as Advanced Oxidation Process (AOP) are being studied and applied to mineralize non-biodegradable organic compounds or oxidize bio degradable compounds, that converts them completely into CO_2 and H_2O (Hoffman et al., 1995). Advanced Oxidation Process (AOP) is defined as aqueous phase oxidation processes which are based primarily on the intermediacy of the hydroxyl radicals in the mechanism resulting in the destruction of target pollutant (Poulopoulos et al., 2006).

In the present work, synthetic nickel wastewater was prepared by Nickel Ammonium Sulphate for the concentration of 200 mg/L and was treated by Advanced Oxidation Process (AOP). The processes were carried out with Hydrogen Peroxide (H_2O_2), Fenton Reagent, and Ultrasound and with a combination of US + H_2O_2 and US + Fenton Reagent Further removal of nickel has been studied. Various process parameters like concentration of oxidant, effect of pH, Optimum dosage of Oxidants and time taken were investigated.

An Experimental Investigation on the Properties of Geopolymer Concrete with Partial Replacement of Marble Powder

Kowsalya Burra[1], Dr. B. Madhusudana Reddy[2]

[1]PG Student, Department of Civil Engineering, SVU College of Engineering, Tirupati, Andhra Pradesh, India
[2]Professor, Department of Civil Engineering, SVU College of Engineering, Tirupati, Andhra Pradesh, India

ABSTRACT

This research provides a geopolymer concrete investigation in which fly ash is partially replaced with marble powder. Geopolymer concrete uses waste materials such as fly ash (FA) and an alkaline solution (NaOH&Na2SiO3) to form a strong binder, replacing cement and including marble powder as a partial substitute. This experimental study looks at the tensile properties of geopolymer concrete with different quantities of fly ash replaced by marble powder. The major purpose is to use landfilling waste, such as marble powder, as a binding agent in geopolymer concrete at varying percentages (0, 5%, 10%, 15%, 20%, and 25%) instead of fly ash. The geopolymer mix is designed for a 12M, with an alkaline-to-binder ratio of 0.45. By adding fly ashwith marble powder, the concrete achieves 28-day cube strengths ranging from 40 to 60 MPa utilizing air curing procedures. This formulation allows for rapid strength development, making it appropriate for large structural elements (e.g., precast) without the requirement for extended conventional curing times. Superplasticizers, notably PCE (Poly Carboxylate Ether)-based ones, are used to improve workability. Mechanical property tests were performed, including compressive strength for 100*100*100 mm cubes, split tensile strength for 100*200 mm cylinders, and flexural strength for 500*100*100 mm prisms. When compared to conventional geopolymer concrete, which does not contain partial replacement marble powder, the concrete achieves 28-day cube strengths ranging from 40 to 60 MPa using air curing methods. This formulation allows quick strength growth, making it suited for heavy structural parts.

Keywords: Geopolymer concrete, Fly ash, Marble powder, Mechanical properties, Optimum percentage.

INTRODUCTION

Sustainable development is a crucial topic today due to the deterioration of the human environment and natural resources. Cement manufacture is a large contributor to air pollution, accounting for around 7% of global carbon dioxide emissions. Rapid urban development causes building construction and demolition, resulting in large volumes of waste that are frequently dumped in landfills. To address this issue, researchers are investigating the use of industrial waste materials such fly ash, powdered granulated blast furnace slag, and marble powder as alternatives to ordinary cement in construction. Geopolymer, a cement-free binder, is gaining popularity for its ability to include elements such as fly ash and marble powder. In a recent study, marble powder was studied as a partial replacement for fly ash in geopolymer to determine the impact on strength attributes. Various percentages (0%, 5%, 10%, 15%, 20%, and 25%) of marble powder were examined, and mechanical properties of the resulting geopolymer materials were evaluated. The data were compared to traditional concrete mixes to examine the feasibility and effectiveness of employing marble powder in geopolymer concrete manufacture.

This experimental investigation focuses on the strength behavior of geopolymer concrete when Fly Ash is partially replaced with Marble powder. The primary goal of the study is to determine the optimal proportion of Marble powder in enhancing the strength of Fly ash-based Geopolymer Concrete by partially substituting Fly ash with Marble powder at various percentages such as 0%, 5%, 10%, 15%, 20%, and 25%. The geopolymer is designed for 12M and has an alkaline-to-binder ratio of 0.45 and a sodium silicate-to-sodium hydroxide ratio of 2. The mechanical properties of geopolymer materials including fly ash, marble powder, fine aggregate, coarse aggregate, and alkaline solution were tested. For the compression test, 100mm x 100mm x 100mm cubes were constructed.For the purpose of testing split tensile strength, a 200mm diameter by 100mm length cylinder was used, and 500mm x 100mm x 100 mm prisms were constructed. The results of the flexural strength test were compared with the typical control mix, that is, without partial replacement.

Objectives:

- To find the optimum percentage of Marble Powder in developing the strength in Fly ash based Geopolymer concrete mix.
- To determine the mechanical properties of geopolymer concrete such as Compressive strength for cubes(100mm*100mm*100mm), Split tensile strength for cylinders(200mm*100mm), Flexural strength for prisms (500mm*100mm*100mm) at various replacement levels of Marble Powder dust as partial replacement of Fly ash in geopolymer concrete.
- To compare the mechanical properties of Fly ash based Geopolymer Concrete with partial replacement of Fly ash with Marble Powder to those of control concrete mix of Geopolymer Concrete.

MATERIALS USED

Fly ash

Fly ash, a residue derived from the combustion of pulverized coal in coal-fired thermal power plants, serves as a valuable component in hydraulic-cement concrete, significantly enhancing its properties. When mixed with hydraulic cement during hydration, fly ash contributes to the formation of a binding agent. This study employs class-F fly ash as a supplementary cementitious material, aiming to improve both the initial and long-term characteristics of concrete. Typically, fly ash utilized in concrete applications exhibits a color spectrum spanning from dark grey to yellowish tan.

Coarse aggregate

Well graded coarse aggregate conforming to the provision of IS: 383-2016 is going to use throughout the investigation. The aggregate of nominal size 12mm were blended to a desired proportion and mixed intimately to obtain well graded aggregate.

Table-1: Properties of Coarse aggregate

Specific gravity	2.65
Water absorption	0.73%
Fineness modulus	6.31

Fine aggregate

Locally available river sand conforming to is 383:2016 specifications passing through 4.75 mm sieve and retained on 75µm was used as the fine aggregate in the concrete mix. The fineness modulus, specific gravity were determined and sieve analysis of the fine aggregate and the corresponding grading curve is shown.

Table -2: Properties of Fine aggregate

Specific Gravity	2.58
Fineness modulus	3.15
Grading	Zone-II

Marble Powder

Marble powder entering open areas causes environmental, health and economic losses. Waste marble powders can be used in geopolymers to eliminate these disadvantages and provide sustainable environmental and eco-economic benefits. The Marble Powder is a calcium-rich waste material produced from processing plants sawing and polishing of marble blocks.

Table -3: Chemical composition of Marble Powder

Chemical composition	**Percentages**
Silica (SiO_2)	21.12
Iron Oxide (Fe_2O_3)	3.24
Alumina (Al_2O_3)	5.62
Calcium Oxide (Ca O)	62.94
Magnesium Oxide (MgO)	2.73
Potassium Oxide (K_2O)	0.25
Loss on ignition	38.65
Fineness	Completely passing through 90 Micron sieve

Sodium Hydroxide solution
Generally, the sodium hydroxides (NaOH) are available in solid-state in the forms of pellets or flakes. The price of sodium hydroxide varies a lot depending on how pure of product. The solution of NaOH was prepared by dissolving pellets in water for different molarity. It is recommended that NaOH solution should be made 24 hours before casting and should be used within 36 hours of preparing the solution otherwise it will be converted into a semi-solid state.

Sodium Silicate solution
Sodium metasilicate is also known as sodium silicate and is of industrial grade with SiO2 as 29.4% by mass and Na2O as 14.7%. As per the manufacturer, silicate is used as a bonding agent in detergent industries and textiles industries.

Super plasticizer
AURAMIX 450 is utilized as superplasticizer in this project. It is a polycarboxylate ether (PCE) based high performance super plasticizer. It is used for concrete requiring long workability retention. Appearance is light yellow colored and its pH is of minimum 6.

Water
The locally available potable water, which is free from the concentration of acids, organic substances, is used for mixing solution and concrete which promotes chemical reaction and also helps in the strength attaining of concrete. So bad quality of water affects the strength. It is necessary to follow quality analysis and water purity before being used in the project.

MIX DESIGN

Preparation of Alkaline solution
Alkaline solutions are created by mixing sodium hydroxide solution and sodium silicate at room temperature. When these solutions are combined, they initiate a reaction, known as polymerization, releasing a significant amount of heat. It is advisable to let the mixture sit for approximately 24 hours to allow the alkaline liquid to fully form as a binding agent. In this study, geopolymer concrete is prepared using 12 molarities of sodium hydroxide. The molecular weight of sodium hydroxide is 40. To prepare a 12M solution, 480g of sodium hydroxide flakes are measured and dissolved in distilled water to create a 1-liter solution. This process involves slowly adding sodium hydroxide flakes to distilled water in a 1-liter capacity pycnometer until fully dissolved. Water and Super plasticizer are used only for workability purpose. After many trial mixes by changing water and super plasticizer percentages at finally below mentioned percentages got high workability of 110 mm slump.

Table – 4: Ingredients of Geopolymer concrete

Material	Proportions (Kg/m^3)
Coarse aggregate	924
Fine aggregate	756
Binder	496.55
Sodium Hydroxide	74.48
Sodium Silicate	148.96
Super plasticizer	1% of Binder
Water	10% of Binder
Molarity	12M
Na_2SiO_3: NaOH	2

Mix design
In this design, a 12M solution of sodium hydroxide is utilized for alkaline preparation. The ratio between sodium hydroxide and sodium silicate is set at 2. The aggregate volume is determined as 70% of the total volume of the cube. The ratio of alkaline liquid to fly ash is maintained at 0.45. Fly ash is substituted with different percentages ranging from 0% to 25%, including 5%, 10%, 15%, 20%, and 25%.

Table -5: Various mix proportions of Geopolymer concrete

Mixes	Fly ash (%)	Marble Powder (%)
M0	100	0
M5	95	5
M10	90	10
M15	85	15
M20	80	20
M25	75	25

Mix Procedure

In the lab, the dry mixing of fly ash and aggregates took about three minutes in a pan mixer. Aggregates were prepped in a saturated-surface-dry (SSD) condition. Alkaline liquid was combined with superplasticizer and water. This liquid mix was then added to the dry materials, followed by mixing for an additional four minutes. Workability was assessed via the conventional slump test. Air curing is typically advised for low-calcium fly ash-based geopolymer concrete, with curing time and temperature significantly impacting strength. Specimens were cured at room temperature for 24 to 48 hours, with longer durations enhancing polymerization and strength

Figure 1: Casted Specimens

Figure 2: Failure Specimens

RESULTS AND DISCUSSION

Compressive strength Test

The primary test for strength evaluation is compressive strength, commonly conducted on cube specimens measuring 100mm x 100mm x 100mm. Compaction of each layer is achieved using a tamping rod, followed by leveling the top surface of the mould with a trowel. Specimens are tested after 7 days, 28 days, and 56 days to assess compressive strength across varying curing durations.

Table-6: Compressive strength

Mixes	Compressive Strength (MPa)		
	7 days	28 days	56 days
M0(Std mix)	34.88	39.15	40.80
M5	25.52	44.16	45.74
M10	27.67	52.85	54.43
M15	33.43	59.65	60.75
M20	**33.84**	**60.47**	**62.34**
M25	31.87	53.26	54.20

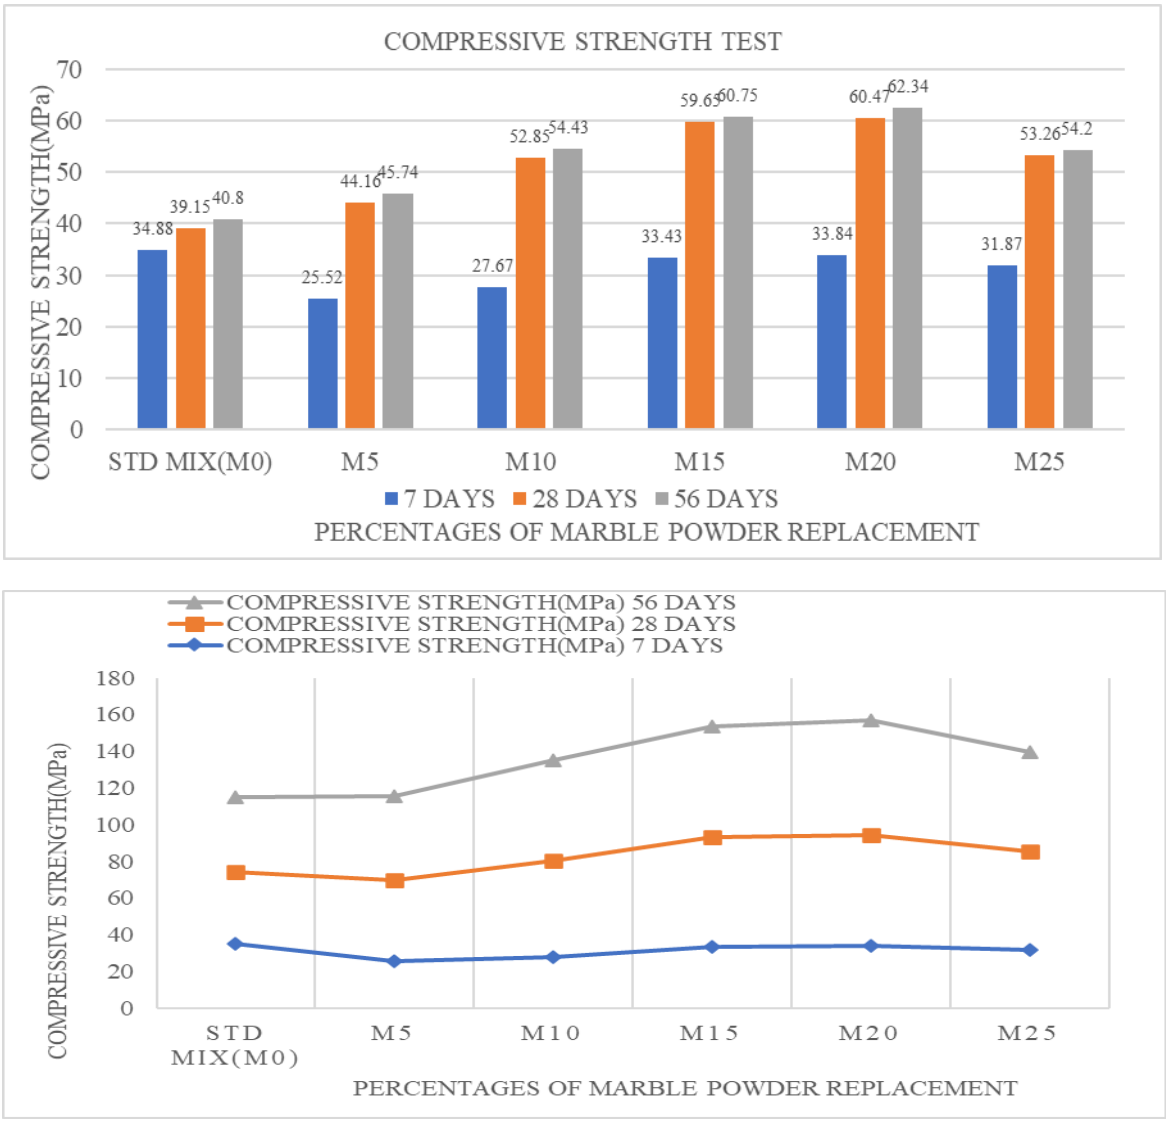

Figure 3: Comparison test of compressive strength on 7, 28 and 56 days with standard mix

Split tensile strength test

This test employs an indirect tension method, involving the placement of a cylindrical specimen horizontally between the compression testing machine's loading surfaces. Load is gradually applied until the cylinder fails along its vertical diameter. Notably, the same compressive testing machine and cylindrical specimen used for compression tests can be utilized. To mitigate high compressive stresses, narrow cracking strips of suitable material are incorporated. The split tensile test is known for its simplicity and ability to produce uniform results.

Table 7: Split Tensile strength

Mixes	Split tensile strength (MPa)
M0(Std mix)	1.71
M5	2.22
M10	2.51
M15	3.05
M20	**3.26**
M25	2.48

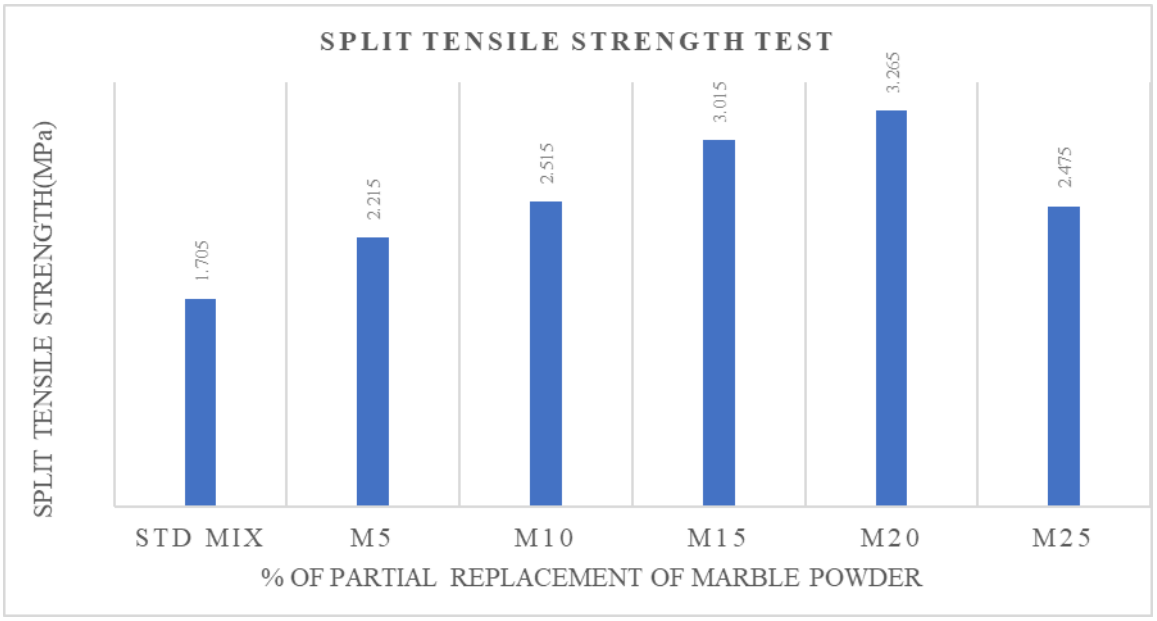

Figure 4: Variation of split tensile strength at 28 days with partial replacement of marble powder

Flexural Strength

The specimen was held on two rollers supports on the testing machine, Until its breakdown, the load was applied hydraulically through two equal rollers placed at the third point of the supporting span. The specimen is of 500 mm length, 100 mm breadth and100 mm height.

Table 8: Flexural strength test

Mixes	Flexural strength (MPa)

M25	5.94

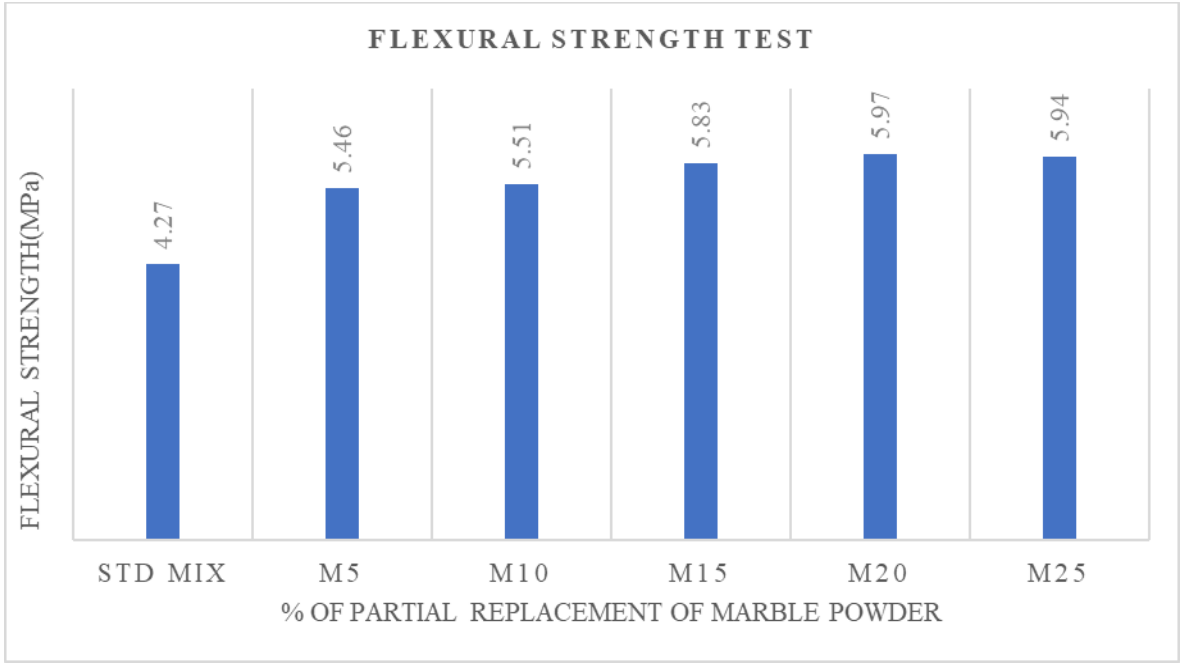

Figure 3: Variation of Flexural strength with partial replacement of Marble powder at 28 days

CONCLUSION

Durable, eco-friendly materials are sought for by the construction sector. GGBS and fly ash provide benefits over regular concrete. Optimizing the use of marble powder is the project's goal. The compressive strength of marble powder substitute peaks at 20% replacement by 28 days, and it is comparable to the regular mix after 7 days. Marble powder can boost the strength of geopolymer concrete by up to 20%. Structure is somewhat impacted by strength when it approaches 20% replacement. Marble powder has a compressive strength of 60.75 MPa at 20% replacement, which is 54% higher than that of normal mix. Marble powder outperforms normal mix, increasing strength by 76% (@M20) at 20% replacement in the split tensile test. At 20% replacement, flexural strength peaks at 5.97 MPa, representing a 40% increase (@M20) above normal mix. Slump value increases with the percentage of marble powder and exceeds that of traditional geopolymer concrete. The ease of geopolymer innovation is especially advantageous for precast applications. Particularly in harsh conditions, geopolymer concrete provides strength and a greater range of applications than regular concrete. Marble powder, an industrial waste that is only used for landfilling, is a very cost-effective addition to geopolymer concrete, and is the primary cause of the compressive strength increase of up to 60 MPa. It also contributes to the geo-polymerization process, which gives strength to the concrete. Instead of using cement, geopolymer concrete employs industrial waste as a binder, which reduces pollution and is also utilized in areas with limited fly ash production. There are therefore numerous benefits to employing these industrial wastes in the geopolymer concrete used for many heavy structural works.

Abstract: In this paper, a study was performed on the rheological properties of self-compacting concrete by the addition of Supplementary Cementitious Material (SCM) as Fly Ash with various percentages of 15%, 20%, 25%, and 30% in the different types of cement OPC, PPC, and PSC. The mix designs of self-compacting concrete were done by two methods of constants: Water-Binder Ratio Constant and Weight and Volume of Aggregates Constant for varying percentages of addition of Fly Ash with a fixed cement content of 380 kg per cubic meter. Flow ability (Flow Table and V Funnel) and Passing Ability (L-Box and U-Box) tests were carried out on fresh concrete in accordance to EFNARC with three different mixing times 5(initial), 30, and 90 minutes were done to find the self-compactibility of designed concrete mixes. Varying dosages of Super Plasticizer (Auromix 450) were added to obtain the required flow ability and passing ability of SCC without bleeding of water and segregation of aggregates. Self-compactibility of the designed SCCs was obtained for 20%, 25%, and 30% addition of SCM in Water-Binder Ratio Constant Method and 15%, 20%, and 30% addition of SCM in Weight and Volume Constant Method.

Keywords: Self-Compacting Concrete, Fresh Properties, Supplementary Cementitious Materials, Fly Ash, Constant methods, Mixing Time.

1. Introduction

With the rapid expansion of numerous structures throughout the world, the demand for self-compacting concrete (SCC) application is growing. Now a day's majority of the construction sites have issues of congestion of reinforcement in the structural members. The considerable seismic danger in the area, the facilities' susceptibility to cyclonic storms, and their massive capacity of expansion, all exacerbate the design flaws. SCC has become the only choice in such difficult site environments. Ideally, the development of concrete mix where placing and compaction have minimal dependence on the Standard of workmanship available on a particular site should improve the true quality of the concrete in the final structure, and hence its durability. This was an important driving force behind the development of self-compacting concrete (SCC). Self-compacting concrete is considered as a breakthrough in concrete technology due to its improved performance and working environment. It has wide application from thin elements to huge structures. SCC can be taken as the greatest technical advancement and most revolutionary development in concrete technology over the years. SCC is the concrete of the future, as it will be replacing normal concrete due to its distinct advantages.

The European Federation for Specialist Construction Chemicals and Concrete Systems (EFNARC) has developed guidelines for SCC, known as the "EFNARC Specification and Guidelines for Self-Compacting Concrete." These guidelines provide recommendations on mix design, fresh and hardened properties, and testing methods for SCC.

SCC can be produced using the same ingredients as that of normal concrete. A closer tolerance is required to ensure strict control of workability characteristics. The proportioning of SCC mix is much more scientific than that of conventional concrete mixes. SCC mix requires high powder content, lesser quantity of coarse aggregate, high range super plasticizer, and VMA (Viscosity Modifying Agent) to give stability and fluidity to the concrete

mix. The workability of SCC is the equilibrium of fluidity, deformability, filling ability, and resistance to segregation. This equilibrium has to be maintained for a sufficient time period to allow for its transportation, placing, and finishing. Combinations of tests are required to characterize the workability properties.

The most commonly used cement in self-compacting concrete (SCC) is Ordinary Portland Cement (OPC). OPC is widely available and has been extensively used in various concrete applications, including SCC. In self-compacting concrete, the cement content is usually adjusted based on the specific requirements of the project and the desired properties of the SCC mix. The selection of cement type may also depend on factors such as the project's location, local availability, and any specific performance requirements. The use of alternative types of cement is becoming more prevalent in the construction industry to address environmental concerns. For example, in some regions, where environmental regulations are stricter, or sustainability is a top priority, blended cements such as Portland Slag Cement (PSC) and Portland Pozzolana cement (PPC), have gained popularity due to their reduced carbon footprint and improved performance characteristics. Blended cements are already a combination of Ordinary Portland Cement (OPC) and supplementary materials, such as fly ash and slag. Adding more SCMs to these blended cements further enhances their properties and performance in SCC mixes such as Improved Workability, Reduced Permeability and Improved Durability, Reduced Heat of Hydration, Sustainable Solution, Setting Time, and Strength Development. The addition of SCMs to blended cements can also bring challenges to the mix design process. The interaction between various materials can affect the rheological behavior, setting time, and strength development of the SCC. Precise mix proportioning and testing are essential to ensure the desired performance of the concrete. The Percentage of dosage of SCMs in blended cements for SCC depends on various factors such as the type of SCM, Cementitious content, water-to-binder ratio, desired strength, and workability. Mix designs should be tested thoroughly to verify the fresh and hardened properties of the SCC to meet project specifications and requirements. In this study, the effect of fresh properties of SCC on addition of SCM to blended cement with different design mix methods was done.

Concrete, in general, loses workability over time because of the evaporation of water, the absorption of water through the aggregates, the hydration of cement, and increased mixing temperature. The properties of SCC deteriorate with prolonged mixing, casting, and finishing time. The effect of mixing time on concrete can be avoided or reduced by adding alternative cement materials or/and by increasing the dosage. Many researchers reported that the addition of high super plasticizer dosage may increase workability and decrease its negative effects that are caused by long mixing time. The increase in super plasticizer dosage may lead to wet surroundings, which increase workability, and the hydration process accelerates as water spreads between the cement granules. Thus, reducing concrete consistency increases bleeding and segregation. The effects of mixing time and suitable super plasticizer dosage still need further investigations to maintain the workability and consistency of concrete for a long time. In this study, workability was measured with 5, 30, and 60 minutes of mixing times with an optimized super plasticizer dosage for each mix.

2. Materials.

2.1. Cement:

In Production of SCC, Ordinary Portland Cement (OPC) - 53 grade, Portland Pozzolona Cement (PPC), and Portland Slag Cement (PSC) were used in this study. Some physical and chemical properties of cements which are collected from the cement manufacturer are shown in Table 1.

Table 1: Physical and Chemical Properties of Cements

2.2. Fly Ash

For this Study, Class F Fly Ash was used which is procured from Sri Damodaram Sanjeevaiah Thermal Power Station is located in Nelatur Village, near Krishnapatnam, Andhra Pradesh, India. The power plant is one of the coal-based power plants of Andhra Pradesh Power Development Company Limited (APPDCL) and is in compliant with India Standard IS 3812:2003.

Table 2: Physical and Chemical Properties of Fly Ash

Component	SiO_2	Al_2O_3	Fe_2O_3	CaO	MgO	TiO_2	SO_3	LOI	K_2O	Na_2O	Specific Gravity	Blaines' s Fineness
%	65.80	21.32	4.87	1.00	0.53	0.50	0.20	0.16	0.81	0.21	2.14	321

2.3. Aggregates

2.3.1. Fine Aggregate

Locally available river sand is used as fine aggregate. The sand was dried before use to avoid the problem of bulking. The fine aggregate complies with Zone 2 from the sieve analysis as per Indian Standard IS 383:2016

2.3.2 Coarse Aggregate

Locally available granite with a size ranges from 12.5 mm and down was used as coarse aggregate.

Table 3: Physical Properties of Fine Aggregate

Aggregate	Specific Gravity	Fineness Modulus	Water absorption	Bulk Density	Dry Rodded Unit Weight
Fine Aggregate	2.63	3.65	0.50%	1582.85 kg/m^3	-
Course Aggregate	2.66	6.66	0.10%	1472 kg/m^3	1495 kg/m^3

2.5 Super Plasticizer

For this study, the super plasticizer used in Auramix 450 manufactured by FOSROC Chemicals which complies with Indian Standards IS 9103: 1999. Properties of Auramix 450 which are collected from the manufacturer are shown in Table 7.

Table 4: Properties of Super Plasticizer

Specific Gravity	pH	Chloride Content	Appearance
1.07	6.1	Nil	Light yellow colour liquid

2.6 Water

Potable water is used in this study.

3. Mix Design of Self Compacted Concrete

Mix design procedure of self-compacting concrete is adopted by taking guidelines from the reference of works by Dr. Okamura and Dr. Ouchi, Japanese researchers who first developed Self Compacting concrete and the norms given in EFNARC. These guidelines are not intended to provide specific advice on mix design but give an indication of the typical range of constituents in SCC by weight and by volume. These proportions are in not restrictive and SCC mixes may fall outside this range for one or more constituents.

3.1. Self Compacting Concrete Proportions

Generally, most of the researches are conducted by simple replacement method. Replacement of cement is done in different percentages of Supplementary Cementitious Material (SCM) either by volume or Weight (Mass). In this method the quantity of Binder Material (BM) is fixed and when replacement of SCM is done in different percentages of quantities, there will be change in the cement quantity and SCM quantity. The replacement method is represented in the form of equations as

C_0 + 0% SCM = BM i.e. C_0 = BM

C_1 + 5%SCM = BM

C_2 + 10%SCM = BM

C_3 + 15%SCM = BM etc

C_0, C_1, C_2, C_3 etc of quantities of Cement and %SCM is of BM

However, in this work, the addition method is adopted which involves the direct addition of SCM without changing the quantity of cement which is fixed and SCM is added with an increase of percentages of 15%, 20%, 25%, and 30% for binder material in SCC. The percentage of SCM is of the quantity of Binder Material.

$C + 15\%SCM = BM_1$

$C + 20\%SCM = BM_2$

$C + 25\%SCM = BM_3$

$C + 30\%SCM = BM_4$

C = Cement is taken as 380kg in this work. The experiments are conducted taking OPC, PPC, and PSC Cements, and SCMs are Fly Ash (F) and GGBS (G) added separately to each individual kind of cement in percentages given above

Further, the design of concrete in this work is done by addition method by taking two methods of constants.

1. Water Binder Ratio Constant Method
2. Aggregate Weight and Volume Constant Method

3.1.1. Water Binder Ratio Constant Method.

In this method as mentioned above the binder material is varied in all the types of cement (OPC, PPC, and PSC) by adding SCM percentages. The design is done by keeping the water-binder ratio constant for all quantities of binder material. The quantities of aggregates are adjusted accordingly for the volume of 1 cum of SCC satisfying the EFNARC norms and the dosage of super plasticizer is adjusted for getting the required fresh properties of SCC.

The equation of design will be as following in this method.

$SCC_1 = BM_1 + CA_1 + FA_1 + W\% + SP$

$SCC_2 = BM_2 + CA_2 + FA_2 + W\% + SP$

$SCC_3 = BM_3 + CA_3 + FA_3 + W\% + SP$

$SCC_4 = BM_4 + CA_4 + FA_4 + W\% + SP$

$W\% = 0.4\ BM_{1\ to\ 4}$

After few trails the suitable water binder ratio for this work was fixed at 0.4

3.1.2. Aggregate Weight and Volume Constant Method

In this method similar to the earlier method the binder material is varied in all the types of cement (OPC, PPC, and PSC) by adding SCM percentages. The design is done by keeping the quantities of aggregates constant. The weight and volume of aggregates are kept constant for all mixes and the water binder ratio is changed accordingly for 1 cum of SCC satisfying the EFNARC norms and the dosage of super plasticizer is adjusted for getting the required fresh properties of SCC.

The equation of design will be as following in this method.

$SCC_5 = BM_1 + CA + FA + W_1\% + SP$

$SCC_6 = BM_2 + CA + FA + W_2\% + SP$

$SCC_7 = BM_3 + CA + FA + W_3\% + SP$

$SCC_8 = BM_4 + CA + FA + W_4\% + SP$

CA = Coarse Aggregate is constantly taken as 50% weight of Dry Rodded Unit Weight, and

FA = Fine Aggregate is constantly taken as 55% of the total aggregate weight.

These values of aggregate quantities are also constant in terms of the volume of aggregates satisfying the EFNARC norms.

SP, the super plasticizer dosage was fixed on trial and error basis with number of trials to achieve at he mix with satisfactory fresh properties in both methods.

4. Results

4.1. Fresh Properties of Self Compacted Concrete

The fresh properties of Self Compacting Concrete designed and mixed with different cements and addition SCMs as per the tables given above are tested for Flow Ability and Passing Ability. The flow ability is tested by Slum Flow, T_{500} Slump Flow and V Funnel methods and passing ability is tested by L-Box and U-Box methods.

4.1.1. Slump Flow

The slump flow of fresh Self Compacting Concrete is measured on flow table using Abraham Cone. Unit of measurement of slump flow is millimeters. The acceptance levels as per EFNARC are 650 mm to 800 mm. In this work the acceptance levels of slump flow are taken from 600 mm and above.

4.1.2. Slump Flow – T_{500}

Viscosity of the Self Compacting Concrete can be assessed by T_{500} time during slump flow test. The time value obtained does not measure the viscosity of SCC but is related to it by describing the rate of flow. Concrete with a low viscosity will have a very quick initial flow and the stop. Concrete with high viscosity may continue to creep forward over an extended time. The acceptance levels as per EFNARC are 2 sec to 5 sec. In this work the acceptance levels of slump flow are taken from 2 sec and 7 sec.

4.1.4. L-Box Test

Aggregate blocking must be avoided as Self Compacting Concrete flows through the reinforcement and the L-Box Test is indicative for passing ability of Self Compacting Concrete mix. The acceptance levels as per EFNARC are 0.8 to 1.0 (Ratio of h_2/h_1, h_1 is interior height and h_2 exterior height in L-Box base line after concrete stops flowing).

4.2. Discussion

The fresh properties of the mixes were mostly within the acceptance levels for the 20%, 25% and 30% addition with Water Binder Ratio constant method and 15%, 20% and 25% addition with Aggregate Weight and Volume Constant Method.

The slump flow in almost all mixes was observed with slight bleeding after resting of flow with initial mixing of 5 minutes. On Continuous mixing for 30 minutes the flow was good and no bleeding was observed in any of the mixes. After 60 minutes of continuous mixing the flow reduced when compared to 30 minutes with no bleeding.

The values of Slump flow $-T_{500}$ for almost all the mixes were was within the range of acceptance levels.

The V Funnel flow was good for all the mixes which had satisfactory slump flow. No blockage was found at the bottom of funnel for any of the mixes during the flow. The $T_{5Minutes}$ flow in V Funnel were also within the range of acceptance levels for all the mixes.

The values of L Box flow and U-Box Flow were observed to be good with addition of fly ash in OPC and PPC. Addition in PSC was observed with blockage and bleeding of water.

5. Conclusions

From the results and observations in this study the following conclusions may be made:

1. In Water Binder Ratio Method for 15% addition of fly ash in all types cements the quantity of aggregates was at higher side and the water was not sufficient for the binder material for getting the sufficient viscosity to get the required flow. If the super plasticizer was added more to get the flow, bleeding was observed with very low values of flow. The similar kind of observation was found in Aggregate Weight and Volume Method with addition of 30% of fly ash in all types of cements. The water content was not sufficient for the powder to get the viscosity and there were mixes with no flow. All other percentages of addition of fly ash in both the methods of mix design the results were all within the range of acceptance levels.
2. The mixing time in this study was one of the major factors. The initial mix for 5 minutes of continuous mixing in the pan mixer for all the mixes are within the acceptances levels but observed with some bleeding after the flow rested. After 30 minutes of continuous mixing almost all the mixes showed very good results with all the values within the acceptance levels. After the 60 minutes of continuous mixing almost all the flows slowed down when compared to the values 30 minutes of mixing but within the acceptance levels.
3. The mixes SCC2, SCC3, SCC4, SCC5, SCC6 and SCC7 were found to be self compactable almost satisfying the acceptance levels. All these mixes are found to be highly good with 30 minutes of continuous mixing.
4. The mixes which satisfied self compactibility can be further tested for strength properties

غالبؔ دکن ۔یسیرؔ کرنولی

پروفیسر محمد امین اللہ
شعبۂ عربی، فارسی واردو، جامعہ سری وینکٹیشورا، تروپتی، آندھراپردیش۔انڈیا

دہلی کے بلّی ماراں محلّہ سے مرزا اسداللہ خاں غالبؔ کی شہرت کا سلسلہ شروع ہوتا ہے۔ جورفتہ رفتہ ہندو پاک اورایران کی سرحدوں کو پار کرتے ہوئے دنیائے ادب پر چھا گیا ہے۔ غالبؔ ایک آفاقی شاعر ہیں۔ان کی شاعرانہ عظمت کے چرچے صرف اردو اور فارسی تک محدود نہیں ہیں۔ بلکہ دنیا کی دیگر زبانوں کے ادیبوں اور شاعروں نے بھی غالبؔ کو بڑا شاعر تسلیم کیا ہے۔مختلف زبانوں میں غالبؔ کی شاعری کے ترجمے ہورہے ہیں۔اور روز بہ روز غالبؔ کے شیدائیوں اور پرستاروں میں اضافہ ہورہا ہے۔اُنہیں پرستاروں میں ایک نام امیر علی خاں یسیرؔ کرنولی کا ہے جو غالبؔ دکن کے لقب سے مشہور ومعروف ہیں۔

یسیرؔ کرنولی کی ولادت، غالبؔ کی ولادت کے سو سال بعد ۱۹۰۶ء میں جنوبی ہند کی ریاست آندھراپردیش کے شہر کرنول میں ہوئی۔ پٹھان گھرانے میں پیدا ہوئے۔ابا واجداد جاگیردار تھے۔یسیرؔ نے بی۔اے۔اور ایم۔اے۔کی تعلیم حاصل کی۔ بعد میں بی۔ایل۔بھی پاس کیا۔سرکاری ملازم ہوئے۔ ملازمت کو اپنی طبیعت سے ناموافق پاکر استعفی دے دیا۔وکالت کی۔یہاں بھی دل نہ لگا۔پیشۂ وکالت کو بھی خیرباد کہکر گھر پر رہنے لگے۔پھر کسی پیشہ یا ملازمت سے وابستہ نہ ہوئے۔اور شادی بھی نہیں کی۔وراثت میں جاگیر ملی تھی۔گزر بسر کے لیے یہی کافی تھی۔شعر کہنے میں اور شاگردوں کی اصلاح میں مصروف رہے۔ ۱۹۸۸ء میں وفات پائی۔

یسیرؔ کرنولی نے اپنا دیوان ''نفیر شوق'' بطور یادگار چھوڑا ہے۔ جو ۱۹۸۰ء میں کرنول سے شائع ہوکر منظر عام پر آیا۔اس دیوان کے مطالعہ سے بخوبی واضح ہوتا ہے کہ یہ غالبؔ کی پیروی میں لکھا گیا ہے۔اس دیوان کی بیشتر غزلوں کی زمینیں، ردیف وقافیے، موضوعات، زبان، انداز بیان دیوان غالبؔ سے مماثلت رکھتی ہیں۔اور یہ سچ بھی ہے۔اس کا اندازہ ہمیں اس بات سے بھی ہوتا ہے کہ انہوں نے اپنا دیوان ''نفیر شوق'' غالبؔ کے پرستاروں کے نام معنون کیا ہے۔ انتساب میں لکھتے ہیں:

''نجم الدولہ دبیر الملک نواب مرزا اسداللہ خاں غالبؔ کے پرستاروں کے نام۔'' (نفیر شوق، ص:۳)

یسیرؔ کرنولی نے شاعری کی ابتداء تحصیل علم کے زمانے میں ہی کی تھی۔ غالبؔ کی طرح یسیرؔ کے خاندان میں بھی کوئی شاعر گزرا ہے اور نہ ہی ان دونوں نے شاعری میں کسی کی شاگردی اختیار کی ہے۔بغیر کسی استاد کے عروض کی کتابیں پڑھیں۔استاذی شعراء میرؔ، غالبؔ، مومنؔ، ذوقؔ، نصیرؔ اور ناسخؔ کا مطالعہ کیا۔مزاج شاعرانہ تھا اور طبعیت میں روانی تھی۔ بہت جلد فن شعر پر دسترس حاصل کرلی اور شعر کہنے لگے۔ چوں کہ وہ غالبؔ سے بے حد متاثر تھے، لہذا غالبؔ ہی کے رنگ میں شعر کہنا اپنا شیوہ بنالیا۔ڈاکٹر یعقوب شریف لکھتے ہیں:

''یسیرؔ، غالبؔ سے بہت متاثر رہے ہیں۔انہوں نے نہ صرف غالبؔ کے طرزِ ادا اور اسلوب کی پیروی کی ہے بلکہ غالبؔ کی غزلوں کی بحریں، زمینیں، ردیف وقافیے بھی من وعن اپنا لیے ہیں۔'' (غالب دکن۔یسیر کرنولی، ص:۱۶۴)

یہی وجہ تھی کہ یسیرؔ کو ''غالبؔ دکن'' کہا جانے لگا۔غالبؔ دکن کے لقب سے متعلق ملک الشعراء اوج یعقوبی یورقم طراز ہیں:

''جب اُس مشاعرہ میں غالبؔ کی ایک سنگلاخ زمین میں یسیرؔ صاحب نے غزل سنائی تو خود میری ہمہ گوئی اور ہمہ دانی کا احساس متزلزل رہ گیا۔ میں سوچ بھی نہیں سکتا تھا کہ کرنول جیسے دور افتادہ مقام میں ایسا شاعر بھی ہوگا۔ میں اگر زیادہ صاف گوئی سے کام لوں تو بلا جھجک یہ کہہ سکتا ہوں کہ رفع شک کے طور پر میں نے ان سے کچھ سنانے کی خواہش کی۔ چنانچہ یسیرؔ صاحب نے غالبؔ ہی کی زمینوں میں مزید دو غزلیں سنائیں۔ نتیجہ کے طور پر مجھے کہنا پڑا کہ علامہ یسیرؔ کو غالبؔ دکن کا خطاب دینا چاہیئے۔ غالباً یہ بات میرے دل کی گہرائیوں سے نکلی تھی جس میں بھرپور خلوص تھا کہ آج سارا آندھرا پردیش آپ کو غالبؔ دکن ہی کے نام سے جانتا ہے۔'' (نفیر شوق' ص:۴ اور ۵)

اوج یعقوبی نے سنگلاخ زمینوں کے استعمال پر یسیرؔ کو غالبؔ دکن کہا تو مولوی سید افتخار احمد نے فکری اعتبار سے یسیرؔ کو غالبؔ دکن سے یاد کیا ہے۔ خود یسیرؔ کرنولی ''نفیر شوق'' میں لکھتے ہیں:

''میرے مکرم دوست مولوی سید محمد افتخار احمد صاحب بشرؔ نے پہلی بار مجھے غالبؔ دکن کے نام سے یاد کیا' اس بنا پر کہ میرے شعر غالبؔ کے اشعار کی طرح دعوتِ فکر دیتے ہیں۔'' (نفیر شوق' ص:۳۵)

اس میں کوئی شک نہیں کہ یسیرؔ کرنولی نے غالبؔ کی پیروی کی ہے۔ غالبؔ اور یسیر کے درمیان ایک صدی کا فاصلہ ہے۔ یسیرؔ کے زمانے میں اردو کی شعری روایات کافی بدل چکے تھے۔ تاہم یسیرؔ نے اپنی شاعری میں کلاسیکی روایات کی پاس داری کی ہے۔ عشقیہ واردات کی ترجمانی' فارسی تراکیب کا استعمال 'غزل کی لفظیات اور طرز بیان ان سب سے یسیرؔ کی غزل مزین ہے۔ کلاسیکی روایات کا لحاظ کرتے ہوئے غالبؔ کی سنگلاخ زمینوں میں غزل کہنا یسیرؔ کرنولی کا وصف خاص رہا ہے۔ غالبؔ پسندی کا ذکر کرتے ہوئے ڈاکٹر ابوالفضل سید محمود قادری لکھتے ہیں:

''غالبؔ اور یسیرؔ کے درمیان ایک صدی سے زیادہ عرصہ کا فصل موجود ہے۔ اس طویل عرصے میں ادبی اقدار نے طرح طرح کی کروٹیں بدلیں' لیکن یسیرؔ کے ذہن و شعور پر غالبؔ ہی غالب رہے۔ یہاں تک کہ ترتیبِ دیوان کے مرحلے پر بھی 'نقش فریادی ہے کس کی شوخیٔ تحریر کا' کی زمیں میں یسیرؔ نے بھی نفیرِ شوق کو کاغذی پیرہن میں پیکرِ تصور بنایا۔'' (نفیر شوق ایک جائزہ' ص:۷ اور ۸)

''نفیر شوق'' کی پہلی غزل ہی اس بات کی غماز ہے۔ جس میں دیوان غالبؔ کی پہلی غزل کی زمین' ردیف و قافیہ کی پیروی کرتے ہوئے نہایت خوب صورت شعر کہے ہیں۔ دیوان غالبؔ کے پہلے دو شعر ملاحظہ ہوں:

نقش فریادی ہے کس کی شوخیٔ تحریر کا — کاغذی ہے پیرہن ہر پیکر تصوری کا
کاو کاوِ سخت جانی ہائے تنہائی نہ پوچھ — صبح کرنا شام کا لانا ہے جوئے شیر کا

اسی طرز پر لکھے یسیرؔ کرنولی کے شعر ملاحظہ ہوں:

ہے یہ عالم اضطرابِ شوق کی توقیر کا — ضبط بھی صیدِ زبوں فتراکِ دار و گیر کا
اشکِ خوں میں بہہ گیا دل عاشقِ دلگیر کا — تشنہ لب رہ جائے گا پیکاں کسی کے تیر کا
جذبۂ ایثار کی گرمی کا عالم دیکھنا — دیر تک فتراک سے ٹپکا لہو نخچیر کا
یوں بھی غالبؔ کی زمینوں میں غزل لکھنا یسیرؔ — فکر کے کہسار سے لانا ہے جوئے شیر کا

غالبؔ اور یسیرؔ کی غزلوں کا تقابلی مطالعہ کیا جائے تو ان دونوں کے اشعار میں بحر' ردیف اور قافیہ کے علاوہ فکر اور احساس میں بھی مماثلت اور یکسانیت کو دیکھا جا سکتا ہے۔ چند شعر ملاحظہ ہوں:

غالبؔ: بازیچۂ اطفال ہے دنیا میرے آگے ہوتا ہے شب و روز تماشا مرے آگے
یسیرؔ : ایک وہم ہے رنگینیٔ دنیا مرے آگے یہ محو تماشا ہے ' تماشا مرے آگے

غالبؔ: ابن مریم ہوا کرے کوئی میرے دکھ کی دوا کرے کوئی
یسیرؔ : اک زحمتِ نظر تو گوارا کرے کوئی میرے غمِ دوراں کا مداوا کر ے کوئی

غالبؔ: کیا کیا خضر نے سکندر سے اب کسے رہنما کرے کوئی
یسیرؔ : جنابِ خضر کو بھی ہمسفر میں کر نہیں سکتا ابھی جو فرق کر نا ہے مجھے رہبر و رہزن میں

غالبؔ: کیوں جل گیا نہ تابِ رخِ یار دیکھ کر جلتا ہوں اپنی طاقتِ دیدار دیکھ کر
یسیرؔ : یوں کھو گئے جمالِ رخِ یار دیکھ کر ہم دیکھتے رہے انہیں سو بار دیکھ کر
غالبؔ: میں نے مجنوں پہ لڑکپن میں اسدؔ سنگ اُٹھایا تھا کہ سر یاد آیا
یسیرؔ : حالِ مجنوں پہ اڑے ہوش یسیرؔ سنگ یاد آیا نہ سر یاد آیا

غالبؔ کی طرح یسیرؔ نے بھی فارسی تراکیب کا بخوبی استعمال کیا ہے۔یسیرؔ' دکن کے شاعر ہیں۔تاہم انہوں نے اشعار میں فارسی تراکیب کو اس خوبصورتی سے برتا ہے کہ ایسا لگتا ہے کہ یسیرؔ شمالی ہند کے کلاسیکی شاعر ہیں۔جیسے :صیدِ زبوں' انیسِ شام' پروانۂ شتاب' چرخ نیلی فام' چراغِ سرِ مدفن' لباس حریر ضبط وغیرہ۔

مثال کے طور پر دو شعر ملاحظہ ہوں:

خیالِ یار کو میں نے انیس شام کیا طلوعِ صبح، تمنا کا اہتمام کیا
زندگی کانپتے گزری ہے شبِ فرقت میں ایک افسردہ چراغِ سرِ مدفن

مذکورہ بالا اشعار میں یسیرؔ کرنولی نے انوکھی اور دلاویز تشبیات سے شعروں میں معنوی دینا آباد کردی ہے جو کلام غالبؔ کی بھی ایک نمایاں خصوصیت ہے۔جیسے خیال یار کو انیس شام اور مشکل بھری زندگی کو چراغِ سرِ مدفن۔

غالبؔ اور یسیرؔ کے کلام میں دقیقہ رسی اور مشکل پسندی کے ساتھ ساتھ سہل الممتنع کی کیفیت بھی پائی جاتی ہے۔نفیر شوق کے مطالعہ سے ایسا محسوس ہوتا ہے کہ یسیرؔ نے بعض مقامات پر کلام غالبؔ کی تقلید و تتبع کرنے کی کوشش کی ہے۔ذیل میں یسیرؔ کے چند مطلعے ملاحظہ ہوں:

ان کا انداز نظر یاد آیا ساتھ ہی زخمِ جگر یاد آیا
یوں کھوگئے جمالِ رخِ یار دیکھ کر ہم دیکھتے رہے انہیں سو بار دیکھ کر
ایک وہم ہے رنگینیٔ دنیا میرے آگے ہر محو تماشا ہے تماشا مرے آگے
ملا ہے درد' حیاتِ رواں دواں کے لیے نفیر شوق ضروری تھی کارواں کے لیے

غرض یسیرؔ کرنولی کا شمار غالبؔ کے معنوی شاگردوں میں ہوتا ہے۔ انہوں نے من وعن غالبؔ کی پیروی کرنے کی کوشش کی ہے۔ غالبؔ کی طرح سنگلاخ زمینوں میں غزلیں کہی ہیں۔ بحر، ردیف اور قافیہ کا اہتمام کیا ہے۔ کلاسیکی روش کو اختیار کرتے ہوئے بہترین شعر کہے ہیں۔ اس میں شک نہیں کہ یسیرؔ کرنولی نے ''نفیرِ شوق'' کی شکل میں غالبؔ شناسی کا مبیّن ثبوت دیا ہے۔

شہہ میریہ خانوادہ کے چند شعرا کا دکنی کلام

پروفیسر محمد نثار احمد
صدر شعبۂ اردو، سری وینکٹیشورا یونی ورسٹی، تروپتی، آندھرا پردیش۔انڈیا

ریاست آندھرا پردیش کے علاقۂ رائل سیما کے معروف صوفی خانوادۂ شہہ میریہ کو یہ امتیاز حاصل ہے کہ یہ ایک علمی وادبی خانوادہ ہے۔اس سلسلہ کے کئی شعرا کا کلام محفوظ ہے۔اس خانوادے کے شعرا نے دکنی میں کئی تصانیف یادگار چھوڑی ہیں۔اس خانوادے کا ادبی سرمایہ شاعری اور نثر دونوں میں موجود ہے۔

ہندوستان کے دیگر صوبوں کی طرح آندھرا پردیش میں بھی صوفیاء کرام کی آمد ہوئی اور یہاں کے مختلف خطوں میں انھوں نے اسلام کی تبلیغ واشاعت اور تلقین کا فریضہ انجام دیا۔رائل سیما صوبۂ آندھرا پردیش کا ایک اہم خطہ ہے اور یہ چار اضلاع پر مشتمل ہے، کرنول، کڑپہ، انت پور اور چتّور۔رائل سیما میں صوفیانہ شعروادب کی روایت حضرت خواجہ بندہ نواز گیسودرازؒ سے وابستہ ہے۔

خانوادۂ شہ میریہ کے بعض قلمی تصانیف سے بھی پتہ چلتا ہے کہ رائل سیما میں صوفیانہ شعروادب کی روایت حضرت خواجہ بندہ نواز گیسودرازؒ ہی سے وابستہ ہے۔حضرت جلال الدین اکمل فرزندِ حضرت شاہ کمال ثانی جامیٔ دکن کی تصنیف ''مقصود السالکین'' کے اس اقتباس سے بھی واضح ہوجاتا ہے کہ رائل سیما کے صوفیاء نے جب تصنیف وتالیف کا آغاز کیا تھا تو ان کے سامنے حضرت میراں جی شمس العشاق، حضرت برہان الدین جانم اور حضرت امین الدین اعلیٰ کی ادبی روایتیں موجود تھیں۔مقصود السالکین کا یہ اقتباس ملاظہ ہوں:

''حضرت شاہ برہان الدین جانم بیجاپوری والدِ ماجد حضرت امین الدین اعلیٰ قدس سرہٗ جو ہمارے پیروں کے پیر اور حضرت خواجہ سید محمد حسینی گیسودراز بندہ نوازؒ قدس سرہٗ کے سلسلہ اور خلفاء میں ہیں۔'' (مقصود السالکین۔ص۲۳)

رائل سیما میں شہ میریہ خانوادہ میں کئی علماء، شاعر، ادیب، صاحبِ تصنیف بزرگ گذرے ہیں۔شہ میریہ خانوادہ بخارا سے نکل کر شمالی ہند، گلبرگہ، بیجاپور ہوتے ہوئے حیدرآباد، کرنول، کڑپہ، گرم کنڈہ پہنچا۔رائل سیما میں یہ خانوادہ تقریباً چار سو سال کی تاریخ رکھتا ہے۔اس خانوادہ میں جو صاحبِ تصانیف بزرگ گذرے ہیں وہ یہ ہیں: حضرت شاہ میرؔ، حضرت شاہ نورؔ، حضرت شاہ کمالؔ، حضرت بیرنگؔ، حضرت سالکؔ، حضرت مقبلؔ، حضرت لامعؔ اور حضرت اکملؔ وغیرہ۔ان بزرگوں نے حقائق ومعارف کے ذریعہ تبلیغِ اسلام واحسان کی اہم خدمات انجام دیں۔

حضرت شاہ میرؔ:

حضرت شاہ میرؔ حضرت سید شاہ جمال الدین کے لڑکے اور حضرت سید شاہ کمال اول کے پوتے تھے۔آپ کا اسمِ گرامی سید محمد حسینی اور لقب شاہ میر تھا۔آپ حضرت مخدوم جہانیانِ جہاں گشتؒ کی اولاد میں سے تھے۔شاہ میر کے بھائی شاہ نوراللہ بخاری اپنی تصنیف 'تجلیٔ انوار' میں لکھتے ہیں ؎

حضرت سید محمد مرشد روشن ضمیر تاجِ سر سلطان کا' اور قطبِ حق دوران کا

ڈاکٹر رفیعہ سلطانہ لکھتی ہیں:

''ان کا نام سید محمد حسینی اور لقب شاہ میر تھا۔ والد کا نام سید شاہ جمال الدین تھا جو حضرت مخدوم جہانیان جہاں گشتؒ کی اولاد سے تھے۔'' (اردو نثر کا آغاز وارتقاء۔ص ۲۳۷)

نصیرالدین ہاشمی کے الفاظ ملاحظہ ہوں:

''شاہ میر دکن کے ایک صوفی بزرگ گذرے ہیں جو قادریہ اور حسینی طریقہ کی بیعت لیا کرتے تھے۔.....شاہ میر شاہ میاں کے لقب سے بھی موسوم تھے۔''

مندرجہ بالا تمام بیانات سے یہ بات واضح ہوجاتی ہے کہ بام سید محمد حسینی تھا۔ لیکن آپ نے اپنے تخلص شاہ میرؔ کے نام سے شہرت پائی۔ آج بھی دنیائے ادب اور خانقاہوں میں آپ شاہ میرؔ ہی کے نام سے جانے اور پہچانے جاتے ہیں۔

حضرت سید محمد حسینی میرؔ تخلص کیا کرتے تھے۔ کہیں کہیں شاہ میرؔ یا شہ میرؔ بھی تخلص کے طور پر باندھا ہے۔ ذیل کے اس شعر میں تخلص میر استعمال کیا ہے ؎

کر تلاوت رات دن اپنا وجود باتدبر میرؔ در ہر فصل و باب (شاہ کمال۔ کلماتِ کمالیہ۔ص۔۲۰۸)

حضرت شاہ میر نے اپنی رباعی میں اپنے مشہور نام کو بطور تخلص استعمال کیا ہے۔

شہ میر نہ کر فکر تو کچھ قوت کی واللہ
رازق تیرا قادر و قیوم ہے اللہ
چیرا ہے جنے منہ کو تیرے ولے رزق نہ دے وے
لاحول ولاقوۃ الا باللہ!!

حضرت شاہ میر کا نمونۂ کلام:

ذات کو ہر شئے کے نیں ہے انقلاب اور صفت کو انفکاک و انسلاب
جو کہ آب آتش نہ ہوئے عکس نیر سلب نہ ہوئے عرق آتش غرق آب
نا ہوےء صرفِ عدم محض وجود حال بیداری نہ ہوئے حال ِخواب
نا مبدل ذات نا متغیر صفات یہ عقائد سنت و راہِ صواب
ذات کو ہر دم تلبس ہے و لیک صورت ہر وصف سے اے کامیاب
اور صفت کو صورت افعال سے ہے تلبس ہر زماں بے ارتیاب
فعل کو آثار کے صورت سے ہے ہم تجلی ہم تلبس ارتکاب
ذات کو ہر شئے کے یوں ہے خلع بس اس کو کہتے ہیں تجدد ذولباب
گر نہ یوں ہو ذات کیونکر ہو بدیع بے بدیعیت کا یہ سارا حساب
خلع کو کہتے عدم در اصطلاح بس کو بولیں وہ وجود اے بہرہ یاب
مصطلح اہلِ حقایق کا سخن نیں لغت سے کام ان کو اے صحاب
کیا فنا اور کیا موت وحیات یا دو غفلت انکشاف و احتجاب
عینیت اور غیریت وصل و فراق ذوق و جدان و یقیں ریب ونقاب
کفر و ایمان راہِ منزل اور مقام سیر وطیر و جذب وسعی واکتساب

نفی و اثبات اورقرب و حضور بیخودی و باخودی کشف و حجاب
یہ مسائل اصطلاحی ہیں سمجھ یک بہ یک واللہ اعلم بالصواب
کر تلاوت رات دن اپنا وجود باتدبر میؔر در ہر فصل وباب
(کلماتِ کمالیہ۔ص۲۰۸)

حضرت شاہ نوؔر:

نام سید نوراللہ حسینی الملقب بہ سید شاہ نوراللہ بادشاہ بخاریؒ۔آپ کا نام خود آپ کی تصانیف میں اس طرح لکھا ہوا ہے۔حضرت شاہ نوؔر رسالۂ ارشادِ نوریہ میں اس طرح لکھتے ہیں:''ہندی زباں سوں سید نوراللہ بن جمال الدین آسان کرکر حضرت سید محمد حسینی شاہمیر صاحب قدس سرہٗ کی فیض ہورارشادِنوریہ کی برکت سوں ہورحق تعالیٰ کی عنایت ہور ہدایت کی اعانت سوں لکھتا ہے۔''(ارشادِنوریہ۔ص۷۶)

آپ نوؔر تخلص کیا کرتے تھے۔آپ اپنے فارسی واردو کلام کے کئی بیتوں میں تخلص نوؔر استعمال کیا ہے۔اس کی چندایک مثالیں ملاحظہ ہو:

محبوب ندا کند کہ اے نوؔر آنجا کہ توئی منم ہمیشہ (تجلیِ انوار۔ص۱)
بندی نورکونورایمان دے تیرادیدجنت منی دان دے (عقائدِنوریہ۔ص۵)

حضرت شاہ نوراللہ بخاری کے ہمعصروں میں کئی صوفیاء کرام اورعلماء وشعراء ہیں۔جن میں حضرت شہ میر اول،مولانا باقر آگاہ ویلوری،شاہ فی الحال کرنولی،وجدی کرنولی،سراج اورنگ آبادی کے علاوہ آپ کے بھائی حضرت سید شاہ کمال مصنف''مخزن العرفان''وغیرہ تھے۔

شاہ نوؔر کثیرالتصانیف بزرگ ہیں۔آپ کو عربی،فارسی اوراردو زبانوں پرعبور حاصل تھا۔شاہ نوؔر فارسی اوراردو میں کئی تصانیف اپنی یادگار چھوڑی ہیں۔جن میں عقائدِ نوریہ،تجلیاتِ نورانی اورمجموعہ التکسیر ہیں۔یہ تمام کتابیں قلمی ہیں اورکتب خانۂ کمالیہ،گرمکنڈہ،ضلع چتّور میں موجود ہیں۔

نمونۂ کلام:

ذاتِ رب کی جسم و جسمانی نہیں نفس بی نیں اور نفسانی نہیں
قلب و قلبی بھی نہ پہچانے اوسے بلکہ نیں ہی روح وروحانی نہیں
ذات وذاتی ذات اوراسکے صفات یوں جو نا سمجھے سو عرفانی نہیں
معرفت رب کی،ہر اک پرفرض ہے ہور عبادت انکی جس ثانی نہیں
ذاتِ مطلق ہے ہمہ باطن ہے لیک باہمہ ظاہر ہے پنہانی نہیں
منشائ ہر دوھے وحدت جمع توں او حقیقت احمدی فانی نہیں
بعد اس کے ہے الٰہیت سو کیا غیر نفس الامر انسانی نہیں
بعدہٗ ہے جان ارواح ومثال جاں اگن پانی پوں پانی نہیں
(تجلیِ انوار،ص۔۲۶)

حضرت شاہ کمالؔ:

حضرت شاہ کمالؒ(دوّم)۔حضرت سید شاہ کمال الدین بخاری رحمۃ اللہ علیہ اپنے وقت کے بلندمرتبت ولی کامل گزرے ہیں۔علم وعرفان کی دنیا میں آپ کی ذات قطعاًمحتاج تعارف نہیں۔درس وتدریس،تالیف وتصنیف،پندونصائح اورمجاہدہ وریاضت ایسے جملہ امور میں اپنی نظیر آپ تھے۔حضرت شاہ کمال اپنے عہد کے ایک قادرالکلام اور باکمال اور پرگو شاعرومصنف ہیں۔آپ ایک فطری اوروہبی شاعر تھے،بلا مبالغہ ہزاروں اشعار آپ کے نوکِ قلم سے تخلیق

پائے ہیں۔آپ کے اشعار کا موضوع تصوف واحسان ہونے کے باوجود آپ نے اس پامال مضمون کو اپنے قلمِ معجز رقم سے زندۂ جاوید بنادیا،اس کی نظیر اس دور کے دیگر شعرا میں ملنا بہت مشکل ہے۔آپ کو عربی، فارسی اور دکنی اردو تینوں زبانوں پر عبور حاصل تھا۔آپ نے عربی، فارسی اور دکنی اردو زبانوں میں تصانیف چھوڑی ہیں۔حضرت سلطان ٹیپو شہیدؒ نے آپ کو بجا طور پر ''جامیٔ دکن'' کے خطاب سے سرفراز فرمایا تھا۔بقول محمد سخاوت مرزا آپ کو اپنے تمام ہم عصروں میں اپنے طرز و رنگ کے لحاظ سے فوقیت حاصل ہے۔حضرت شاہ کمالؒ (دوم) کے علم وفضل وتقویٰ و بزرگی کا عالم یہ تھا کہ عوام تو عوام خواص الخاص بھی آپ کے عقیدت مندوں کی قطار میں نظر آتے تھے،جن میں جلیل القدر سلطان ٹیپو شہیدؒ کا بھی نام شامل ہے۔

آپ کا نام سید شاہ کمال الدین تھا۔آپ سید شاہ جمال الدین بخاریؒ کے تیسرے فرزند تھے۔شاہ کمال نے اپنے دیوان ''مخزن العرفان'' میں اپنا نام اس طرح لکھا ہے ؎

دیکھ اس کے حال پر اپنی نوازش کی نظر جم جم کمال الدین تیرا بندہ ہے کمتر یا جمال الدین

(دیوانِ مخزن العرفان۔ص۱۸۶)

رسالۂ اردو میں سخاوت مرزا نے بھی حضرت شاہ کمال کا نام کمال الدین ہی لکھا ہے۔سخاوت مرزا لکھتے ہیں:

''اسمِ گرامی کمال الدین سادات الحسینی الحسنی ابن سید جمال الدین۔۔۔۔۔'' (رسالۂ اردو۔بابت ماہ اپریل،۱۹۳۹ء ص۔۲۶۳)

ڈاکٹر زور نے بھی کتب خانہ اداریۂ ادبیات اردو،حیدرآباد کی وضاحتی فہرست جلد سوم میں حضرت شاہ کمال کا ذکر یوں کیا ہے:''سید شاہ کمال الدین ولد سید شاہ جمال الدین شاہنور (بیجاپور) کے رہنے والے تھے۔بعد کو کڑپہ اور کرنول میں مقیم ہوئے۔'' (وضاحتی فہرست جلد سوم۔کتب خانہ اداریہ ادبیات اردو ،ص۲۰۷)

نصیر الدین ہاشمی نے بھی حضرت شاہ کمال کے بارے میں اپنے خیالات کا اظہار کیا ہے۔وہ لکھتے ہیں:''شاہ کمال المتخلص بہ کمال کڑپہ آپ کا مولد تھا۔صاحبِ باطن بزرگ تھے۔'' (وضاحتی فہرست کتب خانۂ سالار جنگ میوزیم،ص۔۷۶۸)

حکیم محمود بخاری لکھتے ہیں:''اسمِ گرامی کمال الدین جامیٔ دکن لقب کمال تخلص فرماتے تھے۔آپ سید جمال الدین بادشاہ بخاری اول کے تیسرے فرزند اور سید محمد حسینی شاہ میر اول کے چھوٹے بھائی ہیں۔'' (شہ میری اولیاء،ص۔۱۱۳)

شاہ کمال الدین کمالؔ تخلص کیا کرتے تھے۔دکن کے پہلے صاحبِ دیوان شاعر محمد قلی قطب شاہ کی طرح آپ نے بھی کئی تخلص اپنائے۔شاہ کمال اپنے کلام میں کمالی،کمالا،کمال اللہ اور کمالیا کو تخلص کے طور پر استعمال کیا ہے۔کہیں کہیں پورا نام کمال الدین بھی تخلص کے طور پر باندھا ہے۔اس طرح انھوں نے اپنے نام اور تخلص کو کلام میں مختلف طرح سے لکھا ہے۔

دیوانِ مخزن العرفان (منظوم دکنی اردو)،معراج نامہ (منظوم دکنی اردو)،ضیافت نامہ (منظوم دکنی اردو)،حسن السوال وحسن الجواب (منظوم دکنی اردو)۔فارسی زبان میں بھی شاہ کمال نے کئی تصانیف قلم بند کی ہیں۔جن میں نصاب،کمال المعرفت،کلماتِ کمالیہ،معدنِ محاسن،رحیما اور دیوانِ کمال بہت مشہور ہیں۔

اول الذّکر تصنیف حضرت شاہ کمالؔ کا منظوم دکنی اردو دیوان ہے۔جس میں انھوں نے اپنے سارے تجربوں،مشاہدوں اور فنی وادبی صلاحیتوں کو اس دیوان کے ذریعہ اجاگر کیا ہے۔شاہ کمالؔ نے اپنے صوفیانہ نظریات کو بڑی حکمت و آسانی کے ساتھ سمجھایا ہے۔اس دیوان کے دو حصّے ہیں جس میں کئی غزلیات،رباعیات،مثنویات کے علاوہ منقبتی کلام بھی موجود ہے۔دیوان میں نعتیہ کلام سے زیادہ تصوف کے مسائل بیان کئے گئے ہیں۔اس کے علاوہ مختلف بزرگانِ دین کی مدح میں بھی کئی نظمیں لکھی گئی ہیں۔ساتھ ہی شاہ کمالؔ نے ریختی صنف پر بھی طبع آزمائی فرمائی اور انھوں نے اپنی ریختیوں کے ذریعہ صوفیانہ نکات کو واضح کیا ہے۔اس کے علاوہ شاہ کمالؔ نے ایک چکّی نامہ بھی اپنی یادگار چھوڑا ہے۔اس چکّی نامہ کو شاہ کمالؔ نے تمثیلی انداز میں پیش کیا ہے جو معرفت کے خزانے

سے مزین ہے۔حضرت شاہ کمالؔ نے اپنی صوفیانہ شاعری کے ذریعہ فصاحت و بلاغت کے دریا بہائے ہیں۔آپ کی شاعری میں آمد ہی آمد نظر آتا ہے۔شاہ کمالؔ کوالہامی شاعر کہا جائے تو بے جانہ ہوگا۔ذیل میں آپ کے کلام سے چند ایک نمونے ملاحظہ فرمائیں۔

جیئو مین پیئو عیان تھا مجھے معلوم نہ تھا آشکارا ہو نہاں تھا مجھے معلوم نہ تھا
میں سمجھتا تھا مرا پیئو ہے مرے سے جدا سربسر وہم وگماں تھا مجھے معلوم نہ تھا
پیئو کے ہی ذات وصفت باطن وظاہر ہے مرا میں تو نامی بہ میاں تھا مجھے معلوم نہ تھا
متلبس ہو وہ یک پیئو سدا جلوہ نما درلباسِ دوجہاں تھا مجھے معلوم نہ تھا
پیئو ہے ہست بجز نیست نہیں پیئو کا غیر عینِ ایمان یہ بیاں تھا مجھے معلوم نہ تھا
پیئو زمین پیئو زمان پیئو مکین پیئو مکان پیئو تن پیئو ہی جاں تھا مجھے معلوم نہ تھا
پیئو کو پیر سے پانا ہے وگر نئیں تو محال پیر یوں فیض رساں تھا مجھے معلوم نہ تھا
پیئو نے پیر کے گھنگٹ میں دکھایا ہے جمال یہ عجب رازِ نہاں تھا مجھے معلوم نہ تھا
پیئو نے پیر نما آپ ہوا ہے ورنہ پیئو بے نام ونشاں تھا مجھے معلوم نہ تھا
پیر نے پیئو کو ہر شئی میں بتایا ہے مجھے نئیں تو وہ پیئو کہاں تھا مجھے معلوم نہ تھا
پیئو کو پیئو سے دکھلانے مرے تئیں یہ کمالؔ پیر شہمیر ضماں تھا مجھے معلوم نہ تھا

(مخزن العرفان،ص۱۰۵)

حضرت شاہ کمال کی ایک ریختی کے چند شعر:

تجھ حُب کا جب سے لذت پائی ہوں اے دھنی میں
تب سے بندھی ہوں اپنی راحت سے دشمنی میں
قُمری نمن لگا کر سب تن کو راکھا اپنے
تجھ سرو قد کے کارن بن گئی ہوں جوگنی میں
چولے پہ تجھ برہ کے سینہ کے رکھ توے کو
دل اور جگر اُپس کا دھنیان نمن بھنی میں

حضرت شاہ کمال کے کلام میں صنائع اور بدائع کے مطالعہ سے پتہ چلتا ہے کہ آپ جملہ محاسنِ سخن کے رمز شناس تھے۔آپ نے اپنے کلام میں اسرارِ معرفت کے بیان اور اپنی غزلوں میں جہاں علوم ومعارف کے اسرار ورموز بیان کئے ہیں، وہیں آپ نے ظاہری محاسن اور جملہ کلام کے خصائصِ لفظی ومعنوی کا بھی بطورِ خاص لحاظ رکھا ہے۔

حضرت شاہ کمال کے کلام میں غزل،حمد ونعت اور مناجات کے علاوہ دیگر اصناف جیسے قصیدہ،منقبت،مرثیہ اور مثنوی کے ساتھ ساتھ مخمس،ترجیع بند، رباعی،سی حرفی اور ریختی پر بھی طبع آزمائی ملتی ہے۔

مخزن العرفان کی زبان اردو کی قدیم دکنی زبان ہے۔لیکن یہ دکنی زبان نہایت قدیم اور مشہور دکنی تصانیف کی طرح غریب لفظیات کی حامل نہیں ہے ،جیسا کہ قلیؔ،وجہیؔ،غواصیؔ،ابن نشاطی وغیرہ کے ہاں قدیم دکنی الفاظ ہی ملتے ہیں۔حضرت شاہ کمال کا زمانہ اس کے کافی بعد کا زمانہ ہے،جس کی وجہ سے زبان میں کافی اصلاحات ہوچکی تھیں اور زبان میں معیاری الفاظ کے استعمال کا رواج عام ہو چکا تھا۔یہی وجہ ہے کہ مخزن العرفان میں شامل کلام میں معرب اور مفرس

الفاظ کے ساتھ ساتھ معیاری زبان کے الفاظ بھی ملتے ہیں۔ یہ کہا جا سکتا ہے کہ اس عہد تک دکنی زبان نے کافی ترقی کر لی تھی۔ بھاشا کے الفاظ اور جنوبی ہند کے علاقائی زبانوں کے الفاظ بھی ملتے ہیں، بلکہ اگر یہ کہا جائے تو بیجا نہ ہوگا کہ حضرت شاہ کمال کے کلام میں مستعمل اردو زبان کافی معیاری اور معتبر لسانی ساخت کے ساتھ فصاحت و بلاغت کے تمام محاسن سے لبریز ہے۔

حضرت عبدالحق شاہ میرؔ:

سید عبدالحق نام عرف شاہ میر بادشاہ اور تخلص شاہ میرؔ تھا۔ آپ کی پیدائش ۱۲۸۷ھ میں محلّہ نبی کوٹ کڑپہ میں ہوئی۔ حکیم محمود بخاری نے شہ میری اولیاء میں لکھتے ہیں: ''اسمِ گرامی عبدالحق عرف شاہ میر بادشاہ، شاہ میرؔ تخلص فرماتے تھے۔ سن بارہ سو ستیاسی ہجری (۱۲۸۷ھ) مطابق اٹھارہ سو ایکہتر عیسوی میں بہ مقام کڑپہ (محلّہ نبی کوٹ) اپنے قدیم آبائی گھر میں پیدا ہوئے۔'' (شہ میری اولیاء، ص۔۱۷)

حضرت شاہ میر سن ۱۲۸۷ھ مطابق اٹھارہ سو ایکہتر عیسوی میں بہ مقام کڑپہ (محلّہ نبی کوٹ) اپنے قدیم آبائی گھر میں پیدا ہوئے۔

حضرت شاہ میر کے اکیسویں دادا حضرت سید جلال الدین حسین جلال اعظم سرخ بخاریؒ سلطان شہاب الدین غوری کے زمانہ میں ملتان تشریف لائے اور نویں دادا حضرت سید جمال الدین بخاریؒ نے ملتان سے گلبرگہ آکر حضرت سید محمد حسینی بندہ نواز گیسو درازؒ کی پڑپوتی سے شادی کی۔ سید جمال الدین بخاری کے پوتے حضرت سید کمال الدین بخاری نے گلبرگہ سے بیجاپور آکر چندے قیام فرمایا۔ پھر شاہ نور اور کرنول ہوتے ہوئے کڑپہ پہنچے اور گرمکنڈہ جا کر انتقال فرمایا۔ اس طرح یہ خاندان تقریباً تین سو سال سے علاقۂ رائل سیما میں آباد ہے۔

آپ کی تصانیف میں دیوانِ شاہ میر، حقیقتِ محمدیہ، گلدستہ اشرف العالمین، فضائلِ توبہ، منازل المصحف، نصابِ نصیحت قابلِ ذکر ہیں۔ آپ کا دیوان، دیوانِ شاہ میر کے نام سے طبع ہو چکا ہے۔

نمونۂ کلام کے طور پر حضرت شاہ میر کی ایک نعت پیش ہے:

آتش ہجر پیمبر میں ہوں جلتا جاتا — ہے دھواں آہ کا سینے سے نکلتا جاتا
دن قریب آئے ہیں طیبہ سے جدا ہونے کے — چشمۂ غم مرے دل سے ہے ابلتا جاتا
ذکرِ رخصت جو کیا کرتے ہیں زائر باہم — غمِ فرقت سے مرا دم ہے نکلتا جاتا
مجھ سے کیوں کہتا ہے زائر کہ چلو طیبہ سے — دل مرا ایسی ہی باتوں سے ہے جلتا جاتا
ہند کے رہنے سے حیراں و پریشاں تھا میں — اب مدینے میں جو ہوں دل ہے بہلتا جاتا
دل کو دیتی جو کبھی طاقتِ رفتار جواب — سر کے بل راہِ مدینے میں میں چلتا جاتا
دشتِ طیبہ کو جو جاتا ہوں تو ہر پتھر سے — مثلِ فرہاد سر اپنا ہوں کچلتا جاتا
خوابِ غفلت میں عبث عمر کی شب کٹتی ہے — شمع کی طرح ہوں اس غم میں پگھلتا جاتا
آرہا ہے مرے لب پر جو محمد کا نام — دل ِ بیتاب ہے سینے میں اچھلتا جاتا
غیرتِ گوہر ِ نایاب ہے وہ اے شہ میرؔ — سخن نعت جو منھ سے ہے نکلتا جاتا

حضرت سید جلال الدین اکملؔ:

حضرت سید جلال الدین نام اور اکملؔ تخلص ہے۔ آپ حضرت شاہ کمال الدین بخاری کے فرزند اور خلیفہ تھے۔ آپ نے درس نظامیہ کی تکمیل مدراس میں فرمائی۔ تحصیل علم ظاہری کے بعد آپ نے خرقۂ خلافت اور فیض باطنی والد ماجد سے حاصل فرمایا۔ آپ کے دو صاحبزادے تھے۔ سید مراد علی عرف علی مراد شاہ

افضلؔ اور سید فقیر محی الدین متقبلؔ۔ آپ کی وفات ۱۲۷۷ھ میں ہوئی۔ مزارِ اقدس محل، ضلع چتّور میں واقع ہے۔

اکملؔ کو نثر اور نظم دونوں پر قدرت حاصل تھی۔ آپ کی تصانیف میں مقصود السالکین اور چہل حدیث قابلِ ذکر ہیں۔ چہل حدیث اکملؔ کی منظوم تصنیف ہے جو آپ کے والد ماجد کی فارسی نظم چہل حدیث کا منظوم ترجمہ ہے۔ اس کے علاوہ آپ نے چند ایک حمد و نعت بھی کہے ہیں۔ نمونہ کلام ملاحظہ ہوں: ؎

کروں حمدِ خدا یہ دم ہے کہاں — یہ لب و لہجہ اور فہم ہے کہاں
کس طرح یہ رقم ہونا — دست و لوح اور قلم ہونا
ایسا دست اور دوات و خامہ کہاں — وہ سکت یہ سیاہ نامہ کہاں
ہے زبس یہ ثنا کا بام بلند — کیوں وہاں پہنچے فکر کا یہ کمند

حضرت جلال الدین اکملؔ کے چیدہ کلام سے دو غزلیں اور ایک رباعی بطورِ نمونہ پیش ہیں۔

رات دن پیچ و تاب ہے ہم کو — طلب آفتاب ہے ہم کو
اپنے چہرے سے تو اٹھایا نقاب — نے حجابی حجاب ہے ہم کو
حسنِ خلق اے فرشتہ خو تیرا — گلِ باغ گلاب ہے ہم کو
معنیٔ وجہ حق سمجھنے کو — تیری صورت کتاب ہے ہم کو
رات دن یاد بن نہ گزرے تری — اپنے دم کا حساب ہے ہم کو
ہم تو ہیں خاکسار اے اکملؔ — جد علیؓ بو تراب ہے ہم کو

حضرت اکملؔ نے مناجاتِ بجناب سرورِ کائنات علیہ التحیہ والتسلیمات کے عنوان سے ایک مناجات بھی لکھے ہیں۔ اسکے چند ابیات یہ ہیں ؎

عرض ہے یہ حضورِ انور سے — تیری درگاہِ پاک و برتر سے
شاق ہے مجھ پہ ہجرِ دلبر کا — چمنِ نازک کے صنوبر کا
سرور گلزار جس کی قامت ہے — جس سے اس دل پہ اک قیامت ہے
جب سے اس دل کو اس نے چھین لیا — دل لیا اور میرا دین لیا
آہ وزاری ہے بے قراری ہے — یا نبی وقت انتظاری ہے
یہ زمانہ تو ہے عجب الٹا — جس کو دیکھو تو ہے کہ ڈھب الٹا
ایسا کچھ کرئے یا رسولِ کریم — کہ ملے مجھ سے میرا یار قدیم
جس نے مجھ کو کیا فریفتہ ہو — یاد سے اس نے ہمارا شیفتہ ہو
آہنِ دل کو اس کے گرم کرو — موم کی طرح نرم نرم کرو
ماہِ رخ مہربان ہو جائے — ملتفت جانِ جان ہو جائے
یا محمد تم اس ستم سے چھڑاؤ — اپنے یوسف کو بند غم سے چھڑاؤ
میرے دلبر سے مجھ کو جلد ملاؤ — یا نبی میری التجا بر لاؤ

حضرت سید علی مراد شاہ افضلؔ:

آپ کا اسم مبارک مراد علی عرف مراد شاہ اور افضلؔ تخلص کیا کرتے تھے۔ آپ حضرت سید جلال الدین اکملؔ کے بڑے صاحبزادے اور شاہ کمال جامیؒ

دکن کے پوتے ہیں۔۱۲۴۹ھ میں آپ کی ولادت ہوئی۔ابتدائی تعلیم والد صاحب سے حاصل کی۔علومِ ظاہری کے بعد نعمتِ باطنی اور خلافت اپنے والدِ ماجد حضرت اکمل سے پائی۔

نمونۂ کلام:

نہ ورد میں ہے نہ لالہ میں نہ سمن میں ہے — بہار جو ترے رخسار کے چمن میں ہے
نہ زعفراں میں نہ ہے مشک میں نہ عنبر میں — جو نکہت اس شہ کونین کے بدن میں ہے
ہو کس طرح نہ دل ہر کدام کا پروانہ — کہ شمع نور کی تیرے ہر انجمن میں ہے
ہے نور صدید ِبیضا کا ہر کف پا میں — اثر ہزار مسیحا کا ہر سخن میں ہے
فقط نہ روئے زمیں پر ہے تذکرہ تیرا — وظیفہ چرخ پہ شام وسحر عدن میں ہے
ہے ہم سے ذکرِ الٰہی میں دو جہاں مشہور — ترا ہی نام ِمقدس ہر اک دہن میں ہے
صفات وذات میں تیرا عدیل اورمانند — نہ کوئی قدرت خلاق ذوالمنن میں ہے
نصیب کیجئے شاہا سفر مدینے کا — مزہ وہ رنج کا کب راحتِ وطن میں ہے
کبھی نہ بھول وظیفہ درود کا افضلؔ — کہ لفظ ِصلّ ِعلیٰ کاہراک دہن میں ہے

بہ اعتبارِ مجموعی کہا جاسکتا ہے کہ حضرات شہہ میری اولیاء نے علاقۂ رائل سیما اور آندھرا پردیش کے علاقوں کو اپنی صوفیانہ تعلیمات سے متاثر کیا۔اس عہد کی مقبول عام دکنی زبان کو اظہارِ خیال کا وسیلہ بنایا۔دکنی میں شہہ میری خانوادے کے شعرا کا کلام اہمیت کا حامل ہے۔آج بھی عوام وخواص اس سلسلہ سے جڑے ہوئے ہیں اوران صوفیائے کرام کی تعلیمات سے فیض حاصل کررہے ہیں۔شہہ میری سلسلہ کے دکنی رسائل اور کتابوں پر تحقیق کا سلسلہ بھی جاری ہے۔

MARKETING STRATEGIES TO OVERCOME THE CHALLENGES FACING THE PHARMACEUTICAL COMPANIES IN INDIA

M.Venkatesulu, Research Scholar, Department of Management Studies, Sri Venkateswara University, Tirupati-517502
Dr. P. Raghunadha Reddy, Professor & Research Supervisor, Department of Management Studies, Sri Venkateswara University, Tirupati -517502

Abstract:

This paper analyses and examines the current situation, recent developments, issues and challenges for Pharmaceutical companies in India from the perspective of marketing management. This paper highlights the current position of pharmaceutical companies in the Global pharma markets in order to understand its implications for current market challenges faced by the pharma industry. The challenges faced by pharmaceutical companies in the Indian market with reference to the Marketing function have been examined in this article. The discussion is focused on the marketing mix for pharmaceutical companies comprising the 4Ps, namely, Product, Price, Place and Promotion. This paper suggests a few effective strategies to overcome the challenges faced by the pharmaceutical industry.

Key terms: Product, challenges, marketing, Price, Place and Promotion.

Introduction:

Indian pharmaceutical industry is the 3rd largest in the world by volume and is USD 40 billion in terms of value. India contributes around 3.5% of total drugs and medicines exported globally. India exports pharmaceuticals to more than 200 countries and territories including highly regulated markets such as the USA, The UK, European Union, Canada etc. The Indian Pharma sector has complete ecosystem for development and manufacture of pharmaceuticals. Its Pharma companies possesses the state of the art facilities including highly skilled/technical manpower. Our

countries also has a large number of renowned pharmaceutical educational and research institutes as well as a robust ecosystem of allied industries.

India is the largest provider of generic drugs globally. Access to affordable HIV treatment from India is one of the greatest success stories in medicine. India is one of the biggest suppliers of low-cost vaccines in the world. Because of low price and high quality, Indian medicines are preferred worldwide, thereby rightly naming the country "the pharmacy of the world". The Pharmaceutical sector currently contributes around 1.72% to the country's GDP.

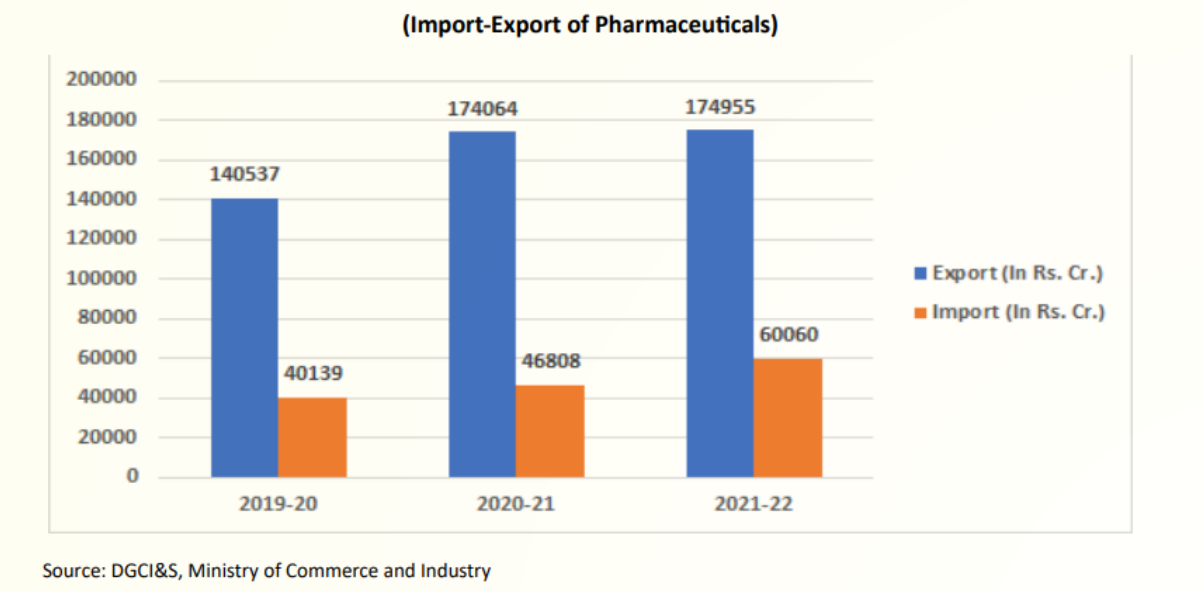
At present a major constituent of Indian exports are low value generic drugs while a large proportion of the demand for patented drugs is met through imports. This is because the Indian Pharmaceutical sector lacks in high value production along with world class pharma R&D. In order to encourage the global and domestic players to enhance their investment and production in these product categories, a well-designed and suitably targeted intervention is required. This would promote the manufacture of specific high value goods such as biopharmaceuticals, complex generic drugs, patented drugs or drugs nearing patent expiry, cell based or gene therapy drugs.

Further, in order to ensure drug security by, unbridled support to the domestic production capability in APIs/KSMs is needed. This would enhance the resilience of the Indian pharmaceutical industry to external shocks. These initiatives improve our ability to achieve the ultimate to objective of affordable healthcare in the country and the target of Health for all by 2030.

History of Pharmaceutical companies in India

Bengal Chemicals and Pharmaceutical Works is the first pharmaceutical company in India. Today, it is one of the five government-owned drug manufacturers that was incorporated on 12th April, 1901. For the next 60 years, most of the drugs in India were imported by multinationals either in fully-formulated or bulk-drug form. The government has actively encouraged the growth of drug manufacturing by Indian companies in the early 1960s, and with the Patents Act in 1970, the Indian an pharma industry emerged stronger. The patent act 1970 deleted the from food and drugs. However, retained the process patents, whose duration was shortened to a period of five to seven years. The absence of patent protection made the Indian market unattractive to the

multinational companies who had dominated the Indian market. As a result, the Indian companies gradually replaced the MNCs. The Indian companies carved a niche in both the Indian and world markets with their expertise in reverse-engineering, in innovative process design for manufacturing drugs at low costs. Although some of the larger companies have taken baby steps towards drug innovation, the industry as a whole has been following this business model until the present.



India's pharmaceutical sector is well-known for producing affordable vaccines and generic medications at a third-place global volume in pharmaceutical manufacture. In 2020–21, the industry made up around 1.32% of the Indian economy's gross value added (calculated using constant prices from 2011–2012). For the fiscal year 2021–2022, Pharmaceuticals had a total yearly sale of Rs. 3,44,125 crore (USD 42.34 billion). Generic medications, over-the-counter medications, bulk medications, vaccines, contract research and production, biosimilars, and biologics are some of the main sectors of the Indian pharmaceutical industry. When it comes to the provision of DPT, BCG, and measles vaccinations, India leads the world. About 8% of the worldwide API industry is contributed by 500 API firms. The main source of generic medications is India. It produces over 60,000 distinct generic brands in 60 therapeutic areas, making approximately 20% of the world's generic drug supply. One of the biggest medical achievements is the availability of reasonably priced HIV therapy from India. Indian pharmaceuticals are favored globally due to their affordable prices and superior quality, earning them the title of "pharmacy of the world." The industry has been expanding at a robust pace.

Table shows the sector's yearly turnover trend over the last five years.

Financial Year	Turnover (Rs. in Crore)	Growth Rate
2017-2018	2,26,423	3.03
2018-2019	2,58,534	14.18
2019-2020	2,89,998	12.17
2020-2021	3,28,054	13.12
2021-2022	3,44,125	4.89

Source: Pharmatrac/NPPA/DGCIS, Kolkata

The Indian pharmaceutical business is a major worldwide player, providing millions of people with low-cost, accessible generic medications. The industry provides lower costs without sacrificing quality, as evidenced by the fact that India is home to the greatest number of pharmaceutical facilities outside of the United States that have received approval from the US Food and Drug Administration (USFDA). Additionally, a sizable number of these facilities comply with Good Manufacturing Practices (GMP) regulations set forth by the World Health Organization (WHO) and have also received approval from foreign regulatory bodies. As can be observed from Graph 1A, India's pharmaceutical industry contributes significantly to the nation's international trade and has been steadily producing trade surplus. Pharmaceutical exports totalled Rs. 1,74,955 crore (USD 23.5 billion) in 2021–22, while pharmaceutical imports totalled Rs. 60,060 crore (USD 8.06 billion). As a consequence, there was a trade surplus of Rs. 1,14,895 crore (USD 15.44 billion).

Future growth prospects of Indian Pharmaceuticals:

The pharmaceutical sector has seen significant changes in recent years, putting new demands on payers, providers, and manufacturers. Customers today expect the same variety and convenience from the pharmaceutical sector as they do from other industries. Pharmaceutical marketing aids in raising knowledge of treatments for chronic diseases, which are the major cause

of health-care costs. India is also anticipated to become a pharmaceutical R&D hub in the coming decade, with the Department of Pharmaceuticals preparing a road map for India to become a worldwide player in the industry by 2030.

The Indian Pharmaceutical industry is predictable to grow up to USD 130 billion in value by the end of 20301. In FY22 India had exported pharmaceutical products worth USD 24.62 billion and it has been expected that Indian pharmaceutical exports will reach USD 27 billion in FY 2023. India also has the largest number of manufacturing sites approved by the United States Food and Drug Administration (US FDA) outside of the United States.

Some of the recent developments/investments in the Indian pharmaceutical sector are as follows:

1. In December 2020, Piramal Pharma Solutions announced plans to invest Rs. 235 crore (US$ 32 million) to expand its facility in Michigan, US, with additional capacity and new capabilities for development and manufacturing of active pharmaceutical ingredients (APIs).
2. In November 2020, Indian Immunologicals (IIL) commenced work on Rs. 75 crore (US$ 10.17 million) viral antigen manufacturing facility in Genome Valley, Telangana, that will enhance its vaccine production capacity by 35% by October 2021.
3. In November 2020, the Indian Institute of Technology (IIT) Bombay has stepped up research and development (R&D) amid COVID-19 and researchers are developing products such as a portable sterilization device and germicidal cabinet; wheeled sterilization unit, especially for hospitals; portable and rechargeable car sanitizer; eco-friendly sprays, and alcohol-free and bleach-free sanitizers.
4. In October 2020, six generic drug makers--Dr. Reddy's Laboratories, Zydus Cadila, Glen mark Pharmaceuticals, Torrent Pharmaceuticals, Hetero Drugs and Ackerman Pharma signed a deal with Hidalgo ,a state in Mexico, to establish a large pharmaceutical cluster for production and logistics in Mexico.
5. In October 2020, Aurobindo Pharma acquired MViyeS Pharma Ventures for Rs. 274.22 crore (US$ 37.30 million).

6. In May 2020, Jubilant Generics Ltd entered into a non-exclusive licencing agreement with US-based Gilead Sciences Inc to manufacture and sell the potential COVID-19 drug Remdesivir in 127 countries, including India.
7. Affordable medicines under Pradhan Mantri Bhartiya Janaushadhi Pariyojana (PMBJP) achieved record sales turnover of Rs 52 crore (US$ 7.38 million) in the month of April 2020.
8. During December 2019, on moving annual total (MAT) basis, industry growth was at 9.8%, with price growth at 5.3%, new product growth at 2.7%, while volume growth at 2% y-o-y.
9. In October 2019, Telangana Government proposed Hyderabad Pharma City with financial assistance from the Central government of Rs 3,418 crore (US$ 489 million).

Review of Literature:

Saurabh Kumar Saxena[9], (2008), came out with a paper titled as "A Review Of Marketing Strategies Work By Different Pharmaceutical Companies" Provides valuable insights into the supply chain processes and end customer perceptions that determine the formulation of marketing strategies.

Eric Langer, Abhijeet Kelkar (2008), in their paper entitled "Pharmaceutical Distribution in India. Biopharma International", insights the challenges faced by Indian Pharm companies in ensuring the delivery of uncompromised quality in the multilayered distributed system.

P.Parveen, P.Usha, V.Vasu naik, Rajesh Akki (2013), in their paper entitled "Pharmaceutical Distribution in India" this presents the marketing strategies of a pharma company that shifts from Acute-base to chronic therapy base. This study focus on the processes and outcomes of globally distributed pharma companies as well as the drug pricing control order. The DPCO has been a mill stone around the neck of the Indian industry as its severely restricted pharmaceutical companies.

Dr. Pramod Kumar, Dr. Pramod Kumar (2013)," Marketing Mix of Pharmaceutical Industry in India: An Exploration", this paper explores the marketing mix of pharmaceutical

industry in India**.** It provides a crical evaluation of policies and strategies of the pharma companies in the light of the complex interplay of the 4Ps or marketing mix of the pharma companies.

Anil Kalotra (2014), in the paper entitled "Marketing Strategies Of Different Pharmaceutical Companies", has focused on the three stakeholders in the pharma sector that are fundamental to the success of the marketing strategies. The success the marketing strategies in the competitive context is derived from either a cost advantage or a value advantage or ideally from a combination of both. That flows from a synergistic balance amongst the three stakeholders (the firm, its competitors and its customers)

Manvi Aayush Sood (2019), in their paper entitled "Evolution of Indian Pharmaceutical Industry-Overview" The Indian Pharmaceutical Industry has witnessed several fluctuations in its fortunes over the last three to four decades. It is one of the most efficient industry in India it provides employment and health care to the nation. This paper mainly concentrates on the evolution of the industry, its growth and recent trends.

Issues and Challenges faced pharmaceutical companies in India

Several Indian pharmaceutical companies have successfully deployed many standard strategies with a view to target the various customer types. However, the emerging business and customer trends throw up many challenges and opportunities that may improve the profitability. In the pharmaceutical and healthcare industries, a complex web of decision-makers determines the nature of the transaction (prescription) for which direct customer (doctor) of pharmaceutical industry is responsible. However, as the end-user (patient) consumes the product, he/she pays the cost. The appointment of medical representatives for marketing the products to physicians and to convenience the others in the hierarchy of decision makers has been a time-tested tradition.

The industry is still faced with some very serious strategic and operational level issues:

1. Real-time good manufacturing practices and research components are severely lacking in the Indian pharmaceutical business. This has consistently been the main challenge facing the Indian pharmaceutical business. The Pharma businesses should ideally be set up so that they have superior operational capabilities and infrastructure.

2. Indian pharmaceutical businesses are not making enough money since their revenues are essentially much lower than those of their competitors in other nations, like the US. The Indian pharmaceutical sector is thus unable to support its research initiatives.
3. The pharma industry is dependent on China for the supply of raw material for generic medicines production of Active Pharmaceutical Ingredients (API).
4. India needs user friendly government policy for the common man to establish small scale, raw material manufacturing units/ incubators in all states of the country to improve availability of raw materials to manufacture generic drugs at affordable rates.
5. The government and industry should facilitate the pharmacist community to become entrepreneurs and promote incubators' establishment.
6. Raw material produced from small scale units should be properly validated in the testing laboratory of the state to ascertain their quality specifications.
7. There is a need for a functional testing laboratory in every state to hasten the work of raw materials specification.
8. Small scale produces may be re-processed in another industry or via a chain of industry for quality products that can be used for parenteral/tailor-made formulations.
9. Skilled manpower from academic institutions can be achieved through continuing education programmes.

Marketing Mix Strategy for pharmaceutical companies in India

The classical marketing mix consists of four different Ps; product, price, place and promotion (McCarthy 1960). Conceptually, this mix may be adapted and relevant to a most product segments. However, experts are skeptical about its utility and relevance in the case of for marketing of services. Some experts also argue that marketing approach in such cases should not be imitated from Kotlerian Marketing.

In order to outline efficient marketing of services the 7Ps approach were introduced - adding people, physical evidence and process to the traditional mix.

Marketing is an essential function in any business upon which the survival of the business entity is dependent. "There can be no effective corporate strategy that is not marketing oriented, that does not in the end follow this unyielding prescription: The purpose of business is to create

and keep customer" (Theodore Levitt 1960). However, Levitt should also add that businesses must also develop products and services that customers want and at prices they are willing to pay. Marketing may be broadly conceived as the process of making decisions about what products or services to put on the market, who are the potential customers for these goods, how to reach the target markets and induce them to buy; how to price the product or service optionally so as to be make is attractive to the customers; and finally how to provide the goods physically to the ultimate customers. These matters are often expressed as the four Ps of marketing: Product, Price, Promotion and Place.

The four Ps of Pharmaceutical marketing are discussed below.

Product:

Product is an item that is created in an organization to fulfill the demand of the consumers. It can be intangible or tangible – i.e. service or goods.

The Product related decisions encompass the following aspects such as Brand name, Functionality, Product styling, Quality, Safety, Packaging and After-sales service.

The Product related decision fringes on what your customer wants from you. The Product parameters many changes according to its phase of the Product Life Cycle. For instance, during the introduction phase, the company may launch limited versions of the product just to explore adaptability to the customer needs. Similarly, the number of service centers for after-sales service as well as their location may be determined by the geographical spread of its customers**.**

The following are some of the challenges faced by the Pharma sector with respect to 'Product':

The recent COVID-19 Pandemic has highlighted the short comings of the pharma sector in providing the necessary quantities of drugs and other protective items including sanitizers to meet the unexpected surge in the international demand for drugs and accessories to tackle the Pandemic.

1. Demand forecasting and Market Potential
2. Risk management
3. Social Challenges
4. Legal and Regulatory Challenges
5. Distribution Challenges
6. Identifying Customer Pain Points

Price:

Price of the product is the amount that the customer is willing to pay for it. The 'Price' element of the marketing mix is vital for ensuring the economic viability of the Product.

The Major decision elements of 'Price' are pricing strategy (model), retail price, wholesale price, discounts offered, seasonal pricing, bundling pricing, price flexibility and price discrimination.

The decision of price depends on Product Life Cycle. A product during its journey from the Introduction stage to the Decline stage has to modify its Pricing strategies according to the changing market situation.

It gives an advantage to the company as the early adopters buy the product at the very initial stage even at a higher price.

India is recognized lowest priced drug manufacturer and marketer of pharmaceuticals products domestically and internationally. One reason for lower value share is the lower cost of drugs in India ranging from 5% to 50% less as compared to most other countries.

The Pricing Policies of the Indian Pharma sector have to overcome the following challenges. They are:

1. High 'Out of Pocket (OoP) expenditure
2. Pricing of patented drugs
3. Non-Standard drugs

4. Public and government pressure to make drug prices more affordable
5. Inadequate health insurance schemes is an impediment to high-priced drugs.
6. Higher healthcare cost forces the Pharma sector to focus on cost minimization.
7. Unknown value of revenue from each retailer in the territory.

Place:

This P is all about placement and distribution of the product in the market. The place also suggests the Point of Sale of the product. A business has to make sure that the availability of the product should be easy for the customers.

The 'Place' factor comprises of several decision elements such as (i) Distribution channels, (ii) Market coverage, (iii) Inventory, (iv) Warehousing, (v) Order processing and (vi) Transportation.

Market coverage can be intensive, selective or exclusive. For example cigarettes have intensive coverage, while Smartphones selling involves selective coverage in a city. In contrast, luxury products like Mercedes Benz have exclusive coverage.

The decision concerning the 'Place' is determined by the stage in the PLC (Product Life Cycle).

The following are some of the challenges faced by the Pharma sector with respect to 'Place':

1. Storage and Transportation of Temperature sensitive drugs.
2. The availability of adequate transportation facilities could pose a challenge in the delivery of drugs to remotely located destinations.
3. As the decision of the customer (the Patient) to use a particular drug is dependent on the Prescription of the Doctor. Hence, the success of the Distribution channel is dependent on the ability of the Drug manufacture to convince the professional Doctor who is mainly responsible for prescribing the drug. As a result, the Pharma sector faces a stiff competition with respect to cringing the Doctors recommendation for the drug.

4. Absence of transportation on the amount of time invested on profitable and not-so profitable customers and lack of time-share planning towards developing customer base for future and un-tapped markets.
5. Unavailability of go down on storage of cold medicines.

Promotion:

Promotion is comprised of elements like advertising, sales promotion, personal selling, public relation, publicity, etc.

The various phases of PLC give the different meaning of promotion. The advertising activity is extensive at the introduction stage and comes to selective channels in the maturity stage.

Sales promotion also varies at different stages. The budget of the overall advertising also gets affected. At the decline stage, a business dedicates almost nil budget for advertising. It becomes very crucial to work with the advertising or marketing agency that understands the connection of stages of PLC and Promotion.

The following are some of the major challenges faced by the Pharm sector vis-à-vis 'Promotion':

1. Increased competition and unethical practices adopted by some of the propaganda base companies.
2. Low level of customer knowledge (Doctors, Retailers, Wholesalers).
3. Poor customer (both external & internal) acquisition, development and retention strategies.
4. Varying customer perception.
5. The number and the quality of medical representatives
6. High training and re-training costs of sales personnel.
7. Busy doctors giving less time for sales calls.
8. Poor territory knowledge in terms of business value at medical representative level.
9. Unclear value of prescription from each doctor in the list of each sales person.

10. Absence of ideal mechanism of sales forecasting from field sales level, leading to huge deviations

Conclusion:

The Indian pharmaceutical industry has recognized a strong presence in the international generics market by distributing high-quality drugs at measure. The industry has made innovations in processes and formulations and developed itself as are liable, high quality and cost-effective global drug supplier. Currently the industry is worth over USD 38 billion and can hope to grow to USD 120 to 130 billion by 2030 by exploiting on the wonderful opportunities that lie ahead. However the Indian pharma companies can achieve the aspiration of eleven to twelve percent CAGR.

Marketing may be broadly conceived as the process of making decisions about what products or services to put on the market, who are the potential customers for these goods, how to reach the target markets and induce them to buy; how to price the product or service optionally so as to be make is attractive to the customers; and finally how to deliver the goods physically to the ultimate customers. The Indian pharmaceutical companies facing challenges related to the four Ps of marketing: Product, Price, Promotion and Place.

ARTICLE INFO

ABSTRACT

Marketing challenges is a crucial strategic driver for increasing operational performance and maximizing the achievement of organizational objectives, such as improved productivity, improved customer service and enhanced profitability. The age of both market globalization and outsourcing has started, and many companies tend to manage their marketing challenges activities. Most of these organizations understand that marketing challenges needs to be tested for its performance in order to create an effective and efficient marketing. The marketing challenges is the most critical element for companies to boom in pharmaceutical, which needs to be quick, uninterrupted and safe. The competition is fierce because not one or two, but hundreds of pharmaceutical companies are competing for market share, each finding and creating specific strategies for sale and distribution. The present study is an attempt to examine various marketing challenges in the pharmaceutical context. Although there is a lack of literature in this context, the current study critically reviewed the current literature and built a questionnaire with the inputs from leading pharm marketing representatives by identifying the main marketing challenges such as product, price, place, promotion and trying to find the effect of these variables on organizational efficiency. A sample size of 100 employees employed in pharmaceutical departments at different levels of ten leading pharmaceutical organizations in India was taken for a questionnaire survey as a sampling unit. The study found fascinating insights of marketing challenges in pharma, which eventually benefit the marketers to design more effective marketing challenges. Further, the study is confined to Ten Pharma organisations in India which becomes a limitation in generalizing the findings.

Key Words: Marketing Challenges, Operational Performance, Pharmaceutical Organizations

I. INTRODUCTION:

The pharmaceutical sector generates around 2.8 trillion dollars in revenue globally, making it the largest industry in the world. Recent years have witnessed significant changes in the pharmacy sector, putting new demands on payers, providers, and manufacturers. Consumers now expect the pharmaceutical business to provide them with the same options and conveniences as other market segments. The Indian pharmaceutical sector is expected to grow rapidly and steadily over the coming years due to a variety of factors.

The pharmaceutical industry in India stands at the crossroads of opportunity and challenge. With a robust domestic market fueled by a burgeoning population and increasing healthcare awareness, coupled with a strong presence in the global pharmaceutical arena, Indian pharmaceutical companies have made significant strides. However, amidst these achievements lie formidable marketing challenges that require meticulous navigation and strategic acumen to surmount.

At the heart of these challenges lies the regulatory landscape. India's pharmaceutical sector is subject to rigorous regulatory oversight, spanning drug approvals, pricing regulations, and stringent advertising

Copyright © 2024 by Author/s and Licensed by Kuey. This is an open access article distributed under the Creative Commons Attribution License which permits unrestricted use, distribution, and reproduction in any medium, provided the original work is properly cited.

guidelines. Navigating this intricate web of regulations demands not only compliance but also agility to adapt to evolving regulatory frameworks. Moreover, with recent regulatory reforms aimed at enhancing drug safety and efficacy, pharmaceutical companies face heightened scrutiny, necessitating robust compliance mechanisms and risk mitigation strategies.

Beyond regulatory hurdles, understanding the dynamics of consumer behavior and healthcare preferences is imperative. India's healthcare landscape is undergoing a paradigm shift, driven by factors such as increasing urbanization, rising disposable incomes, and a growing emphasis on preventive healthcare. Consequently, consumers are becoming more discerning, seeking value-driven healthcare solutions and placing greater emphasis on factors such as brand reputation, efficacy, and affordability. Pharmaceutical marketers must therefore unravel the complexities of consumer behavior, leveraging insights to tailor marketing strategies that resonate with target audiences and drive brand loyalty.

Amidst these shifts, competitive pressures further compound the challenges faced by pharmaceutical companies. The Indian pharmaceutical market is fiercely competitive, characterized by a myriad of domestic players vying for market share alongside multinational giants. Price competitiveness, product differentiation, and market segmentation emerge as pivotal battlegrounds, necessitating continuous innovation and strategic positioning to stay ahead of rivals. Moreover, with the emergence of disruptive technologies and digital platforms, the landscape of competition is evolving rapidly, requiring pharmaceutical marketers to embrace digital transformation and harness data-driven insights to gain a competitive edge.

II. LITERATURE REVIEW:

Giuseppe Festa, Ashutosh Kolte, Maria Rosaria Carli, Matteo Rossi (2022), in their study focussed on annual growth in pharmaceutical, medicinal chemical, and botanical production for healthcare purposes. The country sells generic medications on a big scale, having significant impact in American and European markets. Although the industry's infrastructure and R&D skills have grown, difficulties such as pricing regulation, sector fragmentation, and intellectual property continue to exist. Patents are a major topic of contention in the national industry. Despite India's large population and low per capita income, stronger patent regulations may result in reduced access to medicine for a considerable portion of the population. Affordability of drugs poses a serious challenge in India and South Asia, potentially affecting life and death. The study found a strong economic, business, and commercial outlook for the Indian pharmaceutical industry, notwithstanding certain worries. The sector's main problem is to strike a balance between commercial aspirations for innovative growth and social needs for affordable healthcare.

Abinav Sharma (2020) made an attempt, to study the creation, communication, and provision of value to the target market by healthcare professionals is greatly aided by healthcare marketing. Rather than starting with goods or services, modern marketers start with the customer. Establishing a long-lasting connection holds greater significance than completing a single transaction. Creating a high degree of customer satisfaction should be the goal of a healthcare service provider in order to encourage repeat business from satisfied clients. According to the report, hospitals face a number of difficulties when trying to sell their services, but there are also opportunities in the market that healthcare organizations can take advantage of. With a carefully thought-out marketing strategy, hospitals can maintain their competitive edge and build a long-lasting relationship with patients by providing top-notch care and building a solid reputation.

Priyanka Singh (2013) examined a particular facet of rural marketing that these markets have not been utilized in any way. Its sole objective is to draw attention to the rural markets' increasing significance in the rapidly shifting economic landscape. Due to the wide range of courses that must be taken in rural marketing, particular consideration must be given to the product, its quality, packaging, brand, price, advertisement, personal selling, and distribution channel. The rural marketing strategy must be suitable, fully understanding the dispersed nature of rural consumers and the requirement for a distinct communication mix due to the lower educational attainment and environmental variations. All of this necessitates coordinated and coordinated action from the sector and the government. Even while producers may experience early losses due to high promotion and distribution costs, they shouldn't let this stop them from entering the market because the potential in the rural area is enormous. The country's shifting economic landscape combined with the rural population's increased purchasing power means that the recently established rural markets will undoubtedly pay off handsomely.
Luv Saini and P.K. Agarwal (2023) in their study highlighted a pharmaceutical business would be a smart decision because the industry is growing and has a bright future. The process involves several steps, which present the entrepreneur with a variety of challenges. Materials and information must come from trustworthy and credible sources. This study focuses on the various challenges that come with starting a pharmaceutical business in India. The study is qualitatively descriptive and makes use of secondary data. The results show that registration and licensing, resource requirements, financial concerns, business plan formation, raw material availability, skilled labor, and workforce optimization are the primary barriers to starting a pharmaceutical company in India.

Kalyani Rajput and Dr. Rajesh Kumar Pandey (2022) examined product marketing is a standard practice recognized by the worldwide business community as being essential to organizations seeking to achieve their targeted outcomes. The pharmaceutical industry is one of the most important and widespread industries. Its scope is broad, encompassing anything from over-the-counter (OTC) goods to life-saving medications to medical equipment. So much so that pharmaceutical education is given its own area in medical education as a whole, and the foundation for the production of pharmaceutical products is laid by these excellent educational opportunities. It takes a certain set of abilities to get these medications on the market, which is why pharmaceutical marketing is involved. Pharma marketing is more essential than general product marketing because it falls into the category of necessities and useful goods rather than desired goods, as most people don't plan to purchase medications or medical equipment unless they are prescribed or advised by a healthcare professional. This element presents a significant obstacle for the pharmaceutical marketing industry.

III. METHODOLOGY:

This research study aims to assess the association among important marketing challenges components empirically, namely Product challenges, Price challenges, Place challenges, Promotion challenges and how these critical components influence effective performance, which impacts the organizational performance. The present study framed the following objective of the study to enhance the limited literature available on Marketing challenges in the Pharma context: To study the relationship between marketing effectiveness and organizational Performance in Pharmaceutical organizations in India.

The following Hypotheses were framed for the present study
Ha01: There is a significant relationship between Marketing (4P's) challenges and Organizational Performance.
Ha02: There is a significant relationship between Marketing Effectiveness and Organizational Performance.
Data was collected from both Primary and secondary sources. The primary data was collected by administering a structured questionnaire from the employees working in the selected Pharmaceutical organizational in marketing domain. The secondary data was collected from research articles, journals, company records, and manuals. Measures for the research constructs used in the present study were developed by seeking the help from real time professionals who are working in the Pharma organizations with a framework borrowed and adapted by compiling various standard studies from prior literature. Most of the items were measured using a 5-point Likert scale ranging from "very poor" to "excellent". The antecedents in our research model comprise four constructs. "Product Performance of Marketing challenges" was assessed using six items; "Price Performance of Marketing challenges" was assessed using Five items. Nine items used to capture "Place Performance". "Promotion Performance" was assessed using eight items. Finally, "Marketing Effectiveness Performance" and "Organizational Performance" were assessed by using twelve and eight items respectively. A pilot study with a sample size of 50 responses was conducted before arriving at the final questionnaire. Reliability analysis ***(Cronbach's alpha)*** was applied to check the reliability of items used in initial questionnaire which showed that *Cronbach Alpha ranges from 0.7 to 0.9*(which is quite reliable). Based on reliability analysis and feedback from the Marketing representatives working in Pharma organizations, the final questionnaire was prepared.
The population universe consists of the employees working in India's marketing management wing of the pharmaceutical organization. The present study has limited the scope by restricting the universe as a pharmaceutical organization that only deals with marketing mix challenges. A total of 100 questionnaires were distributed and collected from the employees working in marketing management in pharmaceutical organizations in India.

IV. ANALYSIS

The profile of the respondents includes age, gender, designation, and work experience. The distribution of respondents based on their characteristics is shown in table 1. Analytical aspects of these characteristics are worth noting.

Tabel: 1 Profile of the Respondents

Variables	Categories	Frequency	Per cent
Age of the Respondent	Less than 25 years	24	24.0
	25 – 35 years	56	56.0
	Above 35 years	20	20.0
	Total	100	100.0
Education	Certificate Level	23	23.0
	Diploma Level	7	4.0
	Degree	28	28.0
	Masters	42	42.0
	Total	100	100.0
Qualification	Related to Job	58	58.0

	Unrelated to Job	42	42.0
	Total	100	100.0
Place of Work	City	28	28.0
	Town	38	38.0
	Both	34	34.0
	Total	100	100.0
Experience as Medical Representative	0 – 2 years	25	25.0
	2 – 5 years	44	44.0
	> 5 years	31	31.0
	Total	100	100.0

The final sample (N=100) was respondents are in the age group less than 25 is 24(24%), age group of '25 – 35 years is 56 (56%), 20 respondents are in the age group of 'above 20 years' (20%), Designation wise, the majority of the respondents are at 'Team lead level' (N=56). Twenty respondents are at 'Executive level', and 24 respondents are managers. Similarly, majority of the respondents have experienced are 2-5 five years. 25 respondents have experienced '0-2 years', 31 respondents have experience of 'above 5 years' in the marketing department. As the present study is based on the employees' perception towards marketing challenges practices, having more respondents from team lead level and good experience in marketing departments will make the data collected more authenticate in this survey. Table 2 is designed to exhibit the mean distribution of marketing effectiveness and marketing variables along with organizational performance scale. From the table, it can be noted that the highest mean was observed to the scale 'Product challenges' (M=3.68) and 'Organizational Performance' (M=3.65), whereas low mean was observed to the scales 'Pricing Challenges' (M=3.61) and 'Marketing effectiveness'(M=3.63).

Table:2 MARKETING CHALLENGES AND ORGANIZATIONAL PERFORMANCE

S. No	**Variable**	**Mean**	**S.D.**
1	Product Challenges	3.68	0.676
2	Pricing Challenges	3.61	0.564
3	Place Challenges	3.64	0.689
4	Promotion Challenges	3.67	0.560
5	Marketing Effectiveness	3.63	0.647
6	Organizational Performance	3.65	0.624

The present paper attempts to examine the relationship between marketing effectiveness and organizational performance with two hypotheses. The following deals with hypotheses testing by applying suitable statistical tools. Ha1: There is no significant relationship between selected variables on marketing challenges and Organizational Performance H01: There is a significant relationship between selected variables on marketing challenges and Organizational Performance. The hypothesis is framed to test the statistically significant relationship between marketing effectiveness and organizational performance. To test this hypothesis, linear regression is employed by considering organizational performance as dependent variables and variable of the marketing challenges such as Product challenges, Price challenges, Place (Distribution) challenges, and Plance challenges as independent variables. Table 3a portrays the regression test results, giving that marketing effectiveness variables can explain 71.1% of organizational performance.

Ha01: There is a significant relationship between Marketing (4P's) challenges and Organizational Performance.

Table: 3a **Model Summary**

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.843[a]	**.711**	.699	.35513

Table: 3b **ANOVA[a]**

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	29.455	4	7.364	58.387	**0.000[b]**
	Residual	11.981	95	0.126		
	Total	41.436	99			

Table: 3c **Coefficients[a]**

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-0.196	0.266		0-.738	.463
	Product Challenges	0.406	0.079	0.424	5.170	**0.000**
	Pricing Challenges	0.520	0.078	0.453	6.705	**0.000**
	Distribution Challenges	0.095	0.079	0.101	1.202	0.232
	Promotion Challenges	0.030	0.119	0.026	0.248	0.804

From table 3b, it can be inferred from the ANOVA test result that the overall model is significant. Table 3c shows that all the marketing challenges variables significantly influence organizational performance except two variables: product challenges and price challenges. Thus, the null hypothesis (H01) is rejected from the regression analysis test results, and the alternate hypothesis (Ha1) is accepted. H02: There is no significant relationship between marketing effectiveness and Organizational Performance Ha1: There is a significant relationship between Marketing Effectiveness and Organizational Performance. This hypothesis is framed to examine the relationship between marketing challenges and organizational performance. The earlier hypothesis has considered the variables of marketing challenges as independent variables. In this hypothesis, the marketing challenges is regarded as an independent variable and organizational performance as a dependent variable. Linear regression is applied to examine the relationship between the two selected variables. Table 4a shows that 64.1% of organizational performance can be explained by Marketing Effectiveness, which found to be consistent with the previous finding of the present study.

Ha02: There is a significant relationship between Marketing Effectiveness and Organizational Performance.

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	0.783[a]	**0.614**	0.610	.38980

ANOVA[a]

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	23.637	1	23.637	155.564	**0.000[b]**
	Residual	14.890	98	0.152		
	Total	38.527	99			

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	0.913	0.223		4.089	**0.000**
	MARKETING EFFECTIVENESS	0.755	0.061	0.783	12.473	**0.000**

Table 4b and 4c have given a p-value less than 0.05, which means that there is a statistically significant relationship between marketing effectiveness and organizational performance. Hence, the null hypothesis (H02) is rejected, and an alternative hypothesis (Ha2) is accepted

V. LIMITATIONS

- Any study based on a survey through a predesigned questionnaire suffers from the basic limitation.
- The study is confined to Ten Pharma organisations in India which becomes a limitation in generalizing the facts.
- Non-Probabilistic Sample used in for the survey stands as another limitation of the present study.

VI. CONCLUSION

The study found that organizational performance can be attained by effective marketing management. Marketing challenges can be effective only if designed to meet the various product, price, place and promotion. The study found that product and price are the key issues that significantly impact organizational purpose. The researcher found that the place and promotion are the key issues to address while studying marketing challenges, especially in the pharmaceutical market.

As the study selected marketing segment, product and stock-out situations are unavoidable. But still, efforts should be made to reduce the occurrence of these situations in the future. There are many issues to focus on detail like the product design, accessibility, return policy etc. Hence, further study is recommended to the researchers who shown interest in marketing management.

ABSTRACT

In the contemporary and dynamic landscape of business, the retention of skilled and experienced software professionals is a critical challenge faced by organizations. High turnover within the software industry not only results in substantial costs but also leads to a loss of productivity and knowledge. To address this challenge, organizations must adopt effective strategies to attract and retain talented software professionals. This research study aims to assess the various employee retention strategies implemented by organizations within the software industry. The study will delve into factors influencing employee retention and evaluate the effectiveness of diverse strategies employed to retain software professionals. Specifically, the research will investigate the impact of organizational culture, work-life balance initiatives, career development opportunities, compensation packages, and employee engagement practices on employee retention. Through a comprehensive analysis, the study seeks to contribute valuable insights that can inform organizations in developing and enhancing their strategies to retain skilled software professionals in the competitive business environment.

Keywords: Employee retention, Productivity, Organizational strategies, Compensation packages, Employee engagement, Human resources.

1. INTRODUCTION

In the contemporary global business arena, the retention of top-tier talent has emerged as a critical concern for organizations, particularly within the fiercely competitive software industry. With India solidifying its position as a major hub for software development and technology services, companies in this sector face unique challenges in retaining skilled professionals amidst high demand and intense competition [1]. Effective employee retention is pivotal for organizational success, contributing to stability, enhanced productivity, and reduced recruitment and training costs. This study seeks to explore the diverse strategies employed by software companies in India to retain their professionals and evaluate the effectiveness of these strategies in fostering long-term commitment. Given the high demand and competition for skilled professionals in the software industry, organizations deploy a variety of retention strategies to maintain a stable workforce, minimize turnover costs, and cultivate a positive work environment conducive to employee satisfaction and loyalty [2][3]. This paper examines several commonly implemented employee retention strategies in the Indian software industry. It includes many factors such as Competitive Compensation Packages, Career Development Opportunities, Work-Life Balance Initiatives, Recognition and Rewards, Employee Engagement Programs, Transparent Communication, Employee Well-being Initiatives and Strong Leadership and Management [4]. Generally, to attract and retain top talent, companies strive to offer competitive salaries and benefits that align with industry standards, reflecting the value of employees' skills and expertise. Recognizing the motivation driven by growth, organizations invest in employee development, providing clear career paths through training programs, mentorship initiatives, and challenging project opportunities. Acknowledging the importance of balancing work and personal life, software companies often implement flexible schedules, remote work options, and paid time off policies to support work-life integration, reducing burnout and increasing employee loyalty. Fostering a positive work culture involves acknowledging and appreciating contributions through rewards, bonuses, and public appreciation programs, boosting morale and creating a sense of loyalty among employees. Recognizing the link between engagement and retention, software firms implement team-building activities, social events, and employee resource groups to create a supportive work environment that fosters a sense of belonging and camaraderie [5][6]. Open and transparent communication channels build trust and loyalty. Ensuring access to organizational information, regular feedback sessions, and performance reviews provide opportunities for employees to voice concerns and receive constructive feedback. Prioritizing employee well-being involves offering wellness programs, mental health support, and access to fitness facilities, demonstrating a genuine concern for employees' health and building trust and loyalty. Effective leadership and management practices significantly influence retention. Investments in training managers to be supportive, empathetic, and skilled in employee development foster positive relationships, reducing turnover [7]. By examining these strategies, this research paper aims to contribute valuable insights for organizations seeking to enhance their employee retention approaches in the dynamic and competitive landscape of the Indian software industry. The key factors that helps to assess the strategies implemented by Indian software industries for investigating the employee retention strategies in the Indian software industry and the benefits of the employee retention is shown in the following fig.1.

Fig 1: Employee retention in IT industry

II. LITERATURE REVIEW

Employee retention strategies play a crucial role in the contemporary business landscape, particularly within the Information Technology (IT) sector, where attracting and retaining skilled professionals is paramount. This literature review seeks to explore and synthesize existing research on the impact of employee retention strategies on the job satisfaction of IT professionals. Understanding the intricate relationship between retention strategies and job satisfaction is essential for organizations striving to create a positive work environment and retain their valuable IT workforce. Through investigation on the research papers available in the literature reveals the following observations and conclusions.

Rahman, M., Islam, M. A. presented a paper on "Effective Strategies for Employee Retention in the IT Industry"[8]. The presented research work explores, in the ever-evolving landscape of the Information Technology (IT) industry, the retention of skilled professionals stands as a critical imperative for organizational success. This literature review examines several key studies that delve into effective strategies for employee retention within the IT sector. The insights provided by these studies contribute to a comprehensive understanding of the multifaceted approaches organizations employ to reduce turnover, enhance employee satisfaction, and elevate overall organizational performance

Madhavan, A., & Mahadevan, N, presented a paper on “The Impact of Compensation and Benefits on Employee Retention in the IT Sector"[9]. Their research scrutinizes the intricate relationship between compensation and benefits and employee retention within the IT sector. The study underscores the pivotal role of competitive salaries, incentives, and comprehensive benefits packages in attracting and retaining IT professionals. Additionally, it explores the significance of non-monetary rewards, such as flexible work arrangements and career growth opportunities, in bolstering employee retention.

Mehta, P presented a paper on "Employee Retention Strategies and Organizational Performance: A Comprehensive Review with Special Reference to IT Industry"[10]. Mehta's comprehensive review delves into the nexus between employee retention strategies and organizational performance, with a specific focus on the IT industry. The study explores strategies encompassing career development, work-life balance, employee recognition, and leadership development. It provides valuable insights into the positive impact of these strategies on employee commitment, satisfaction, and overall organizational success.

Jain, A., & Kaur, P submitted study on "A Study of Employee Retention Practices and its Effectiveness in IT Sector"[11]. Jain and Kaur's study systematically explores employee retention practices within the IT sector, evaluating their effectiveness. The research meticulously examines factors such as compensation, career growth opportunities, work environment, and employee engagement. It identifies the pivotal role of a positive work culture, supportive leadership, and effective communication in retaining IT professionals.

Singh, A., & Verma, N. presented a paper on “Impact of Work-Life Balance on Employee Retention: A Study in Indian IT Industry"[12]. Singh and Verma's research focuses on the critical impact of work-life balance initiatives on employee retention within the Indian IT industry. The study accentuates the role of flexible work arrangements, family-friendly policies, and employee well-being programs in not only reducing turnover but also enhancing job satisfaction.

Altogether, these studies provide comprehensive understanding of the diverse strategies and practices employed within the IT industry to retain skilled professionals. The insights gathered from these works offer a valuable resource for organizations seeking to refine and implement effective employee retention strategies, thereby fostering a resilient and satisfied IT workforce.

III. RESEARCH METHODOLOGY

To assess the employee retention strategies of software professionals in India, a mixed-methods research approach will be employed. The study will commence with a comprehensive literature review to establish a theoretical foundation and identify existing frameworks and models relevant to employee retention in the software industry. Subsequently, qualitative data will be gathered through semi-structured interviews with HR professionals and software experts to gain insights into the industry's specific context and nuances. The interview data will be thematically analyzed to identify recurring patterns and themes related to effective retention strategies. Additionally, a quantitative survey will be administered to a representative sample of software professionals across different organizations in India. The survey will encompass standardized measures of job satisfaction, perceptions of organizational culture, and the perceived effectiveness of various retention strategies. Statistical analyses, including regression analysis and correlation assessments, will be conducted to determine the relationship between retention strategies and job satisfaction. The combined findings from qualitative and quantitative data will contribute to a holistic understanding of the efficacy of employee retention strategies in the Indian software industry [13] [14] [15].

The survey comprises two sections: The initial part delves into respondents' demographic details, while the subsequent section focuses on gathering insights into their perspectives on the correlation between strategic impact elements and customer perceptions and purchasing behaviors. Using a Likert scale ranging from 1 (strong agreement) to 5 (strong disagreement), respondents rated the claims. Disagreement is denoted by scores of 4 or 5 [16] [17]. Regarding the sample design, a convenience sample was employed, distributing a total of 300 questionnaires, with 240 being fully completed. Upon thorough examination, an impressive 80 percent response rate was achieved. Descriptive statistics indicated a final sample size of 241, comprising both males and females.

IV. CONCEPTUAL FRAMEWORK

The conceptual framework for assessing employee retention strategies among software professionals in India is structured around key dimensions: organizational context, individual factors, and retention strategy effectiveness. The organizational context involves analyzing industry dynamics, examining organizational culture, and evaluating leadership effectiveness. Individual factors encompass demographic variables, job satisfaction, and professional

development needs [18]. The retention strategy effectiveness dimension involves assessing the impact of compensation, career development programs, work-life balance initiatives, and recognition programs on employee retention. The interactions between these dimensions will be explored through qualitative interviews and quantitative surveys.

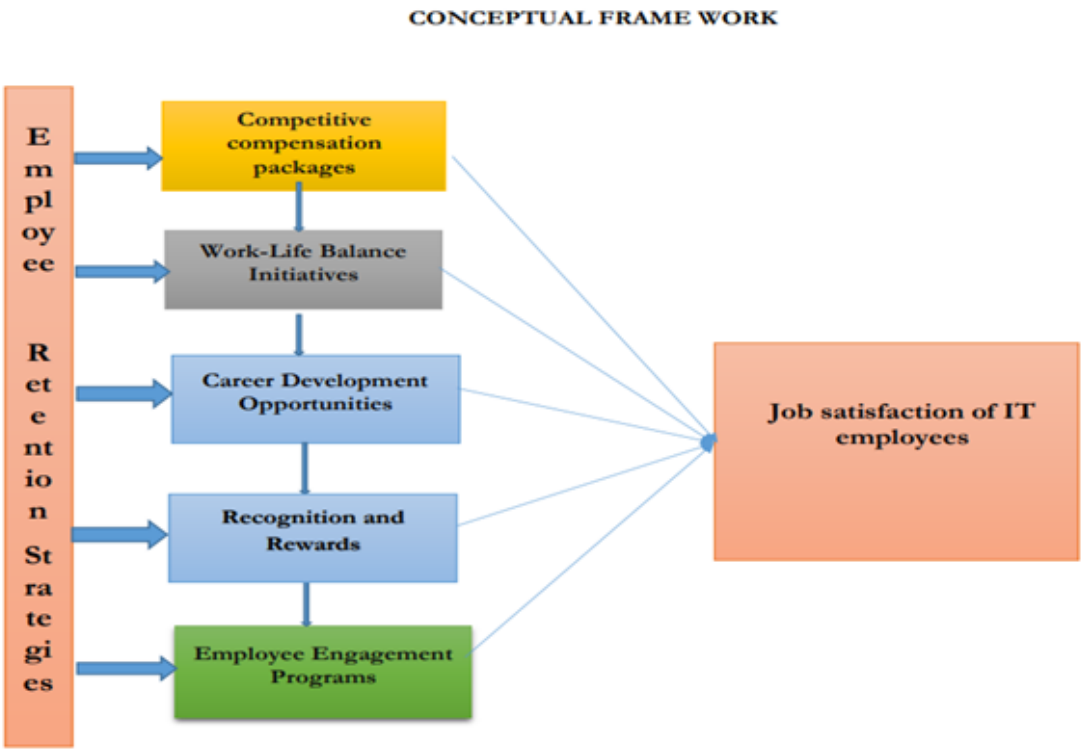

Fig 2: Conceptual frame work

The study aims to delineate the interplay of these factors in the Indian software industry, providing a nuanced understanding of effective retention strategies and their alignment with the unique needs and expectations of software professionals in this dynamic context [19]. The figure 2 revels the concept of the conceptual frame work.

V. OBJECTIVES

The main objective of this paper is to understand the influence of strategies on the job satisfaction of IT employees. The specific objectives of this research study are outlined as follows:

- Evaluate the impact of competitive compensation packages on the job satisfaction of IT employees.
- Analyze the influence of work-life balance initiatives on the job satisfaction of IT employees.
- Assess the impact of career development opportunities on the job satisfaction of IT employees.
- Examine the influence of recognition and rewards on the job satisfaction of IT employees.
- Evaluate the impact of employee engagement programs on the job satisfaction of IT employees.

VI. HYPOTHESIS

Competitive Compensation Packages:

- H0: The impact of Competitive Compensation Packages on Job satisfaction of IT employees is statistically significant.
- H1: There is no statistically significant impact of Competitive Compensation Packages on Job satisfaction of IT employees.
- Work-Life Balance Initiatives:
- H0: The impact of Work-Life Balance Initiatives on Job satisfaction of IT employees is statistically significant.
- H1: There is no statistically significant impact of Work-Life Balance Initiatives on Job satisfaction of IT employees.
- Career Development Opportunities:
- H0: The impact of Career Development Opportunities on Job satisfaction of IT employees is statistically significant.
- H1: There is no statistically significant impact of Career Development Opportunities on Job satisfaction of IT employees.
- Recognition and Rewards:
- H0: The impact of Recognition and Rewards on Job satisfaction of IT employees is statistically significant.
- H1: There is no statistically significant impact of Recognition and Rewards on Job satisfaction of IT employees.
- Employee Engagement Programs:
- H0: The impact of Employee Engagement Programs on Job satisfaction of IT employees is statistically significant.
- H1: There is no statistically significant impact of Employee Engagement Programs on Job satisfaction of IT employees.

VII. RESULTS & DISCUSSION

To attain the desired outcome of this research work, a systematic research methodology is implemented and the respective outputs were described in this section to conclude the impact of employee retention strategies on job satisfaction of it professionals. In this proposed work, Statistical Package for the Social Sciences SPSS is a software package widely used for statistical analysis in various fields, including management and social sciences. In management, SPSS is often used for tasks such as data analysis, statistical modelling, and reporting. SPSS 22 is a statistical software tool that can be utilized in management for analysing and interpreting data, making informed decisions, and gaining insights into various aspects of organizational processes and behaviour. In this research work SPSS 22 is used to analyse the data. The study under consideration employs exploratory factor analysis to illustrate concept validity and assesses internal consistency using Cronbach's alpha. To identify potential relationships between variables, the study utilizes the regression method. Principal Component Analysis (PCA) is employed in the Exploratory Factor Analysis (EFA) to validate constructs. Referring to Hair et al.'s research in 1998, a factor loading equal to or greater than 0.30 is considered to meet the minimum criterion, followed by factor loadings of 0.40 and 0.50, which are deemed progressively more crucial. This study establishes a termination point at a factor loading of 0.50. The outcomes of the factor analysis are presented in the accompanying table. KMO is a statistic used in management research, particularly in the context of factor analysis, to assess

the adequacy of the data for identifying underlying factors or constructs. The value of KMO, when it is between 0.5 and 1.0, a component analysis is advantageous for the data.

The extent of interdependence among variables is assessed through Bartlett's sphericity test, with researchers measuring the outcome by computing the test's significance level. If the resulting values are significantly small, typically below 0.05, it indicates substantial correlations between the variables. Conversely, a p-value exceeding 0.10 suggests that the data may not be well-suited for factor analysis. The findings affirm the appropriateness of employing factor analysis for the given dataset, as all twenty-one items were validated for the final analysis, with none exhibiting a loading value below 0.5.

Table 1: Results of Exploratory Factor Analysis

Table 1: Results of Exploratory Factor Analysis								
Macro Variable	**Micro Variable**	**Factor loadings**	**KMO Measureof Sample Adequacy (>0.5)**	**Bartlett's Test of Sphericity**		**Items confirmed**	**Items dropped**	**Cum % of loading**
				Chi Square	**Sig. (<.10)**			
Impact of strategies	Competitive compensation packages -1	.907	.574	211.429	.000	3	0	65.843
	Competitive compensation packages - 2	.843						
	Competitive compensation packages -3	.665						
	Work-Life Balance Initiatives-1	.878	.705	355.625	.000	3	0	78.536
	Work-Life Balance Initiatives-2	.857						
	Work-Life Balance Initiatives-3	.922						
	Career Development Opportunities: - 1	.737	.642	309.165	.000	3	0	72.860
	Career Development Opportunities: -2	.901						

Reliability Assessment:

The researchers utilized Cronbach's Alpha calculation to assess the internal consistency and reliability of the questionnaire. Nunally and Bernstein (1994) recommend an alpha value as low as 0.60 for new scales, with acceptability extending to lower values. However, common practice often dictates a requirement for an internally consistent established scale with an alpha value of 0.70 or higher. In this study, the predefined threshold for Cronbach's alpha is established at 0.7.

Table 2: Results of the Reliability Examination

	Independent Variable	Cronbach Alpha
1	Competitive compensation packages	.722
2	Building trust and credibility	.861
3	Career Development Opportunities:	.808
4	Recognition and Rewards	.669
5	Employee Engagement Programs	.946
Over all Reliability of the Questionnaire		.801

Table 2 reveals, the presents Cronbach's alpha values for various independent variables, indicating their internal consistency or reliability within a questionnaire.

1. **Independent Variable:** This column lists the different factors or constructs that were assessed in the questionnaire.
2. **Cronbach Alpha**: Cronbach's alpha is a measure of internal consistency, which assesses how closely related a set of items are as a group. It ranges from 0 to 1, where higher values indicate greater reliability. Competitive compensation packages have a Cronbach alpha of 0.722, suggesting moderate internal consistency. Building trust and credibility has a Cronbach alpha of 0.861, indicating high internal consistency. Career Development Opportunities have a Cronbach alpha of 0.808, indicating a high level of internal consistency. Recognition and Rewards have a Cronbach alpha of 0.669, suggesting moderate internal consistency. Employee Engagement Programs have a Cronbach alpha of 0.946, indicating high internal consistency. The overall reliability of the questionnaire, including all items, has a Cronbach alpha of 0.801, suggesting a good level of internal consistency.

These values provide insights into the reliability of the questionnaire items related to each independent variable, with higher Cronbach alpha values indicating greater reliability.

Table 3: Correlations

	CCP	CDO	R&R	EEP	WLB
Competitive compensation packages(CCP)	1				
Career Development Opportunities: (CDO)	.806**	1			
Recognition and Rewards(R&R))	.755**	.798**	1		
Employee Engagement Programs(EEP)	.757**	.768**	.723**	1	
Work-Life Balance Initiatives(WLB)	.308**	.348**	.343**	.367**	1

Table 3 reveals that the Cronbach's alpha values surpass the acceptable cutoff of 0.7, indicating satisfactory reliability. Specifically, the questionnaire exhibits an overall reliability demonstrated by a Cronbach's alpha value of 0.801.

Moving on to the correlation analysis, the study on independent variables indicates a robust connection among all of them. Each variable demonstrates a significant correlation with the five variables under examination in the "impact of strategies" framework. Notably, all five independent variables within the "impact of strategies" framework exhibit substantial associations with one another (refer to Table 4). The correlation between "Career Development Opportunities" and "Competitive Compensation Packages" is the highest at 0.806, while the least significant relationships are observed between "Building Trust and Credibility" and "Competitive Compensation Packages" at 0.308.

Regression Analysis:

The study utilizes stepwise regression analysis to discern the predictor-criterion relationship between dependent and independent variables. Specifically, the correlation between the impact of retention strategies on job satisfaction was explored.

Results of Hypotheses Testing for Job Satisfaction of IT Employees as Dependent Variable:

Multiple regression models were developed and tested to assess the job satisfaction of IT employees as the dependent variable. The study considered five factors related to the impact of strategies—Competitive Compensation Packages (CCP), Career Development Opportunities (CDO), Recognition and Rewards (R&R), Employee Engagement Programs (EEP), and Work-Life Balance Initiatives (WLB)—as independent variables in the regression models.

Table (4a): Model summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.863[a]	.744	.743	.355
2	.911[b]	.830	.829	.290
3	.936[c]	.876	.874	.248
4	.955[d]	.912	.910	.210
5	.962[e]	.926	.925	.192

The results of the stepwise regression analysis indicate that, according to Table 4(a), five factors (Competitive Compensation Packages, Career Development Opportunities, Recognition and Rewards, Building Trust and Credibility, Employee Engagement Programs) emerged as significant predictors of "Job satisfaction of IT employees." With an R-square value of 0.934, these five variables collectively explain job satisfaction to the extent of 93.4 percent in the dataset.

a. Dependent Variable: Job satisfaction of IT employees
b. Predictors: (Constant), Career Development Opportunities:
c. Predictors: (Constant), Career Development Opportunities: Employee Engagement Programs
d. Predictors: (Constant), Career Development Opportunities: Employee Engagement Programs,
e. Predictors: (Constant), Career Development Opportunities: Employee Engagement Programs, Recognition and Rewards

Table (4b). ANOVA

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	87.776	1	87.776	696.150	.000[b]
	Residual	30.135	239	.126		
	Total	117.911	240			
2	Regression	97.885	2	48.943	581.674	.000[c]
	Residual	20.026	238	.084		
	Total	117.911	240			
3	Regression	103.276	3	34.425	557.490	.000[d]
	Residual	14.635	237	.062		
	Total	117.911	240			
4	Regression	107.488	4	26.872	608.429	.000[e]
	Residual	10.423	236	.044		
	Total	117.911	240			
5	Regression	109.232	5	21.846	591.557	.000[f]
	Residual	8.679	235	.037		
	Total	117.911	240			

Moreover, Table 4(b) showcases the ANOVA outcomes for the regression model, affirming validity with a 95 percent confidence level.

Table (4c): Coefficients

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
	(Constant)	.498	.087		5.752	.000
1	Career Development Opportunities:	.800	.030	.863	26.385	.000
2	(Constant)	.517	.071		7.310	.000
	Career Development Opportunities:	.475	.039	.512	12.280	.000
	Employee Engagement Programs	.325	.030	.457	10.961	.000
3	(Constant)	.215	.069		3.124	.002
	Career Development Opportunities:	.440	.033	.475	13.217	.000
	Employee Engagement Programs	.284	.026	.400	11.055	.000
	Building trust and credibility	.183	.020	.231	9.343	.000
4	(Constant)	.156	.058		2.663	.008
	Career Development Opportunities:	.262	.034	.283	7.811	.000
	Employee Engagement Programs	.224	.023	.316	9.928	.000
	Building trust and credibility	.171	.017	.216	10.310	.000
	Recognition and Rewards	.271	.028	.328	9.765	.000
5	(Constant)	.074	.055		1.358	.176
	Career Development Opportunities:	.185	.033	.199	5.655	.000
	Employee Engagement Programs	.191	.021	.268	8.965	.000
	Building trust and credibility	.168	.015	.212	11.045	.000
	Recognition and Rewards	.250	.026	.302	9.758	.000
	Competitive compensation packages	.173	.025	.191	6.873	.000

a. Dependent Variable: Job satisfaction of IT employees

A brief scrutiny of the corresponding coefficients in Table 4(c) discloses beta values for the factors— "Competitive Compensation Packages (CCP), Career Development Opportunities (CDO), Recognition and Rewards (R&R), Employee Engagement Programs (EEP), Work-Life Balance Initiatives (WLB)"—as 0.129, 0.221, 0.215, 0.265, and 0.195, respectively. These findings strongly underscore the significance of these factors in influencing job satisfaction among employees.

Table 5: Test Results for Hypotheses

Hypothesis	Independent Variables	Dependent Variables	R-Square	Beta Coefficient	t-value	Sig Value
H1	Competitive compensation packages (CCP)	Job satisfaction of IT employees	0.129	3.593	0.076	Accepted
H2	Career Development Opportunities (CDO)	Job satisfaction of IT employees	0.221	7.437	0.000	Accepted
H3	Recognition and Rewards (R&R)	Job satisfaction of IT employees	0.215	11.793	0.003	Accepted
H4	Employee Engagement Programs (EEP)	Job satisfaction of IT employees	0.265	8.771	0.012	Accepted
H5	Work-Life Balance Initiatives (WLB)	Job satisfaction of IT employees	0.195	7.379	0.017	Accepted

The table 5 presents the findings of a research study examining the relationship between various factors and the job satisfaction of IT employees. The study hypothesized that factors such as competitive compensation packages, career development opportunities, recognition and rewards, employee engagement programs, and work-life balance initiatives influence job satisfaction in the IT sector. The results indicate that all hypotheses were supported, as evidenced by the statistically significant relationships between the independent variables and job satisfaction. Specifically, career development opportunities, recognition and rewards, employee engagement programs, and work-life balance initiatives showed particularly strong associations with job satisfaction, as indicated by their higher beta coefficients, t-values, and lower significance values. These findings suggest that organizations seeking to enhance job satisfaction among IT employees should prioritize initiatives related to career development, recognition, engagement, and work-life balance. Overall, the study highlights the importance of considering various organizational factors in understanding and promoting job satisfaction within the IT industry. The research findings support the hypotheses with numerical evidence and are summarized as follows. Competitive compensation packages (CCP): The relationship with job satisfaction has a beta coefficient of 0.129, a t-value of 3.593, and a significance value of 0.076.Career Development Opportunities (CDO): The association with job satisfaction is stronger with a beta coefficient of 0.221, a t-value of 7.437, and a significance value of 0.000.Recognition and Rewards (R&R): This factor has a beta coefficient of 0.215, a t-value of

11.793, and a significance value of 0.003, indicating a significant impact on job satisfaction. Employee Engagement Programs (EEP): The relationship with job satisfaction is notable, with a beta coefficient of 0.265, a t-value of 8.771, and a significance value of 0. 012.Work-Life Balance Initiatives (WLB): This factor shows a beta coefficient of 0.195, a t-value of 7.379, and a significance value of 0.017, indicating a statistically significant relationship with job satisfaction.

These numerical values provide quantitative evidence supporting the conclusion that career development opportunities, recognition and rewards, employee engagement programs, and work-life balance initiatives have significant associations with job satisfaction among IT employees.

VIII. RECOMMENDATIONS & SUGGESTIONS

Based on the extensive research conducted on employee retention strategies and their impact on job satisfaction of IT professionals, the primary recommendations and suggestions are listed below.

1. **Tailor Compensation Packages**: Customize compensation packages to align with industry standards and the unique skills and expertise of IT professionals.
2. **Invest in Career Development**: Prioritize investments in training programs, mentorship initiatives, and challenging project opportunities to support career growth and advancement.
3. **Promote Work-Life Balance**: Implement flexible work arrangements, remote work options, and paid time off policies to support work-life integration and reduce burnout.
4. **Enhance Recognition and Rewards**: Recognize and reward outstanding performance through bonuses, incentives, and public appreciation programs to boost morale and loyalty.
5. **Strengthen Employee Engagement**: Foster a supportive work environment through team-building activities, social events, and employee resource groups to promote engagement and camaraderie.
6. **Facilitate Transparent Communication**: Establish open channels of communication between management and employees to address concerns and provide feedback effectively.
7. **Prioritize Employee Well-being**: Offer wellness programs, mental health support, and access to fitness facilities to demonstrate genuine concern for employee health and well-being.
8. **Develop Leadership Skills**: Invest in training managers to be supportive, empathetic, and skilled in employee development to foster positive relationships and reduce turnover.
9. **Promote Diversity and Inclusion**: Create a diverse and inclusive workplace culture where all employees feel valued and respected.
10. **Regularly Review HR Policies**: Continuously review and update HR policies to ensure they meet the evolving needs and expectations of IT professionals and the organization.
11. **Encourage Cross-Functional Collaboration**: Facilitate collaboration between IT teams and other departments to promote innovation and problem-solving.
12. **Implement Mentorship Programs**: Pair junior IT professionals with experienced mentors to facilitate knowledge transfer and career development.
13. **Offer Performance-Based Incentives**: Tie rewards and incentives directly to individual and team performance to motivate IT professionals and drive results.

14. **Provide Leadership Opportunities**: Identify and groom future leaders within the IT department by offering leadership training and opportunities for advancement.
15. **Support Continuous Learning**: Encourage IT professionals to attend workshops, conferences, and training programs to stay updated with the latest technologies and trends.
16. **Create a Positive Work Culture**: Foster a culture of trust, collaboration, and appreciation to enhance job satisfaction and employee retention.
17. **Promote Flexibility**: Allow IT professionals to have autonomy over their work schedules and environments to accommodate personal preferences and obligations.
18. **Encourage Innovation:** Create avenues for IT professionals to contribute ideas and solutions to drive innovation within the organization.
19. **Provide Clear Expectations**: Communicate clear goals, expectations, and performance metrics to ensure alignment and accountability.
20. **Seek Feedback and Iterate**: Regularly solicit feedback from IT professionals and adapt retention strategies based on their input and changing needs.

These recommendations aim to help organizations in the IT industry develop and enhance their employee retention strategies to foster job satisfaction and create a conducive work environment for their valuable IT workforce.

Altogether, the recommendations and suggestions outlined provide a comprehensive framework for organizations within the IT industry to enhance their employee retention strategies and promote job satisfaction among their workforce. By implementing tailored compensation packages, investing in career development, promoting work-life balance, and fostering a supportive work culture, organizations can create an environment where IT professionals feel valued, motivated, and engaged. Additionally, prioritizing transparent communication, recognizing and rewarding performance, and supporting employee well-being are essential components of effective retention strategies. By continuously reviewing and updating HR policies, promoting diversity and inclusion, and encouraging innovation, organizations can adapt to the evolving needs and expectations of their workforce while staying competitive in the dynamic IT landscape.

Ultimately, by incorporating these recommendations into their retention strategies, organizations can cultivate a dedicated and loyal IT workforce, driving organizational success, growth, and innovation. As the IT industry continues to evolve, organizations must prioritize employee satisfaction and retention to remain competitive and thrive in the ever-changing market.

IX. CONCLUSION

Research on employee retention strategies within the software industry consistently emphasizes the robust correlation between these strategies and job satisfaction. The software industry, renowned for its competitiveness and high demand for skilled professionals, grapples with substantial challenges in retaining its workforce. Nevertheless, organizations can overcome these challenges by deploying effective retention strategies, thereby establishing a positive work environment conducive to job satisfaction, heightened employee commitment, and increased loyalty. Numerous studies have pinpointed key employee retention strategies integral to fostering job satisfaction in the software industry. These encompass competitive compensation packages, career development opportunities, work-life balance initiatives, recognition and rewards, employee engagement programs, transparent communication, employee well-being initiatives, and robust leadership and management practices. Research findings underscore the critical importance of offering competitive salaries and benefits in

attracting and retaining software professionals. Furthermore, providing avenues for career development, such as training programs and clear career paths, proves instrumental in promoting job satisfaction by enabling skill enhancement and career progression within the organization. In the demanding landscape of the software industry, work-life balance initiatives, including flexible work schedules and remote work options, emerge as pivotal contributors to job satisfaction, facilitating a healthy integration of work and personal life. Recognition and rewards programs significantly contribute to job satisfaction by acknowledging employee contributions and nurturing a positive work culture. Engagement programs, transparent communication channels, and employee well-being initiatives collectively play a substantial role in cultivating a supportive and fulfilling work environment, thereby enhancing job satisfaction. Finally, strong leadership and management practices that prioritize employee development and support further contribute to job satisfaction and employee retention. In summation, the literature review unequivocally supports the conclusion that the implementation of effective employee retention strategies in the software industry leads to heightened job satisfaction among software professionals. By addressing key influencers of job satisfaction, organizations can cultivate a dedicated and loyal workforce, ultimately bolstering the company's success and growth.

ABSTRACT

The Digital India Programme represents a transformative vision aimed at reshaping India's digital landscape to promote widespread digital inclusion and socio-economic development. Despite significant advancements in digital banking, e-governance, and rural development, the programme faces numerous challenges, especially in rural areas. These challenges include inadequate digital literacy, poor infrastructure, socio-economic disparities, and cybersecurity threats, which hinder the effective adoption of digital financial services. Studies highlight these impediments and underscore the need for interventions to ensure equitable distribution of digital benefits. This comprehensive evaluation identifies pain points associated with the programme's implementation and suggests measures to enhance its efficacy. This study discusses key issues such as network and infrastructure limitations, digital literacy gaps, socio-cultural resistance, economic barriers, insufficient customer support, and slow regulatory responses. The findings emphasize the importance of strategic investments, regulatory support, and community engagement to overcome these challenges and achieve the programme's full potential.

Keywords: Digital India, digital literacy, rural development, e-governance, cybersecurity.

1. INTRODUCTION

The Digital India Programme represents a transformative vision to fundamentally reshape India's digital landscape, promoting widespread digital inclusion and enhancing socio-economic development. However, the programme's implementation has encountered significant challenges, especially in rural areas where barriers such as inadequate digital literacy, poor infrastructure, and socio-economic disparities persist. Literature reviews, including studies from the Thane District, reveal that these challenges hinder the effective adoption of digital financial services, underscoring the need for interventions to ensure equitable distribution of digitalization benefits. Despite notable advancements in digital banking and e-governance, cybersecurity threats and the need for regulatory frameworks remain pressing issues. The programme's impact on rural development is evident through improved access to information, education, healthcare, and government schemes, yet

obstacles like unreliable internet connectivity and resistance to change within governmental bodies persist. Furthermore, digital initiatives in education and healthcare, such as telemedicine and mobile health applications, highlight both the potential and the hurdles of digital transformation, with infrastructural deficiencies and digital illiteracy posing significant barriers. The role of the Digital India Programme in fostering entrepreneurship and growth in MSMEs is also notable, though limited digital skills, access to finance, and infrastructural constraints need to be addressed through supportive policies and capacity-building initiatives. This comprehensive evaluation aims to identify the pain points associated with the Digital India Programme's implementation and suggests measures to enhance its efficacy. The study employs a descriptive research design, drawing on secondary data from journal articles, books, and electronic sources. Key issues discussed include network and infrastructure limitations, digital literacy gaps, socio-cultural resistance, economic barriers, insufficient customer support, and slow regulatory responses.

2. LITERATURE REVIEW:

The Digital India Programme has made significant strides in fostering digital inclusion and enhancing financial literacy among marginalized communities, yet it faces considerable challenges, particularly in rural areas. Studies, such as the one conducted in Thane District, highlight several barriers to the effective adoption of digital financial services, including a lack of digital literacy, inadequate infrastructure, and socio-economic challenges. These impediments hinder the programme's goal of creating a digitally empowered society. While the initiative has made headway in promoting digital inclusion, there is a clear need for interventions to address these challenges and ensure the equitable distribution of digitalization benefits. Furthermore, the transformative impact on the Indian banking sector through the Digital India Programme has been profound, with digital banking services like mobile and internet banking reshaping traditional models. This transformation has enhanced efficiency, customer experience, and broadened financial inclusion, especially in rural areas, though cybersecurity threats and the need for regulatory frameworks remain pertinent challenges.

The role of the Digital India Programme in enhancing e-governance and its socio-economic impact on rural communities underscores its broad influence across various sectors. The integration of digital technologies into government-led operations has improved transparency, efficiency, and citizen engagement, as evidenced by successful initiatives like the Digital Locker system and online grievance redressal mechanisms. However, persistent hurdles such as the digital divide and resistance to change within governmental bodies need addressing. In rural India, digital initiatives have facilitated access to information, education, healthcare, and government schemes, contributing significantly to rural development. Despite these positive outcomes, challenges such as inadequate internet connectivity and lack of awareness about digital services continue to pose obstacles. Sustained efforts are required to bridge these gaps and ensure inclusive digital growth, highlighting the importance of strategic investments in infrastructure and comprehensive digital literacy campaigns.

The Digital India Programme's impact on education, healthcare, and entrepreneurship further illustrates its transformative potential and the accompanying challenges. Digital education initiatives hold promise for transforming education by making learning more accessible and interactive, though infrastructural deficiencies

and digital illiteracy among students and teachers pose significant barriers. Similarly, digital health initiatives like telemedicine and mobile health applications have improved healthcare access, particularly in underserved areas, but issues related to data privacy and the digital divide persist. The programme has also spurred entrepreneurship and growth in MSMEs by creating new business opportunities and expanding market access. However, limited digital skills, access to finance, and infrastructural constraints remain challenges that need to be addressed through supportive policies and capacity-building initiatives. Overall, the Digital India Programme has made commendable progress, but achieving its full potential requires addressing these challenges through strategic investments, regulatory support, and community engagement.

3. OBJECTIVES AND RESEARCH METHODOLOGY:

Objectives:

1. To study the pain points associated with the implementation of Digital India Programme.
2. To suggest, based on the findings, various measures to the Government of India to advance the Digital India Programme.

Research Design: Used a descriptive research design.

Data Sources:

The researcher collected secondary data from journal articles, write-ups from books and electronic sources.

Discussion:

Network and infrastructure issues result in fewer digital payments, as unreliable connectivity disrupts transactions and undermines trust in digital financial systems. The limited digital infrastructure in these regions exacerbates the problem, with many rural areas lacking essential facilities like reliable internet and digital devices, thus hindering access to digital services. Poor internet connectivity further restricts the use of online platforms for education, healthcare, and government services, isolating rural populations from digital advancements. Additionally, the dependence on an unreliable power supply for digital devices poses a major challenge. Frequent power outages and unstable electricity supply disrupt the functioning of digital services, making it difficult for rural communities to maintain consistent digital connectivity.

Many rural individuals lack the basic skills to navigate and utilize digital platforms, which limits their ability to benefit from digital initiatives. The limited outreach of digital literacy campaigns exacerbates this issue, as many such efforts fail to reach remote and underserved communities, leaving a substantial portion of the rural population without essential digital knowledge. Furthermore, a lack of awareness about digital financial services leads to underutilization of digital payment systems, online banking, and other financial technologies that could enhance economic efficiency and inclusivity. Additionally, insufficient training and capacity-building programs for rural users mean that even those who have access to digital technologies struggle to keep pace with rapidly evolving digital environments.

Resistance to adopting new digital technologies in rural areas where traditional methods are preferred. This reluctance is compounded by a lack of trust in digital financial transactions, with fears of security breaches and

digital fraud discouraging engagement with online financial services. Cybersecurity concerns and the fear of fraud further deter users, as potential risks associated with cyber threats and scams create apprehension about the safety of digital transactions. Socio-cultural barriers also play a crucial role, as deeply entrenched norms and practices in rural communities foster suspicion and skepticism towards digital adoption. These socio-cultural attitudes, along with a lack of digital literacy, reinforce distrust and resistance.

High costs of digital devices and internet access create significant barriers for rural and economically disadvantaged populations, preventing them from fully participating in the digital economy. Many individuals and families in these areas cannot afford the initial investment in smartphones, computers, or consistent internet connectivity, which are essential for accessing digital services. Furthermore, limited access to financial resources for digital investments exacerbates this problem. Without sufficient financial support or affordable financing options, rural users are unable to invest in the necessary infrastructure to benefit from digital advancements.

Insufficient customer support for digital services significantly in rural and remote areas where users often require assistance to navigate new technologies. The limited availability of localized digital content and services further exacerbates this issue, as many digital platforms fail to cater to the specific needs and preferences of diverse regional populations. This gap in service availability prevents users from fully benefiting from digital initiatives designed to improve their daily lives. Additionally, the lack of multilingual support on digital platforms creates a barrier for non-English speaking users, making it difficult for them to access and utilize digital services effectively. This language barrier particularly affects rural users, who may be more comfortable with regional languages.

Many rural populations remain excluded from formal financial systems. This exclusion is exacerbated by ineffective digital payment systems in rural areas, where poor connectivity and inadequate infrastructure hinder seamless transactions. Consequently, the slow adoption of digital payment systems by small businesses further restricts the economic benefits of digitalization, as these enterprises struggle to transition from cash-based operations to digital platforms. Moreover, there is a dependency on intermediaries for digital transactions, which increases costs and reduces trust among users. These intermediaries often charge fees for facilitating transactions, making digital payments less attractive for both consumers and small businesses.

Slow regulatory responses to emerging digital challenges hinder the program's ability to adapt and evolve in a rapidly changing technological landscape, leaving gaps in legal and operational frameworks necessary for effective digital governance. Limited collaboration between the private and public sectors further exacerbates these issues, as the lack of coordinated efforts and shared goals between these entities stifles innovation and the effective implementation of digital initiatives. Additionally, limited financial incentives for digital adoption discourage businesses and individuals from transitioning to digital platforms, slowing the overall progress of the programme.

Verification challenges often stem from inconsistencies and inaccuracies in digital identity databases, leading to difficulties in authenticating users and accessing services. This undermines trust in digital systems and discourages their use. Additionally, the lack of seamless integration between digital services and existing government schemes hampers the efficiency and effectiveness of digital initiatives. Without cohesive integration, beneficiaries face obstacles in leveraging digital platforms to access various welfare and support programs.

The Digital India Programme faces significant challenges in achieving its goals due to the digital exclusion of elderly and less-educated populations. These groups often lack the necessary digital skills and familiarity with technology, which prevents them from fully participating in and benefiting from digital initiatives. The elderly, in particular, may find it difficult to adapt to new digital tools and platforms, leading to their marginalization in an increasingly digital society. Individuals with lower levels of education may struggle to understand and use digital services, further exacerbating the digital divide.

To address the challenges faced by the Digital India Programme, the Indian government needs to implement a comprehensive and integrated approach that leverages existing capacities while fostering innovation and collaboration. Enhancing network and infrastructure is paramount; thus, investments in expanding reliable internet connectivity and robust digital infrastructure, particularly in rural areas, must be prioritized. This could include initiatives such as deploying satellite internet services and strengthening the power supply to ensure consistent digital connectivity. Simultaneously, expanding digital literacy campaigns is essential to equip rural populations with the skills needed to navigate digital platforms. Tailored training programs, supported by localized and multilingual content, can bridge the knowledge gap and foster greater digital inclusion. To build trust and overcome resistance to digital adoption, the government should enhance cybersecurity measures, provide extensive awareness campaigns about the safety and benefits of digital transactions, and establish customer support networks. Encouragingly, subsidies and financial incentives for purchasing digital devices and internet access can alleviate economic barriers, enabling wider participation in the digital economy. Additionally, fostering public-private partnerships can drive innovation and resource-sharing, expediting the development and deployment of digital solutions tailored to diverse regional needs. Improving the regulatory framework to adapt swiftly to emerging digital challenges will ensure legal and operational coherence, enhancing the program's effectiveness. Furthermore, streamlining digital identity verification processes and integrating digital services with existing government schemes can bolster trust and efficiency in accessing welfare programs. To specifically address the needs of elderly and less-educated populations, targeted outreach and simplified digital interfaces can make digital services more accessible and user-friendly.

4. CONCLUSION

The Digital India Programme faces significant challenges that hinder its effectiveness, particularly in rural areas where network and infrastructure issues disrupt digital payments, education, healthcare, and government services. Limited digital literacy, resistance to adopting new technologies, and cybersecurity concerns further exacerbate these issues, creating a significant digital divide. High costs of digital devices and internet access, insufficient customer support, and verification challenges add to the complexity, preventing

many from fully benefiting from digital initiatives. To address these challenges, a comprehensive and integrated approach is essential. Prioritizing investments in reliable internet connectivity, expanding digital literacy campaigns, enhancing cybersecurity measures, and providing financial incentives can foster greater digital inclusion. Public-private partnerships and improved regulatory frameworks can drive innovation and adaptability, while tailored outreach programs can make digital services more accessible to elderly and less-educated populations. By adopting this holistic strategy, the Indian government can advance the Digital India Programme, ensuring inclusive participation in the digital revolution.

Legal Rights of Girl Child: Indian scenario

Dr. I.V.Lalitha Kumari, Professor, Dept. of Social Work, Sri Padmavathi Mahila Visvavidyalayam, Tirupati, A.P-517502.
&
Dr.T.Chandrasekarayya, Associate Professor, Dept. of Population Studies & Social Work, S.V.University, Tirupati, A.P-517502.

Abstract

International Day of the Girl Child increases awareness of issues faced by girls around the world. International Day of the Girl Child is an international observance day declared by the United Nations; it is also called the Day of Girls and the International Day of the Girl. October 11, 2012, was the first Day of the Girl Child. In 2022, we commemorate the 10th anniversary of the International Day of the Girl (IDG). In these last 10 years, there has been increased attention on issues that matter to girls amongst governments, policymakers and the general public, and more opportunities for girls to have their voices heard on the global stage. Yet, girls' rights remain limited and girls around the world continue to face unprecedented challenges to their education, their physical and mental wellness, and the protections needed for a life without violence. The paper aims at discussing Legal Rights of Girl Child and their situation in Indian scenario based on secondary data.

Keywords

Female Foeticide, Education, Safe environment, Abusive, Stridhan, Child marriage, Sexual harassment and Work place

Introduction

India's population of the girl child and adolescents is 253 million as per UNICEF report and the sex ratio at birth is 929 per 1000 male children as per NFHS-5. Girl is considered of no value in her parental home. Out of 12.5 million children married in India, 8.9 million are girls as per UNICEF report. India is the only large country in the world where more baby girls die than baby boys. The gender differential in child survival is currently 11 per cent, states UNICEF. A woman gives birth to a daughter the new mother risks being shamed and abused by her own family. A daughter may be considered a financial burden and likely not be able to support her and her husband in their older age. A strong preference for sons is a consequence of patriarchal and 'patrilineal' societies that favour men in both power and status. It can be most pronounced in highly agricultural and subsistence societies. These systems value sons over daughters because family assets are passed through male family members (patrilineal), and the greater earning potential of men in patriarchal societies leads

households to rely on boys as future supports as parents age. Though there are many laws in favour girl children in India, practices, such as, female foeticide, female infanticide, child marriage, malnutrition, exploitation, child trafficking, neglect and discrimination, child mortality and child abuse. In addition, opportunities need to be promoted to facilitate education and employment opportunities among them.

Objective and method

The main purpose of this research paper is to acquire an understanding of status of girl child in India. The paper aims at discussing the legal rights of girl children and examines the prevailing situation in India based on secondary data collected through various sources. It will helpful to create awareness on the legal rights of girl children and their situation in India.

Discussion

The legal rights of girl children in India and their prevailing situation briefly discussed hereunder.

Right against female Foeticide

Female foeticide refers to a practice which removes the female foetus after 18 weeks of growth in the uterus. It has been still practicing at high rate all over India though the government of India banned pre-natal sex determination under the PC-PNDT Act 1994. It was enacted on 20 September 1994, amended and effectively implemented in 2003 and strictly amended in 2011with the intent to prohibit prenatal diagnostic techniques for determination of the sex of the foetus leading to female feticide. Therefore, one cannot find out the sex of their unborn child till birth. Though it has been illegal in India since 1996, at least 9.0 million (0.9 crore) female births went “missing” between 2000 and 2019 because of female-selective abortions, as per Pew Research Centre. However, the average annual number of baby girls “missing” in India fell from about 480,000 (4.8 lakh) in 2010 to 410,000 (4.1 lakh) in 2019, the Center’s analysis finds (Yunping Tong, 2022). According to Amartya Sen (1990) around 37 million females missing from the Indian population, caused by a deepening crisis of gender inequality that had led to the widespread practice of sex selective abortions, female infanticide and neglect of girl-children. Gender-biased sex selection is a profound form of discrimination that results from the combination of three factors: strong preferences for sons within a society, the rising use of modern technologies, and generally declining fertility rates.

Right to Education

The Right to Education Act, 2009, provides all children between the ages of 6 and 14 years the right to free and compulsory elementary education. Although this law is gender-

neutral, it gives a push to the education of girl children, by giving them enhanced access to schooling. Further, the recent National Education Policy (NEP) 2020 envisages equitable and inclusive education for all, with special focus on children and youth, especially girls, from socially and economically disadvantaged groups. The policy's focus is important because despite effort to educate women, the dropout rate for girls is still high after secondary education. The enrolment ratio too dips at the secondary and higher secondary levels. Among many reasons, the onset of menstruation and the lack of availability of hygienic toilets are responsible for girls leaving school without completing education. The National Family Health Survey-5 (2019-21) indicates that over 21,800 girls who had dropped out of school before the 2019-20 school year, just over 13% girls did so as they were required for house work and almost 7% did so as they were married off even though child marriage is illegal. UNICEF's U-Report poll (2022) reveals that 38% of respondents knew at least one female student to have dropped out of school.

Right to be raised in a safe environment

All children, including female children, have the right to be brought up in a safe and protected environment. The Juvenile Justice Act, 2015 makes it illegal for parents and guardians of children to abuse, assault, neglect, or abandon a child. Study on Child Abuse: India (2007), out of the total working children, 23.2% was child domestic workers. Among these 81.16% were girls. Out of all child domestic workers, 44.19% were in the age group of 5-12 years followed by 33.27% in the age group of 15-18 years and 22.54% in the age group of 13-14 years. Further, the study reveals that majority of the girl child respondents (70.57%) reported neglect of one form or the other by family members. 48.4% of the girls reported having gone through such feelings as less attention, less food, less time for recreation, more household work, etc. an overwhelming majority 68.99% reported physical abuse, out of which most of the respondents (54.68%) were boys. UN Women supported survey, 2013 in Delhi shows 95 per cent of women and girls feel unsafe in public spaces.

Right against abusive family members

The Domestic Violence Act, 2005 protects all females from any kind of physical, emotional, sexual, or financial abuse by family members. The protection extends to all family members with whom the female shares a house-including her own family members like parents, siblings, uncles, aunts, etc. Therefore, this law protects female children from being abused at home. But, the Ministry of Women and Child Development (MWCD, 2007) released a study report on child abuse. Of the young adults (ages 18-24)

interviewed, almost half of them reported having been physically or sexually abused as children.

Right to stridhan

'Stridhan' is the property of a female, both movable and immovable, which is her own. It can be a gift, inheritance, maintenance, or even her own earnings. Only she has rights over her 'stridhan' and she can exclusively decide what she wants to do with it. This law applies only to Hindus. Since 2005, Hindu women have equal rights as men to inherit property. Therefore, a girl can inherit the same amount of property as her brother. Inheritance can be through a Will or through succession (if the deceased person does not leave a Will, the property will pass on to legal heirs according to the law). Supreme Court of India passed a landmark judgement declaring that all gifts made over to a woman at the time of her marriage remained her absolute private property till the end; and that her husband, or any other, had no right to them without her sanction.

Right against child marriage

The minimum age of marriage for girls is 18 years (and for boys, it's 21 years). Any adult responsible for marrying a female child under the age of 18 can be punished by law. Interestingly, the Parliament is now looking to increase the marriageable age for girls to 21 years now (on par with boys). In spite of the Prohibition of Child Marriage Act (2006), the practice of child marriage remains pervasive due to factors spread across the socio-ecological spectrum, including structural inequalities and regressive social norms in India. Girls with either no or below primary level education have experienced higher levels of child marriage. As per theNFHS-5, 23.3% women got married before attaining the legal age of 18 years from 26.8% reported in NFHS-4 and 48% of girls with no education were married below 18 years of age as compared to only 4% among those who attained higher education

Right against sexual harassment

Sexual harassment broadly means any kind of unwelcome physical contact, sexual gestures, comments, sexual advances, requests for sexual favours, etc. by a man to a woman. Indian law protects all women from sexual harassment by men. By virtue of this law, every girl child in India is protected against sexual harassment. Sexual violence is a major problem faced by women and girls in India. It is already a challenge for survivors to obtain justice in the Indian legal system, and those from the country's marginalized communities face even more major barriers. According to official crime data, there were 3,486 reported cases of rape against Dalit (Scheduled Caste) women and girls in 2019, and 1,110 reported rape cases against Adivasi women and girls (Scheduled Tribes). According to the latest National Family

Health Survey (NFHS-5), nearly 1 in 3 Indian women age 18-49 have suffered some form of spousal abuse; and around 6% have suffered sexual violence. Study on Child Abuse: INDIA 2007 reveals that among respondents, 48% of boys and 39% of the girls faced sexual abuse. The prevalence of sexual abuse in upper and middle class was found to be proportionately higher than in lower or in lower middle class. Sexual abuse was found to be prevalent in both joint and nuclear families.

Right against sexual harassment at work place

It is common for young girls these days to intern or work in offices, while they are still studying. The Prevention of Sexual Harassment at Workplace Act 2013 protects all female workers, whether they are full-time, part-time, consultants, or even interns, against any kind of sexual harassment at work. It defined sexual harassment; lay down the procedures for a complaint and inquiry, and the action to be taken. It broadened the Vishaka guidelines, which were already in place. As per NCRB Report 2020, total cases of sexual harassment reported stood at 17,003 in 2020, down by 1,331 cases from 2019's 18,334. With most people working from home in the last year, only 485 incidents of workplace sexual harassment were reported, down marginally from 2019's 505 cases.

Right to abortion

Abortion was legalized in the country in 1971. A female child has the right to abortion to terminate an unwanted pregnancy. The Medical Termination of Pregnancy Act, 1971 permits a minor girl to have an abortion, with the written consent of her guardian. However, abortion is only permitted under special conditions like if the pregnancy is 'likely to cause injury to the physical or mental health of the pregnant women'. At least 7% of all women aged 15-19 years began child-bearing in 2019-21, as per National Family Health Survey-5. Teenage pregnancies are higher in rural India (8%) than urban (4%). UNFPA's State of the World Population in 2008 suggested that teen pregnancy in India is high with 62 pregnant teens out of every 1,000 women. In 2015, abortions among teenage girls had seen an alarming rise at 67 per cent. Abortion among girls under the age of 15 in Mumbai has risen by 144 per cent over the last three years as per BMC (The Times of India, 2015).

Conclusion

India is home to 20 per cent child population of the world. Here, nearly 100 million children fall in the poorest wealth quintile. Though the girl children has legal rights, they facing many problems such as Female infanticide and Foeticide, Early Marriage, better education, health, Neglect and Discrimination, Trafficking, Abuse , exploitation and Violence etc. However, The opportunity to be born, opportunity to grow in a safe and secure

environment, opportunity to develop ones' full potential are some of the major issues concerning the girl children in India must be taken into account for giving girl children their due position in India.

Women's Empowerment in India:A critical analysis based on NFHS-5

Dr.K.V.Sunil Kumar[1] and Dr.T.Chandrasekarayya[2]
[1]Academic Consultant,and [2]Associate Professor, Dept. of Population Studies, S.V.University, Tirupati, A.P.

"You can tell the condition of a nation by looking at the status of its women."

- Jawaharlal Nehru

Abstract

Women's empowerment refers to the process of enabling women to have greater control over their lives and to be able to make their own decisions. This can include empowering women to participate fully in the economy and in the political process, as well as empowering them to make decisions about their own health and well-being. It is the key to improving their participation in decision-making, which is the most crucial factor in socio-economic and cultural development. India is a developing country, has a very poor economic status of females due to its male-dominated nature. Women constitute roughly 50 per cent of the country's population, and most of them are still economically dependent, unemployed, and in many ways inferior to men. However, women's empowerment is very necessary to create a bright future for the family, society and country. Empowering women would mean encouraging women to self-sufficiency, financial independence, positive self-esteem, creating confidence in difficult situations and active participation in various socio-political development endeavours. The paper aims at examine the six key indicators on women empowerment, based secondary data collected from NFHS-5 by taking descriptive research design and suggestions are made to empower women in India.

Key words

Women Empowerment, Household Decisions, Work Participation, Own of Property, Access to Bank & Mobile Phone, and Health withHygienic

Introduction

Women's empowerment can be defined to promoting women's sense of self-worth, their ability to determine their own choices, and their right to influence social change for themselves and others. It means increasing and improving the social, economic, political and legal power of women, ensuring equal rights and sufficient self-confidence for women to claim their rights and develop independently. Women's empowerment equips and allows women to make life-determining decisions through the different societal problems.The empowerment of women is a key aspect in achieving gender equality, where men and women

have equal power and opportunities for education, health, economic participation and personal development. The empowerment of women is essential for the health and social development of families, communities and countries. Panda (2017) opined that the empowerment of women is not a necessary fact for our country, but it is necessary for the sustainable development of the nation. When women live safe, satisfied and productive lives, they can reach their full potential. In addition, they contribute their skills to the workforce and can raise happier and healthier children. Women are key factors in the economy and play an important role in the workforce and contribute to the growth and development of the family, society and nation. India's journey towards women empowerment has its ups and downs.

Seema Singh and Antra Singh (2020) concluded that while thinking about improving educational attainment and political participation, the downward trend in economic participation and opportunity and health and survival segment has been quite significant.Women empowerment refers to women's ability to make strategic life choices that were previously denied themAs India progresses economically, the country is encouraged to pay more attention to social and human development, including women's empowerment. The equal rights of men and women are enshrined in Articles 14 to 16 of the Constitution of India, which came into force on 26 January 1950 (Constitution of India, 2020). Empowerment refers to a situation where the powerless gain greater control over resources and ideologies. It is associated with concepts such as autonomy, power, status and agency. The empowerment of women in India is highly dependent on several variables which include geographical location (urban/rural), social status (caste and class), educational status, marital status, religion and age. As a traditional patriarchal society, women have been given a secondary status, which is reflected economically, socially and politically. However, women's equality and empowerment has always been a priority and taken very seriously by stakeholders (Seema Singh and Antra Singh, 2020).

Review of Literature

Shettar (2015) concludes that access to education; employment and changes in the social structure are only factors contributing to the empowerment of women. Khatri (2016) focuses on the impact of literacy and education on the empowerment of women and a proposal to improve the changes considered for the empowerment and economic development of women. Suresh and Sivakumar (2017) found that the empowerment of women is essentially a process that raises the economic, social and political status of

traditionally disadvantaged women in society. It is a process to protect them from any kind of violence. A study by Banashri Mandal (2018) shows that women empowerment means increasing and improving the social, economic, political and legal power of women to ensure equal rights for women and make them confident enough to demand their rights.SangeethaMenon et al (2020) examined at indicators of women's empowerment such as women's decision-making power in domestic affairs, economic autonomy, also freedom of movement and access to education. Sobha Rani (2023) states that the empowerment of women would mean giving women financial independence, self-confidence and positive evaluation so that they can face difficult situations and participates in development activities.

Objective

1. The paper examines the six key indicators of women empowerment in India and
2. Suggest measures to improve women status in India.

Methodology

The paper is descriptive in nature also based on secondary data collected from NFHS-5 (National Family Health Survey-2019-21) for India and 14 States /UTs included in two Phases of the Survey and gathered information from 6,36,699 households covering 7,24,115 women of aged 15-49 years. The six key indicators of women empowerment considered in paper are:1. Currently married women who usually participate in three household decisions (Decisions about health care for herself, making major household purchases, and visits to her family or relatives), 2. Women who worked in the last 12 months and were paid in cash 3. Women owning a house and/or land (alone or jointly with others) 4. Women having a bank or savings account that they themselves use, 5. Women having a mobile phone that they themselves use and 6. Women age 15-24 years who use hygienic methods of protection during their menstrual period (Locally prepared napkins, sanitary napkins, tampons, and menstrual cups are considered to be hygienic methods of protection.)

Results and Discussion

The women empowerment aspects such as participation of women in household decision, paid work, Ownership of house/land, Access to mobile phone and bank and Practice of Menstrual Hygiene are briefly discussed hereunder.

Women in Household decision

One of the characteristics of women's empowerment is decision-making. The participation of women in household decision-making can reduce the perceived gender inequality. Nowadays, married women reveal their position in the family, usually involved in making three household decisions (e.g. self-care, important household purchases, and

visitingfamily or relatives).Acharya,et al. (2010) found that almost half (47.1%) of ever-married women made their health care decisions alone or with their spouse. This proportion is 52.8% for large household purchases, 57.6% for everyday household purchases and 56.6% for family/friends.

Table-1: Currently married women who usually participate in three household decisions

S. No	India/ State/ Union Territory	NFHS-5 (2019-21)			NFHS-4 (215-16)
		Urban (%)	Rural (%)	Total (%)	Total (%)
1.	India	91.0	87.7	88.7	84.0
2.	Arunachal Pradesh	89.2	86.6	87.0	89.1
3.	Chhattisgarh	96.5	91.6	95.7	90.5
4.	Haryana	90.7	86.2	87.5	76.5
5.	Jharkhand	94.6	89.8	91.0	86.6
6.	Madhya Pradesh	91.7	84.1	86.0	82.8
7.	Odisha	89.9	90.3	90.2	81.8
8.	Punjab	93.3	90.3	91.4	90.2
9.	Rajasthan	90.6	86.8	87.7	81.7
10.	Tamil Nadu	91.8	93.7	92.8	84.0
11.	Uttar Pradesh	90.1	86.8	87.6	81.7

13.	Chandigarh	94.6	-	94.6	96.6
14.	NCT Delhi	92.0	94.3	92.0	73.8
15.	Puducherry	98.4	96.6	97.9	85.1

Source: Government of India; 2019-21: Ministry of Health And Family Welfare, Compendium of Fact Sheets, India and 14 States/UTs (Phase-11), National Family Health Survey (NFHS-5)

Table-1 depicts that currently married woman (aged 15-49) who usually participate in three household decisions like health care for herself, making major household purchases, and visits to her family or relatives has been slightly increased from NFHS-4 to NFHS-5. Further, women who reside in urban areas have more involved in household decisions than their rural counterparts. Women who participated in household decisions were differing by states and union territories.

Participation in paid works

Paid work is still the privilege of few women around the world, although it can be said that all women work. One of the main factors preventing women from controlling household decisions is the value of the work they do. There is substantial evidence that women in India have limited opportunities to participate in paid work outside the home (Mehrotra et al., 2016).

Table-2: Per cent of women who worked in the last 12 months and were paid in cash

S. No	India/ State/ Union Territory	NFHS-5 (2019-21)			NFHS-4 (215-16)
		Urban (%)	Rural (%)	Total (%)	Total (%)
1.	India	25.0	25.6	25.4	24.6
2.	Arunachal Pradesh	23.0	23.6	23.5	17.2
3.	Chhattisgarh	28.4	42.6	31.1	36.8
4.	Haryana	22.6	17.0	18.8	17.6
5.	Jharkhand	18.8	17.7	18.0	24.8
6.	Madhya Pradesh	23.2	28.0	26.8	29.9
7.	Odisha	26.3	25.6	25.7	22.5
8.	Punjab	25.6	20.2	22.3	18.5

13.	Chandigarh	22.0	-	22.0	32.6
14.	NCT Delhi	25.0	17.2	24.9	21.1
15.	Puducherry	35.4	44.8	38.2	21.2

Source: Government of India; 2019-21: Ministry of Health And Family Welfare, Compendium of Fact Sheets, India and 14 States/UTs (Phase-11), National Family Health Survey (NFHS-5)

Table-2 portrays that currently married woman (aged 15-49) who worked in the last 12 months and were paid in cash has been meagrely increased from NFHS-4 to NFHS-5. Further, women who reside in urban areas have worked in the last 12 months and were paid in cash than their rural counterparts. Women who worked in the last 12 months and were paid in cash were more or less similar in many states and but differ in union territories.

Ownership of house/land

Women's access to and control over productive resources, especially ownership of agricultural land, is key to their economic empowerment, social status, physical security, and their own and their families' overall well-being. It also analyses intra-gender gaps, and identifies the factors–individual, household and regional–affecting a woman's likelihood of owning land. Despite significant advancement towards equality in inheritance laws, women are found to constitute barely 14% of landowners owning 11% of agricultural land in rural landowning households, averaged across states. (Agarwal, B., et al, 2020).

Table-3: Percent of women owning a house and/or land (alone or jointly with others)

S.No	India/ State/ Union Territory	NFHS-5(2019-21)			NFHS-4 (215-16)
		NFHS-5(2019-21)			NFHS-4 (215-16)
		Urban (%)	Rural (%)	Total (%)	Total (%)
1.	India	38.3	45.7	43.3	38.4
2.	Arunachal Pradesh	69.8	70.3	70.2	59.7
3.	Chhattisgarh	46.1	45.5	45.6	26.4
4.	Haryana	35.7	41.0	39.3	35.8
5.	Jharkhand	57.4	66.5	64.2	49.7
6.	Madhya Pradesh	35.8	41.3	39.9	43.5
7.	Odisha	35.4	45.5	43.5	63.5
8.	Punjab	58.0	67.1	63.5	32.1
9.	Rajasthan	26.5	26.6	26.6	24.1
10.	Tamil Nadu	43.2	52.0	47.9	36.2
11.	Uttar Pradesh	46.8	53.5	51.9	34.2
12.	Uttarakhand	23.3	25.1	24.6	29.2
13.	Chandigarh	30.4	-	30.4	21.6
14.	NCT Delhi	22.6	27.4	22.7	34.9
15.	Puducherry	36.8	38.3	37.2	40.3
Government of India; 2019-21: Ministry of Health And Family Welfare, Compendium of Fact Sheets, India and 14 States/UTs (Phase-11), National Family Health Survey (NFHS-5)					

Table-3 reveals that women owning a house and/or land (alone or jointly with others)have been significantly increased from NFHS-4 to NFHS-5. Further, significantly higher per cent of rural women owned a house and/or land (alone or jointly with others) than women reside in urban areas. Women who owning a house and/or land (alone or jointly with others)were significantly varied in many states and but differ in union territories.

Access to Bank

Financial inclusion is essential for economic growth and sustainable development; for women, it is a pathway to economic and social empowerment. Expanding financial access for women is proven to have a positive impact not only on the women themselves but, consequently, on household incomes. Banks as part of their programs facilitate women by providing personalised banking services which are designed specially according to their needs and preferences. Jan DhanYojana is an initiative towards financial inclusion which also paves way for women financial empowerment. ShrutiJha (2019) stated that various initiatives are being implemented and more to roll out, Indian women is on the way of empowerment, socially and financially, to reach towards the goals of gender equality and empowerment.

Table-4: Per cent of women having a bank or savings account that they themselves use

		Urban (%)	Rural (%)	Total (%)	Total (%)
1.	India	80.9	77.4	78.6	53.0
2.	Arunachal Pradesh	86.0	76.7	78.2	56.6
3.	Chhattisgarh	77.9	81.1	80.3	51.3
4.	Haryana	76.3	72.4	73.6	45.6
5.	Jharkhand	79.2	79.8	79.6	45.1

11.	Uttar Pradesh	79.8	78.1	75.4	54.6
12.	Uttarakhand	81.3	79.8	80.2	58.5
13.	Chandigarh	87.1	-	89.1	79.6
14.	NCT Delhi	72.3	84.8	72.5	64.5
15.	Puducherry	90.9	96.6	97.9	85.0

Source: Government of India; 2019-21: Ministry of Health And Family Welfare, Compendium of Fact Sheets, India and 14 States/UTs (Phase-11), National Family Health Survey (NFHS-5)

Table-4 shows that women having a bank or savings account that they themselves use have been significantly increased from NFHS-4 to NFHS-5. Further, significantly higher per cent of urban women having a bank or savings account that they themselves use than women reside in rural areas. Women who women having a bank or savings account that they themselves use were significantly varied in many states and but differ in union territories.

Access to mobile phone

Many have heralded mobile phones as promising new tools for women's empowerment in the Global South. The mobile phone revealed the opportunities and freedom of women to make their own choices, improve their social network, change attitudes and change their lives. The mobile phone is changing the general socio-economic, political and psychological life of women. Only 28% of all 612 million women own mobile phones, compared to 43% of men. The gender gap in mobile phone ownership is as high as 114 million. "Gender inequality is relatively large and widespread in India, affecting women's access to and use of mobile phones.Ashim Nandi (2021) found that mobile phone use generally facilitates women's empowerment, but mobile phone use does not support women's empowerment in a male-dominated economy.

Table-5: Per cent of women having a mobile phone that they themselves use

S.No	India/ State/ Union Territory	NFHS-5(2019-21)			NFHS-4 (215-16)
		Urban (%)	Rural (%)	Total (%)	Total (%)

Source: Government of India; 2019-21: Ministry of Health And Family Welfare, Compendium of Fact Sheets, India and 14 States/UTs (Phase-11), National Family Health Survey (NFHS-5)					

Table-5 illustrations that women were having a mobile phone that they themselves use have been significantly increased from NFHS-4 to NFHS-5. Further, significantly higher per cent of urban women having a bank or savings account that they themselves use than women reside in rural areas. Women who women having a mobile phone that they themselves usewere significantly varied in many states and but differ in union territories.

Practice of Menstrual Hygiene

Poor menstrual hygiene,however, can lead to serious health risks, such as reproductive and urinary infections, which in the future can lead to infertility and birth complications. Not washing your hands after changing menstrual products can spread infections such as hepatitis B and thrush. Dasgupta and Sarkar(2008) found that 78 (48.75%) girls knew how to use sanitary napkins during menstruation. Of the practices, only 18 (11.25%) girls used sanitary napkins during menstruation. When cleaning, 156 (97.5%) girls used both soap and water. Singh, A., Chakrabarty, M., Singh, S. jt 2022)

Table-6: Per cent of women age 15-24 years who use hygienic methods of protection during their menstrual period

S.No	India/ State/ Union Territory	NFHS-5 (2019-21)			NFHS-4 (215-16)
		Urban (%)	Rural (%)	Total (%)	Total (%)
1.	India	89.4	72.3	77.3	57.6
2.	Arunachal Pradesh	93.5	91.4	91.8	73.4
3.	Chhattisgarh	83.2	64.8	68.8	47.1
4.	Haryana	96.7	91.6	92.2	78.3
5.	Jharkhand	88.2	70.8	74.9	49.6
6.	Madhya Pradesh	81.9	53.4	60.5	37.6
7.	Odisha	91.7	79.5	81.5	47.4
8.	Punjab	95.4	91.1	93.2	84.4
9.	Rajasthan	92.2	81.9	84.1	55.2
10.	Tamil Nadu	98.6	98.0	98.3	91.4
11.	Uttar Pradesh	86.7	68.4	72.6	419.1
12.	Uttarakhand	94.5	89.7	91.2	69.9
13.	Chandigarh	93.3	-	93.0	92.1
14.	NCT Delhi	96.9	98.4	96.9	90.0
15.	Puducherry	99.1	99.1	99.1	96.5

Source: Government of India; 2019-21: Ministry of Health And Family Welfare, Compendium of Fact Sheets, India and 14 States/UTs (Phase-11), National Family Health Survey (NFHS-5)

Table-6 depicts that women age 15-24 years who use hygienic methods of protection during their menstrual period (Locally prepared napkins, sanitary napkins, tampons, and menstrual cups are considered to be hygienic methods of protection) have been significantly increased from NFHS-4 to NFHS-5. Further, significantly higher per cent of urban women having a bank or savings account that they themselves use than women reside in rural areas. Women who women having a mobile phone that they themselves use were significantly varied in many states and but differ in union territories.

Conclusion

Most of the currently married women (aged 15-49 years) have usually participated in three household decisions. But, only about one-fourth of currently married woman (aged 15-49) had worked in the last 12 months and was paid in cash. On an average, less than half of women were owned a house and/or land (alone or jointly with other). Nearly four-fifths of women had a bank or savings account that they themselves used. Nearly half of the were having a mobile phone that they themselves used and nearly four-fifths of women aged 15-24 years had used hygienic methods of protection during their menstrual period by way of locally prepared napkins, sanitary napkins, tampons, and menstrual cup. However, the six

empowerment aspects examined have been increased from NFHS-4 to NFHS-6 period, but rural-urban differentials were observed. Based on the findings, it is suggested that gender discrimination can be reduced by creating awareness on need of women empowerment and their benefits. Further, apart from new programmes, existing women empowerment policies should strengthen in rural areas, where in more women are residing. Women empowerment helpsthe women to handle their issues in better.It can direct them towards progress and development by channelizing their energies and efforts into productive purposes, thus creating gender equality and accelerating the speed of development of the Indian economy.

Determinants of the performance achieved by the Auxiliary Nurse Midwifes under MCH Services in National Rural Health Mission - A study

Valluri Venkata Vara Prasad, PhD Scholar & Dr.T.Chandrasekarayya, Associate Professor,
Dept. of Population Studies & Social Work, S.V.University, Tirupati, A.P-517502.

Abstract

India's Primary Health Care and the Family Planning Programs have come a long way after the independence in improving health indicators in general, yet it has high 'maternal' and 'under five' mortality rates. However, a lot of ground still needs to be covered to complete the demographic and epidemiological transition and improve Maternal and Child Health Indicators in a country which is as big as a continent. It is important to understand why the role of Auxiliary Nurse Midwifes (ANMs) changed from primarily a Midwife in 60s to a Preventive Health Worker with focus on Family Planning and Immunization. Changes in Program Priorities - emphasis on Preventive Services, lack of focus on Curative/Midwifery Services, changes in monitoring mechanism, lack of supervision/training, weak management, neglect by International Agencies and NGOs are major factors associated with this change. The present study aims at examines the Determinants of the performance achieved by the Auxiliary Nurse Midwifes under MCH Services in National Rural Health Mission. It is based on primary date by covering the sample size of 175 Auxiliary Nurse Midwifes with simple random sampling technic and suggestions are made for policy implications

Keywords

Auxiliary Nurse Midwifes The National Rural Health Mission, Maternal and Child Health, Health Care System, Performance and Rural Areas.

Introduction

The National Rural Health Mission (NRHM) launched by the Hon'ble Prime Minister on 12th April 2005 throughout the country with special focus on 18 states, including eight Empowered Action Group (EAG) states, the North-Eastern states, Jammu & Kashmir and Himachal Pradesh seeks to provide Accessible, Affordable and Quality Health Care Services to Rural Population, especially the Vulnerable Sections. The NRHM operates as an omnibus broadband programme by integrating all Vertical Health Programmes of the Departments of Health and Family Welfare including Reproductive & Child Health Programme and various Diseases Control Programmes. The NRHM has emerged as a Major Financing and Health Sector Reform Strategy to strengthen States Health Systems. The National Rural Health

Mission (NRHM) has been launched with a view to bringing about dramatic improvement in the Health System and the health status of the people, especially those who live in the Rural Areas of the Country. The Mission seeks to provide Universal Access to Equitable, Affordable and Quality Health Care which is accountable at the same time responsive to the needs of the people, reduction of Child and Maternal Deaths as well as Population Stabilization, Gender and Demographic Balance. In this process, the Mission would help achieve goals set under the National Health Policy and the Millennium Development Goals during the Mission Period i.e., 2005-2012. Later, the Mission Period has been extended up to 2017. To achieve these goals NRHM will:

- ✓ Facilitate increased Access and Utilization of Quality Health Services by all.
- ✓ Forge a partnership between the Central, State and the Local Governments.
- ✓ Set up a platform for involving the Panchayat Raj Institutions and Community in the management of Primary Health Programmes and Infrastructure.
- ✓ Provide an opportunity for promoting Equity and Social Justice.
- ✓ Establish a mechanism to provide flexibility to the States and the community to promote Local Initiatives.
- ✓ Develop a framework for promoting inter-spectral convergence for Promotive and Preventive Health Care.

The Objectives of the NRHM Mission

The influences of major determinants like a) Socio-Demographic Characteristics viz., Age, Marital Status, Religion, Caste, Education, Income b) Awareness on NRHM Goals and c) Professional Factors like Experience and Transfers on the performance rendered under MCH Services by the ANMs were presented. MCH Services viz., 1). ANC Registration, 2). IFA Tablet Distribution, 3). TT(PW), 4). Total Deliveries, 5). Institutional Deliveries, 6). BCG, 7). OPV, 8). Hepatitis-B, 9) Fully Immunized and 10). Family Planning Cases of the ANMs for the last two years have been taken as the dependent variable, and the influence of different factors like Socio-economic, demographic, knowledge and professional factors on it have been analysed.

Review of Literature

A study on Factors governing the performance of Auxiliary Nurse Midwives in Pune district, India by Pyone T et al concluded that focusing on the tasks of ANMs with technical inputs alone is insufficient to achieve the full potential of ANMs in a changing context. Systematic efforts tackling factors governing ANMs in their workplaces can produce a useful cadre that can play an important role in achieving universal health coverage in India. Razee

.H et al (2012) focussed on 'Listening to the rural health workers in Papua New Guinea-the social factors that influence their motivation to work'. Sunder Gujral (1991) studied the determinants of community health workers' performance in India. Bhombe, Ishwari et al (2019) studied the workload and work pattern of ANMs and identify the causes for improving work efficiency of ANMs and conclude that clarity about job responsibilities of ANMs is lacking and available working time is not effectively utilized. Time spent on supporting tasks such as travel and waiting is maximum and training to manage time for priority tasks and to improve skills is required. Factors influencing ANMs in their practices, scope of work and the mechanisms that influence ANMs' performances remain understudied. According to Zahra Hadizadesh Talasaz, Shahla Nourani Saadoldin et al, Mashhad, Iran, (2014), the mean age of the participants was 39.63±6.92 years. Spearman Correlation Test showed a direct correlation between Job Satisfaction and the Total Score of Job Performance ($P<0.001$, $r=0.490$). A direct relationship was also found between Job Satisfaction and the quality of Educational Performance ($P<0.001$, $r=0.415$), Care Performance ($P<0.001$, $r=0.335$), and Communicative Performance ($P<0.001$, $r=0.510$). There was a positive correlation between Job Satisfaction and Job Performance of Midwives. Ch. Platis, P. Reklitis, S. Zimeras et al, (2014**):** Relation between Job Satisfaction and Job performance in Healthcare Services

Objective

The paper aimed to study Determinants of the performance achieved by the Auxiliary Nurse Midwifes under MCH Services in National Rural Health Mission in Krishna District, Andhra Pradesh, India.

Methodology

The study is based on primary data consisting of 170 Auxiliary Nurse Midwives working in 18 PHCs covering a total of all the 109 Sub-Centres were interviewed with a semi structured questionnaire. There are ten MCH services of the ANMs during 2014-15 & 2015-16, weightages have been to MCH services rendered by ANMs. Basing on the performance under MCH services of the ANMs, the average performance of the each ANM per year was calculated and all the ANMs under study have been categorized into three groups based on the individual achievements under each service' are categorized in three as "high performance, average performance and poor performance".

Results and Discussion

These changes will require sustained and careful planning and resource allocation. Increasing resources along with systemic reforms will improve health status of the women

and children who are the focus of Reproductive Child Health programs. Nurses' Job Satisfaction is an important indicator of Nurses' Job intent to stay, provide quality of Nursing Care and Professional Performance, which therefore needs a greater focus of Administrators or Managers. The determinants such as Job-satisfaction, Attitude and Awareness about the programme those are likely to influence the performance of the Auxiliary Nurse Midwives (ANMs).

Table-1: Association between the Type of appointment of ANMs and their performance under MCH Services

Type of Appointment	Performance under MCH Services						Total	
	High		Average		Poor			
	No.	%	No.	%	No.	%	No.	%
2nd ANM	20	21.74%	42	45.65%	30	32.61%	92	100.00%
Regular ANM	18	23.08%	44	56.41%	16	20.51%	78	100.00%
Total	38	22.35%	86	50.59%	46	27.06%	170	100.00%
Chi-Square Value	Degree of freedom		P - Value				Inference	
3.28	2		> 0.05				Not Significant	

From Table-1, slightly more proportion of Regular ANMs (23.08%) recorded 'High Performance' as against (21.74%) among 2nd ANMs. (56.41%) of Regular ANMs manifested as 'Average Performance' as against (45.65%) among 2nd ANMs. (32.61%) of 2nd ANMs recorded under 'Poor Performance' as against (20.51%) among Regular ANMs. The difference observed is statistically not significant at $P > 0.05$.

Table-2: Association between the Religion of the ANMs and their performance under MCH Services

Religion	Performance under MCH Services						Total	
	High		Average		Poor			
	No.	%	No.	%	No.	%	No.	%
Hindus	34	21.25%	82	51.25%	44	27.50%	160	100.00%
Christians	4	40.00%	4	40.00%	2	20.00%	10	100.00%
Total	38	22.35%	86	50.59%	46	27.06%	170	100.00%
Chi-Square Value	Degree of freedom		P - Value				Inference	
1.91	2		> 0.05				Not Significant	

From the table-2, out of total 170 ANMs (both Regular and 2nd ANMs), only meagre number i.e., only 10 ANMs are recorded under 'Christians'. However, slightly more proportion of 'Christians' category ANMs recorded 'High Performance' as against 21.25% of 'Hindu' category ANMs. 51.25% of 'Hindu' ANMs recorded 'Average Performance' as against 40.00% of 'Christian' ANMs. 27.5% of 'Hindu' ANMs recorded 'Poor Performance' as against 20.0% of 'Christian' ANMs.

Table-3: Association between the Income of the ANMs and their performance under MCH Services

Income (per month)	Performance under MCH Services						Total	
	High		Average		Poor			
	No.	%	No.	%	No.	%	No.	%
< Rs. 15,000/-	20	21.74%	42	45.65%	30	32.61%	92	100.00%
Rs. 15001/- to Rs. 30,000/-	0	0.00%	4	100.00%	0	0.00%	4	100.00%
> Rs. 30,001/-	18	24.32%	40	54.05%	16	21.62%	74	100.00%
Total	38	22.35%	86	50.59%	46	27.06%	170	100.00%

From the table-3, It is evident that slightly more proportion (24.32%) of ANMs whose income is more than Rs: 30,001/- recorded 'High Performance' as against (21.74%) among ANMs whose Income is less than Rs: 15,000/-. No one is recorded 'High Performance' among ANMs whose Income is in between Rs: 15,001/- & Rs: 30,000/-. Though, meagre number 100 % (4) ANMs whose Income is in between Rs: 15,001/- & Rs: 30,000/- recorded 'Average Performance as against 54.05% among ANMs whose Income is more than Rs. 30,001/- and 45.65% among ANMs whose Income is less than Rs. 15,000/-. More proportion (32.61%) of ANMs whose Income is less than Rs: 15,000/- recorded 'Poor Performance' as against (21.62%) among ANMs whose Income is more than Rs: 30,001/-. No one is recorded 'Poor Performance' among the ANMs whose Income is in between Rs: 15,001/- & Rs: 30,000/-.

Table-4: Association between the Education of the ANMs and their performance under MCH Services:

Education	Performance under MCH Services						Total	
	High		Average		Poor			
	No.	%	No.	%	No.	%	No.	%
Up to 10th Class	22	19.64%	48	42.86%	42	37.50%	112	100.00%
Inter/PUC	14	29.17%	30	62.50%	4	8.33%	48	100.00%
Degree & above	2	20.00%	8	80.00%	0	0.00%	10	100.00%
Total	38	22.35%	86	50.59%	46	27.06%	170	100.00%

Education is an important influencing factor in rendering better services in any sector. From the table-4, also it is quite evident that better the education higher the performance. 'High Performance' is recorded in high proportion i.e., 29.17% of ANMs who studied 'Inter/PUC' as against 20% among ANMs studied 'Degree & above' and 19.64% among ANMs studied 'Up to 10th Class'. However, out of total 172 ANMs, only 10 ANMs studied 'Degree & above'. 'Average Performance' is recorded in high proportion i.e., 80% of ANMs who studied 'Degree & above' as against 62.5% among ANMs studied 'Inter/PUC' and

42.86% among ANMs studied 'up to 10th Class'. High proportion (37.5%) of ANMs studied 'up to 10th Class' recorded 'Poor Performance' as against 8.33% of ANMs studied 'Inter/PUC'. No one from ANMs studied 'Degree & above' recorded 'Poor Performance'.

Table-5: Association between Total Length of Service of ANMs and their performance under MCH Services

Length of the Service of the ANMs (Yrs)	Performance under MCH Services						Total	
	High		Average		Poor			
	No.	%	No.	%	No.	%	No.	%
Up to 10 Yrs	26	23.21%	56	50.00%	30	26.79%	112	100.00%
> 10 to < 20 Yrs	8	30.77%	12	46.15%	6	23.08%	26	100.00%
> 20 Yrs	4	12.50%	18	56.25%	10	31.25%	32	100.00%
Total	38	22.35%	86	50.59%	46	27.06%	170	100.00%
Chi-Square Value	Degree of freedom		P - Value				Inference	
2.93	4		> 0.05				Not Significant	

From the table-5, slightly more proportion (30.77%) of ANMs whose service is in between '10 Years & 20 Years' recorded 'High Performance' as against (23.21%) of ANMs whose service is 'Up to 10 Years' and (12.5%) of ANMs whose service is '> 20 Years'. High proportion (56.25%) of ANMs with '> 20 Years' of service recorded 'Average Performance' as against (46.15%) of ANMs with service 'between 10 & 20 Years' and (50%) of ANMs with service 'Up to 10 Years'. (31.25%) of ANMs with '> 20 Years' of service recorded 'Poor Performance' as against (23.08%) of ANMs with service between 'between 10 & 20 Years' and (26.79%) of ANMs whose service is 'Up to 10 Years'. The said difference is statistically not significant at P > 0.05.

Table-6: Association between Preferences of ANMs to join in the present post and their performance under MCH Services:

Preference to join in the present post	Performance under MCH Services						Total	
	High		Average		Poor			
	No.	%	No.	%	No.	%	No.	%
Interest and desire to serve the people	36	25.00%	66	45.83%	42	29.17%	144	100.00%
Economic Necessity/ Shifted from the other department	2	7.69%	20	76.92%	4	15.38%	26	100.00%
Total	38	22.35%	86	50.59%	46	27.06%	170	100.00%
Chi-Square Value	Degree of freedom		P - Value				Inference	
8.71	2		< 0.01				Highly Significant	

From the table-6, it is evident that the ANMs who joined in the present post with 'Interest and desire to serve the people' have performed better MCH Services. 25% of ANMs who joined with 'Interest and desire' recorded 'High Performance' as against only 7.69% of ANMs who joined with 'Economic necessity'. 76.92% of ANMs joined with 'Economic Necessity' recorded 'Average Performance' as against 45.83% of ANMs joined with 'Interest and Desire'. 15.38% of ANMs joined with 'Economic Necessity' recorded 'Poor Performance' as against 29.17% of ANMs joined with 'Interest and Desire'. The said difference is statistically highly significant at $P < 0.05$.

Table-7: Association between ANM's present Sub-Centre happens to be her native place and their MCH Services:

Present Sub Centre whether native place or not of the ANM	Performance under MCH Services						Total	
	High		Average		Poor			
	No.	%	No.	%	No.	%	No.	%
Yes	8	12.90%	32	51.61%	22	35.48%	62	100.00%
No	30	27.78%	54	50.00%	24	22.22%	108	100.00%
Total	38	22.35%	86	50.59%	46	27.06%	170	100.00%
Chi-Square Value	Degree of freedom		P - Value				Inference	
6.48	2		< 0.05				Significant	

From the table-7, it is evident that the performance of ANMs who's present Sub-Centre is not her Native Place recorded 'high' when compared with the performance of ANMs who's present Sub-Centre happens to be her Native Place. Slightly more proportion (27.78%) of ANMs who's present Sub-Centre is not her native place recorded 'High Performance' as against (12.9%) of ANMs whose present Sub-Centre happens to be her native place. The difference observed is statistically significant at $P < 0.05$.

Table-8: Association between the Transfers of the ANMs and their performance under MCH Services:

No., of Transfers in the service	Performance under MCH Services						Total	
	High		Average		Poor			
	No.	%	No.	%	No.	%	No.	%
No Transfers	28	25.93%	50	46.30%	30	27.78%	108	100.00%
One Transfer	2	9.09%	16	72.73%	4	18.18%	22	100.00%
Two & more Transfers	8	20.00%	20	50.00%	12	30.00%	40	100.00%
Total	38	22.35%	86	50.59%	46	27.06%	170	100.00%
Chi-Square Value	Degree of freedom		P - Value				Inference	
5.76	4		> 0.05				Not Significant	

From the table-8, slightly more proportion (25.93%) of ANMs who have not been transferred in their service recorded 'High Performance' as against (20%) of ANMs who

have 'Two & more transfers' and (9.09%) of ANMs who have 'No Transfer'. 46.3% of ANMs with 'No Transfer', 72.73% of ANMs with 'One Transfer' and 50% of ANMs with 'Two & more Transfers' recorded 'Average Performance' where as 27.78% of ANMs with 'No Transfer', 18.18% of ANMs with 'One Transfer' and 30% of ANMs with 'Two & More Transfers' recorded 'Poor Performance'. The difference is statistically not significant at P > 0.05.

Conclusion

The findings of all these major aspects related Determinants of the performance achieved by the Auxiliary Nurse Midwifes under MCH Services to may be very useful for the administrators and decision makers of health sector in identifying the shortfalls in National Health Mission and to change its administrative policies accordingly, to get good results in terms of principles of Primary Health Care namely Equitable Distribution, Community Participation, Intersect oral Co-ordination and Appropriate Technology. Therefore, it is recommended that Health Care Administrators provide organizational supports for Midwives to improve their Professional Performance.

Abstract

Land is a basic natural resource. It forms the basis for all the biological, human and economic activities. In the developing countries like India, where agriculture is the main source of economy and livelihood for more than two-thirds of the working population, proper utilisation of land resource is vital.

Introduction

In recent years, serious concern has been shown on ecological management and optimum utilization of land resources for the benefit of mankind. Hence the use of land resource is "central to all discussions of land problems and policies [(1)] . Land use at any region is a complex, diversified and dynamic concept. It is due to the operation of whole range of environmental factors but modified by socio-economic and historical elements. In dry areas, the use of land resources is virtually associated with climatic and edaphic conditions, besides the socio-economic needs of the mankind. Undoubtedly, the erratic behaviour of the monsoon, frequent occurrences of drought and prolonged dry spells have had a devastating and debilitating effect on land use pattern and as a result, the landscapes in dry areas gets continuously varied and modified. Since land itself is one of the important components of the ecosystems, a critical study on landscape ecology and its planning calls for greater attention to be paid to the drought prone areas to keep the ecological balance between the environment and the socio-economic needs of the region.

Ecological View of Landscape

In the sense of ecology, land carries ecosystems, but is itself also a part of these ecosystems. Although the use of land resource may be considered from abroad view of human welfare, its use is always a process of modifications of ecosystem. The idea that land use is a process of modification of ecosystem was well explored by Simmons [(2)] .

He suggested that land use ecology might form a central theme in biogeography. It is also mentioned that the ecosystem concept provides the necessary modern scientific framework to the study of land use. The form and function of land use is a human enterprise, while the development of landscape is the continuous efforts of man for his needs and sustenance under every possible combinations of terrain, climatic, edaphic and vegetative conditions. By all means, it suggested that any scientific and rational land use planning should see that the ecological balance was not disturbed and that proper equilibrium between the environment and the socio-economic needs of the area be maintained.

Ecological Problems of Land Use

In the process of land use management and optimisation, ecological problems are becoming a most serious concern. The ever increasing pressure of population and decreasing man-land ratio are posing challenging problems to the land-use planners. Structurally, a land-use system consists of three interacting spheres namely, ecological (environmental), economic and social. Each sphere has its own unique set of human-ascribed goals. Ecological problems are those, which appear in connection with human socio-economic needs, change the quality of the physical environment and indiscriminate use of natural resource base. Ecological problems appear in different types of physical environment and various socio-economic, technological and political conditions.

The negative ecological effects like degree of decertification, land degradation, soil erosion, soil salinisation, chemical contamination and water pollution are frequent in the dry areas but taking place in different intensities and degree of criticality. The other problems related to land use are under-utilisation, over-utilisation and mis- utilisation of land resources. So the question is what are the reasons for the appearance of negative ecological effects in different environmental and socio- economic conditions. Off all, undoubtedly, man's indiscriminate use of land resources has resulted in the creation of negative ecological effects. His failure to recognise the long term implications of deforestation, faculty methods of cultivation, overgrazing, massive application of fertilisers and pesticides, practice of single crop monocultures, imbalances in the input and output factors and large scale exploitation of land and soil resources throughout an entire ecosystem. Results in widespread degradation.

The practice of monoculture was accompanied subsequently by great losses of genetic varieties in the fields, involving high risks of large hectarages being destroyed by single drought or pest. To cultivation of the same crop continuously and their synthetic fertilisation year after year has resulted in the disruption of the soil balance. With diminishing organic matter in the soil, its ability to retain moisture is also reduced and as a consequence, the soil becomes sterile and dry. To circumvent some of these problems a critical examination of landscape ecology is essential for a more rational approach to land use planning and conservation of resources.

Eco-development and Ecological Planning of Land Use

Generally speaking, ecological planning is a fundamental tool for landscape and regional planning, such that many landscape ecological studies are now done as integral parts of landscape and regional planning projects[3] . It offers an effective means of helping mankind to adapt to the dynamic changing environment of which he is but one integral part. Mc Harg[4] has defined ecological planning as "an instrument for revealing regions as interacting and dynamic natural systems having intrinsic opportunities and constraints for all human uses.

The goals of such planning are derived from the region and its people as proffered by locations where all or most advantageous (safe, healthy and beautiful) factors exist with none or few detrimental factors for any and all anticipated future uses. What constitutes 'detrimental' or 'advantageous' is derived from the use itself and the value system of the initiating person or group. The concept of eco-development forms the main strategy of 'Habitat Ecology'. It helps in explaining the form of planned growth which is concerned with the development of local available land resources within the constraints of local environment with a view to optimise the local capacities of the biosphere to support the welfare of life. The eco-development approach is very close to ecological and environmental planning to balance and harmonise the various enterprises of land use which man for his own benefit has superimposed on physical environment.

The eco-development approach related to land use rests on (i) rational utilisation, (ii) development of mankind pertaining to their well-being rather than in economic sense, and (iii) advancing a true symbiosis between man and environment. To activate and regulate the harmony between landuse development and environment both the demand and supply side of the equation must be acted upon. In the eco-development and ecological planning sense, any land use planning should not be considered merely from the agricultural point of view and bringing more land under the plough making it viable for cultivation, but should include rational utilisation of land resource, conservation of land from erosion, development of nutrients and soil cover through multiple vegetative systems, improving the potential capacity of land, application of modern scientific technology and lastly the preclusion of over exploitation of land.

Study Region

Anantapur district is one of the chronically drought-prone areas in the country. It is located in the rain-shadow region of

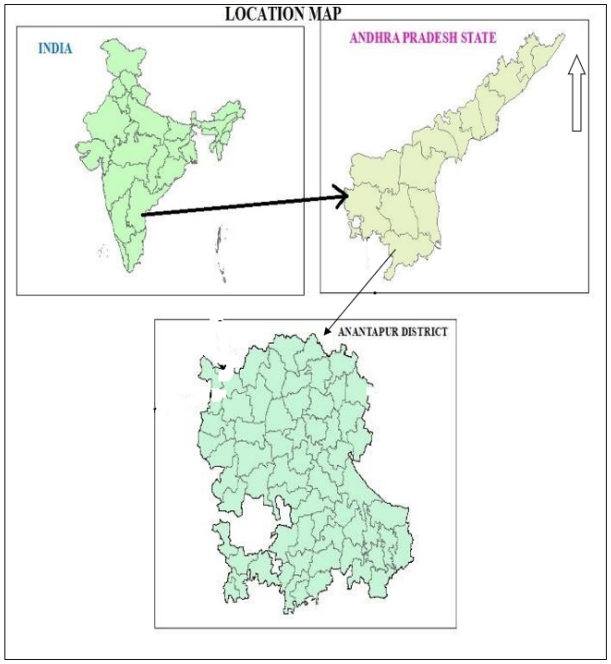

Fig. 1. Location map

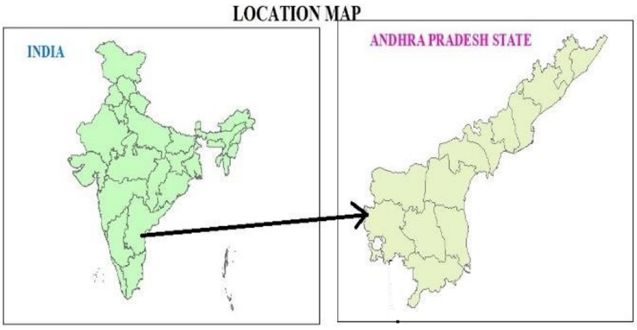

Fig. 2. Location map

the Western Ghats in Andhra Pradesh. It is the largest district in terms of area in the State. The population spread is very sparse with a density of population of 166 persons per Sq.Km. Agriculture is the predominant occupation of the people. The average annual rainfall of the district is 544 mm. with the lowest number of rainy days of 35 in the State. The district has been experiencing a drought once in every two years which is really serious and detrimental to stable agriculture.

Methodology

The spatial distributional pattern and changes in important land use types namely, forest land, fallow land and crop-land are examined and delineated with the help of both quantitative and cartographic techniques. The quantum of change is determined through percentages, regression trend and growth rates The impact of rainfall on land use types is measured with correlation testing.

Forest Land Use

Forests form distinct ecosystems. In fact, Anantapur district is very poor in forest cover with only 10.3% of the total geographical area of the district. The nature and character of forests in the district does not indicate any dense growth of tree population with different variety of plants. The forests of the district may be described as dry mixed deciduous and thorny open scrub types.

The distribution of forest-cover in the district is not only very low in proportion but also most uneven. Relatively, higher concentrations (15.1-20% and >20%) of forest-cover are found in southern, south-eastern and north-eastern parts of the district. In these areas, the amount of rainfall is comparatively higher than the other parts of the district. The western part of the district is found with very thin forest cover with discontinuous thorny thickets and scrub woodlands whose vegetative growth is stunted due to poor edaphic and very low isohyetal conditions.

During the three decades under consideration (1960-90) total area under forest has not shown any substantial change but showed a small increase of 0.1 per cent or 2000 hectares. The regression analysis has also revealed that the trend of forest land is marginally positive with 2 per cent of the goodness of fit. The annual compound growth rate has also shown a negligible rate of increase of 0.003 per cent.

Planning for the Development of Forest Land

In drought-prone areas, maintenance of ecological balance is one of the most important considerations to build-up the humus contents in the soil, avert soil erosion, increase the moisture in the atmosphere, raise the ground water level and heap in ground water recharge and storage besides other economic purposes. However, the poor quantity of forest cover in the district is too short to fulfil the requirement of ecological balance and is seriously jeopardizing the ecosystem of the region it is necessary to take up massive efforts on war-footing to develop forest-cover in the district

The development of forest-cover in the district heavily depends upon the (i) plantation of drought resistant species in large parts of the reserve forest areas, which are devoid of any vegetative cover, (ii) there are number of tanks in the district which are silted and do not fill up with meagre rainfall The foreshore of these tanks can be planted with eucalyptus and subabul plantations., (ii) depending upon the suitability of site and topography, particularly in the slopy agricultural lands and cultivable wastelands and all along the road sides the species like tamarind, neem, gulmohar, eucalyptus, fruit and flowering plants can be planted extensively. Agave species

can be planted in 'estate concept' mainly to yield raw material for fibre extraction and to put otherwise unproductive areas to productive use and (iv) pasture development can be taken up on the barren hills, slopy soils, community lands and village poramboke lands. Having all the afforestation schemes, it is utmost necessary to convert this dry belt gradually into a green belt for balancing the ecosystem.

Fallow Land Use

Land under fallows accounted for 17 per cent of the geographical area of the district. which is indeed a high proportion. More than one fifth of the geographical area under fallows is found in 17 mandals mostly located in western and north-eastern parts of the district.

During thirty years period, the proportion of fallow land has increased by 5.6 per cent amounting to about 106 thousand hectares. The increase is found in many parts of the district. The regression analysis has also confirmed this trend of increase of fallow land but is accounted by 22 per cent of co-efficient of determination. It indicates that the increase in the area under fallows is not perpetual from year to year but highly fluctuating. The annual average rate of increase is 0.6 per cent.

It is suggested that an increasing trend of fallow land should be controlled and utilised at optimum level through scientific land use management systems. If possible all the fallow lands should be brought under dry farming cultivation with suitable drought resistant rain-fed crops like millets, pulses, fodder crops and agro-forestry A considerable change in the outlook of farmers is to be brought out from traditional practices to new methods of dry farming for optimum use of fallow lands with multi-tier vegetations in different ecological systems and the sound management of Sylvi-Agri-Pastoral Systems.

Agricultural Land Use

The district has vast agricultural land resource base but suffers from instability due to vagaries of monsoon. The net area sown in the district accounted for 49.9 per cent of the total geographical area which is significantly. Higher than the average proportion of net sown area in Andhra Pradesh State (41.3 per cent)

The quantum of change in the proportion of net area sown during 1960- 1990 showed a significant decline of 5.5 per cent amounting to 105 thousand hectares. The trend of net area sown in the district has been negative. The goodness of fit of the regression trend states that the present negative trend is to the tune of 11 per cent only. It means that the negative trend of the net area sown is not exactly perfect but it is highly fluctuating from year to year depending on the variation of rainfall On an average, the annual compound growth rate declined at 0.03 per cent.

Impact of Rainfall on Arable Land

In the drought-prone region, where rain-fed farming is predominant and irrigation development is very low, it is a common assumption that the increase or decrease in either cropped area or fallow land will be in close association with the success or failure of monsoons. In the present study, the correlation analysis has revealed that there has been a positive correlation between rainfall and net area sown in the district to the tune of 0.55 Co-efficient value and negative correlation between rainfall and fallow land to the tune of 0.62 co-efficient value. A high negative correlation of 0.85 is found between net area sown and fallow land. It shows that if there is an increase in rainfall, the land under cropping may increase or if there is decrease in rainfall, the land under fallows may increase. It indicates that these two land use types are inversely correlated and functionally related with each other.

Strategy for the Development of Suitable Cropping Pattern

The present cropping pattern dominated by groundnut, cannot be treated as inappropriate and it appears to be a more or less natural consequence of the poor natural resource endowments of the district. Now that it required all the more is the optimisation and strengthening of present cropping pattern without further spatial extension of mon-crop groundnut. In view of varying drought conditions and agricultural drought which differs from one crop to another crop in an area, an extending monoculture groundnut farming to wider area may not be advisable, as a wide-spread drought may adversely affect the agricultural economy of the district. In such circumstances, all rainfed crops which are of high value and low water consuming must be preferred. The risks from droughts could be reduced by popularising suitable inter-cropping methods. If there is failure of rain, at least one of the component crops will yield something and thereby minimise the risk of total loss. The non-traditional crops like sunflower, safflower and castor etc. should also be grown in the suitable soil and moisture conditions.

Soil Characteristics and Problems

The soil is a dynamic layer which immediately reacts to the pattern of its use or changes in the soil forming environment. The district has 82 per cent of red soils and 18 per cent of black soils. The phosphorus and organic matter 3 content is poor in 82 to 90 per cent of the soils. But more than 90 per cent of the soils are moderately rich in potash more than 95 per cent of the soils are neutral or weakly alkaline. Less than 5 per cent of the soils are having severe saline and or alkaline problems.

The results of studies made by different organisations reveal that the soil characteristics are being changed in a short span of time by such activities of man like (i) removal of vegetation cover, (ii) application of heavy irrigation, (iii)

change of cropping pattern and (iv) change of morphology. The conclusions are that (1) in the undulating piedment regions where dry farming is practiced there is an increase of rill and gully erosion, (2) there is steady increase in the salinity and alkalinity problems in the canal irrigated mandals like Rayadurg, Gooty. Tadipatri and Anantapur, (3) there is a decreasing tendency in the potassium content of the soils particularly in the paddy cultivated areas and (4) with the shift from millet oriented to groundnut oriented cropping pattern, the soils have shown sulphur and zinc deficiency. Iron deficiency is also predicted in the near future.

Soil Management

The soil management programme in a semi-arid region like Anantapur district should be comprehensive and integrated one. First and foremost adequate importance should be given to the extension programmes to create the awareness in the farming community about the dangers of the mismanagement of the soil ecosystem and to motivate them to follow proper soil management 2 guidelines. The soil forming environment could be improved by managing catchments at t micro-level Construction of check dams and watersheds on small catchments serves as a multi-purpose schemes in this direction Both agronomic and engineering measures of soil conservation should be implemented in a complementary manner to achieve better results. The alkalinity and salinity problems of the soils have to be solved with suitable measures like zypsum application and leaching of excessive salts with suitable dosage of irrigation respectively Proper care should also be taken to minimise water sepage from the irrigation canals which will lead to the problems of salinity and alkalinity.

Conclusion

It has been observed that man, rather than the nature is bringing considerable change in the quality of land in a short span of time. The short- sighted and unplanned commercial and subsistence gathering of resources from the nature's bounty have caused considerable damage to the land system Many of his activities though fetching short-term gains, are causing long-term and sometimes irreversible damages to the quality of landscape system in this dry region. In view of very low proportion of forest cover, high proportion of fallow land, instability in agriculture land followed by mono-cultures and poor nature of soil cover, the landscape ecosystem of this region is delicate and is being easily disturbed.) The maintenance of ecological balance is one of the most important 4 considerations and is to be looked into it very seriously. To achieve the required goals, "Sustainable Land Use Development" is the way of environmental feature. Jacobs [5] has referred to sustainable development as "the offspring of ecological planning". To understand both and carry them out, environmental education is essential at all levels and in all sectors of the population.

It is also often emphasised that the transformation of rural habitat is the fundamental lead for the eco-development of the region the integrated Rural Development (IRD) is to be concerned with ecological and environmental issues in addition to the integration of sectors and policies in space-time dimensions. The IRD concept is also to be conceived as strategic design of problem solving planning process for the effective involvement of local human and physical resources to improve the socio-economic and ecological situation of the rural habitat.

Abstract: This paper explores the profound social reforms and contributions of Savitribai Phule to the advancement of women in Indian society. Born on January 3rd, 1831, in Naigaon village, Maharashtra, Savitribai Phule, along with her husband Jyoti Rao Phule, dedicated themselves to empowering women, particularly those from marginalized communities. She staunchly advocated for women's education, viewing it as a powerful tool to combat social discrimination. Through her pioneering efforts, she laid the foundation for significant societal change. She started teaching girls in Pune and fought off those who opposed girl education at that time.

Key words: Savitribai Phule, Social Reforms, Women Education Development, Indian Society.

Introduction

Savitribai Phule, born on January 3rd, 1831, in Naigaon village, Maharashtra, emerged as a pivotal figure in India's social reform movements of the 19th century. Despite facing numerous challenges and societal opposition, Savitribai, alongside her husband Jyoti Rao Phule, embarked on a mission to uplift women and marginalized communities through education and social reform. This paper delves into Savitribai Phule's remarkable contributions to women's development in Indian society.

Early Life and Education: Savitribai Phule was born to Lakshmi Bai and Khandoji Nevse Patil in Naigaon village, Maharashtra. At the tender age of nine, she was married to Jyoti Rao Phule, a visionary social reformer. Despite her early marriage, Savitribai's thirst for knowledge remained unquenched. Encouraged by her husband, she pursued education and training, eventually becoming India's first female teacher. Her journey into education marked the beginning of her lifelong dedication to empowering women through knowledge.

Establishment of Schools: In 1848, Savitribai and Jyoti Rao Phule established the first indigenous school for girls in Pune, Maharashtra. Despite facing ostracism from both family and society, the couple remained undeterred in their mission. They provided education to girls from all castes, including those considered untouchable. Their efforts expanded with the establishment of multiple schools, aimed at breaking the chains of illiteracy and social oppression.

Advocacy for Women's Rights: Savitribai Phule was a vocal advocate for women's rights in a patriarchal society plagued by oppressive customs and traditions. She actively campaigned against practices such as child marriage, sati, and the mistreatment of widows. Savitribai's unwavering commitment to social justice extended to promoting widow remarriage and providing support to marginalized women. Her advocacy laid the groundwork for gender equality and women's empowerment in India.

Legacy and Recognition: Savitribai Phule's tireless efforts and unwavering dedication to social reform earned her widespread recognition and accolades. In 1852, the British government honored the Phule family for their contributions to education, with Savitribai being acclaimed as the best teacher. Posthumously, her legacy continued to inspire generations, leading to the renaming of the University of Pune as Savitribai Phule Pune University. Her remarkable life and achievements continue to be commemorated through various tributes and memorials across India.

Review of Literature

Sourav and Subir (2021) discussed in this study on "Savitribai Phule the first lady teacher and social reformer in nineteenth century of India". Savitribai Phule was an important social reformer and leading character of the then Maharashtra. She was the first lady teacher of first girl's school in India. Not only a teacher she was a great social reformer. In nineteenth century, she was a power source of woman education and woman empowerment. She was also a founder of modern Marathi poetry. At this crisis time she and Jyoti Rao Phule established a girl's school with nine students in 1848 at Pune in Bhide Wada and she also taught in this school. She did not stop there, she raised her voice against the practice of child marriage, sati paratha and child widows for the betterment of humans and society. At the same time, she promoted a positive attitude towards widow remarriage. She was an idol of Dalit and Mang community like Bhimrao Ramji Ambedkar. She also moved against untouchability and rule out the discrimination grounded on caste and gender.

Rita (2021) describes in his study on "Savitribai Phule: A Great Social Reformer". Savitribai Phule whose mission in life was to support the downtrodden women. She is an inspiration for all women undergoing suffering in various fields in society. To alleviate the position of women, women should get educated. Education was the prerogative of the elite caste, and to initiate the process of the transformation of society, both men and women should be educated. The life of Savitribai Phule is an inspiration for the student and the teacher, the parent, and the community at large. With the dynamic backing of her liberal minded husband, Mr. Jyoti Rao Phule, she embarked on a mission to cleanse society of the age-old superstitious evils, which debarred the welfare of the lower caste people. Savitribai encountered various challenges from the elite class, which she faced with a steadfast determination, and paved the path for the education of women in India.

Katke (2019) Conducted a study entitled "Savitribai Phule Contribution towards Indian Social Elements – A Study". In this study it was mentioned that Savitribai Jyoti Rao Phule was a famous Indian social reformer, educator, and poet who played an active role in the education and empowerment of women in the 19th century. Savitribai is one of the few educated women of this time and is responsible for having founded the first girls' school in Pune, Bhide Wada, with her husband Jyotirao Phule. She went to great lengths to raise and emancipate child widows, opposed child marriage and Sati Pratha, and advocated the remarriage of widows. As a major protagonist of Maharashtra's social reform movement, she is considered an icon of the Dalit Mang caste along with B. R. Ambedkar and Annabhau Sathe. She campaigned against untouchability and actively campaigned for the abolition of caste and gender discrimination.

Santoshkumar (2019) describe in his study on "Savitribai Phule Contribution towards Indian Social Elements – A Study". Savitribai Jyoti Rao Phule was a prominent Indian social reformer, educationist and poet who played an instrumental role in women education and empowerment during the nineteenth century. Counted among few literate women of those times, Savitribai is credited for founding the first girl's school in Pune in Bhide Wada with her husband Jyoti Rao Phule. She took great effort towards educating and emancipating child widows, campaigned against child marriage and sati pratha, and advocated for widow remarriage. A leading figure of Maharashtra's social reform movement, she is considered an icon of Dalit Mang caste along with likes of B. R. Ambedkar and Annabhau Sathe. She campaigned against untouchability and worked actively in abolishing caste and gender-based discrimination.

Pandey (2019) Conducted a study entitled "Locating Savitribai Phule's Feminism in the Trajectory of Global Feminist Thought". Feminism shows shades of the first wave of feminism when she talked about the ability to reason, self-reliance, and public schools. Her feminism showed traces of the second wave of feminism as she raised her voice over shelters and marriages between castes. Her feminism also showed some valuable characteristics of third wave feminism when she talked about raising women with different identities and bringing Stree Shudra Atishudra together. Savitribai was also the first woman to put her husband's stake in the whole history of India. Her decision to light her husband's pyre must have shocked the most radical feminists all the time.

Mangala (2018) conducted a study entitled "Savitribai Phule: Revolutionary work and literature". In this study the important issues are Savitribai's educational thinking is an era promoter. Savitribai Phule can be proudly mentioned as a positive force that shapes the female life of Maharashtra. It is glad to say that Savitribai gave prestige to the woman because of Savitribai, a noble and revolutionary spectator of her personality and activities. This light of innovation is a motivation for women who have worked in various fields and proved their mettle. Savitribai's work was challenging the difficulty of the times, Because Savitribai thought and worked for the freedom of all women and the Shudratishudra society in the world of slavery in the then orthodox society of the nineteenth century. Krantijyoti Savitribai Phule's position as a champion of the downtrodden and a supporter of teaching is inevitable in the wake of India's first teacher women's liberation movement. Phenomenal Education is a instrument for social transformation. He wanted to generate awareness in the society through education. Savitribai Phule was one of the immense educators of India who laid down the basic idea of education for humanity about 175 years before. Savitribai Phule's social and educational work is amazing and phenomenal. At the same time, Savitribai also produced literature. Her literature was enlightening the society. His entire literature was on social awareness. All literature was for the welfare of the citizens.

Jain (2016) carried out a study entitled **"**Caste and Education: The Vision of Mahatma Joti Rao Phule". There major findings are the ideologies the ideologies of the anti-caste movements were geared towards the "emancipation" that all intellectuals needed for Dalits. Phule was the first anti-caste intellectual to think about education for the masses (for Dalits). He fought against Brahmanism, which is "superstition, bag of tricks, weapon of domination" (Omvedt, Dalit Visions 8). Phule is not only considered the main figure of the anti-caste movement, but also a protester for the empowerment of women His wife, Savitribai Phule, is the main contributor to the education mission for oppressed women. According to Jyoti Rao Phule, the education of women and the lower caste deserves priority as their social position and condition in society are greatly degraded.

Somkuwar (2014) discussed in his study on "Dalit Women Poets and New Themes in Poetry". Major issues discussed in this work are as follows Dalit literature in the hands of modern women's writers has gone through a multidimensional revolutionize. Adjudging new themes and concepts it hardly remains the literature of lower classes. These modern poets writing is not only the writing of lamentation, breast-beating, praising or even consideration but also feministic, reflective, and universal. By representing universal themes in their text, they have taken the movement of Dr Ambedkar on a high peak. Their society as well as Dalit Writers from first and second generations has sky-scraping hopes from these Modern Dalit Women poets. Finally, all discussion indicates to the quote Dr Ambedkar who said, "I measure the progress of the community by the degree of progress which women have achieved.

Wolf (2011) conducted a study on Savitribai Phule. It is opined that for present day, every literate woman of India, anywhere in the world, stands as testimony to the influence of the four original and extraordinary ideas shared by Comenius and Savitribai: that education for every child, without exception, must be universally accessible, child sensitive, intellectually critical, and socially reforming. And every girl child, in any school, on any day, in India sitting at the side of boys, reading a book, exploring the Internet, learning new things. It is a

Savitribai-kind of India. Might just such a different arrangement incite a future with a different kind of social structure a world venue learning place different from the detention center house kind of culture within which Savitribai lived? If so, then I don't know the children of India may yet sing in a pleasant house, little canaries freed into a most original and extraordinary future a Comenius and Savitribai kind of future.

Role in Women Education & Empowerment

The first indigenously run school for girls in Pune (at that time Poona) was started by Jyoti Rao and Savitribai in 1848 when the latter was still in her teens. Although they were ostracized by both family and community for this step, the resolute couple was given shelter by a friend Usman Sheikh and his sister Fatima Sheikh, who also gave the Phule couple place in their premises to start the school. Savitribai became the first teacher at the school. Jyoti Rao and Savitribai later started schools for children from the Mang and Mahar castes, who were regarded as untouchables. Three Phule schools were in operation in 1852. On November 16 that year, the British government honored the Phule family for their contributions in the field of education while Savitribai was named the best teacher. That year she also started the Mahila Seva Mandal with the objective of creating awareness among women regarding their rights, dignity, and other social issues. She was successful in organizing a barbers strike in Mumbai and Pune to oppose the prevailing custom of shaving heads of widows.

All the three schools run by the Phule's were closed by 1858. There were many reasons for this, including drying up of private European donations post the Indian Rebellion of 1857, resignation of Jyoti Rao from the school management committee due to difference of opinion on curriculum, and withdrawal of support from the government. Undeterred by the circumstances Jyoti Rao and Savitribai along with Fatima Sheikh, took charge of educating people from the oppressed communities as well. Over the years, Savitribai opened 18 schools and taught children from different castes. Savitribai and Fatima Sheikh began teaching women as well as other people from downtrodden castes. This was not taken well by many, particularly the upper caste of Pune, who were against Dalits education. Savitribai and Fatima Sheikh were threatened by the locals and were also harassed and humiliated socially. Cow dung, mud and stones were thrown at Savitribai when she walked towards the school. However, such atrocities could not discourage the determined Savitribai from her goal, and she would carry two saris. Savitribai and Fatima Sheikh were later joined by Saguna Bai who also eventually became a leader in the education movement. Meanwhile, a night school was also opened by the Phule couple in 1855 for agriculturist and laborer's so that they can work in daytime and attend school at night.

To check the school dropout rate, Savitribai started the practice of giving stipends to children for attending school. She remained an inspiration for the young girls she taught. She encouraged them to take up activities like writing and painting. One of the essays written by a student of Savitribai called Mukta Salve became the face of Dalit feminism and literature during that period. She conducted parent-teacher meetings at regular intervals to create awareness among parents on the significance of education so that they send their children to school regularly.

In 1863, Jyoti Rao and Savitribai also started a care center called 'Balhatya Pratibandhak Griha,' possibly the first ever infanticide prohibition home founded in India. It was set up so that pregnant Brahmin widows and

rape victims can deliver their children in a safe and secure place thus preventing the killing of widows as well as reducing the rate of infanticide. In 1874, Jyoti Rao and Savitribai, who were otherwise issueless, went on to adopt a child from a Brahmin widow called Kashibai thus sending a strong message to the progressive people of the society. The adopted son, Yashavantrao, grew up to become a doctor.

While Jyoti Rao advocated widow remarriage, Savitribai worked tirelessly against social evils like child marriage and sati pratha, two of the most sensitive social issues that were gradually weakening the very existence of women. She also made effort in bringing the child widows into mainstream by educating and empowering them and advocated for their re-marriage. Such pursuits also met with strong resistance from the conservative upper caste society.

Conclusion

Women in India have always been inspiring, whether it is now or during the times of the Indian freedom struggle. Women have always been a source of power and ideal of courage for society. There were several prominent faces in the Indian Freedom Struggle, and the role of women brought a significant change.

Savitribai Phule pursued her education in English which broadened her perspective of principles that contributed for the transformation of society. Savitribai, and her husband, Jyoti Rao was a historic couple who worked together for the empowerment of women and the oppressed classes. The couple did not have any biological child, so when Jyoti Rao was coaxed to remarry, he humbly stated that the defect in having a child may be in myself and not in Savitri. The couple adopted a boy who later became a medical doctor. They considered it their mission to purge society of the evil practices and do away with the misuse of religion as a tool to subordinate the lower castes. India is a nation which is characterized as a *karma Bhoomi,* wherein an individual's merits are a criterion for his social status. A person who is virtuous is superior and one of loose character is inferior. The exploitation of the world under the guise of antiquity must be disapproved because they are trying to gain an advantage for themselves, rather than trying to help other people do what is right. The life of women should not be restricted to her husband and children. The identity of a woman is not restricted only to her husband and children. Today the literacy rate of women is high, but are we really educated or only literate. Feminism outside the academic circle will challenge us in ways, which yet we cannot even foresee. Women must build up their identity by their contribution to society and their lives should not be restricted as being just wives and mothers of great reformers. Savitribai proved herself as a woman of substance and not as an appendage of a man. Even after the death of Jyoti Rao, she continued her mission of empowerment of women. In the famine of 1896, she compelled the British to undertake relief measures. An epidemic of plague swept Pune in 1897. Savitri was personally involved in the relief effort, contracted the disease which resulted in her death on 10th March 1897.

Academic research has given us extremely valuable insights into women's lives in different ages and different cultures. One can get a glimpse of an educated woman through the way she communicates, with other women in society, the women who collect our rubbish, deliver the laundry, and work as domestic helps and in menial jobs. Women empowerment will take new strides, when we teach our sons to treat women in a humane

manner. Savitribai Phule is an inspiration for the students, the parents, and the community at large. In her mission of social resurgence, she encountered several adversities, which she tackled sometimes through discussions and at times with debates. In every era a woman may not be blessed with a liberal minded husband like Jyoti Rao, hence a woman must light up her own life through the medium of education.

Abstract: This study critically assesses the impact of Savitribai Phule's social reforms on the advancement of women in Indian society from an analytical perspective. Savitribai Phule, a prominent figure in the 19th-century Indian social reform movement, dedicated her life to advocating for women's rights, education, and social equality. Through a comprehensive analysis of historical sources, biographical accounts, and scholarly literature, this study examines the multifaceted influence of Savitribai Phule's initiatives on the status and empowerment of women in Indian society. Key areas of focus include the expansion of educational opportunities for women, efforts to challenge patriarchal norms and discriminatory practices, and the promotion of women's participation in social and political spheres. By critically evaluating the legacy of Savitribai Phule, this study aims to shed light on the enduring relevance of her ideals and contributions to the ongoing struggle for gender equality and social justice in India.

Keywords: Savitribai Phule, social reforms, women's advancement, gender equality, Indian society, analytical perspective.

Introduction:

Background information on Savitribai Phule and her socio-cultural context: Savitribai Phule was a pioneering figure in the Indian social reform movement of the 19th century. Born in 1831 in Maharashtra, India, Savitribai faced discrimination and oppression due to her gender and caste. However, despite facing immense societal barriers, she pursued education, becoming one of the first female teachers in India. Savitribai's marriage to Jyoti Rao Phule, a social reformer and thinker, marked the beginning of her involvement in social activism. Together, they challenged prevailing social norms and worked towards the upliftment of marginalized communities, particularly women and lower castes, in Indian society.

During the 19th century, Indian society was deeply entrenched in patriarchal and caste-based hierarchies. Women, especially those from lower castes, faced systemic oppression, denied access to education, subjected to child marriage, and deprived of basic rights. Savitribai Phule emerged as a beacon of hope for these marginalized groups, advocating for their rights and dignity.

Statement of the problem and research objectives: Despite her significant contributions, the impact of Savitribai Phule's social reforms on women's development in Indian society remains underexplored in academic discourse. Therefore, this study seeks to address this gap by conducting an analytical examination of the influence of Savitribai Phule's initiatives on the status and empowerment of women in Indian society.

The primary objectives of this research are as follows:

To critically analyze the key social reforms advocated by Savitribai Phule, including her efforts in promoting female education, challenging gender-based discrimination, and advocating for women's rights to property and inheritance.

To assess the extent to which Savitribai Phule's reforms contributed to the advancement of women's development in Indian society, particularly in terms of educational attainment, socio-economic empowerment, and participation in public life.

To explore the enduring legacy of Savitribai Phule and her relevance in contemporary discussions on gender equality, social justice, and women's rights in India.

Importance of studying the impact of Savitribai Phule's social reforms on women's development in Indian society: The study of Savitribai Phule's social reforms is of paramount importance for several reasons:

Historical significance: Savitribai Phule played a pivotal role in challenging oppressive social norms and advocating for the rights of marginalized communities, particularly women and lower castes, during a critical period in Indian history.

Inspirational legacy: Savitribai's life and work continue to inspire generations of activists, scholars, and policymakers in their quest for gender equality and social justice.

Policy implications: Understanding the impact of Savitribai Phule's reforms can inform contemporary policy initiatives aimed at promoting women's development and empowerment in India.

Academic inquiry: The study of Savitribai Phule's social reforms provides valuable insights into the dynamics of social change and resistance in Indian society, offering lessons for future research and scholarship in the fields of gender studies, social history, and development studies.

Historical Context of Women's Status in 19th Century India:

Overview of the status of women in pre-colonial and colonial India: Pre-colonial India:

In pre-colonial India, women's status varied significantly depending on factors such as region, religion, caste, and socio-economic class.

Women in ancient India were often depicted in scriptures and texts as revered figures, embodying virtues such as wisdom, strength, and devotion. However, this idealized portrayal did not necessarily translate into societal practices.

Despite the presence of powerful female rulers such as Rani Lakshmibai of Jhansi and Ahilyabai Holkar, most women in pre-colonial India were subject to patriarchal norms and restrictions.

The practice of child marriage was prevalent, with girls often married off at a young age, sometimes even before reaching puberty.

Women's access to education was limited, particularly among lower castes and marginalized communities. Formal education was primarily reserved for boys from privileged backgrounds.

Colonial India:

The colonial period brought significant changes to Indian society, including alterations in the status and roles of women.

British colonial policies, while ostensibly aiming to uplift Indian society, often reinforced existing patriarchal structures and stereotypes.

The introduction of English education and Western values led to debates on gender roles and women's rights within Indian reformist circles.

The codification of Hindu personal laws by the British colonial administration further entrenched discriminatory practices against women, particularly in matters of inheritance, marriage, and property rights.

Missionary activities and Christian schools provided education and social welfare services to some Indian women, albeit within a framework that promoted Western cultural values and norms.

The emergence of social reform movements, such as the Brahmo Samaj and the Arya Samaj, brought attention to issues such as widow remarriage, female infanticide, and the status of widows in Indian society.

Social and cultural constraints faced by women in traditional Indian society:

Patriarchal family structures: Indian society was characterized by patriarchal family systems in which male authority was dominant, and women's roles were primarily confined to domestic duties and caregiving.

Child marriage: The practice of child marriage was deeply ingrained in Indian society, perpetuating cycles of early motherhood, limited education, and economic dependence for girls.

Sati and widowhood: The custom of sati, in which widows were expected to immolate themselves on their husbands' funeral pyres, was prevalent in certain regions despite being outlawed by British authorities in the 19th century. Widows often faced social ostracism, economic deprivation, and limited autonomy.

Restrictions on education and mobility: Access to education for girls was restricted, with emphasis placed on domestic skills rather than formal schooling. Women's mobility outside the household was often curtailed, particularly in conservative communities.

Lack of property and inheritance rights: Women had limited rights to property and inheritance, with property ownership and control largely vested in male relatives.

Overall, the 19th century witnessed a complex interplay of continuity and change in the status of women in Indian society. While traditional social norms and cultural practices persisted, the colonial encounter and emerging social reform movements laid the groundwork for shifts in attitudes towards gender roles and women's rights, setting the stage for future struggles for gender equality and empowerment.

Life and Work of Savitribai Phule:

Biography of Savitribai Phule: Early life, education, and marriage to Jyoti Rao Phule:

Early Life: Savitribai Phule was born on January 3, 1831, in Naigaon, Maharashtra, India, into a family belonging to the Mali caste, which was considered low caste at that time. She faced discrimination and social stigma due to her caste and gender from an early age.

Education: Despite societal opposition to female education, Savitribai's father, Khandoji Nevase Patil, recognized the importance of education and arranged for her to receive schooling at an early age. Savitribai showed exceptional academic aptitude and became one of the first women in Maharashtra to receive formal education.

Marriage to Jyoti Rao Phule: At the age of nine, Savitribai was married to Jyoti Rao Phule, who later became a prominent social reformer. Their marriage was unconventional for the time, marked by mutual respect, support, and a shared commitment to social justice. Jyoti Rao played a crucial role in Savitribai's intellectual and personal development, encouraging her to pursue further education and actively participate in social reform activities.

Role of Savitribai Phule in the Satyashodhak Samaj and social reform movements:

Co-founding the Satyashodhak Samaj: In 1873, Jyoti Rao Phule founded the Satyashodhak Samaj (Society for Truth Seekers) as a platform for social reform and the upliftment of marginalized communities, including women, Dalits, and lower castes. Savitribai was an integral part of this movement, actively participating in its activities and advocating for women's rights.

Promotion of Female Education: Savitribai recognized the importance of education in empowering women and challenging social hierarchies. Together with Jyoti Rao, she established the first school for girls in Pune in 1848, breaking new ground in female education in India. Despite facing opposition and hostility from conservative elements, Savitribai remained steadfast in her commitment to providing educational opportunities for girls from all castes and backgrounds.

Campaign against Social Evils: Savitribai Phule was a vocal critic of prevalent social evils such as child marriage, caste discrimination, and the mistreatment of widows. She actively campaigned for the abolition of child marriage and the promotion of widow remarriage, challenging entrenched patriarchal norms and traditions.

Advocacy for Women's Rights: Savitribai played a pioneering role in advocating for women's rights to property, inheritance, and social equality. She supported women in asserting their agency and autonomy, encouraging them to participate in public life and pursue their aspirations.

Literary Contributions: Savitribai was also a prolific writer and poet, using her literary talents to raise awareness about social issues and inspire change. She wrote powerful poems addressing themes of gender equality, caste oppression, and the struggle for justice, which continue to resonate with audiences today.

Overall, Savitribai Phule's life and work exemplify her unwavering commitment to social reform and the empowerment of marginalized communities, particularly women. Her legacy continues to inspire generations of activists and feminists in India and around the world, highlighting the transformative potential of grassroots movements for social change.

Social Reforms Advocated by Savitribai Phule:

Promotion of Female Education and Establishment of Schools for Girls:

Savitribai Phule recognized education as a potent tool for empowering women and challenging entrenched social hierarchies. Alongside her husband, Jyoti Rao Phule, she played a pivotal role in promoting female education in 19th-century Maharashtra.

In 1848, Savitribai and Jyoti Rao established the first school for girls in Pune, breaking new ground in female education in India. The school aimed to provide formal education to girls from all castes and backgrounds, including those from marginalized communities who were traditionally denied access to schooling.

Savitribai's efforts in establishing and running schools for girls were met with resistance f from conservative elements in society who opposed the idea of educating women. She faced various challenges, including social ostracism and threats of violence, but remained steadfast in her commitment to the cause of female education.

Campaign Against Child Marriage and Widow Remarriage:

Savitribai Phule was a staunch critic of prevalent social practices such as child marriage and the mistreatment of widows. She actively campaigned for the abolition of child marriage and the promotion of widow remarriage, which were deeply ingrained customs in Indian society.

Through her writings, speeches, and activism, Savitribai challenged the notion that girls should be married off at a young age, emphasizing the importance of allowing them to pursue education and personal development. She also advocated for the rights of widows to remarry and lead fulfilling lives beyond the confines of widowhood.

Savitribai's advocacy for the rights of women and girls to choose their own destinies and break free from oppressive social norms laid the groundwork for future reforms in India's legal and social systems.

Advocacy for Women's Rights to Property and Inheritance:

Savitribai Phule was a vocal proponent of women's rights to property and inheritance, which were often denied to them under prevailing social and legal norms.

She argued that women should have equal rights to property and inheritance as men, challenging the patriarchal notion that women were inherently inferior and dependent on male relatives for their economic well-being.

Through her activism and writings, Savitribai sought to raise awareness about the injustices faced by women in matters of property ownership and inheritance, advocating for legal reforms to ensure gender equality in these areas.

Efforts to Eradicate Caste-Based Discrimination and Promote Social Equality:

Savitribai Phule was deeply committed to the eradication of caste-based discrimination and the promotion of social equality in Indian society. She believed that caste oppression was one of the most significant barriers to social progress and advocated for the rights of Dalits and lower castes.

Savitribai actively supported inter-caste marriages and social integration, challenging the rigid caste hierarchy that perpetuated inequality and injustice. She worked tirelessly to create a more inclusive and egalitarian society where individuals were judged not by their caste or birth but by their character and abilities.

Through her involvement in social reform movements such as the Satyashodhak Samaj, Savitribai contributed to the broader struggle for social justice and equality, leaving behind a legacy of activism and advocacy that continues to inspire generations of social reformers in India.

Impact of Savitribai Phule's Reforms on Women's Development:

Expansion of Educational Opportunities for Women and its Socio-Economic Implications:

Savitribai Phule's relentless advocacy for female education led to a significant expansion of educational opportunities for women in 19th-century India. Through the establishment of schools for girls and her promotion of female literacy, Savitribai paved the way for thousands of girls to receive formal education, empowering them with knowledge and skills that were previously inaccessible.

The expansion of educational opportunities for women had profound socio-economic implications. Educated women were better equipped to participate in the workforce, contribute to household income, and break the cycle of poverty. They gained access to a wider range of employment opportunities beyond traditional domestic roles, thus enhancing their economic independence and socio-economic status.

Furthermore, educated women were more likely to make informed decisions about their health, family planning, and overall well-being, leading to improvements in maternal and child health outcomes. Education also fostered critical thinking, creativity, and problem-solving skills among women, enabling them to become agents of change in their communities.

Changes in Social Attitudes towards Women's Rights and Gender Roles:

Savitribai Phule's advocacy for women's rights and gender equality challenged deeply ingrained patriarchal attitudes and norms in Indian society. Her efforts contributed to a gradual shift in social attitudes towards women's status and roles, fostering greater recognition of women's rights and capabilities.

By advocating for the abolition of practices such as child marriage and the mistreatment of widows, Savitribai helped raise awareness about the injustices faced by women and inspired broader social reform movements aimed at addressing gender-based discrimination.

Savitribai's emphasis on the importance of women's education challenged prevailing stereotypes about women's intellectual inferiority and their limited role within the household. As more women gained access to education and knowledge, traditional gender roles began to be questioned, paving the way for greater gender equity and opportunities for women in various spheres of life.

Empowerment of Women through Increased Participation in Social and Political Spheres:

Savitribai Phule's reforms played a crucial role in empowering women to actively participate in social and political spheres, thereby amplifying their voices and agency. Through education and awareness-raising initiatives, women gained the confidence and skills necessary to engage in public discourse, advocate for their rights, and challenge oppressive systems of power.

Women who received education under Savitribai's initiatives became leaders and change-makers in their communities, spearheading social reform efforts and championing causes related to women's rights, education, and social justice.

Furthermore, Savitribai's advocacy for women's inclusion in decision-making processes and political activism laid the foundation for future movements advocating for women's suffrage and political representation in India.

Overall, Savitribai Phule's reforms had a transformative impact on women's development by empowering them with education, challenging discriminatory social norms, and fostering their active participation in shaping the socio-political landscape of India. Her legacy continues to inspire generations of women to strive for equality, justice, and empowerment.

Legacy of Savitribai Phule and Contemporary Relevance:

Continuation of her work by subsequent generations of activists and reformers:

Savitribai Phule's pioneering efforts in the field of social reform and women's empowerment laid the groundwork for subsequent generations of activists and reformers in India. Her legacy continues to inspire individuals and organizations dedicated to advancing gender equality, social justice, and human rights.

Many grassroots organizations and non-governmental organizations (NGOs) in India today draw inspiration from Savitribai's commitment to education, social reform, and the empowerment of marginalized communities. These organizations work towards promoting access to education for girls, combating gender-based violence, and advocating for women's rights in various spheres of life.

Savitribai's emphasis on the intersectionality of caste, class, and gender oppression has influenced contemporary social justice movements in India, which seek to address multiple forms of discrimination and inequality.

Women's rights activists and feminists in India continue to invoke Savitribai's name and legacy in their advocacy efforts, highlighting her pioneering role in challenging patriarchal norms and advocating for women's agency and autonomy.

Savitribai's legacy is also evident in the work of educators, scholars, and intellectuals who strive to promote critical thinking, gender-sensitive pedagogy, and inclusive education systems that prioritize the needs and aspirations of all learners, regardless of their gender or social background.

Reflections on the enduring relevance of Savitribai Phule's ideals in the context of contemporary gender issues in India:

Gender-based violence and discrimination: Savitribai Phule's advocacy against practices such as child marriage, widowhood rituals, and caste-based discrimination remains highly relevant in the context of contemporary gender issues in India. Despite legal reforms and social progress, women and girls continue to face various forms of violence, discrimination, and marginalization based on their gender, caste, and socio-economic status.

Education and empowerment: The importance of education as a tool for women's empowerment and social transformation, championed by Savitribai, continues to be a central theme in contemporary debates on gender equality and development. Efforts to promote girls' education, ensure access to

quality schooling, and address gender disparities in education remain key priorities for policymakers and activists alike.

Political participation and representation: Savitribai Phule's advocacy for women's participation in public life and decision-making processes resonates strongly in the contemporary context of efforts to increase women's political representation and leadership. Despite progress in some areas, women remain underrepresented in political institutions and face numerous barriers to meaningful participation in governance and decision-making.

Intersectionality and social justice: Savitribai's recognition of the intersecting nature of caste, class, and gender oppression provides a valuable framework for understanding and addressing contemporary social justice issues. Efforts to combat multiple forms of discrimination and promote inclusivity and equity across various social domains are informed by Savitribai's legacy of intersectional activism and solidarity with marginalized communities.

Struggles for social change: Savitribai Phule's life and work serve as a source of inspiration and resilience for contemporary activists and movements striving for social change and justice. Her commitment to challenging power structures, amplifying marginalized voices, and advocating for the rights and dignity of all individuals continues to guide and motivate those engaged in the ongoing struggle for gender equality and social justice in India and beyond.

Conclusion:

Summary of key findings and insights from the study:

Savitribai Phule emerged as a pioneering figure in the Indian social reform movement of the 19th century, advocating for women's rights, social equality, and education.

Through her relentless efforts, Savitribai promoted female education by establishing schools for girls and challenging prevailing social norms that restricted women's access to learning.

She campaigned against social evils such as child marriage, widowhood rituals, and caste-based discrimination, advocating for the rights and dignity of women from all backgrounds.

Savitribai's advocacy for women's rights to property, inheritance, and social equality laid the groundwork for future reforms in India's legal and social systems.

Her legacy continues to inspire generations of activists, scholars, and policymakers in their quest for gender equality, social justice, and human rights in India and beyond.

Implications for policy and future research directions:

Policy Implications: The study underscores the importance of policies and programs aimed at promoting female education, combating gender-based violence, and ensuring women's participation in decision-making processes.

Educational Reforms: There is a need for comprehensive educational reforms that prioritize gender-sensitive pedagogy, inclusive curricula, and equitable access to quality schooling for all learners, regardless of their gender or social background.

Legal Reforms: Efforts should be made to enact and enforce laws that protect women's rights to property, inheritance, and social equality, in line with the principles advocated by Savitribai Phule.

Future Research Directions: Further research is needed to explore the long-term impacts of Savitribai Phule's reforms on women's development in Indian society, including their effects on education, health, economic empowerment, and political participation.

Intersectionality and Social Justice: Future studies should adopt an intersectional approach to examine the intersecting forms of discrimination faced by women based on factors such as caste, class, religion, ethnicity, and sexual orientation.

Final reflections on the significance of Savitribai Phule's contributions to women's development in Indian society:

Savitribai Phule's contributions to women's development in Indian society are immense and enduring. Her advocacy for education, social reform, and gender equality laid the foundation for subsequent generations of activists and reformers.

She challenged prevailing social norms and fought against systemic injustices, inspiring millions to strive for a more equitable and just society.

Savitribai's legacy serves as a reminder of the transformative power of grassroots movements and the importance of collective action in advancing women's rights and social justice.

Her life and work continue to inspire individuals and organizations dedicated to promoting gender equality, social justice, and human rights, reaffirming her status as a symbol of courage, resilience, and hope for women's empowerment in India and beyond.

Abstract

Literacy forms an important input in overall development of individuals enabling them to comprehend their social, political and cultural environment better and respond to it appropriately. It acts as a catalyst for social upliftment enhancing the returns on investment made in almost every aspect of development effort, be it population control, health, hygiene, environmental degradation control, employment of weaker sections of the society. Literacy rate in India (Census of India, 2011) was found to be 74.04 percent. When compared to the adult literacy rate, the youth literacy rate was about 9 percent higher. During the last decade, the highest improvement in literacy rate was observed among rural females (24 percent). This paper is descriptive in nature and examines the regional inequality in literacy aspects in India based on 75th round of National Sample Survey data. This will be useful in decision support, frame policy measures to improve literacy rate among the regions.

Key Words

Literacy, Education, Region, Inequality, gender and Census of India

Introduction

Educational attainment is the first and foremost step towards improving quality of life, awareness level and also level of skill of people in the society. Considering the importance of education, India has enacted ‘ Right to Education Act,2009’ to ensure free and compulsory Education for children in the age group 6-14 years. Literacy and education are important indicators in a society and play a central role in human development that impacts overall social-economic development milieu. Higher levels of literacy and education lead to better attainment of health and nutritional status, economic growth, population control, empowerment of the weaker sections and community as a whole. Also, higher literacy rates improve

development indicators consistently. Census obtains information on literacy for every individual, as this is recognised as one of the most important social characteristics. In census, a person aged seven years and above who can both read and write in any language, is treated as ‘ literate’ . A person, who can only read but cannot write, is not considered as ‘ literate’ (Census of India, 2011).

Literacy is the main foundation for social and economic growth. Literacy is the ability to identify, understand, interpret, create, communicate and compute, using printed and written materials associated with varying contexts. Literacy involves a continuum of learning in enabling individuals to achieve their goals, to develop their knowledge and potential, and to participate fully in their community and wider society (UNESCO, 2018). Generally, literacy also encompasses numeracy, the ability to make simple arithmetic calculations. Literacy and education is also one of the main components of human development index (HDI), as it has direct impact on the per capita income, level of living and ultimately on life expectancy. There is a strong empirical co-relation between literacy and life expectancy (Khan, 2004). In international usages, literacy is defined as the ability to read write and at least a simple message in any language (Hassan, 2005). Education is the single best development investment and a powerful instrument to develop an economically prosperous society. The long term social and economic return from education is enormous. The level of development of any region or any area may be gauged through the socio-economic characteristics of people. Of the various elements of population characteristics, the level of literacy and education gives the best exposition of regional development because of its dual functions as cause and effect of modernization.

Review of literature

Gopala Krishan and Madhav Shyam (1978) describe and interpret the regional aspects of the urban-rural differential in literacy in India in relation to economic, society and educational history different of India on the basis of 1971 census data. Siddiqui Shafiqullah (2011) attempted to analyses the trends of differential in literacy rate, spatial patterns of urban-rural differential and the relationship between differential index and selected variables of development among the districts of Uttar Pradesh, India. Kalyan Sundar Som and Ramesh Prasad Mishra (2014) examined the literacy and their differential in West Bengal, India. Ghanshyam Prasad Jhariya and C.K.Jain (2014) attempted to study the trends and pattern and their differential (Male-female and urbanrural) of literacy in Madhya Pradesh. The male – female and rural – urban differential has been worked out. There are remarkable gaps between male and female and between rural and urban rates in the state. Jangra, Ravinder and Kaushik, Satya (2015) describe and interpret the regional aspects of the urban-rural differentials in female literacy during 1991, 2001 and 2011, identify the correlates of female literacy in an agro-based economy, the total female literacy rate has increased significantly during the study period, and there are wide gaps in urban-rural female literacy. Comparatively, the increase is more remarkable in rural areas and gap is narrowing down. Vachaspati Shukla and Udaya S

Mishra (2020) examined the progress in literacy among the Indian states are evaluated here from an age cohort perspective.

Objectives

1. To examine the inequality in literacy aspects in India, also its states and
2. To suggest measures to improve aspects of literacy

Method and Material

The paper is based on descriptive and data collected from 75th round of National Sample Survey conducted on Household Social Consumption: Education during 1st July 2017 to 30th June 2018. A stratified multi-stage design was adopted for the 75th round survey and covers whole of the Indian Union except the villages in Andaman and Nicobar Islands. In this survey, total number of persons of age 3 to 35 years surveyed was 2, 86,456 (1, 73,397 in rural areas and 1, 13,059 in urban areas). Percentage of literates among persons of age 7 years and above has been defined as literacy rate.

Analysis and Discussion

Literacy rate

Literacy and level of education are basic indicators of the level of development achieved by a society. Spread of literacy is generally associated with important traits of modern civilization such as modernization, urbanization, industrialization, communication and commerce. Literacy forms an important input in overall development of individuals enabling them to comprehend their social, political and cultural environment better and respond to it appropriately. Education is a human right. Education is essential for human emancipation and social development. It contributes to better health, higher productivity, greater income, human freedom, capability and esteemed living, increased participation in community life. Literacy is an important demographic element of human process. It is essential for human character, social and economic development. Education includes new ideas for a better building of the society and their personal life style. Table- 1 gives data on literacy rate (in per cent) among persons of age 7 years and above for different States and regions.

Table-1: Literacy rate (in per cent) among persons of age 7 years and above for different states and regions

Note: Figures for rural Delhi is not presented separately. However, ' rural + urban' for Delhi includes, ' rural' also.
Source: NSS 75th Round, July 2017 – June 2018.

Table-1 depicts that higher literacy rate is found in the region of north-east followed west, north, central, east and south. Central and east region had lower literacy rate than all India level. Among the regions, lowest literacy rate registered Uttar Pradesh in north, Gujarat in west, Madhya Pradesh in Central, Bihar in East and Andhra Pradesh in South in order. In the regions and states, literacy rate was lower for females. The differentials in literacy rate in regions and states can be attributed to disparities in socio-economic, cultures, physical conditions, infrastructure facilities and education related policies.

Years of formal education

Number of years completed in formal education or levels of education and literacy lead to a greater awareness and also contributes in improvement of economic and social conditions. Also better literacy and educational level definitely have a positive impact on the health as well as other sectors that influences level of development. Data on average number of years completed in formal education among persons of age 15 years and above for different states and regions presented in table-2

Table-2 reveals that the average number of years completed in formal education among persons of age 15 years and above has registered in region of north followed by south, west, north east, west and east region. Enteral and east regions registered lower literacy rate than national level. Among the regions, Uttar Pradesh in north, Andhra Pradesh in south, Gujarat in west, Madhya Pradesh in Central and West Bengal in east in order had lower average number of years completed in formal education among persons of age 15 years and above. Average number of years completed in formal education was lower for females. It is generally influenced by socio-economic status and cultural aspects along with parents' perception on importance of higher education.

Gross Attendance Ratio (GAR)

GAR is one of the important indices of literacy rate. For each level of education, GAR is the ratio of the number of persons attending in the level of education to the number persons in the corresponding official age-group. GAR is calculated as " Number of persons attending in particular Classes/ estimated population in the respective classes' age-group x100. Table-3 furnishes details of Gross Attendance Ratio (GAR).

Table-3: Gross Attendance Ratio (GAR) at different levels of education for different States and region (rural+urban person)

State	Level of education					
	Primary level	Upper primary/ Middle level	Primary and Upper primary/ Middle level	Secondary level	Higher Secondary level	Post higher Secondary level
Jammu and Kashmir	101.9	96.9	100.2	115.7	77.0	33.1
Himachal Pradesh	99.3	92.1	96.1	100.9	110.0	34.1
Haryana	106.3	93.8	101.3	96.7	70.3	25.2
Punjab	101.5	94.9	99.1	95.4	79.4	22.8
Uttarakhand	99.8	111.6	104.0	80.7	98.7	32.8
Uttar Pradesh	98.9	88.8	95.4	64.0	60.4	20.8
Delhi	100.2	90.6	96.8	93.6	86.2	29.6
Rajasthan	110.5	87.0	101.6	82.4	70.1	28.9
North Region	**102.3**	**94.5**	**99.3**	**91.2**	**81.5**	**28.4**
Gujarat	106.0	89.1	99.1	88.3	59.2	15.3
Maharashtra	101.1	96.5	99.5	104.0	74.3	29.3
West Region	**103.6**	**92.8**	**99.3**	**96.2**	**66.8**	**22.3**
Chhattisgarh	102.4	100.4	101.6	90.3	66.9	16.2
Madhya Pradesh	95.3	97.5	96.1	83.9	59.9	17.3
Central Region	**98.9**	**99.0**	**98.9**	**87.1**	**63.4**	**16.8**
Bihar	97.2	98.4	97.6	82.0	65.7	16.2
Jharkhand	112.4	91.4	105.3	90.0	51.3	16.8
Odisha	103.4	91.3	98.8	87.2	53.4	14.5
West Bengal	101.6	105.2	103.0	92.4	59.3	18.7
East Region	**103.7**	**96.6**	**101.2**	**87.9**	**57.4**	**16.6**
Assam	103.6	104.7	104.0	86.6	56.0	16.5
Northeast Region	**103.6**	**104.7**	**104.0**	**86.6**	**56.0**	**16.5**
Andhra Pradesh	99.3	81.9	92.2	114.1	73.0	26.1
Telangana	92.8	106.1	97.7	109.0	96.8	28.9
Karnataka	104.4	90.1	99.3	92.3	73.4	21.7
Kerala	103.6	97.2	100.9	97.3	99.9	37.6

Tamil Nadu	103.2	96.4	100.4	89.8	91.9	35.4
South Region	**100.7**	**94.3**	**98.1**	**100.5**	**87.0**	**29.9**
All India	**101.2**	**94.4**	**98.7**	**86.4**	**68.3**	**22.8**

Note: Figures for rural Delhi is not presented separately. However, ' rural + urban' for Delhi includes, ' rural' also.
Source: NSS 75th Round, July 2017 – June 2018.

Table-3 reveals that the gross attendance ratio in primary level was lower in central region and southern than all India. In upper primary/ middle level, least GAR was recorded in west region. In primary and upper primary/middle level, least GAR recorded in south. In secondary level, least GAR recorded in north-east. In higher secondary level, least GAR recorded in east region. In post higher secondary level, least GAR recorded in east and central region. In primary level, Telangana of south region had least GAR. In Upper primary/Middle level, Rajasthan of north region had lowest GAR. In Primary and Upper primary/Middle level, Andhra Pradesh of south region had lowest GAR. In Secondary level, Uttar Pradesh of north region had lowest GAR. In higher secondary level, Jharkhand of east region had lowest GAR. In post higher Secondary level, Odisha of east region had recorded lowest GAR. Thus, differential in Gross Attendance Ratio (GAR) at different levels of education for different States and region were recorded. It can be due to differential in socio-economic and cultural progress, access of education facilities and other factors.

Net Attendance Ratio (NAR)

Net Attendance Ratio is the better indicator than GAR and shows level progress in literacy rate .It is the ratio of the number of persons in the official age-group attending a particular level of education to the total number of persons in the age-group. NAR is calculated as " Number of persons currently attending in particular Classes/ estimated population in the age-group in those particular classes x100.

Table-4: Net Attendance Ratio (GAR) at different levels of education for different States and regions (rural+urban person)

State	Level of education					
	Primary level	Upper primary/ Middle level	Primary and upper primary/ Middle level	Secondary level	Higher Secondary level	Post higher Secondary level
Jammu and Kashmir	88.1	78.4	91.3	69.6	46.1	29.5
Himachal Pradesh	90.1	80.6	90.7	68.2	67.5	28.1
Haryana	89.9	77.2	90.6	63.2	47.5	20.9
Punjab	88.8	78.1	90.9	65.3	49.7	19.8
Uttarakhand	87.1	80.8	94.0	54.3	56.5	29.2
Uttar Pradesh	79.2	59.7	84.0	38.7	33.1	17.2
Delhi	89.8	73.1	87.3	62.4	54.0	23.4
Rajasthan	89.5	69.1	88.2	48.2	37.8	24.2

Source: NSS 75th Round, July 2017 – June 2018.

Table-4 reveals that in primary level, a difference in net attendance ratio was meager. However, Uttar Pradesh in North, Madhya Pradesh in Central, Bihar in east, and Telangana in south region recorded lowest net attendance ratio. In upper primary/middle level, lowest net attendance ratio observed in east region. In primary and upper primary/middle level, north region recorded lowest. In secondary level, net attendance ratio was lowest in north-east region. Lowest net attendance ratio found in east region in higher secondary level and central region in post higher secondary level. Among the states, except post higher Secondary level, Uttar Pradesh recorded lowest net attendance ratio.

Dropouts

Inspite of huge expenditure spent by the national and states/UTs on education sector along with several education policies, dropout is still serious issue in India. Parent’ s attitudes, unwillingness of students, distance and lack of facilities, bad school environment and building are the few of causes for dropouts. A Study of Dropout rate of School Children in Punjab by Inderpreet Kaur (2018) highlights the alarming rate of school dropouts, find out the causes of students drop out rates and their impact on Indian economy also report that children within the rural areas drop out of school earlier than those in the urban areas. An ever-enrolled person was considered as dropped out if he/ she did not complete the last level of education for which he/she enrolled and currently not attending any educational institution for reasons other than ‘ completion of the desired level of education’ .

Table-5: Percentage of persons dropped out among ever enrolled persons of age 3 to 35 years for different States

State	Rural			Urban			Rural+Urban		
	Male	Female	Person	Male	Female	Person	Male	Female	Person
Jammu and Kashmir	10.4	13.9	11.9	7.9	10.2	8.9	9.8	13.1	11.3
Himachal Pradesh	5.4	4.8	5.1	3.8	3.9	3.8	5.2	4.7	5.0
Haryana	11.0	10.8	10.9	5.2	4.5	4.9	9.1	8.7	8.9
Punjab	5.3	3.0	4.2	4.6	2.5	3.7	5.0	2.8	4.0
Uttarakhand	3.4	3.2	3.3	4.7	2.4	3.7	3.7	3.0	3.4

Odisha	22.5	23.5	23.0	10.4	14.1	12.2	20.6	21.9	21.2
West Bengal	24.9	24.7	24.8	19.9	20.4	20.1	23.5	23.5	23.5
East Region	**17.5**	**19.4**	**18.3**	**10.9**	**12.6**	**11.7**	**16.3**	**18.1**	**17.1**
Assam	18.6	23.8	21.0	13.0	15.9	14.3	18.0	23.0	20.3
Northeast Region	18.6	23.8	21.0	13.0	15.9	14.3	18.0	23.0	20.3
Andhra Pradesh	14.4	14.6	14.5	10.4	11.3	10.8	13.1	13.5	13.3
Telangana	11.2	13.9	12.4	6.5	6.3	6.4	8.9	10.3	9.5
Karnataka	15.0	18.4	16.5	7.9	9.2	8.5	12.3	14.7	13.3
Kerala	14.6	14.5	14.5	13.1	11.9	12.5	13.9	13.3	13.6
Tamil Nadu	10.8	9.4	10.1	6.9	6.6	6.7	8.1	9.0	8.5
South Region	**13.2**	**14.2**	**13.6**	**9.0**	**9.1**	**9.0**	**11.3**	**12.2**	**11.6**
All India	**13.2**	**14.7**	**13.8**	**9.5**	**9.7**	**9.6**	**12.1**	**13.2**	**12.6**

Note: Figures for rural Delhi is not presented separately. However, ' rural + urban' for Delhi includes, ' rural' also. Source: NSS 75th Round, July 2017 – June 2018.

Table-5 shows that percentage of persons dropped out among ever enrolled persons of age 3 to 35 years was east and west region. Rural of all regions recorded higher dropped out in rural than urban and higher for females than males. This clearly reveals some of the hurdles like poverty and social norms access to education in rural and for females. In northern region, highest dropout recorded in Rajasthan. Similarly, Gujarat in west region, Madhya Pradesh in central region, West Bengal in east, Assam in north east, and Kerala, Karnataka and Andhra Pradesh states in south recorded higher dropouts. Thus, significant differential in dropouts recorded among the regions, states, rural-urban areas and by gender.

Summary and policy implications

Among the regional and states, inequality in literacy rate, years of formal education, gross attendance ratio, net attendance ratio and dropped out among ever enrolled persons of age 3 to 35 years was found. Hence, tackle the inequality in examined literacy aspects, emphases should be given to special educations of New Education policy 2020 apart from strict implementation of free and compulsory education as per Right to Education Act, 2009 by considering the level of literacy, influencing obstacles such as geographical, socio-economic and cultural apart from other aspects that prevails at regional and states level.

Measures to improve Literacy Rate

- Encouraging every female to study
- Teaching in mother tongue
- Develop love for reading
- Use of technology in teaching and learning
- Encourage learning by doing
- Institutional Social Responsibility (ISR)
- Social Responsibility of every educated and employed citizen

Every citizen should be given a compulsory task to educate children in their own neighbourhoods. Local Governing bodies can target the area to analyse and formulate plan to cover up the population in bringing up the rate of literacy in India.

Limitation

The main limitation of the study is that for north-east region, data related to education aspects available for Assam state only.

WOMEN WELFARE PROGRAMMES THOURGH SUSTAINABLE DEVELOPMENT OF WOMEN IN ANDHRA PRADESH

Dr.A.Kusuma
Assistant Professor,
Department of Sociology,
S.V University, Tirupati,

Abstract:

Women's empowerment is a crucial process aimed at granting women access to and control over material and informational resources. This concept, first articulated in 1985 by Development Alternatives with Women for a New Era (DAWN), empowers individuals, groups, and communities to take charge of their circumstances, thereby enhancing their quality of life. Women constitute an essential part of the labor force, and their economic involvement is intricately linked to overall development. The level of women's integration into economic development serves as an indicator of economic independence and social status. Women's empowerment encompasses equipping rural women with the necessary skills to undertake various tasks independently or collectively, granting them improved access to and control over societal resources. Empowerment is recognized as a pivotal strategy for enhancing the well-being of individuals, families, communities, as well as governmental and non-governmental agencies. It is crucial to continually refine women's empowerment strategies to ensure they are effective and yield tangible results. Notably, income earned by impoverished women tends to be prioritized for essential life needs, underscoring the significance of women as focal points in development efforts. When women work together in groups, it fosters a newfound sense of solidarity and cooperation, contributing to their economic independence.

Keywords: Women Empowerment, Economic Independence, Sustainable development, Leadership.

Introduction:

India, with its staggering population of over one billion people, grapples with the complex challenge of poverty and gender inequality. Approximately 26 percent of its populace lives below the poverty line, based on national minimum calorie intake standards of 2,400 calories per person in rural areas and 2,100 calories in urban areas. This poverty is unevenly distributed across the country, with pronounced regional disparities, notably between northern and southern India, where poverty concentrations are more pronounced in the north. Moreover, income inequality has been on the rise, increasing by 10 percent in the 2000s.

Furthermore, considering broader indicators such as education and health, as measured by the UNDP Human Development Index, the poverty rate in India becomes even more distressing, with 32 percent of households experiencing poverty in 2003. However, these statistics alone fail to capture the full extent of vulnerability, including factors contributing to the risk of falling in and out of poverty.

Vulnerability in India emanates from multiple sources, including shock-induced poverty, stemming from factors such as income loss and asset destruction at the household level, and idiosyncratic vulnerability due to elements like disease epidemics, healthcare expenses, death-related costs, theft, violence, and the consequences of globalization, such as job loss and inflation. Entire communities also face covariate vulnerability, encompassing threats like floods and droughts.

The marginalized status of women in Indian society plays a pivotal role in exacerbating these structural issues. In many regions of India, women endure neglect, discrimination, domestic responsibilities, caring for siblings, and often engage in labor outside the home. From a young age, girls face the specter of inadequate attention, nourishment, medical care, and education. As they reach adolescence, they become vulnerable to forced marriage, child labor, or prostitution. Following marriage, their status frequently deteriorates further, subjecting them to institutionalized subservience, loneliness, mental anguish, harassment, and even violence or murder.

This dire situation of women in India contributes to the concept of "missing women," a term coined by Amartya Sen, referring to women who should be alive but aren't due to social disadvantages. Disturbing statistics highlight the extent of gender bias, including women earning only 34 percent of men's wages, adult literacy ratios for women at 70 percent of those for men, and disparities in primary and high school enrollment ratios.

The unequal allocation of resources, lower wage rates, and lack of inheritance rights further compound these disparities, resulting in poorer life outcomes for women compared to men. These gender biases extend beyond the household, affecting women's legal and normative entitlements to land ownership and property exchange, leading to market failures related to the prices they receive for their labor and produce. Additionally, women's social relationships within their households and communities are influenced by these biases, as are their claims on the state for welfare and other benefits.

In addition to these challenges, significant disparities persist between men and women in terms of their access to assets, control over their labor, status, training opportunities, and access to resources for income generation activities. While there have been some improvements in the past decade, overcoming the deeply entrenched institutionalized disadvantages faced by Indian women remains an ongoing struggle.

In this context, women's empowerment and welfare programs play a critical role in addressing these issues, bridging gender disparities, and improving the well-being of women in India. These programs aim to empower women economically, socially, and politically, providing them with the tools and opportunities needed to break free from the cycle of poverty and discrimination. Sustainable development hinges on an equitable distribution of resources for both present and future generations, making gender equality a fundamental component of this pursuit. Women's empowerment is a key driver for achieving sustainable economic growth, social development, and environmental sustainability, as it fosters a balanced approach to development that benefits all segments of society.

NAVARATNALU

Here are the nine Navaratnalu welfare schemes.

1.YSR Rythu Bharosa

The YSRCP promises to offer Rs 50,000 financial assistance to farmers. Starting second year, each farmer family would be given Rs 12,500 per year, in addition to zero-interest loans and free borewells. Cold storages and food processing units in every constituency are among a list of benefits promised to the farmers.

Benefits to the citizens

- Every farmer to be provided Rs 50000 financial assistance. Crop sowing farmers to get Rs 12500 per year.
- Farmers need not worry about crop insurance. Government to pay crop insurance premium on behalf of farmers.
- Interest free Crop loans to be provided to farmers.
- Free bore-wells to be provided to farmers.
- 9 hours Free electricity during day time for agriculture purpose.
- Aqua culture farmers to get electricity @ Rs 1.50 per unit.
- Rs 3000 crores corpus fund allotted to prices stabilization. Rates to be declared before crop sowing.
- Farmers to be assured Minimum support price.
- Rs 4000 crores allotted for Natural disaster Relief fund.
- Every constituency to be provided with cold storages, go-downs. Food processing units to be established where necessary.
- Cooperative sector will be revived during the first year. Every dairy farmer who participates in a cooperative dairy from the second year onwards gets Rs. 4 bonus per liter.
- Toll Tax and Road Tax to be waived off for Agriculture Tractors.
- Rs 7 Lakh YSR Bhima to be provided to the family of farmer for accidental death or suicide. Act will be passed in the assembly to ensure amount does not land into the hands of loaner and government will stand by the deceased farmer family.

In the previous financial year, the government has already deposited Rs. 4.40 lakh crore into 54 lakh farmer's accounts. Other than the financial assistance of Rs 3900 crore spent in the 1st instalment, another Rs 2,000 crore is being provided by the government to the farmers.

2.Fee Reimbursement

Scholarships are of great importance to those students unable to pay their fee due to financial burden, so this scheme provides full fee reimbursement benefits to approximately 14 lakhs students of the state. Also, tuition fees, mess charges, hostel charges will be exempted from all of the students who excel in the studies as per the reports of their academics which will be provided by their hostels or by their college itself. Education expenditure will be borne for poor. Rs. 20,000 per student per annum to be provided in addition to fees reimbursement, boarding and lodging.

As mentioned above, many incentives are provided to all of the beneficiaries who enrolled themselves in the Jagananna Vidya Deevena Scheme as announced by the Chief Minister of Andhra Pradesh state.

1. The students will be given Rs 20,000/- per year.
2. Students studying from Welfare hostels will be exempted from mess charges.
3. Money incentives are as follows-

- Rs 15,000 for Polytechnic students
- Rupee 10,000 for ITI Students
- Rs 20,000 for Graduate Degree and other courses.

This scheme ensures that no student remains inaccessible to education due to his/her financial status and one benefit that has captured all of the good will of Andhra Pradesh people is the free education being provided to all beneficiaries who pass the eligibility criteria of the scheme. Also, monetary incentives are being provided every year to all the beneficiaries.

3.Arogyasri

The Arogyasri scheme would be applicable to all medical treatments of above Rs 1,000. Regardless of the location of the hospital, all medical expenses would be borne by the government.

AP government provides free treatment for specific illness to the eligible patients in any hospital in the state and the country. If the hospital bill is more than Rs.1000, the eligible ArogyaSri card holders can avail their free medical services. The objective of the scheme is to provide good quality medical treatment to BPL People for specific diseases form the renowned hospitals. All the BPL families identified by BPL ration card issued by Civil Supplies Department are eligible. All the people whose photo and name appear on Health Card / BPL (White, Annapurna and Anthyodaya Anna Yojana, RAP and TAP) ration card and suffering from identified diseases are eligible for availing treatment under the scheme.

Benefits of AP Arogyasri Scheme

Health Coverage of Rs 2.5 Lakh will be provided.

- It is a cashless treatment Scheme
- It will reduce death ratio from the state
- 1040 type of diseases will be covered
- It is a 100% government-funded scheme
- 24 hours call centre facility under the scheme (Toll-Free 104)

The Govt. of Andhra Pradesh had given top priority to public health. The annual family income to get the benefit of YSR Arogyasri was pegged at Rs. 5 lakh and the number of treatments covered under it was increased to 2450. As promised, the government had introduced YSR Bima under which poor families will get the insurance benefit if they lose the breadwinner.

Impact on Health Scenario in the State

- Early Recognition of Diseases: As the scheme progressed the pre-existing load of diseases is coming down, particularly in relation to the high-end diseases in cardiology, neurosurgery, gynaecology and obstetrics etc.,
- Improvement in documentation and regulatory effect on Hospitals: The emplacement procedure, defined diagnostic and treatment protocols, capturing of admission notes, daily clinical notes, operation notes, discharge summary and uploading of diagnostic reports including films, WebEx recording of Angio and Laparoscopic procedures and other photographic evidences have resulted in profound improvement of medical documentation in the State and regulatory effect on the hospitals.
- Improvement in quality of services: Continued monitoring of the services both online and in the field by the elaborated field mechanism coupled with disciplinary action against erring hospitals is greatly contributing to the quality of treatment under the scheme.

4.Jalayagnam

Under this scheme, lakhs of families would be benefited by the irrigation projects. Completion of Polavaram project on a war footing is promised.

Jalayagnam or Jala Yagnam, (water worship), is a water management program in India. It has been implemented by Chief Minister of Andhra Pradesh, India, Dr. Y. S. Rajasekhara Reddy as an election promise to the farmers of the state to bring 8.2 million acres (8.2 million acres) under irrigation in five years.

The concept of Jalayagnam was aimed at providing a permanent solution to drought and floods. The Government always feels that if the farmer is happy then the State will flourish. This project has the capacity to redraw the contours of the State itself. Under this scheme, lakhs of families would be benefited by the irrigation projects. Completion of Polavaram project on a war footing is promised.

With the inspiration of his father Y.S.R., Jagan Mohan Reddy promised to the people of Andhra Pradesh, he wants to re-introduce the Jalayagnam Scheme in Andhra Pradesh. Under Navaratnalu, "Jala Kala – Free Borewells" is aimed at utilizing the available groundwater Resources for the improvement of livelihoods of the farmers and thereby improve the GSDP under primary sector.

The scheme is providing free of cost borewells for all of the ranches of the Andhra Pradesh state. A lot of farmers highly depend upon the natural water resources for their irrigation of the field but because there are high draught statistics it is not possible for the farmers to use the natural groundwater resources for their irrigation. Borewells will provide to all of the farmers free of cost so that they can continue their practices and their income is also increase because of the large crop.

5.Ban on Alcohol

The YSRCP promises to put in place a ban on sale of alcohol across the State because Liquor is one of the main reasons for dispute in families due to which human relations are collapsing. Sale of alcohol will be banned in 3 stages and availability of alcohol use to be limited to 5-star hotels only. The plan is to ban its sales totally, but in a phased manner. If all goes to plan, the state should be liquor-free by 2024, well in time for the next legislative assembly election. Andhra Pradesh will join only four other Indian states-Gujarat, Mizoram, Bihar, and Nagaland- in banning the bottle.

Phases of Ban

- Jagan Reddy's plan is to introduce prohibition in a phased manner. In the first step, the Andhra Pradesh government has taken over retail sales, reduced the number of liquors vends from 4,380 to 3,500 across the state and made the state-owned AP State Beverages Corporation the sole supplier from October.
- To gradually cut availability and consumption, liquor shops will stay open from 10 am to 9 pm only, which will be reduced progressively to just a few hours a day. Official estimates of

consumption suggest that liquor sales in the state is already down 18 per cent since Reddy came to power in May end.

- A new bar licensing policy is to come into force from when their number will come down from the current 798--excluding those in star hotels and the micro- breweries. The bars will be allowed to stay open from 11 am and 7 pm. Apart from reducing business hours, the license fee will also see a big hike

6.Amma Vodi

With a view to encourage the families with school-going children, the YSRCP promises to provide Rs 15,000 towards assistance to all the mothers who send their children to school.

Government of A.P has announced "Amma Vodi" for providing financial assistance to each mother who is below poverty line household, irrespective of any differences to enable her to educate her children from class I to XII in all recognized schools/junior colleges. Under this scheme financial assistance of Rs. 15,000/- given to mothers for children education annually. With a view to encourage the families with school going children and to reduce the dropout ratio in schools, the government promises to provide Rs 15,000 towards assistance to all the mothers who send their children to school. Student enrolment has increased by 30% in the 2019-2020 academic year after the announcement of the scheme.

The initial rule of 75% mandatory attendance has been waived to encourage mothers to send their children to school. Orphans and street children studying in schools through voluntary organizations have been covered under the scheme and the money will be given to the organizations. The promised aid of ₹15000 is directly deposited in the beneficiaries' savings bank accounts in January every year until the child completes class 12.

Last year around 42 lakh beneficiaries have got the benefit of Amma Vodi scheme and this year the number has increased to 44.48 lakh. In the fiscal budget, the state government has allocated Rs 22,604 crore to the education sector out of Rs 2,24,789.18 crore. In the year 2020 budget, the government has sanctioned Rs 17,971 crore to the education sector has been increased in the budget for 2021. Out of this amount Rs. 6,107 crores have sanctioned for the Amma Vodi scheme. T

7.YSR Asara

All loans pertaining to the women's co-operative societies would be waived. In addition, zero-interest loans would be Issued YSR Cheyutha Through YSR Cheyutha, the YSRCP intends to support all women from SC, ST, BC and minority communities, who are aged above 45.

AP YSR Cheyutha Scheme being execute under Women government assistance leading body of Andhra Pradesh. Any denied network ladies belonging to these communities of SC, ST, OBC, or Minority and whose age is between 45 to 60 years may profit from the advantages of the AP YSR Cheyutha Scheme. This will be a great initiative for all of the women belonging to the minority community.

Features Of YSR Asara Scheme

- By the implementation of this scheme financial help will be provided to needy women who are living in Andhra Pradesh.
- The Government of Andhra Pradesh is going to give SHG loan to women who belong to the minority community.
- The Government of Andhra Pradesh have decided to spend 25,383 crore for this scheme in the next four years.
- Around 900000 beneficiaries will get benefit from this scheme
  YSR Cheyuta to be provided to BC, SC, ST, Minority women.
- Rs. 75000 to be granted after first year to women above 45 years age of BC, SC, ST and minorities through various corporations as YSR Cheyuta.

8.Pedalandariki illu

In five years, the YSRCP promises to build 25 lakh homes for the poor.

Chief Minister Y.S. Jagan Mohan Reddy's padayatra promise of providing pakka houses to the poor. The Chief Minister has started the construction of Pedalandariki illu vat Komaragiri layout of U Kothapalli mandal in East Godavari district on 25th December 2020. On this programme state government takes initiative to commencement of construction of 15.60 lakh houses in the first phase. In addition to these, the government also distributes sale agreements for 2.60 lakh TIDCO houses.

For the first time in the country, a house site patta is being given for just one rupee and government takes initiative to registered in the name of a woman member of the household. The beneficiaries are given 1.5 cents in rural areas or one cent in urban areas.

So far 30,75,755 beneficiaries have been identified for the scheme, of which 23,37,067 will be given houses in over 17,000 developed 'YSR Jagananna Colonies'. About 4,86,820 people who are already living in unauthorized sites, being legalized and the remaining 2,51,868 will be allocated TIDCO houses.

9.Pensionla Pempu

The eligibility age criteria of 65 years for the pensions would be reduced to 60 years. Senior citizens aged above 60 would be given Rs 2,000 while the physically challenged would be given a pension of Rs 3,000.

Door delivery of pensions under the YSR Pension Kanuka scheme one of the major initiatives of the YS Jagan Mohan Reddy. The idea of delivering pensions at the doorstep of beneficiaries through the village and ward volunteers was mooted by Chief Minister YS Jagan Mohan Reddy. This is another step in the implementation of the Navaratnalu, which were part of the YSRC election manifesto.

Instead of the beneficiaries going to the pension disbursement offices, the volunteers visit the beneficiaries and complete the formalities. The pension has been increased to Rs 2,250 from Rs 1,000 and the volunteers have been equipped with smartphones with biometric information of the beneficiaries to deliver the pension at their doorstep without any hassle. While the government has earmarked Rs 15,675.20 crore for the year towards the program

The existing eligibility criteria for sanction of pensions under the scheme is

- A monthly pension of Rs.2250/- is provided to Toddy Tappers, weavers, Single women, Fishermen, ART (PLHIV) Persons. Traditional Cobblers
- Disabled persons, Transgender and Dappu Artists receive a monthly pension of Rs.3,000/-
- People affected with chronic kidney disease who are undergoing Dialysis in both Government and network hospitals receive Rs.10,000/- per month.
- The enhanced scale of pension came into effect from June, 2019 payable from 1st July, 2019 onwards.

ABOUT DISTRICT

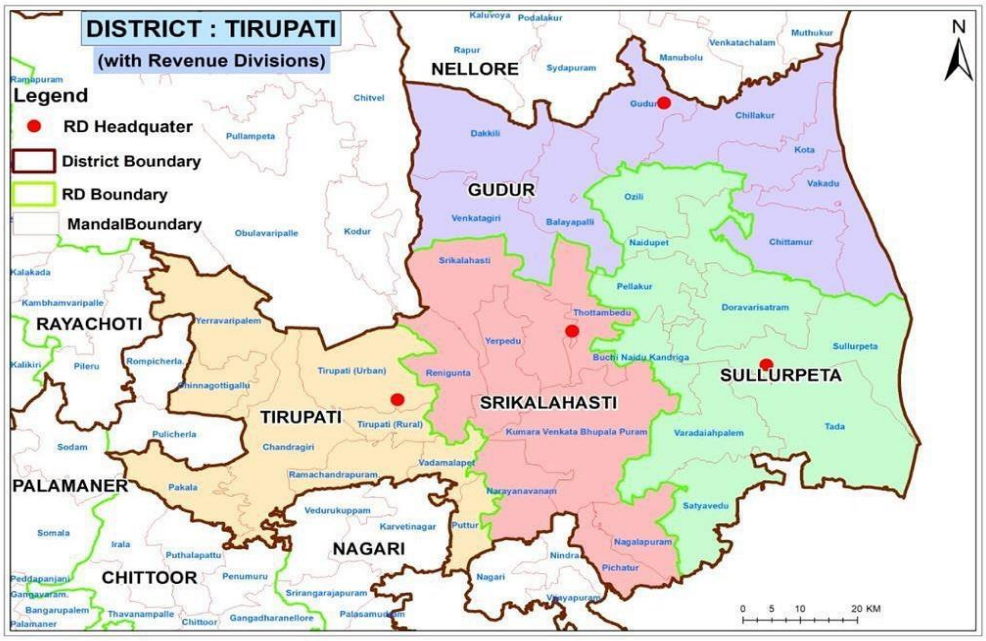
The district derives its name Tirupati is its headquarters town. It is located between the Northern Latitudes of 130 21′ 54″ and 140– 30′ 40″ and between the Eastern Longitudes 790 5′ 42″ and 800 4′ 10″. It is bounded on the east by Bay of Bengal, on the west by Annamayya and Chittoor Districts of Andhra Pradesh, on the North by SPSR Nellore and Annamayya Districts of Andhra Pradesh and on the south by Chittoor District of Andhra Pradesh and Tamilnadu State. In respect of area, it is with an area of 9174 Square Kilometers which accounts for 5.63 percent of the total area of the state. The general elevation of the mountainous part of the district is 2500 feet above sea level. The Chennai & Bangalore cities are located in 150 Kms. and 250 Kms. respectively to Tirupati Town. The district has good business and marketing for Groundnut, Paddy and Other Products.

The Eastern Ghats are pre-dominant in the Western Region and they gradually bend towards the sacred hills of Tirupati, passing through Chandragiri and entering into Nellore District.

Boundaries of the District:

The district is bounded by the following places and features on all the four sides.

East: Bay of Bengal



West: Annamayya and Chittoor Districts

North: SPSR Nellore and Annamayya Districts

South: Chittoor District and Tamilnadu State

Administrative Divisions:

There are 4 Revenue Divisions with Divisional headquarters at Tirupati, Srikalahasti, Sullurpet and Gudur and 34 Revenue Mandal's with 33 Mandal Parishads also existing in the district. A total of 784 Gram Panchayats are in position comprising all notified & non – notified Gram Panchayats.

Objectives

The objectives of the present study are:

1. to study the women participation and implementation of Welfare Programmes;
2. benefits from welfare programmes to study the women economic development of the respondents
3. to study the Problem faced by the different programmes;

Data Collection Techniques

Both primary and secondary data were used in the study. Secondary data was collected from publications of Government of India, Government of Andhra Pradesh, Bureau of Economics and Statistics, dailies etc. Primary data was collected through interview schedules and both participant observation and non-participant observation techniques.

Field Area

The field work was conducted in fourteen villages spread over Two Mandal's (Blocks) of Tirupati district in Andhra Pradesh. The villages selected are as follows:

Ramachandra Puram Mandal	:	2 villages
Vadamalapet Mandal	:	2 villages

Sampling

The study was conducted by selecting100 respondents from the two Mandal's as shown below:

Ramachandra. Puram Mandal	-	50
Vadamalapet Mandal	-	50

The sample was selected by following stratified random sampling method. The sample was selected from different Mandal's of the respondents from all the below the poverty line benefitted from welfare programmes.

Table-1

Releasing the Welfare programmes Mandal Wise Composition

Mandal's	frequency	Percentage
Ramachandra Puram Mandal	50	50.0
Vadamalapet Mandal	50	50.0
Total	**100**	**100.0**

After applying for sanction of navaratnalu Govt. Welfare programmes sanction to respondents the particulars. Ramachandhrapuram Mandal 50 (50.0) Repondents and Vadamalapet Mandal 50 (50.0) respondent . It's concluded the each Mandal are equal.

Table-2

Releasing the welfare programmes Village Wise Composition

Villages	frequency	Percentage
Ravillavaripalli	25	25.0
Venkatarama Puram	25	25.0
Tirumanyam	25	25.0
Vemapuram	25	25.0
Total	**100**	**100.0**

After applying for sanction of navaratnalu Govt. Welfare programmes sanction to respondents the particulars. The table shows ravillavaripalli, venkataramapuram, Tirumanyam and Vemapuram. Each villages are 25(25.0)respondents selected.

Table-3

Benefited of Welfare Programmes of respondents

Welfare Programmes	Frequency	Total	Percentage

	Yes	No	100	100.0
1.YSR Rythu Bharosa	60	40	100	100.0
2.Fee Reimbursement	32	68	100	100.0
3.Arogyasri	40	60	100	100.0
4.Jalayagnam	15	85	100	100.0
5.Ban on Alcohol	50	50	100	100.0
6.Amma Vodi	40	60	100	100.0
7.YSR Asara	60	40	100	100.0
8.Paydalandariki Illu	58	42	100	100.0
9.Pensionla Pempu	30	70	100	100.0

The information on the Govt. Welfare programmes being implemented in the Village has been elicited and presented in the Table.

The particulars of the more membership in YSR Rythu Barosa and YSR Asara 60(60.0) respondents, Paydalandariki Illu 58(58.0) respondents Ban on Alcohol 50 (50.0) respondents, Ammavadi and Arogyasri (40.0) respondents, Free Reimbursement 32 (32.0) respondents Pensionla pempu 30 (30.0) respondents and Jalaysgnam 15 (15.0) respondents .

It is Concluded that majority and more benefited of the respondents YSR Rythu Barosa and YSR Asara 60 (60.0) respondents.

Table-4

Problems faced in the Govt. Welfare Programes

Problems	**frequency**	**Percentage**
Non- Cooperation of Govt. Officers	15	15.0
Corruption of Govt. officers	5	5.0
Non - Cooperation of Village officers	20	20.0
No problems	60	60.0
Total	**100**	**100.0**

The respondents while Govt. Welfare Programmes faced many problems and the types of problems are presented in the table.

It is evident from table that 60(60.0) respondents did not faced any problems. But on the non-cooperation of the village officers 20 (20.0) respondents, 15 (15.0) respondents expressed the problems of Non-cooperation of Govt. officers and 5 (5.0) respondents corruption of Govt. Officers

Conclusion

Respondents of Ramachadrapuram and Vadamalapeta Mandals mostly benefited from Govt. Welfare Programmes (Navaratnalu). Majority of the Respondents received and above under Govt. Welfare Programmes (Navaratnalu) providing substantial additional income to the sample respondents. Govt. welfare programmes had some positive impact on the economic conditions of the sample respondents and made the respondents economically empowered. 60 percent respondents did not face any problems at all under the programmes. The high number of respondents who participated in the programmes and increasing saving amount indicate the high impact of the Govt. welfare programmes. The programmes must continue with the pitfalls covered.

GENDER INEQUALITY IN THE WORKPLACE ITS IMPACT ON SOCIETY

Dr. A. Kusuma
Assistant Professor
Department of sociology
S.V. University
Tirupati – 517502

Abstract: Gender inequality is that people receive different treatment because of gender in this present review, gender in inequality is widespread in the workplace is found including the prevalence of the easier access to promote opportunities for men and women. Gender inequality in the workplace is a pervasive issue with profound implications for individuals, organizations, and society at large. This paper provides a comprehensive analysis of the various dimensions of gender inequality in the workplace and explores its multifaceted impact on society. Drawing on existing literature, statistical data, and real-life examples, the paper examines the root causes of gender inequality, its manifestations in different sectors, and the barriers that perpetuate it. Furthermore, it discusses the detrimental effects of gender inequality on individuals' well-being, organizational performance, and societal progress. Finally, the paper offers recommendations for addressing and mitigating gender inequality in the workplace to foster a more equitable and inclusive society.

Keywords: Gender inequality, workplace, impact, society, gender pay gap, occupational segregation, leadership representation, root causes, stereotypes, biases, structural barriers, economic implications, psychological effects, work-life balance, organizational productivity, talent retention, social cohesion, policy interventions, organizational initiatives, cultural shifts, advocacy efforts.

Introduction

Gender inequality in the workplace remains a significant and persistent issue that has far-reaching implications for individuals, organizations, and society. Society can improve gender inequality and enhance women's awareness of self-worth by adjusting school education. When most women are in society realize that they are important not humble, and begin to say no to inequality, they can change gender inequality in society. Despite advancements in gender equality efforts, disparities in pay, opportunities, and treatment based on gender continue to exist across various industries and sectors. Understanding the complexities of gender inequality in the workplace and its broader impact on society is crucial for developing effective strategies to address and mitigate these disparities. The lack of education on gender equality leads to a lack of timely awareness of gender inequality. Even many women are not thinking they are suffering from gender inequality, which they think is normal.

Overview of Gender Inequality in the Workplace

Gender inequality in the workplace encompasses a wide range of disparities and discriminatory practices that disadvantage individuals based on their gender. One of the most well-documented manifestations of this inequality is the gender pay gap, which persists across industries and occupations, with women earning, on average, less than their male counterparts for comparable work. Additionally, women are often underrepresented in leadership positions and decision-making roles, contributing to a lack of diverse perspectives and voices at the highest levels of organizations. Occupational segregation, wherein certain industries or occupations are dominated by one gender, further perpetuates inequalities by limiting opportunities for career advancement and professional growth.

Importance of Studying its Impact on Society

Understanding the impact of gender inequality in the workplace on society is crucial for several reasons. Firstly, it highlights the broader societal consequences of workplace disparities, including economic ramifications, social cohesion, and the perpetuation of harmful stereotypes and biases. Economic disparities resulting from gender inequality not only affect individual financial stability but also contribute to systemic poverty and inequality within society. Moreover, workplace inequalities can reinforce and perpetuate societal norms and expectations regarding gender roles, further entrenching inequality in various aspects of life.

Purpose and Scope of the Analytical Study

The purpose of this analytical study is to examine the multifaceted impact of gender inequality in the workplace on individuals, organizations, and society. The study will explore the root causes and manifestations of gender inequality in various sectors, including the role of structural barriers, stereotypes, and biases. Additionally, it will analyze the implications of gender inequality for individuals' well-being, organizational performance, and societal progress.

Definition and Concept of Gender Inequality

Gender inequality in the workplace refers to the unequal treatment, opportunities, and outcomes experienced by individuals based on their gender. It encompasses various forms of discrimination and disparities, including but not limited to the gender pay gap, limited access to leadership roles, occupational segregation, and unequal treatment in hiring, promotion, and compensation decisions.

Root Causes and Contributing Factors

Gender gaps are one of the most pressing challenges facing the world of work today. Globally women are substantially less likely than men to participate in the labor market, and once in the workforce, they are also less likely to find jobs than men. Indeed, their access to quality employment opportunities remains restricted. Overall, for example women are more likely to work longer hours than men when both paid and unpaid employment, on average, women work favor ours for pay or profit either because they opt to work part-time or because part- time work is the only option available to them. These gender gaps persist despite the preference of most women worldwide to work in a paid job underlying the fact that women’s choices are constrained by a few factors.

Historical Contest Gender inequality

Gender inequality in the workplace has deep historical roots, stemming from longstanding societal norms and practices that have traditionally assigned different roles and responsibilities to individuals based on their gender. Historical disparities in education, property rights, and legal frameworks have also contributed to the perpetuation of gender inequality.

Societal Norms and Stereotypes: Gender norms and stereotypes play a significant role in perpetuating inequality in the workplace. Societal expectations regarding gender roles often lead to biases in hiring, promotion, and performance evaluations. Stereotypes about women's competence, leadership abilities, and commitment to work can result in limited opportunities for career advancement and leadership roles.

Structural and Institutional Biases: Structural and institutional biases within organizations and industries also contribute to gender inequality in the workplace. These biases may manifest in policies and practices that disadvantage women, such as lack of family-friendly policies, unequal pay practices, and limited opportunities for mentorship and professional development.

Gender Pay Gap: The gender pay gap is one of the most widely recognized manifestations of gender inequality in the workplace. It refers to the disparity in earnings between men and women, with women typically earning less than men for comparable work. Factors contributing to the gender pay gap include occupational segregation, discrimination in pay and promotion decisions, and the undervaluing of women's work.

Occupational Segregation: Occupational segregation refers to the concentration of men and women in different occupations and industries, often based on traditional gender roles and stereotypes. This segregation results in vertical and horizontal gender segregation, with women being underrepresented in leadership positions and overrepresented in lower-paying, less prestigious roles.

Lack of Leadership Representation: Women are often underrepresented in leadership positions across various sectors and industries. This lack of representation can be attributed to various factors, including biases in recruitment and promotion processes, limited access to mentorship and networking opportunities, and the perpetuation of stereotypes about women's leadership abilities.

Economic Impact: Gender inequality in the workplace results in unequal access to opportunities, resources, and compensation. Women, on average, earn less than men for the same work, contributing to the gender pay gap. This economic disparity not only affects individual financial stability but also perpetuates systemic poverty among women and their families.

Career Advancement: Discriminatory practices and biases often hinder women's career progression. Glass ceilings and gender stereotypes limit women's access to leadership roles and decision-making positions. Consequently, there's a loss of diverse perspectives and talents at the managerial and executive levels, impacting organizational performance and innovation.

Work-Life Balance: Gender inequality in the workplace also intersects with challenges related to work-life balance. Women are often expected to fulfill traditional caregiving roles, which can impede their professional growth and opportunities. This imbalance contributes to higher levels of stress and burnout among women, affecting their overall well-being and productivity.

Psychological Impact: Discrimination and bias in the workplace can lead to feelings of marginalization, imposter syndrome, and decreased job satisfaction among women. This psychological toll not only affects individual mental health but also perpetuates a culture of inequality and exclusion within organizations.

Societal Norms and Expectations: Gender inequality in the workplace reflects and reinforces broader societal norms and expectations regarding gender roles. By perpetuating stereotypes and unequal treatment, workplaces contribute to the normalization of gender discrimination in society, which, in turn, perpetuates a cycle of inequality across various domains.

Legal and Policy Implications: Gender inequality in the workplace also highlights gaps in existing legal frameworks and policies designed to promote gender equality. Analyzing these disparities can inform the development of more robust regulations and enforcement mechanisms to address systemic biases and discrimination.

Innovation and Competitiveness: Diverse and inclusive workplaces are more innovative and competitive. Gender inequality limits diversity, stifling creativity and hindering organizations' ability to adapt to changing market dynamics. Addressing gender disparities fosters a more dynamic and resilient workforce, ultimately benefiting organizational performance and societal progress.

Analyzing the Impact on Society: Economic Implications

Gender inequality on society and the economy, namely that there is discrimination between both genders in certain industries, mothers struggle of getting back to an initial position in a job, and a clear understanding of benefits equalized pay. The research has clearly indicated that gender inequality is not necessary, it can be easily avoided by changing the mind set in society, while gender equality gives a Varity of benefits to both society and the economy.

Gender Disparities in Earnings and Wealth: Gender inequality in the workplace contributes to significant disparities in earnings and wealth between men and women. The gender pays gap results in women earning less over their lifetimes compared to their male counterparts, leading to lower levels of wealth accumulation and financial security for women. This disparity in earnings and wealth perpetuates economic inequality between genders and limits women's economic independence and autonomy. **Effects on Poverty Rates and Economic Growth:** Gender inequality in the workplace is also associated with higher poverty rates among women, particularly among single mothers and women in marginalized communities. The gender pays gap and limited access to economic opportunities contribute to higher rates of poverty among women, which, in turn, have broader implications for societal well-being and economic growth. Addressing gender inequality in the workplace is essential for reducing poverty rates and promoting sustainable economic development.

Stress, Anxiety and Mental Health Issues: Gender inequality in the workplace can have significant psychological effects on individuals, particularly women. Discrimination, bias, and unequal treatment based on gender can lead to heightened levels of stress, anxiety, and other mental health issues among women. The constant pressure to prove oneself in a male-dominated workplace environment can take a toll on women's well-being and overall mental health.

Imposter Syndrome and Career Aspirations: Gender inequality in the workplace can also contribute to the development of imposter syndrome among women, leading to self-doubt and diminished confidence in their abilities. Stereotypes and biases about women's competence and leadership capabilities can undermine women's career aspirations and hinder their professional growth and advancement. One of the primary reasons behind workplace gender in equality is the unequal access to career development and progression opportunities for women. Long hours, inflexible work

arrangements inadequate family friendly policies can all contribute to hindering women's career advancement, reinforcing the gender gap in the workplace.

Reinforcement of Gender Stereotypes: Gender inequality in the workplace reinforces and perpetuates harmful gender stereotypes and cultural norms. Biases in hiring, promotion, and leadership decisions based on gender contribute to the normalization of gender discrimination and inequality in society. This reinforcement of gender stereotypes limits opportunities for women and perpetuates rigid gender roles and expectations. Gender stereotypes perpetuate the notion that people of certain gender are naturally suited to specific roles or professions.

Impact on Family Dynamics and Social Relationships: Gender inequality in the workplace also has implications for family dynamics and social relationships. Limited access to economic opportunities and leadership roles for women can strain family dynamics and contribute to unequal distribution of household and caregiving responsibilities. Additionally, workplace discrimination and inequality can negatively impact social relationships and interactions, leading to feelings of isolation and marginalization.

Understanding the multidimensional impact of gender inequality in the workplace on society is essential for addressing systemic barriers and promoting gender equity and inclusion. By addressing economic disparities, prioritizing mental health and well-being, and challenging harmful gender stereotypes, societies can work towards creating more equitable and inclusive environments for all individuals, regardless of gender.

Legal and Policy Interventions: Effective gender inclusive policies may be further supported by reviewing and adhering to legal frameworks that promote gender equality. More recently, some of the states have introduced laws such as pay transparency and minimum wage polices that aim to reduce gender discrimination. By familiarizing themselves with and adhering to these legal frame works, companies can help minimize any disparities that negatively affect women in the workplace.

Gender Equality Legislation: Governments and policymakers have implemented various gender equality laws and regulations aimed at addressing gender inequality in the workplace. These laws prohibit discrimination based on hiring, promotion, and compensation practices and require employers to promote gender equality in their organizations. Examples include the Equal Pay Act, Title VII of the Civil Rights Act, and the Gender Equality Act in different countries.

Affirmative Action Policies: Affirmative action policies are designed to promote equal opportunities for underrepresented groups, including women, in the workplace. These policies may include measures such as quota systems, targeted recruitment efforts, and preferential treatment in hiring and promotion decisions to address historical and systemic barriers to gender equality. Affirmative action aims to level the playing field and increase representation of women in traditionally male-dominated industries and leadership positions.

Diversity and Inclusion Programs: Many organizations have implemented diversity and inclusion programs to promote a more equitable and inclusive workplace culture. These programs aim to foster diversity across various dimensions, including gender, race, ethnicity, and sexual orientation, and create environments where all employees feel valued and respected. Diversity and inclusion initiatives may include training programs, employee resource groups, and mentorship opportunities to support women and other underrepresented groups in the workplace.

Gender-Sensitive HR Policies: Organizations are increasingly adopting gender-sensitive human resources (HR) policies to address gender inequality in the workplace. These policies may include equal pay policies, parental leave, and flexible work arrangements to support work-life balance, and anti-discrimination and harassment policies to ensure a safe and inclusive work environment for all employees. By implementing gender-sensitive HR policies, organizations can promote fairness, equity, and diversity in their workforce.

Awareness Campaigns and Education: Advocacy organizations, non-profits, and grassroots movements play a crucial role in raising awareness about gender inequality in the workplace and advocating for change. These efforts include awareness campaigns, educational programs, and community outreach initiatives aimed at challenging stereotypes, promoting gender equality, and empowering women in the workforce. By raising awareness awareness campaigns, educational programs, and community outreach initiatives aimed at challenging stereotypes, promoting gender equality, and empowering women in the workforce. By raising awareness and educating the public about the importance of gender equality, advocacy organizations contribute to cultural shifts and societal change.

Changing Attitudes and Social Norms: Cultural shifts and changing attitudes towards gender roles and stereotypes are essential for addressing gender inequality in the workplace. This includes challenging traditional gender norms, promoting positive representations of women in leadership and professional roles, and encouraging men to be allies in the fight for gender equality. By challenging harmful stereotypes and promoting more inclusive attitudes towards gender, society can create environments where all individuals have equal opportunities to thrive in the workplace.

Overall, legal and policy interventions, organizational initiatives, and advocacy efforts play complementary roles in addressing gender inequality in the workplace and promoting gender equity and inclusion in society. By working together, governments, organizations, and advocacy groups can create more equitable and inclusive environments where all individuals, regardless of gender, have equal opportunities to succeed.

Implications for Addressing Gender Inequality in the Workplace

Addressing gender inequality in the workplace requires comprehensive strategies that target root causes and promote systemic change. Legal and policy interventions, such as gender equality legislation and affirmative action policies, can help address discrimination and promote equal opportunities for women. Organizational initiatives, including diversity and inclusion programs and gender-sensitive HR policies, are crucial for fostering inclusive workplace cultures and supporting women's advancement.

Advocacy efforts and cultural shifts are also essential for challenging stereotypes and promoting more equitable attitudes towards gender. By raising awareness, educating the public, and challenging traditional gender norms, society can create environments where all individuals have equal opportunities to succeed in the workplace.

Future Directions for Research and Action:

Moving forward, further research is needed to explore emerging trends and innovative strategies for addressing gender inequality in the workplace. Future studies could focus on evaluating the effectiveness of existing interventions, identifying barriers to progress, and exploring the intersectionality of gender with other factors such as race, ethnicity, and sexual orientation. Action is needed at multiple levels to advance gender equality in the workplace. Governments, organizations,

advocacy groups, and individuals all have a role to play in promoting systemic change and fostering inclusive environments where all individuals have equal opportunities to thrive.

Conclusion

Gender inequality in the workplace is a complex and pervasive issue with far-reaching implications for individuals, organizations, and society. Throughout this study, we have explored various dimensions of gender inequality, including its root causes, manifestations, and impact on society.

We found that historical biases, societal norms, and institutional barriers contribute to gender disparities in the workplace, including the gender pay gap, occupational segregation, and lack of representation in leadership roles. These inequalities have significant economic, psychological, and social consequences, affecting individuals' well-being, organizational performance, and societal progress. addressing gender inequality in the workplace is not only a moral imperative but also essential for promoting economic growth, social cohesion, and individual well-being. By working together and implementing evidence-based strategies, we can create workplaces and societies that are more equitable and inclusive for all.

Abstract

The women are mostly engaged in the unorganised sector as labourers. They face the problems of job insecurity and exploitation on par with the male workers. In addition, they are subjected to wage discrimination and the nature of work assigned to them is usually drudgery in nature. They are also subjected to sexual exploitation at the work place. In the homes they are expected to do all the domestic chores. Therefore, the women with Human Immunodeficiency Virus (HIV) positive in lower starts of society need urgent and special attention. Moreover, the women in India are characterized by low status, low level of education, low level of health conditions and employment. They are suffering from insecurity, exploitation in addition to poverty. The paper aims at examines the Socio-Economic and Demographic Characteristics and based on primary data collected from HIV positive pregnant women attending Antiretroviral therapy (ART) Centre.

Keywords

Socio-Economic and Demographic Characteristics, Antiretroviral therapy and Human Immunodeficiency Virus

Introduction

India is one such Third World country which is characterized by poverty and unemployment. According to 2001 census 35 per cent of the population is living below poverty line and 25 per cent below poverty line huge are of developmental benefits are going in favour of a small section of the society, who have high socio-economic status. This has been resulting in the widening of income and wealth disparities. Consequently, the intensity of poverty has been rising and as a result, high incidence of poverty has been falling on women. Rural women are mostly engaged in the farms as agricultural labourers. They face the problems of job insecurity and exploitation on par with the male workers. In

addition, they are subjected to wage discrimination and the nature of work assigned to them is usually drudgery in nature. They are also subjected to sexual exploitation at the work place. In the homes they are expected to do all the domestic chores. Therefore, the rural women in lower starts of society need urgent and special attention. Msamanga, G.I et al (2006) examined the Socio-economic and demographic factors associated with prevalence of HIV infection among pregnant women in Dar es Salaam, Tanzania.

The women will face different problems for their existence depending upon the class to which they belonged to. Therefore, treating all the women as one category may not be helpful in proper understanding often phenomenon. The women belonging to the upper strata are relatively at some advantage, while women in poorer sectors are to wage struggles for their existence. The women in the upper strata of the society have the problem of leisure and the problems that go with the leisure, the middle class women are under the stresses and strains of deteriorating living standards. It is the middle class women who compete for the jobs in the organized sector and encounter stiff competition. The third category of women who belong to the poorer classes and are engaged in the basic struggle for existence, particularly in the rural areas face a different type of problems. Chauhan G (2014) HIV positive pregnant women were younger, primi and housewives. HIV positive antenatal women need to be followed rigorously to link them to ART services. Caroline Granberg (2015) found that higher level of education and belonging to a higher level of wealth quintile were significantly associated with having knowledge about PMTCT. All categories for education showed a significant difference.

The rural women are mostly engaged in the farms as agricultural labourers. They face the problems of job insecurity and exploitation on par with the male workers. In addition, they are subjected to wage discrimination and the nature of work assigned to them is usually drudgery in nature. They are also subjected to sexual exploitation at the work place. In the homes they are expected to do all the domestic chores. Therefore, the rural women in lower starts of society need urgent and special attention. The rural women in India are characterized by low status, low level of education, low level of health conditions and employment. They are suffering from insecurity, exploitation in addition to poverty. Socio-economic status (SES) is often measured as a combination of education, income, and occupation. It is commonly conceptualized as the social standing or class of an individual or group. When viewed through a social class lens, privilege, power and control are emphasized. Furthermore, an examination of SES as a gradient or continuous variable reveals inequities in access to and distribution of resources. The SES is relevant to all realms of behavioural and social science including research, practice, education and advocacy. Padmaja Y et al (2017) studied the demographic characteristics among pregnant and postpartum HIV positive women. Social class and educational status play a vital role in establishing awareness and ensuring the antenatal care and compliance. Empathetic, inclusive and responsive by health care providers in convincing women to get tested goes a long way.

Literature Review

Anne WanjaKibera et al (2017) found that HIV infections in Kenya were predominantly among the resourceful newly married,young educated adults. Gender distribution difference was insignificant (2.2%) in the numbers by sex it was at (2%). The youngest participant was 18 years old implying that the

mode of transmission in this population was sexual and or any other but unlikely to be mother to child. Ottop F. Manyi et al (2020) aimed to describe the socio-demographic profiles of naive to antiretroviral therapy (ART) HIV-infected pregnant women. A total of seventy (70) women were enrolled with age range varying between 15 and 40 years, the Muslim religion, education below secondary level and the profession of housewife were significantly associated. Unyime Patrick Udoudo et al (2021) examined the socio-economic characteristics such as age, marital status, employment status, place of residence, level of education. The result showed that the marital status, place of residence and level of education has a negative relationship with the probability of a pregnant woman having a positive HIV status. Feny Deya Virdausi et al (2022) found that women's age, education level, wealth quintile, residential area and region, access to information, owning cell phones and autonomy were significantly associated with positive knowledge and attitudes toward HIV/AIDS.

Objective

To study the Socio-Economic and Demographic Characteristics of HIV positive pregnant women attending ART Centre

Method and material

The paper is based descriptive research design and based on primary data collected with interview scheduled from 250 HIV positive pregnant women coming to Antiretroviral therapy Center at SVRR Government General Hospital, Tirupati, Andhra Pradesh.

Results and discussion

Age

Age is an important factor which determines the physical ability to work. Age is very important factor besides the active participation in innovative activities and risk taking ability. To understand the working age group, it is necessary to classify the respondents according to their age. Age shows understanding nature and shouldering the responsibility. The age of the respondents is presented in the table-1.

Table-1: Age of the Respondents

Sl. No.	Age	No. of Women	Percentage
1	Below 25 years	75	30.0
2	26 - 35 years	101	40.4
3	Above 35 years	74	29.6
	Total	**250**	**100.0**

The table-1 shows that 40.4 per cent of the respondents are in the age group of 26–35 years, 30 per cent are in the age group of below 25 years and 29.6 per cent are in the age group of above 35 years. Above all, it is concluded that more than 40 per cent of the respondents are in the age group of 26–35 years.

Marital Status

The marital status of the respondents is shown in the table-2.

Table-2: Marital status of the respondents

Sl. No.	Marital Status	No. of Women	Percentage
1	Married	248	99.2
2	Unmarried	2	0.8
	Total	**250**	**100.0**

The table-2 shows that 99.2 per cent of the respondents are married and mere 0.8 per cent is spinsters.

Caste

Caste is another variable to analyse and understand the socio-economic characteristics of the respondents. Caste has become very important in India, for meaningful study it is not possible and feasible without taking caste into consideration. The caste composition of the respondents is furnished in the table-3.

Table-3: Caste of the respondents

Sl. No.	Caste	No. of Women	Percentage
1	Forward Caste	52	20.8
2	Backward Caste	120	48.0
3	Scheduled Caste	60	24.0
4	Scheduled Tribe	18	7.2
	Total	**250**	**100.0**

The table-3 portrays that 48 per cent of the respondents belong to Backward Caste, 24 per cent to Scheduled Caste, around 21 per cent to Forward Caste and a little over 7 per cent belong to Scheduled Tribe.

Education

Education plays a very important role to empower women and for development of society. It gives analysing capacity and wisdom to thinking and decision making capacity. Education - formal and informal - improves awareness for better life and generates positive impulses for socio-economic advancement. It controls the attitudes, opinions and behaviour of the people and influences the economic destiny of the family. The educational status of the respondents is presented in the table-4.

Table-4: Literacy of the Respondents

Sl. No.	Education	No. of women	Percentage
1	Illiterate	106	42.4
2	Up to Primary	39	15.6
3	Up to 10th	85	34.0
4	Intermediate	11	4.4
5	Graduation	9	3.6
	Total	**250**	**100.0**

It is quite obvious from the table-4 that 42.4 per cent of the respondents are illiterates, 34 per cent have SSC qualification, around 16 per cent have primary education, 4.4 per cent have Intermediate and around 4 per cent are graduates.

Occupation

It is a common fact that the occupation of the individual determines his position in the society and standard of living. Table-5 reveals the occupational structure of the sample population. Most of the respondents in the sample are doing business and are in employment. Only a few persons are Involved in agriculture. Majority of the respondents from the employment and business categories show higher fertility and higher additional expected family size compared to the cultivators in the sample population.

Table-5: Occupation of the Respondents

Sl. No.	Occupation	No. of Women	Percentage
1	Housewife	128	51.2
2	Coolie	90	36.0
3	Petty business	11	4.4
4	Daily labourers	14	5.6
5	Private jobs	7	2.8
	Total	**250**	**100.0**

The table-5 shows that 51.2 per cent are housewives, 36 per cent are coolies, around 6 per cent are daily labourers, 4.4 per cent have petty business and around 3 per cent are working in private sector.

Financial Support

The financial support the respondents getting is shown in the table-6.

Table-6: Mode of financial support

Sl. No.	Mode of financial support having to live	No. of Women	Percentage
1	Family members	159	63.6
2	Friends	42	16.8
3	Relatives	49	19.6
	Total	**250**	**100.0**

The table-6 shows that around 64 per cent of the respondents have financial support from their family members to live, around 20 per cent have financial support from relatives and around 17 per cent have financial support from friends.

Conclusion

This study showed that as many women as men were equally vulnerable to HIV infections. Risk factors for HIV infections were being young adults, mostly backward and scheduled caste, illiterate or primary education and majority are being housewife, and receiving financial support from family members most are being married or cohabiting couples, a contrast with the notion that marriage was a protective institution against HIV infections. The high prevalence rate of HIV was attributed to low level of sexual health education and condom use. Low risk factors for HIV infections were associated with low level of education. As such, policy makers should review HIV programmes and consider the contribution of socio-economic and demographic factors done so that gaps in the prevention and control of HIV in could be sealed to reduce the negative impact of HIV infections.

This study showed that as many women as men were equally vulnerable to HIV infections. Risk factors for HIV infections were being young adults, mostly backward and scheduled caste, illiterate or primary education and majority are being housewife, and receiving financial support from family members most are being married or cohabiting couples, a contrast with the notion that marriage was a protective institution against HIV infections. The high prevalence rate of HIV was attributed to low level of sexual health education and condom use. Low risk factors for HIV infections were associated with low level of education. As such, policy makers should review HIV programmes and consider the contribution of socio-economic and demographic factors done so that gaps in the prevention and control of HIV in could be sealed to reduce the negative impact of HIV infections.

A REVIEW ON CHALENGES AND INNOVATION IN THE ORGANIZATION AND SUPERVISION OF FIELD WORK IN SOCIAL WORK EDUCATION

Dr. A. Kusuma
Assistant Professor
Department of Sociology
S.V. University. Tirupati.

Abstract: Field work in social work education serves as a cornerstone for bridging theory with practice, providing students with invaluable experiential learning opportunities. However, the organization and supervision of field work present numerous challenges that impact the effectiveness and quality of students' educational experiences. This article explores these challenges and examines innovative strategies and practices that have emerged to enhance the organization and supervision of field work in social work education. Key topics include placement availability, supervision quality, logistical considerations, and the adaptation of field work to evolving societal needs. By investigating these issues, this article aims to contribute to a deeper understanding of how field work can be optimized to better prepare future social workers for the complexities of professional practice.

Keywords: Field work, Practice, Supervision, Social Work Education, Placements, Challenges Innovative Approaches.

Introduction: Field work, often referred to as practicum or internship, is a fundamental component of social work education, offering students the opportunity to apply classroom learning in real-world settings under the guidance of experienced practitioners. The significance of field work lies in its ability to bridge the gap between academic knowledge and practical skills, preparing students to navigate the complexities and challenges they will encounter in their careers as social workers.

Despite its pivotal role, the organization and supervision of field work in social work education are fraught with challenges that can impact the quality and effectiveness of student learning experiences. One of the primary challenges is securing suitable field placements that align with students' academic interests and professional goals. The availability of placements, especially in specialized fields such as healthcare or child welfare, can be limited, posing logistical hurdles for both students and educational institutions.

Another critical challenge is ensuring the quality of supervision provided to students during their field placements. Effective supervision is essential for nurturing students' professional development, offering guidance, feedback, and support as they navigate complex social work scenarios. However, variations in supervisor qualifications and availability can lead to inconsistencies in the supervision process, affecting students' learning outcomes.

Moreover, logistical considerations such as transportation, scheduling, and administrative tasks add another layer of complexity to the organization of field work placements. These practical challenges can impact the smooth operation of field work programs and require careful coordination and planning from educational institutions.

Furthermore, the landscape of social work practice is constantly evolving, necessitating ongoing adaptation of field work to address emerging societal needs, changes in policy, and advancements in technology. Innovations in field work education, such as the integration of virtual field work experiences and interdisciplinary collaborations, are emerging as strategies to enhance learning opportunities and better prepare students for the dynamic realities of contemporary social work practice.

This article aims to explore challenges innovative approaches and best practices that have been developed to optimize the organization and supervision of field work in social work education. By examining these innovations, educators and practitioners can gain insights into how to effectively navigate the complexities of field work placements and enhance the educational experiences of future social workers.

Challenges

Placement Availability: Challenge Securing appropriate field placements that align with students' academic interests and career goals can be difficult, especially in specialized areas of social work practice (e.g., healthcare, child welfare).

placements may restrict students' opportunities to gain experience in their preferred fields, potentially delaying or compromising their professional development.

Supervision Quality:

Ensuring consistent and effective supervision by qualified professionals throughout the field work experience. Inconsistent or inadequate supervision can hinder students' learning and professional growth, affecting their ability to apply theoretical knowledge to practical situations and develop critical skills.

Logistical Issues:

Managing logistical aspects such as scheduling, transportation, and administrative tasks associated with field placements. Poor logistical coordination can disrupt students' field work

experiences, leading to inefficiencies and logistical challenges that detract from the learning process.

Adapting to Changing Needs:

Field work programs aligned with evolving social work practices, policies, and community needs. Failure to adapt can result in outdated educational experiences that do not adequately prepare students for current professional challenges and opportunities.

Ethical and Professional Boundaries:

Navigating complex ethical dilemmas and maintaining professional boundaries in real-world practice settings. Inadequate preparation or support in handling ethical challenges can jeopardize students' professional development and ethical integrity.

Diversity and Cultural Competence:

Providing field placements that expose students to diverse populations and cultural contexts. Limited exposure to diverse experiences may hinder students' ability to develop cultural competence and sensitivity, essential for effective social work practice in multicultural environments.

Evaluation and Feedback:

Ensuring timely and constructive feedback on students' performance during field placements. Insufficient feedback can impede students' ability to reflect on and improve their practice, limiting their overall learning and professional growth.

These challenges require innovative approaches and collaborative efforts among educators, practitioners, and stakeholders in social work education. By identifying and overcoming these obstacles, institutions can enhance the quality and effectiveness of field work experiences, better preparing students for the complexities of professional social work practice.

Innovations

Virtual Field Work:

Utilizing technology to create virtual field work experiences. Allows students to engage with clients and scenarios remotely, overcoming geographical limitations and enhancing accessibility to diverse practice settings. Virtual platforms can simulate real-world interactions, offering a safe environment for learning and skill development.

Simulation Exercises:

Implementing simulated scenarios that replicate real-life social work challenges. Provides students with opportunities to practice decision-making, critical thinking, and intervention skills in controlled settings. Simulations can be tailored to specific learning objectives and adjusted based on students' progress and feedback. Partnering with other disciplines (e.g., psychology, nursing) to offer joint field work experiences.

Enhances students' understanding of multidisciplinary approaches to client care and strengthens collaborative skills essential for integrated service delivery. Interdisciplinary collaborations broaden students' perspectives and prepare them for team-based practice in diverse healthcare and social service settings.

Reflective Practices:

Incorporating structured reflective supervision and learning activities into field work experiences. Encourages students to critically analyze their experiences, values, and professional development. Reflective practices foster self-awareness, empathy, and ethical decision-making, supporting holistic learning and personal growth as future social workers.

Use of Data and Technology:

Leveraging data analytics and technology tools to enhance supervision and evaluation processes. Enables real-time monitoring of students' progress, identification of learning trends, and personalized feedback. Technology integration facilitates efficient communication between students, supervisors, and field instructors, streamlining administrative tasks and improving overall program management.

Community and Global Engagement:

Offering international or community-based field work placements Exposes students to diverse cultural contexts, global social issues, and alternative service delivery models. Community and global engagement broaden students' perspectives on social justice, advocacy, and human rights, fostering cultural competence and global citizenship in social work practice.

Trauma-Informed Approaches:

Integrating trauma-informed care principles into field work education. Equips students with skills to recognize and respond sensitively to trauma-related issues in client interactions. Trauma-informed approaches promote client empowerment, resilience-building, and the creation of safe, supportive environments in social work practice.

These innovations reflect ongoing efforts to enhance the quality, relevance, and impact of field work experiences in social work education. By adopting and adapting these innovative practices, educational institutions can better prepare future social workers to meet the complex and evolving challenges of the profession.

Importance of Adequate Supervision: Effective supervision is crucial for maximizing the learning outcomes of field work experiences in social work education. Institutions should prioritize ensuring that supervisors are well-trained, experienced, and capable of providing meaningful guidance and support to students.

Need for Diverse Field Placements: Addressing the challenge of securing suitable field placements requires collaboration with a variety of agencies and organizations. Efforts should focus on expanding placement options to include diverse settings that reflect the breadth of social work practice.

Innovative Approaches Enhance Learning: Innovations such as virtual field work, simulation exercises, and interdisciplinary collaborations have demonstrated promise in enriching students' educational experiences. These approaches provide opportunities for immersive learning, skill development, and exposure to new technologies and methodologies.

Integration of Reflective Practices: Incorporating structured reflective practices into field work supervision encourages students to critically analyze their experiences, values, and professional growth. This fosters a deeper understanding of social work practice and promotes ongoing learning and self-improvement.

Challenges in Logistics and Administration: Addressing logistical challenges, such as scheduling, transportation, and administrative tasks associated with field placements, is essential for ensuring the smooth operation of field work programs. Institutions should streamline processes and allocate resources effectively to minimize disruptions.

Adaptation to Evolving Needs: Social work education must adapt to evolving societal needs, technological advancements, and changes in policy and practice. This requires ongoing collaboration between academia and the field to ensure that curricula remain relevant and responsive to current challenges and trends.

Ethical Considerations and Cultural Competence: Emphasizing ethical decision-making and cultural competence is fundamental in preparing social work students for diverse and complex practice environments. Educational programs should prioritize the development of these competencies through rigorous training and exposure to diverse populations.

Future Directions: Continued research and evaluation of field work practices are necessary to identify emerging challenges and refine innovative approaches. Institutions should continue to innovate and adapt to meet the evolving needs of students, practitioners, and the communities they serve.

Conclusion: while challenges in the organization and supervision of field work in social work education are significant, ongoing innovations and strategic approaches can enhance the quality and effectiveness of field work experiences. By addressing these challenges proactively and embracing innovative practices, educational institutions can better prepare future social workers to navigate the complexities of contemporary social work practice and make meaningful contributions to society.

Women in Politics in India: An Analytical Study

Dr.A.Kusuma
Assistant Professor,
Department of Sociology,
S.V University, Tirupati,

Abstract

This analytical study provides an overview of women in politics in India, focusing on their representation, challenges faced, and the impact of their involvement. It examines the historical background, highlighting key figures and milestones in women's political empowerment. The study explores the current state of women's representation in Indian politics, identifying factors contributing to their underrepresentation. It discusses the reservation policy and its impact on increasing women's participation at the grassroots level. Additionally, the study investigates the impact of women in politics on policymaking and governance, emphasizing the positive influence they have on various issues.

It delves into the challenges and barriers faced by women in Indian politics, including gender biases, stereotypes, and violence. Furthermore, the study suggests measures to empower women in politics, such as internal party reforms, education, training.

programs, and legal reforms. It highlights success stories of women leaders who have broken barriers and served as role models. The study concludes by emphasizing the need for comprehensive efforts to address gender disparities and create an inclusive and empowering environment for women in Indian politics.

Keywords : political empowerment, women leaders, party reforms, education, training.

Introduction:

The role of women in politics is a subject of profound significance and study in the context of India, a country known for its rich tapestry of culture, diversity, and democratic governance. This analytical study delves into the intricate dynamics surrounding the participation of women in Indian politics. It seeks to shed light on the challenges,

opportunities, and evolving trends that have shaped the landscape of women's political representation in India.

India, the world's largest democracy, has a long and complex history of gender inequality, which has manifested itself in various spheres of society, including politics. Despite the nation's progressive and inclusive constitutional framework, the political arena has traditionally been dominated by men. over the years, significant strides have been made to break down these barriers and encourage greater gender parity in politics.

The study will examine the historical context of women's involvement in politics in India, tracing the journey from the early days of the independence movement to the present day. It will explore the milestones and challenges faced by women in their pursuit of political leadership, highlighting key figures and movements that have played pivotal roles in this journey.

Moreover, the study will delve into the factors that have hindered women's participation in politics, such as socio-cultural norms, economic disparities, and institutional barriers. It will also analyze the impact of reservation policies and affirmative action measures designed to increase women's representation in elected bodies.

In addition to examining the challenges, this study will underscore the importance of women's participation in politics and the potential benefits it brings to the nation's development and governance. It will explore how the inclusion of diverse voices can lead to more equitable policies, improved governance, and greater social justice.

Furthermore, the study will present a contemporary assessment of the current state of women in politics in India, offering insights into recent trends, achievements, and ongoing struggles. It will also consider the role of women in various political parties and their representation in legislative bodies at the national and state levels.

As we embark on this analytical journey, it is important to recognize that the participation of women in politics is not merely a matter of numerical representation but a reflection of a broader struggle for gender equality and social justice. This study aims to contribute to a deeper understanding of the complex dynamics surrounding women's participation in Indian politics and the implications it holds for the nation's democratic future. Through rigorous

analysis and insightful observations, it seeks to provide a comprehensive view of the challenges and opportunities facing women in politics in India.

1.Historical Background:

The historical background of women in politics in India is a complex and multifaceted narrative that spans centuries, marked by significant milestones, movements, and gradual progress towards greater inclusion and representation. To understand the present state of women in Indian politics, it is essential to explore this historical context:

The historical background of women in politics in India reflects a journey marked by progress, challenges, and ongoing struggles. While significant milestones have been achieved, there is still work to be done to ensure greater representation and participation of women in all levels of Indian politics. This historical context provides the foundation for understanding the current state of women in Indian politics and the efforts being made to address gender disparities in the field of governance.

- **Pre-Independence Era (Ancient and Medieval India):** In ancient and medieval India, women often had prominent roles in governance and administration. Examples include the likes of Rani Padmini and Rani Durgavati. However, these were exceptions rather than the norm, and women's political participation remained limited.
- **Women in the Independence Movement:** The struggle for independence from British colonial rule in the early to mid-20th century provided a platform for women to actively participate in politics. Figures like Sarojini Naidu, Annie Besant, and Kamala Nehru played significant roles in the freedom struggle, raising awareness about political issues and advocating for women's rights.
- **Post-Independence Period (1947 onwards):** After gaining independence in 1947, India adopted a democratic constitution that guaranteed equality for all citizens, regardless of gender. The right to vote was extended to women, and women started participating in electoral politics. In 1952, India held its first general election, and several women were elected to the Constituent Assembly.
- **Reservation for Women:** To address the underrepresentation of women in political offices, India introduced reservation policies at the local level in the form of Panchayati Raj Institutions (PRIs). The 73rd and 74th Constitutional Amendments in 1992 mandated that one-third of seats in local rural and urban bodies be reserved for women.
- **Women's Movements:** Throughout the post-independence period, various women's movements and organizations advocated for gender equality and women's political

empowerment. Prominent among them were the All India Women's Conference and the National Federation of Indian Women.

- **Progress in State Politics:** Some Indian states saw women achieving significant political positions. For instance, Mamata Banerjee in West Bengal and Jayalalithaa in Tamil Nadu became prominent political leaders who served as Chief Ministers.
- **National Leadership:** While India has had a few female Presidents (such as Pratibha Patil) and Prime Ministers (Indira Gandhi and her daughter-in-law, Sonia Gandhi, who declined the position but was a powerful political figure), women's representation at the national level remained relatively low.
- **Challenges and Gender Disparities:** Despite advancements, women in Indian politics faced numerous challenges, including patriarchal attitudes, violence, and unequal access to resources and opportunities. The gender gap in political participation persisted.

- **Contemporary Developments:** In recent years, there has been a growing awareness of the need for greater women's participation in politics. Some states have experimented with increasing reservation quotas, and women have assumed leadership roles in major political parties.

2. **Representation and Participation**: Representation and participation of women in Indian politics are crucial aspects of the broader discourse on gender equality and democratic governance. This section of the analytical study explores the dynamics of women's representation and participation in Indian politics, shedding light on the challenges, opportunities, and evolving trends.

- **Numerical Representation:** Despite progress over the years, women's numerical representation in Indian politics still falls short of gender parity. While women constitute nearly half of the country's population, their presence in legislative bodies at the national and state levels remains disproportionately low. This underrepresentation is particularly evident in the Lok Sabha (House of the People) and Rajya Sabha (Council of States), where women's participation hovers around 14-15% and 10-11%, respectively.
- **Reservation Policies:** One significant step towards enhancing women's representation has been the introduction of reservation policies. As mentioned earlier, the 73rd and 74th Constitutional Amendments mandated one-third of seats in Panchayati Raj Institutions (PRIs) and urban local bodies to be reserved for women. These policies have resulted in a considerable increase in women's participation at the grassroots level, with many women serving as Sarpanches (village leaders) and in other leadership roles at the local level.

- **Role of Political Parties:** Political parties play a pivotal role in shaping women's political participation. While some parties have actively promoted women's leadership and representation, others lag behind. Women continue to face significant challenges in securing tickets to contest elections, and party leadership positions are often dominated by men. However, there is a growing recognition of the need for more women in leadership roles within political parties.
- . **Women in State Politics:** Several Indian states have witnessed the rise of women leaders who have assumed the position of Chief Minister. Leaders like Mamata Banerjee (West Bengal), Mayawati (Uttar Pradesh), and Vasundhara Raje (Rajasthan) have demonstrated the potential of women in top executive roles. These instances serve as examples of successful women leaders at the state level.
- **Challenges and Barriers:** Women in Indian politics face numerous challenges, including societal norms, patriarchy, political violence, and unequal access to resources. Women are often viewed as "proxy" candidates for male family members and are subjected to harassment and discrimination within political parties and during campaigns.
- **Women's Movements and Advocacy:** Various women's movements and civil society organizations continue to advocate for gender equality in politics. These groups raise awareness, provide training and support for women candidates, and push for policy changes that promote women's political participation.
- **Media and Public Perception:** The role of media in shaping public perception of women in politics is significant. Positive media coverage can inspire more women to enter politics and counter gender stereotypes. However, negative, or biased reporting can reinforce existing biases and discourage women from participating.
- **Youth and Emerging Trends:** There is a growing trend of young women entering politics, particularly at the local level. This influx of fresh talent brings new perspectives and energy to the political arena, potentially reshaping the landscape of women's participation in the years to come.

3.**Reservation Policy:** Reservation policies have been a critical and transformative component of women's participation in politics in India. These policies were introduced with the intention of addressing the historical underrepresentation of women in political leadership roles. In this section of the analytical study, we delve into the reservation policies for women in Indian politics, their impact, and the ongoing debates surrounding them.

- **Reservation in Panchayati Raj Institutions (PRIs):** The 73rd and 74th Constitutional Amendments in 1992 mandated that one-third of seats in local rural Panchayati Raj bodies (such as Gram Panchayats, Panchayat Samitis, and Zila Parishads) and one-third of seats in urban local bodies (such as Municipalities and Municipal Corporations) should be reserved

for women. These amendments aimed to increase women's participation at the grassroots level and empower them in local governance.

- **Positive Impact at the Local Level:** The reservation policy for women in PRIs has had several positive outcomes. It has led to a substantial increase in the number of women elected as Sarpanches (village heads) and members of local governing bodies. This increased representation has resulted in greater attention to issues related to women, children, and marginalized communities in local governance.
- **Women's Empowerment:** Reservation policies at the local level have empowered women who were previously excluded from political decision-making. It has given them a platform to voice their concerns, participate in developmental initiatives, and challenge traditional power structures.
- **Challenges and Limitations:** While the reservation policy has been successful at the local level, it has not been extended to the state or national levels. Women's representation in state legislatures (Vidhan Sabha's) and the national parliament (Lok Sabha and Rajya Sabha) remains disproportionately low. Critics argue that this limited scope of reservation policies restricts women's political influence to local issues, preventing their participation in shaping broader policies and legislation.
- **Debates on Efficacy:** There is an ongoing debate about the effectiveness of reservation policies in truly empowering women in politics. Some argue that it might lead to tokenism, where women elected through reservations might not have real decision-making power or be taken seriously by their male counterparts. Others contend that these policies are necessary to break the cycle of male-dominated political leadership.
- . **Intersectionality and Marginalized Communities:** Reservation policies have primarily benefited women from dominant caste groups. Women from marginalized and disadvantaged communities still face significant barriers in entering politics. Addressing intersectionality, which considers factors like caste, class, and religion, is a crucial aspect of promoting inclusivity in politics.
- **Need for Comprehensive Reforms:** Many experts and activists advocate for a more comprehensive approach to address women's underrepresentation in politics. This includes not only increasing the number of women in leadership positions but also creating a conducive environment for their active and meaningful participation.
- **Increasing Reservation Quotas:** Some states in India have experimented with increasing reservation quotas for women in local bodies beyond the mandated one-third. This has led to even greater women's participation at the grassroots level.

4.**Impact of Women in Politics:** The impact of women in politics in India is multifaceted and extends across various dimensions of governance, policymaking, and societal transformation. This section of the analytical study examines the influence and consequences of women's participation in Indian politics.

- **Policy Formulation and Prioritization:**
- **Gender-Specific Policies:** Women in politics often advocate for policies that address gender-specific issues, such as healthcare, education, and violence against women. Their presence in decision-making bodies can lead to the prioritization of these concerns.
- **Empowerment Initiatives:** Women leaders frequently champion programs and initiatives aimed at the economic, social, and political empowerment of women, including schemes for financial inclusion, skill development, and political participation.
- **Legislative Impact:**
- **Enacting Pro-Women Legislation:** Women legislators have played pivotal roles in the formulation and passage of legislation aimed at protecting women's rights and promoting gender equality. This includes laws addressing issues like dowry, domestic violence, and sexual harassment.
- **Advancing Social Justice:** Women in politics often advocate for marginalized and vulnerable groups, including women from marginalized communities, tribal populations, and the economically disadvantaged.
- **Influencing Public Discourse:**
- **Changing Perceptions:** The presence of women in politics challenges traditional gender stereotypes and perceptions about women's roles in society. Women leaders can inspire other women and girls to pursue leadership positions.
- **Highlighting Gender Disparities:** Women in politics use their platforms to draw attention to gender disparities, raising awareness about issues like the gender pay gap, lack of representation, and discrimination.
- **Local Governance and Grassroots Impact:**
- **Improved Service Delivery:** Women leaders in local governance often focus on improving basic services like healthcare, sanitation, and education, which can have a direct impact on the quality of life in their communities.
- **Promotion of Civic Engagement:** Women leaders encourage civic engagement and participation, motivating more women to get involved in community decision-making processes.
- **Role Modeling and Aspirations:**
- **Inspiring Future Leaders:** Women in politics serve as role models for future generations of women leaders, demonstrating that women can excel in traditionally male-dominated fields.
- **Encouraging Political Aspirations:** The visibility of women in political leadership positions encourages more women to enter politics and aspire to higher offices.
- **Championing Social and Economic Development:**
- **Economic Empowerment:** Women leaders often advocate for economic opportunities for women, including entrepreneurship, access to credit, and income-generating programs.
- **Social Welfare:** Women in politics work towards improving the welfare of women, children, and families, including measures to reduce maternal and infant mortality rates.
- **Addressing Violence and Discrimination:**
- **Anti-Discrimination Efforts:** Women in politics actively work to combat discrimination and violence against women, pushing for stricter laws and better enforcement.
- **Raising Awareness:** They use their positions to raise awareness about issues like gender-based violence and harassment, contributing to societal change.
- **Global Impact:**

- **International Diplomacy:** Women leaders in India have represented the country on the international stage, contributing to discussions on global issues such as climate change, peacekeeping, and gender equality.

5. **Challenges and Barrier**: The participation of women in politics in India has been significantly influenced by a range of challenges and barriers, both historical and contemporary. This section of the analytical study explores these challenges and barriers, which have limited women's entry into and progress within the political arena.

- **Patriarchal Norms and Stereotypes:**
- **Traditional Gender Roles:** Deep-rooted patriarchal norms assign women primarily domestic roles, making it difficult for them to break into the male-dominated sphere of politics.
- **Stereotypes:** Stereotypes about women's capabilities, leadership, and decision-making abilities persist, undermining their credibility as political leaders.
- **Violence and Harassment:**
- **Physical Threats:** Women politicians often face physical threats and violence, including assault and vandalism, which can deter them from active political participation.
- **Verbal Abuse:** Verbal harassment, character assassination, and derogatory comments are commonly used as tools to silence women in politics.
- **Lack of Access to Resources:**
- **Financial Barriers:** Women often lack access to the financial resources necessary for mounting political campaigns, such as fundraising networks and campaign financing.
- **Educational Disparities:** Gender disparities in education limit women's access to information and knowledge, affecting their ability to engage in informed political discourse.
- **Family and Social Pressure:**
- **Balancing Family and Politics:** Women often find it challenging to balance family responsibilities with political careers, leading to family pressure to prioritize domestic roles.
- **Social Stigma:** The decision to enter politics can be met with social stigma, as women who challenge traditional gender roles may face backlash from their communities.
- **Lack of Representation in Political Parties:**
- **Underrepresentation in Party Leadership:** Women are often underrepresented in leadership positions within political parties, making it difficult to secure party tickets and nominations.
- **Limited Decision-Making Power:** Women within political parties may have limited influence in shaping party policies and strategies.
- **Electoral Challenges:**

- **Electoral Violence:** Elections in India can be marred by violence and intimidation, disproportionately affecting women candidates.
- **Winner-Takes-All System:** The "winner-takes-all" electoral system can discourage women from entering politics because they may perceive it as a high-stakes, winner-centric environment.
- **Reservation Policies and Tokenism:**
- **Token Representation:** Some critics argue that reservation policies can lead to tokenism, where women elected through reservations may not have real decision-making power or be taken seriously by their male counterparts.
- **Limited Scope:** Reservation policies have primarily been implemented at the local level, leaving state and national-level politics with limited gender diversity.
- **Media Bias and Misrepresentation:**
- **Biased Reporting:** The media sometimes portrays women politicians in a biased or negative manner, focusing on their appearance and personal lives rather than their policies and capabilities.
- **Lack of Coverage:** Women politicians may receive less media coverage compared to their male counterparts, making it difficult to build public profiles.
- **Intersectionality and Caste-Based Discrimination:**
- **Caste and Class Barriers:** Women from marginalized communities often face compounded discrimination due to both their gender and caste or class background, limiting their political opportunities.
- **Institutional Barriers:**
- **Lack of Internal Democracy:** Some political parties lack internal democracy, making it difficult for women to rise through party ranks and assert their influence.
- **Ineffective Complaint Mechanisms:** Many institutions lack effective mechanisms to address harassment and discrimination against women in politics.

6**. Empowering Women in Politics:** Empowering women in politics in India is a crucial endeavor that involves a multifaceted approach aimed at addressing the challenges and barriers women face in the political arena. This section of the analytical study explores strategies and initiatives to empower women in Indian politics.

- **Educational Empowerment:**
- **Promote Girls' Education:** Encourage and incentivize the education of girls and women to enhance their knowledge, skills, and confidence, making them more capable and informed political participants.
- **Financial Support and Resources:**
- **Access to Funding:** Facilitate access to campaign financing and financial resources for women candidates, especially those from marginalized backgrounds.

- **Training and Capacity Building:** Provide training programs and workshops to enhance the political and leadership skills of women interested in politics.
- **Legal Reforms and Policy Advocacy:**
- **Gender-Sensitive Legislation:** Advocate for and enact gender-sensitive legislation that promotes women's rights and addresses gender disparities in all spheres, including politics.
- **Reform Election Laws:** Advocate for reforms in election laws to create a more level playing field for women candidates, such as ensuring fair representation in party candidate lists.
- **Reservation Policies:**
- **Expand Reservation Quotas:** Consider expanding reservation quotas beyond local Panchayati Raj bodies to state and national legislatures, allowing for increased representation of women in higher-level politics.
- **Effective Implementation:** Ensure the effective implementation of existing reservation policies and mechanisms for their enforcement.
- **Political Parties and Internal Democracy:**
- **Intra-Party Democracy:** Encourage political parties to adopt and practice internal democracy, ensuring that women have equal opportunities to rise through party ranks and hold leadership positions.
- **Women's Wings:** Strengthen women's wings within political parties to provide support, mentorship, and networking opportunities for women party members.
- **Media and Public Awareness:**
- **Media Sensitization:** Sensitize the media to report on women politicians fairly and substantively, focusing on their policies and accomplishments rather than their appearance or personal lives.
- **Public Awareness Campaigns:** Launch public awareness campaigns to educate the public about the importance of women's participation in politics and the benefits of gender equality in governance.
- **Leadership Development:**
- **Leadership Programs:** Establish leadership development programs that specifically target women, equipping them with the skills and confidence needed to assume leadership roles in politics.
- **Mentorship:** Pair women politicians with experienced mentors who can provide guidance and support throughout their political careers.
- **Gender-Responsive Governance:**
- **Gender Mainstreaming:** Implement gender mainstreaming in policymaking and governance, ensuring that policies and programs address the specific needs and challenges faced by women.

- **Gender Budgeting:** Incorporate gender budgeting practices to allocate resources effectively for gender-sensitive initiatives and projects.
- **Community Engagement:**
- **Community Mobilization:** Engage communities in supporting and promoting women in politics, emphasizing the benefits of diverse political representation.
- **Women's Participation in Local Governance:** Encourage women's participation in local governance and community decision-making processes, providing opportunities for them to gain experience and build political networks.
- **Research and Data Collection:**
- **Collect Data:** Gather and analyze data on women's political participation, representation, and barriers to better inform policy and program design.
- **Research and Studies:** Conduct research and studies on the impact of women in politics, showcasing their contributions to governance and societal development.
- **International Collaboration:**
- **Exchange of Best Practices:** Collaborate with international organizations and countries to exchange best practices and lessons learned in promoting women's political empowerment.
- **Inclusivity and Intersectionality:**
- **Intersectional Approaches:** Recognize and address the intersectionality of gender with other factors like caste, class, and religion to ensure inclusivity in political empowerment efforts.

7. **Success Stories:**

- **Indira Gandhi:** Indira Gandhi was the first woman to serve as the Prime Minister of India. She held this office for four terms, making her one of the most influential political figures in India's history. Her leadership during crucial moments, such as the Bangladesh Liberation War, has left a lasting impact on Indian politics.
- **Pratibha Patil:** Pratibha Patil served as India's first female President from 2007 to 2012. Her election to the highest constitutional office in the country was a significant milestone for women in Indian politics.
- **Mamata Banerjee:** Mamata Banerjee is the Chief Minister of West Bengal and the founder of the All-India Trinamool Congress (AITC). Her leadership has had a significant impact on state politics, and she is known for her grassroots activism.
- **Sushma Swaraj:** Sushma Swaraj was a prominent leader of the Bhartiya Janata Party (BJP) and served as India's Minister of External Affairs. She was known for her diplomatic skills and her ability to connect with people both within and outside India.
- **Mayawati:** Mayawati, a leader from the Bahujan Samaj Party (BSP), has served multiple terms as the Chief Minister of Uttar Pradesh. Her advocacy for the rights of marginalized communities, particularly Dalits, has reshaped caste politics in the state.

- **Jayalalithaa:** J. Jayalalithaa, also known as "Amma," was a charismatic leader and actress who served multiple terms as the Chief Minister of Tamil Nadu. Her leadership was marked by a strong focus on welfare programs and infrastructure development.
- **Nirmala Sitharaman:** Nirmala Sitharaman is the Finance Minister of India and a prominent member of the BJP. She has played a crucial role in shaping India's economic policies and is known for her leadership in finance and commerce.
- **Smriti Irani:** Smriti Irani, a former television actress, is a senior BJP leader who has held significant ministerial portfolios, including Minister of Textiles and Minister of Women and Child Development. She is known for her active role in politics and governance.
- **Maneka Gandhi:** Maneka Gandhi, a member of the Nehru-Gandhi family, has held various ministerial positions in different governments. She is known for her work in animal welfare and environmental protection.
- **Poonam Mahajan:** Poonam Mahajan is a prominent young leader of the BJP and a Member of Parliament. She has actively worked to engage youth and women in politics and has represented her constituency effectively.
- **Nandini Satpathy:** Nandini Satpathy was the first woman Chief Minister of Odisha. Her tenure was marked by a focus on social welfare and development programs.

Conclusion:

In conclusion, the study on women in politics in India reveals a complex and evolving landscape where women have made significant strides, yet numerous challenges and barriers persist. This analytical study has explored various aspects of women's participation in Indian politics, providing insights into their historical background, representation, challenges, empowerment strategies, and success stories.

- India's political landscape has seen notable achievements in women's participation, with women breaking barriers and attaining leadership positions at the local, state, and national levels. Women leaders have played crucial roles in shaping policies, advocating for gender equality, and addressing the unique needs of women and marginalized communities.

- However, challenges such as patriarchal norms, violence, limited access to resources, and underrepresentation in political parties continue to impede women's progress in politics. The study underscores the importance of addressing these challenges through comprehensive reforms, gender-sensitive policies, and grassroots empowerment initiatives.

- Efforts to empower women in politics in India should encompass educational opportunities, financial support, legal reforms, and awareness campaigns that promote gender equality and inclusivity. Expanding reservation policies and promoting women's

leadership within political parties are also vital steps toward achieving greater representation.

- Success stories of women leaders in Indian politics serve as powerful examples of determination, resilience, and the potential for change. These stories inspire future generations of women to pursue leadership roles and actively contribute to the nation's governance.

- In conclusion, the study recognizes that while significant progress has been made, there is still work to be done to ensure equal and meaningful participation of women in Indian politics. Achieving gender equality in politics is not only a matter of justice and democracy but also a means to enhance the effectiveness of governance and address the unique needs and perspectives of all citizens, regardless of gender. By addressing the challenges and building on the successes, India can move closer to a more inclusive and representative political landscape that reflects the diversity and aspirations of its people.

S.V. University, Tirupati.

Abstract:

This research examines the effectiveness of Information, Education, and Communication (IEC) initiatives among Self-Help Group (SHG) women in rural areas of Tirupati District, Andhra Pradesh. The study aims to assess awareness levels regarding IEC and health issues among SHG women. Adopting purposive stratified random sampling, 500 SHG beneficiaries were selected, with 250 each from Chandragiri Mandal and Ramachandrapuram (RC Puram) Mandal. Data was collected through structured interviews.

The findings reveal that the adoption of new technologies has significantly enhanced income generation among SHG women and increased awareness of health issues such as HIV/AIDS and contraception methods. Furthermore, the study highlights the importance of legal frameworks addressing issues like sexual harassment and domestic violence. The success of IEC initiatives is evidenced by the extensive knowledge and awareness demonstrated by SHG women on various health topics.

Keywords: Information, Education, Communication, Self-Help Group Women, Rural Areas, Tirupati District, Andhra Pradesh, Health Awareness, HIV/AIDS, Contraception, Legal Frameworks, Income Generation

Introduction:

Education and Communication is now rightfully recognized as an integral part of policy making procedure. Over the years, the thrust of the Department has been to place the IEC as an intervention tool to generate demand for the range of services under National Rural Health Mission and various other schemes implemented by this Department. The communication strategy aims to facilitate awareness, disseminate information regarding

availability and access to quality health care within the Government run public health system. The key objective of the IEC strategy is to encourage a health seeking behaviour that is achievable in the context in which people live. The strategy views recipients of health services as not merely users of services but key participants in generating demand for services. During the year under report, the communication strategy has focused on sustaining behaviour changes on key health issues through multimedia tools. The strategy framework thus incorporates a variety of activities involving communities and the various media channels. A judicious mix of the following media channels were used for information, education, and communication during the year. Interpersonal communication, Community mobilization, Mass media, Folk and traditional media, Outdoor media, advocacy, events and exhibitions as also Print media.

In contemporary society, Information, Education, and Communication (IEC) have emerged as indispensable tools in both policy-making and public health interventions. Particularly in rural areas, where access to resources and awareness of health-related issues may be limited, effective IEC initiatives can play a pivotal role in empowering communities and promoting positive behavioral changes. This study directs its focus on assessing the implementation and impact of IEC initiatives among Self-Help Group (SHG) women in Tirupati District, Andhra Pradesh.

Tirupati District, located in the southern state of Andhra Pradesh, represents a typical rural setting where socio-economic challenges intersect with issues related to healthcare access and awareness. Against this backdrop, understanding the efficacy of IEC initiatives becomes imperative, as they serve as crucial channels for disseminating information and facilitating behavior change among marginalized communities.

The primary objective of this study is to evaluate the effectiveness of IEC initiatives in promoting health awareness and education among SHG women in Tirupati District. These women represent a vulnerable yet influential demographic group, as SHGs not only provide them with economic opportunities but also serve as platforms for social and community engagement.

By assessing the impact of IEC initiatives, this study seeks to shed light on the extent to which these interventions have contributed to enhancing awareness levels regarding health issues among SHG women. Additionally, it aims to explore the role of IEC in addressing broader socio-cultural factors such as gender-based violence and legal frameworks related to women's rights.

Given the diverse socio-economic landscape of rural areas, understanding the nuances of IEC implementation and its impact on SHG women can inform policymakers, healthcare practitioners, and development agencies about the most effective strategies for promoting health awareness and education in similar contexts.

In this study delves into the realm of IEC initiatives among SHG women in Tirupati District, aiming to assess their effectiveness in fostering health awareness and education. By examining the implementation processes and outcomes of these initiatives, it seeks to provide valuable insights into enhancing the well-being and empowerment of rural women in Andhra Pradesh and beyond.

Research Objectives:

To assess the awareness levels of Self-Help Group (SHG) women regarding Information, Education, and Communication (IEC) initiatives in Tirupati District, Andhra Pradesh.

To evaluate the effectiveness of IEC initiatives in promoting health awareness among SHG women, with a specific focus on topics such as HIV/AIDS, contraception methods, and reproductive health.

To analyze the impact of IEC initiatives on the knowledge, attitudes, and behaviors of SHG women towards health-related issues in rural areas.

To examine the role of IEC initiatives in addressing broader socio-cultural factors affecting SHG women, including gender-based violence, legal frameworks, and women's rights.

To identify the key sources of information utilized by SHG women for accessing health-related knowledge and resources, including traditional media, community networks, and technological platforms.

To explore the implications of IEC initiatives on income generation, economic empowerment, and social inclusion among SHG women in Tirupati District.

To provide recommendations for improving the design, implementation, and sustainability of IEC initiatives aimed at promoting health awareness and education among SHG women in rural areas.

Methodology:

Sampling Technique: Purposive Stratified Random Sampling was employed to ensure representation from both Chandragiri and RC Puram Mandal's. This method involved dividing the population of SHG beneficiaries into distinct groups (strata) based on geographical location (mandalas). From each stratum, a random sample of SHG beneficiaries was selected to ensure diversity and representativeness in the study sample.

Sample Size: The study aimed to include 500 SHG beneficiaries, with 250 participants from Chandragiri Mandal and 250 from RC Puram Mandal. This sample size was determined to provide adequate statistical power for analyzing the effectiveness of IEC initiatives among SHG women in rural areas.

Data Collection: Data collection was conducted through structured interviews using a pre-designed questionnaire. The questionnaire was developed based on the research objectives and included both closed-ended and open-ended questions to capture quantitative and qualitative data. Trained interviewers administered the questionnaire to the selected SHG beneficiaries, ensuring consistency and reliability in data collection.

Variables: The key variables examined in the study included awareness levels regarding IEC initiatives, knowledge and attitudes towards health issues, sources of information utilized, socio-economic factors, and perceived impact of IEC initiatives on health awareness and empowerment.

Data Analysis: Quantitative data collected through the structured interviews were analyzed using appropriate statistical methods, including descriptive statistics, frequency distributions, and inferential statistics (e.g., chi-square tests) to examine associations and relationships between variables. Qualitative data from open-ended questions were analyzed thematically to identify emerging patterns and themes.

Ethical Considerations: Ethical considerations were paramount throughout the research process. Informed consent was obtained from all participants prior to their inclusion in the study, ensuring voluntary participation and

confidentiality of responses. The study adhered to ethical guidelines and protocols established by relevant institutional review boards and regulatory bodies.

Hypotheses:

SHG women exposed to IEC initiatives will demonstrate higher levels of awareness regarding health issues compared to those not exposed.

There will be a significant association between exposure to IEC initiatives and adoption of positive health behaviors among SHG women.

SHG women who utilize multiple sources of information, including traditional and technological platforms, will exhibit higher levels of health awareness and empowerment.

Socio-economic factors, such as income level and education, will moderate the relationship between exposure to IEC initiatives and health outcomes among SHG women.

The perceived impact of IEC initiatives on health awareness and empowerment will vary based on the effectiveness of implementation strategies and the relevance of content to the target population.

RESULTS AND DISCUSSION

Table No.1: Percentage Distributions of SHG women by current use of Contraceptive Methods

	Chandragiri		**RC Puram**	
Type of method	No	%	No	%
Female sterilization	88	35.2	118	47.2
Male sterilization	3	1.2	1	0.4
Pills	82	32.8	75	30
IUD	3	1.2	6	2.4
Injectables	1	0.4	04	0
Condom/Nirodh	174	69.6	49	19.6

The data reveals extensive knowledge of various contraceptive methods among SHG women in Chandragiri and RC Puram. Female sterilization was the most prevalent method, with 35.2% of Chandragiri and 47.2% of RC Puram SHG women having undergone the procedure. Condom usage was also notable, with 69.6% of Chandragiri and 19.6% of RC Puram SHG women using condoms as a contraceptive method. However, the usage of other methods such as male sterilization, pills, IUD, and injectables was relatively low. This indicates a need for further education and access to a wider range of contraceptive options.

Health Awareness & Education:

Health awareness and education are vital components of community development, particularly in rural areas. The data presented in Table No. 2 highlights the level of awareness among SHG women regarding various health issues and services.

Table No.2: Percentage Distribution of SHG Beneficiaries by Health Awareness & Education

Response	Chandragiri		RC Puram	
	No	%	No	%
HIV awareness	249	99.6	241	95.6
Primary Health center	244	97.6	224	89.6
Leprosy &TB centers	158	63.2	147	58.8
Community health development	112	44.8	113	45.2
Mobile heath unit/visit	84	33.6	77	30.8

The data indicates a high level of awareness among SHG women in both Chandragiri and RC Puram regarding HIV/AIDS, primary health centers, and mobile health units. Over 95% of SHG women in both areas were aware of HIV/AIDS, while more than 89% were aware of primary health centers. However, awareness of other health services such as leprosy & TB centers and community health development was relatively lower, highlighting areas for improvement in health education and outreach programs.

Sources of Information on HIV/AIDS:

Information dissemination plays a crucial role in increasing awareness of HIV/AIDS prevention and treatment.

Table. No.3. Percentage Distribution of SHG women by sources of information on HIV/AIDs

Sources of information on HIV	Chandragiri		RC Puram	
	No	%	No	%t
Radio/Television	50	20	53	20.4
Newspaper/Magazine	34	13.6	72	28.8
friend/relatives	31	12.4	14	5.6
Extension Programmes	83	33.2	61	24.4
SHG	52	20.8	50	20

The data shows that a significant portion of SHG women in both Chandragiri and RC Puram obtained information on HIV/AIDS through extension programs and SHG meetings. Additionally, radio/television and newspapers/magazines served as important sources of information, albeit to a lesser extent. However, there is a need to further explore and utilize newer communication technologies to enhance the reach and effectiveness of HIV/AIDS education programs.

Awareness on HIV Prevention Methods:

Preventive measures are crucial in combating the spread of HIV/AIDS. Table No. 4 presents data on SHG women's awareness of HIV prevention methods.

Table No.4: Percentage Distributions of the respondents by aware HIV prevention methods

Response	Chandragiri		RC Puram	
	No	%	No	%
Using condoms	24	9.6	1	0.4
Limiting sexual intercourse to one uninfected partner	7	2.8	8	3.2
Using condoms and limiting sexual inter course to one uninfected partner	65	26	82	32.8
Abstaining from sexual inter course outside marriage	154	61.6	159	63.6

The data indicates that a majority of SHG women in both Chandragiri and RC Puram recognized the importance of abstaining from sexual intercourse outside of marriage as a key method of HIV prevention. Additionally, a significant portion acknowledged the efficacy of using condoms and limiting sexual intercourse to one uninfected partner. However, there is a need for further education on the consistent and correct use of condoms as a preventive measure.

Overall, the results suggest that while SHG women in rural areas demonstrate substantial knowledge and awareness of health issues, including HIV/AIDS prevention, there are still areas for improvement in terms of access to and utilization of contraceptive methods and broader health services. Effective communication strategies, including the use of newer technologies, tailored educational programs, and community engagement, are essential in addressing these gaps and promoting better health outcomes among rural populations.

Discussion:

The findings of this study underscore the significant impact of Information, Education, and Communication (IEC) initiatives on the empowerment and well-being of Self-Help Group (SHG) women in Tirupati District, Andhra Pradesh. Through targeted interventions aimed at providing information and raising awareness, these initiatives have played a crucial role in improving both health outcomes and socio-economic status among rural women.

Empowerment through Access to Information: One of the key contributions of IEC initiatives is their role in providing SHG women with access to essential information. By disseminating knowledge about health issues, including contraceptive methods, HIV/AIDS prevention, and access to healthcare services, these initiatives have empowered women to make informed decisions about their health and well-being. The high levels of awareness observed in the study, particularly regarding HIV/AIDS and contraceptive methods, highlight the effectiveness of these initiatives in bridging information gaps and empowering women with the knowledge they need to protect their health.

Enhanced Socio-Economic Well-being: Beyond improving health outcomes, IEC initiatives have also contributed to the socio-economic well-being of SHG women. The adoption of new technologies, as evidenced by the increased income generation among SHG women, indicates the economic empowerment facilitated by these initiatives. By equipping women with information and skills necessary for income-generating activities, IEC initiatives have played a pivotal role in enhancing economic opportunities and reducing financial dependency among rural women.

Addressing Legal and Social Issues: Moreover, the study highlights the importance of addressing legal and social issues, such as sexual harassment and domestic violence, within the framework of IEC initiatives. By raising awareness of these issues and providing support mechanisms, these initiatives contribute to the creation of safer and more supportive environments for women. This not only empowers women to assert their rights but also fosters community-level change by challenging harmful social norms and practices.

Challenges and Opportunities: While the findings demonstrate the positive impact of IEC initiatives, several challenges and opportunities remain. For instance, while there is extensive knowledge and awareness among SHG women, particularly regarding HIV/AIDS and contraceptive methods, there is still room for improvement in terms of access to a wider range of contraceptive options and consistent use of preventive measures. Additionally, the study highlights the need for continued efforts to expand access to healthcare services, particularly in remote rural areas where access may be limited.

Conclusion: In conclusion, the findings of this study underscore the transformative potential of IEC initiatives in empowering SHG women in rural areas. By providing access to information, promoting awareness, and addressing socio-economic and legal barriers, these initiatives contribute to improved health outcomes, enhanced socio-economic well-being, and greater empowerment among women. Moving forward, sustained investment in IEC initiatives, coupled with targeted interventions to address existing gaps and challenges, will be essential in advancing the rights and well-being of rural women in Tirupati District and beyond.

CHILD LABOR, EDUCATION AND CHILDREN'S RIGHTS

Dr.G.Adinarayana
Faculty, Department of Law,Sri Venkateswara University,Tirupati, Andhra Pradesh, India.

Abstract
This paper reviews the international legal framework relating to child labour as well as access to education and provides a statistical portrait of child labour and education participation. Moreover, it looks at why children work from the perspective of household decision making. Various policy options are also considered, including those which can improve the incentives to education relative to labour, remove constraints to schooling and increase education participation through legislation. Conclusions are drawn in the final section.

Introduction

"Nonetheless, if the fundamental rights behind our cause are not sufficient to move people to act, then let it be the economic and social rationale behind it. Either way, we are going to challenge people to act."

Nelson Mandela

Child Labour (Prohibition and Regulation) Act of India, 1986 defined that the child is a person who has not completed the age of fourteen years. A child of such tender age is expected to play, study and be carefree about his life. But, as a fact of nature, expectations seldom meet reality. Children, by willy-nilly or by force, are employed to work in the harsh conditions and uncongenial atmosphere which become a threat to their precious life. Child labour leads to underdevelopment, incomplete mental and physical development, which in turn, result in stunted growth of children.

Child labour is retribution to the child and is widespread around the world. It is a curse for development of both the individual child and society and economy in which she/he lives. If allowed to persist to the current extent, child labour will prevent the achievement of the Millennium Development Goals of halving poverty and achieving education for all. All of the countries in the world have ratified international human rights conventions which call for the elimination of child labour and the provision of universal primary education. Fulfilling these commitments is of immensely importance for development.

Child labour is a violation of fundamental human rights and has been a stumbling block to children's development, potentially leading to life-long physical or psychological damage. The fundamental ILO standards on child labour are the two legal pillars of global action to combat child labour.

Over 200 million children between the ages of 5 and 14 years are working around the world. This figure represents one-fifth of the total population of girls and boys in this age group. About 111 million children are in "hazardous work" which refers to forms of labour which are likely to have adverse effects on the child's safety, health and moral development. Nearly 10 million of these children are engaged in some form of slave labour, armed conflict, prostitution or pornography, or other illicit activities. Some observers believe that these figures understate the real magnitude of child labour. The hazardous and worst forms of child labour are of universal prime concern, given the obvious harm that they inflict on the lives of these children and their possibilities for a hopeful future. Child labour also has important various economic implications. Among them the most notable are the

substantial future income losses that working children will incur because of the negative consequences working will have on their human capital, including their health and education. Since children are more likely to work and not go to school if their parents worked as children, the economic losses associated with child labour and their implications for poverty are often transmitted across generations (ILO, 2020).

Child labour, of course, has already received ample attention. Most countries have long had prescriptive legislation as well as compulsory education laws. At the international level, child labour has been the focus of various conventions and recommendations. Among them the UN Convention on the Rights of the Child (1989) and two ILO conventions, the Minimum Age Convention (No. 138, 1973) and the Worst Forms of Child Labour Convention (No. 182, 1999) are most significant. In promoting children's rights, each of these instruments – in very different ways -- has been motivated by an interest in protecting children from exploitation through their labour and providing for education as a preferable alternative.

Human Rights Instruments

The principal international legal instruments for addressing child labour include the UN Convention on the Rights of the Child (1989) that covers both child labour and the right to education and two ILO conventions, the Minimum Age Convention (No. 138, 1973) and the Worst Forms of Child Labour Convention (No. 182, 1999). The UN Universal Declaration on Human Rights (1948) and the International Covenant on Economic, Social and Cultural Rights also address the right to education but the above-listed instruments provide more detail and are commonly seen as the key international instruments for addressing children's rights (Table 1). The Convention on the Rights of the Child (CRC) and the ILO child labour conventions have received widespread international support, the former being ratified by 192 countries – all U.N. members, in fact, save the United States and Somalia. ILO Convention 182, prioritizing action against the worst forms of child labour, was the first convention adopted unanimously and has been the most rapidly ratified convention.

Table 1, International Human Rights Instruments Related to Education and Child Labour

Sl. No.	Title	Date	Ratified	Provisions (Articles)
1.	Universal Declaration on Human Rights	1948	N/A	Right to Education (26)
2.	International Covenant on Economic, Social and Cultural Rights (CESCR)	1966	148	Compulsory and free primary education (13)
3.	ILO Convention 138: Minimum Age	1973	131	Compulsory and free primary education (13)
4.	Convention on the Rights of the Child (CRC)	1989	192	Freedom of association (15); primary education; (28) rest and leisure (31); no hazardous child labour (32); protection from sexual exploitation (34) and trafficking (35)
5.	ILO Convention 182: Worst Forms of Child Labour	1999	147	Ban slavery, use in armed conflict, prostitution, drug trade; Work harmful to health safety, morals.

Global and Regional Overview

Child labour remains unacceptably common in the world today. At the start of 2020, prior to the outbreak of the COVID-19 pandemic, 160 million children – 63 million girls and 97 million boys – were in child labour, or 1 in 10 children worldwide. Seventy-nine million children – nearly half of all those in child labour – were in hazardous work directly endangering their health, safety and moral development.

This global estimate masks large variations across regions. Child labour prevalence stands at 24 per cent in sub-Saharan Africa, three times that of Northern Africa and Western Asia, the region with the second highest prevalence. In absolute terms, the nearly 87 million children in child labour in sub-Saharan Africa are more than in the rest of the world combined.

Recent history provides cause for copious concern. In the last four years, for the first time since 2000, the world did not make any progress in reducing child labour. The absolute number of children in child labour was increased by over 8 million to 160 million while the proportion of children in child labour remained still unchanged. Children in hazardous work mirrored these patterns: The share remained almost unchanged but the number rose by 6.5 million to 79 million.

The pace of progress has varied dramatically across regions. The proportion and number of children in child labour have declined consistently since 2008 in Asia and the Pacific and Latin America and the Caribbean. Similar progress has proved elusive in sub-Saharan Africa, where child labour has actually gone up since 2012, a trend especially pronounced over the last four years when the region accounted for much of the global increase.

At present, the world is not on track to eliminate child labour by 2025. For meeting this target, global progress would need to be almost 18 times faster than the rate observed over the past two decades. According to pre-COVID-19 projections based on the pace of change from 2008 to 2016, close to 140 million children will be in child labour by 2025 without an accelerated action. The COVID-19 crisis is making these scenarios even more worrisome, with many more children at risk of being pushed into child labour. Global progress against child labour has stalled since 2016.

Child Labour across Ages

The results of the global estimates make clear that child labour remains an important concern across the spectrum of children aged 5 to 17. Of the 160 million children in child labour, 89.3 million are young children aged 5 to 11, 35.6 million are children aged 12 to 14, and 35 million are children aged 15 to 17. Child labour among children aged 12 to 14 and 15 to 17 continued to fall in both absolute and percentage terms over the last four years. By contrast, the 2016-2020 period saw a worrying rise in child labour among young children aged 5 to 11. In 2016, there were signs of slowing progress among young children. Today the trend line is moving in the wrong direction. The reason for backtracking is not clear and direly needs to be investigated as a priority. Hazardous work accounted for about two fifths of the total number of additional children aged 5 to 11 in child labour during the four-year period. While children of all ages must be protected from hazardous work, its persistence and now growth among younger children is a particular concern.

Boys and girls in child labour

Involvement in child labour is more common for boys than girls at all ages. For children aged 5 to 17, child labour prevalence is nearly one third higher for boys. The gender gap grows with age, and boys are roughly twice as likely as girls to be in child labour in the 15 to 17 age range. Comparisons of child labour estimates for boys and girls must be accompanied by an important caveat. The definition of child labour upon which the estimates are based does not include involvement in household chores in children's own homes, an area of work for which girls shoulder a disproportionate burden of the responsibility in most societies.

The 2020 global estimates look for the first time at how the inclusion of household chores affects overall child labour estimates as well as estimates of male child labour relative to female child labour. The results are noteworthy. When the definition of child labour is expanded to include involvement in household chores for 21 hours or more per week, child labour prevalence increases for both sexes, but the rise in female child labour is much larger. As a result, the gender gap in child labour prevalence is reduced by almost half, from 2.8 percentage points to 1.6 percentage points. Child labour is more prevalent among boys than girls at every age

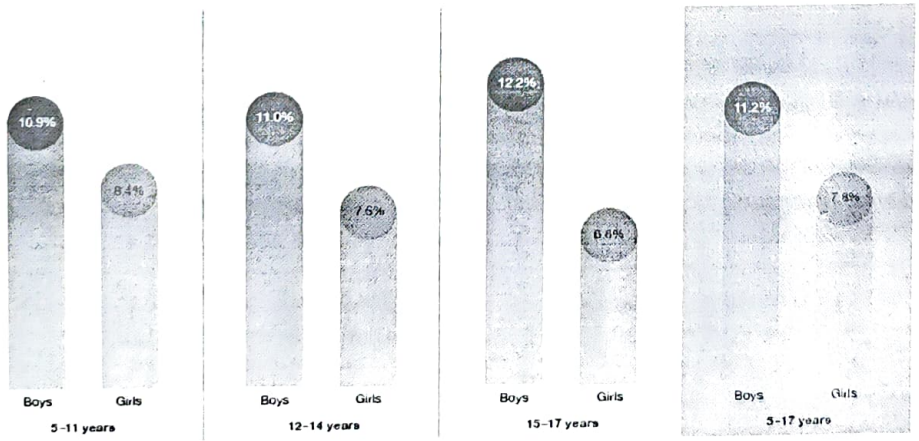

Fig.2. Percentage of children aged 5 to 17 years in child labour, by age and sex

Causes of Child Labour

Major causes of child employment which can be understood keeping in mind the Indian scenario are:

Poverty

In developing countries like India it is quite impossible to control child labour as children have been considered as helping hand to feed their families, to support their families and to feed themselves. Due to poverty, illiteracy and unemployment parents are unable to bear the burden of feeding their children and to run their families. Thus, the poor parents send their children for work in inhuman conditions at lower wages.

Previous Debts

The poor economic conditions of people in India force them to lend money. The illiterate population goes to money lenders and sometimes mortgage their belongings in turn of the debt taken by them. But, due to insufficiency of income, debtors find it quite difficult for paying back the debt and the interest. This vicious circle of poverty drags them towards working day and night for the creditor and then the debtors drag their children too in assisting them so that the debts could be paid off.

Professional Needs

There are some industries such as the 'bangle making' industry, where delicate hands and little fingers are needed to do very minute work with extreme excellence and precision. An adult's hands are usually not so delicate and small, so they require children to work for them and do such a dangerous work with glass. This often resulted in major eye accidents of the children.

Legislation

When in the 20th Century, child labour became so prominent that news of factory hazards and mishappenings taking innocent children's life, flashed all around in the newspapers, then was the time, a need for legislations and statutes were felt to prohibit the malpractice of child labour. Today, there are sufficient statutes condemning and prohibiting child labour such as:

The Factories Act of 1948

The Act prohibits the employment of children below the age of 14 years in any factory. The law also placed rules on whom, when and how long can pre-adults aged 15–18 years be employed in any factory.

The Mines Act of 1952

The Act prohibits the employment of children below 18 years of age in a mine. Mining being one of the most dangerous occupations, which in the past has led to many major accidents taking life of children, is completely banned for them.

The Child Labour (Prohibition and Regulation) Act of 1986

The Act prohibits the employment of children below the age of 14 years in hazardous occupations identified in a list by the law. The list was expanded in 2006, and again in 2008.

The Juvenile Justice (Care and Protection) of Children Act of 2000

This law made it a crime, punishable with a prison term, for anyone to procure or employ a child in any hazardous employment or in bondage. This act provides punishment to those who act in contravention to the previous acts by employing children to work.

The Right of Children to Free and Compulsory Education Act of 2009
The law mandates free and compulsory education to all the children aged 6 to 14 years. This legislation also mandated that 25 per cent of seats in every private school must be allocated for children from disadvantaged groups and physically challenged children.

Conclusion
Child labour is by no means strictly a low income country problem. Three of every five children in child labour live in middle-income countries. For greater national health to translate into reduced child labour, economic growth must be inclusive and its benefits equitably be distributed. The tax revenues it generates must be invested in programmes and services which make a difference for children, above all in education and social protection. The large pockets of child labour persist even in relatively rich countries points to important remaining policy challenges. It is an utmost urgent to put action to end child labour back on track, in line with global commitments and goals.

ENFORCING ENVIRONMENTAL RIGHTS: JUDICIAL RESPONSES TO AIR POLLUTION IN INDIA

Dr.G Adinarayana

ABSTRACT:

Air pollution comes from many sources, depending on location and development. Human actions, like heavy industry, resource overuse, and population growth, are the main culprits. As globalization and industrialization take hold, worsening air quality is a big worry. Protecting the environment from pollution isn't a new idea; it's been crucial for societies forever. Courts, a vital part of our country, play a key role in ensuring environmental justice for those affected by air pollution. They set the rules and hold polluters accountable. This article explores how Indian courts have interpreted laws to control and reduce air pollution, promoting environmental justice in India.

Key words: Air Pollution, resource, globalization, environmental justice, National Green Tribunal.

INTRODUCTION:

When dangerous compounds exist in the Earth's atmosphere and have the potential to negatively impact human health, the environment, and air quality generally, it is referred to as air pollution. These pollutants can come in a variety of forms, such as gases, particles, and chemicals, and they can come from both natural and man-made sources. There are many different effects that air pollution can have, both locally and globally. There have been numerous initiatives in India to address air pollution, such as the adoption of laws, the application of court rulings by the Indian judiciary, the use of cleaner technologies, the promotion of renewable energy sources, the encouragement of sustainable transportation, and the education of the public about the value of clean air. In addition to international agreements and organizations, the judiciary is involved in resolving the problem of transboundary air pollution.

The court, particularly the higher judiciary, has rendered numerous important rulings that have helped to stop the decline in India's air quality. By interpreting and upholding environmental laws, issuing directives, and ensuring that government agencies and businesses take the required steps to lessen the harmful impacts of air pollution, the Indian court plays a critical role in the control of air pollution. The function of the judiciary is especially crucial when environmental rules and regulations are broken.

The enforcement of air pollution control laws, the issuance of guidelines and directives to various governmental agencies and industries, etc., the monitoring and oversight of the implementation of pollution control measures, the provision of compensation and remedies, the dissemination of public awareness and education, and the application of the precautionary principle, which permits preventive action even in the absence of complete scientific certainty about the impacts of air pollution, are just a few of the ways that the Indian judiciary contributes to the mitigation, prevention, or control of air pollution in India. The Supreme Court has rendered several significant rulings in the fight against air pollution, some of which are listed below:

The Bhopal Gas Leak Disaster, a horrific industrial accident, happened in 1984. A poisonous gas called Methyl Isocyanate leaked from a Union Carbide pesticide plant in Bhopal, India. This tragedy caused thousands of deaths and left hundreds of thousands injured, many with permanent disabilities. The case highlights the plight of the numerous victims and criticizes the lengthy court battle for compensation. It emphasizes the severity of the disaster, calling it the worst industrial accident ever, with a leak of nearly 40 tons of toxic gas. For context, the factory belonged to a US company, Union Carbide Corporation.

The Bhopal gas leak caused a huge number of injuries and deaths, raising a complex legal issue how to get fair compensation for so many victims. There was a risk of countless lawsuits, and the severity of harm suffered by each person varied greatly. To avoid this mess of individual cases, the Indian Parliament passed a law in 1985 . This law gave the Indian government the power to sue on behalf of all the victims. This is based on a legal principle called "parens patriae," which allows the government to act as a parent for those who can't represent themselves in court. The Indian government decided to sue in the United States, where the parent company of the factory that caused the disaster was located. They believed the Indian legal system wasn't developed enough to handle such a big case and get the best possible outcome for the victims. However, the company argued that Indian courts were the most appropriate place for the case. Despite the Indian government's objections, the American court agreed with the company and sent the case back to India.

The Bhopal gas leak case started in Indian courts after US courts refused to hear it. Initially, the Madhya Pradesh High Court lowered the compensation amount from 3.5 billion rupees to 2.5 billion rupees. Both the Indian government and Union Carbide appealed to India's Supreme Court. The Supreme Court ordered a final settlement. Union Carbide would pay $470 million to the Indian government to cover all claims from the disaster. This money had to be paid by the end of March 1989. The Supreme Court also used its special authority to end all legal proceedings related to the disaster, including civil lawsuits, criminal cases, and contempt of court charges. These Supreme Court decisions were criticized for being unusually brief and lacking the detailed reasoning typically expected in such a significant case. Some argued the Court based its choices mainly on compassion for the victims.

The Indian Supreme Court took a significant step to protect historical treasures like the Taj Mahal from air and environmental pollution . They ruled that industries in the TTZ must switch to cleaner burning natural gas or relocate outside the zone if they can't use gas. This decision was based on scientific reports and the idea that polluters should be responsible for the damage they cause and that environmental protection should be a priority . The Court actively championed environmental protection through public interest litigation and relied on various parts of the Indian Constitution that guarantee the right to life and a healthy environment. Additionally, they used environmental laws like the Water and Air Pollution Acts to support their judgement. Delhi Vehicular Pollution Case addressed air pollution in Delhi. The Supreme Court ordered several measures to tackle this issue, such as phasing out leaded petrol, replacing old vehicles, building new bus terminals, and improving air quality monitoring. In Vellore Citizen Welfare Forum v. Union of India , the Court emphasized two key environmental principles: the Pre-

cautionary Principle (taking preventive action) and the Polluter Pays Principle (holding polluters accountable). They directed the Indian government to prioritize supplying cleaner-burning natural gas for vehicles nationwide.

Finally, the Oleum Gas Leak case led the Court to recommend a national policy for locating hazardous industries away from populated areas. They also suggested creating a neutral scientific body to advise courts and government, and establishing specialized environmental courts for pollution cases. The Supreme Court took a stand against secondhand smoke, citing the right to life enshrined in the Indian Constitution . They banned smoking in public places and ordered the government to implement this effectively. This is one example of how the Indian courts have championed environmental protection. They've introduced several principles to combat air pollution. The Precautionary Principle was first used in the Vellore Citizens' Welfare Forum case. The Polluter Pays Principle was applied in the Indian Council for Enviro-Legal Action case. And the Public Trust Doctrine was used in the M.C. Mehta v. Kamal Nath case.

PRINCIPLES ADOPTED BY THE COURTS

India's Supreme Court has significantly advanced environmental law by establishing important principles. These principles, developed mainly by the Supreme Court, are like stepping stones that pave the way for cleaner air in India. The Court has incorporated these principles into its decisions, considering international agreements and conferences . This is a major contribution to India's environmental legal system. Some of the principles are;

1. Polluter pays principle
2. Principle of non-discrimination
3. Precautionary principle
4. Principle of intergenerational equity
5. Doctrine of common but differentiated responsibility
6. Public trust doctrine

India's courts have established key principles to fight air pollution. The Precautionary Principle, explained in the Vellore Citizens' Welfare Forum case , states that preventing environmental damage is a government duty, and scientific uncertainty shouldn't delay action. The Polluter Pays Principle, affirmed in the Indian Council for Enviro-Legal Action case, holds polluters responsible for compensating victims and restoring the environment. Finally, the Intergenerational Equity Principle, implies a duty to future generations to leave them a healthy environment. These principles, along with the Public Trust Doctrine, have led to significant court judgements to control air pollution. However, tackling air pollution requires a combined effort. Laws, regulations, technology, public participation, and commitment from everyone are all necessary for clean air.

NGT , established in 2010, is responsible for handling cases related to urban air pollution in India. It aims to fulfill both the constitutional right to a healthy environment (Article 21) and the goals outlined in the NGT Act itself. This Act empowers the NGT to deal with environmental protection, resource conservation, enforce environmental rights, and provide compensation for damages. However, despite significant air pollution problems, there haven't been many cases brought before the NGT regarding this issue.

The National Green Tribunal Act, passed in 2010, reflects India's commitment to international environmental agreements. This is because India participated in major

conferences like Stockholm in the year 1972 and Rio in the year 1992. The NGT is required to consider these international principles, such as sustainable development, the precautionary principle, and the polluter pays principle, when making decisions on environmental protection cases. These international principles are used alongside Indian laws to effectively enforce environmental rights and responsibilities in India. The NGT primarily focuses on protecting environmental legal rights and addressing problems caused by enforcing environmental laws listed in Schedule 1 of the Act.

Vardhaman Kaushik v. Union of India , the first lawsuit under the previously described category 1, was filed in 2014 and concerned harmful air quality in the National Capital Region. The NGT issued numerous directives over the course of four years through judgments and verdicts, including prohibiting polluting companies, controlling traffic, requesting action plans from the government, and demanding certain measures for waste disposal and dust management, among other things. A suo moto case was filed in 2018 in response to the nation's declining urban air quality, based on a Times of India newspaper piece that examined the National Clean Air Programme's timeframes. The NCAP case required 102 'non-attainment cities', or those that had average annual concentration levels of notified criteria, surpassing certain thresholds for five years in a row, to take corrective action regarding air pollution. This lawsuit sought to address the problem of urban air pollution nationwide and mandated that each state and local government prepare action plans under the NCAP, address vehicle pollution, and conduct thorough carrying capacity evaluations for each city.

In both instances, the Tribunal criticized the federal and state administrations and demanded more vigorous action to reduce air pollution by using Right to Life and the three guiding principles of environmental jurisprudence. As a result, the two cases have emerged as the centerpiece of the Tribunal's urban air pollution intervention. Since then, any cases pertaining to urban air quality that are brought before the Tribunal are handled by subsequent benches utilizing the rulings in the two instances as well as the several directions rendered by the Supreme Court in MC Mehta v. Union of India. For instance, the South Zone bench in Vinay Shivanand Naik v. State of Karnataka , a case concerning urban air pollution in Bengaluru associated with vehicle pollution, requested that the State Government adhere to action plans developed under the National Clean Air Plan, as filed in the NCAP Case. In a related case, LG Sahadevan v. Union of India , for Chennai, the Bench requested that an action plan be created taking into account the directives from the NGT regarding the Vardhaman Kaushik issue.

Concerns about air pollution and other environmental issues have been extensively pursued by the NGT. The NGT contributes significantly to the fight against air pollution in the following ways:

1. The NGT has the authority to consider appeals and cases involving environmental infractions, particularly those involving air pollution. It may decide to take up cases on its own initiative or in response to petitions submitted by people, groups, or governmental entities. The tribunal has the authority to penalize and punish polluters as well as individuals who violate environmental standards.

2. The NGT keeps an eye on how environmental laws and rules-including those pertaining to air quality standards-are being applied. It guarantees that businesses and governmental organizations follow established emission guidelines and pollution prevention techniques. The NGT has the authority to make orders to resolve any infractions.

3. The NGT has the authority to enforce the precautionary principle, which stipulates that the burden of proof rests with those promoting an action if it has the potential to harm the environment or the public, even in the absence of conclusive scientific evidence. This approach permits the NGT to regulate air pollution even in the absence of total scientific knowledge by taking preemptive action.

4. The NGT has the authority to mandate routine air quality monitoring and the application of pollution management strategies. In order to evaluate the status of efforts to reduce air pollution and meet established air quality requirements, it may also request periodic reports from the appropriate authorities.

5. The NGT can help spread knowledge about the negative effects of air pollution and the value of environmental preservation. The public is helped to understand the need of addressing air pollution by the frequent media coverage of its rulings and decisions.

6. In order to stop and manage air pollution, the NGT may publish guidelines and recommendations. A broad range of businesses, including waste management, construction, transportation, and industry, may be covered by these guidelines.

It is noteworthy that there may have been changes in the NGT's function and efficacy since my last report. To obtain up-to-date and precise details regarding the NGT's operations and its function in mitigating air pollution, it is advisable to consult official government resources or recent news stories.

Conclusion :

Even with international agreements and laws to fight air pollution, it's still a major health and environmental threat worldwide. This is due to several reasons: a lack of political commitment to enforce existing laws, poor coordination between government agencies, weak institutions, and limited public awareness. To tackle this urgent crisis, we need stricter controls and better technology transfer from developed to developing countries. Additionally, simplifying environmental laws by merging them into one comprehensive piece of legislation would be beneficial. Courts play a crucial role in controlling air pollution in India. They interpret existing environmental laws broadly to fill any gaps and enforce them when the government fails to do so. This "judicial activism" helps protect the environment, which is especially important because environmental damage is often irreversible. However, to be truly effective, the judiciary needs proper resources and qualified judges specializing in environmental cases. Public participation is also essential. The text doesn't continue about public participation, but the idea is that public awareness and action are necessary alongside legal enforcement. Public awareness and participation are key to tackling air pollution. People need to understand their own responsibility for environmental protection. This can be achieved through environmental education programs targeting everyone, especially young people, women, and students. Mass media

also plays a crucial role in spreading awareness. The fight against air pollution requires a multi-pronged approach. The government and NGOs need to work together. The government, in particular, should provide financial aid and annual awards to recognize and encourage environmental activists at various levels (local, regional, national). This will incentivize public participation and help curb air pollution across the country.

FOOD SECURITY IN INDIA- JUDICIAL PROSPECTIVE

Dr. G. Adinarayana

Abstract:

Food security is "an economic and social condition of ready access by all members of a household to nutritionally adequate and safe food". In 1974 at The World Food Conference, Rome, it defines food security as "availability at all times of adequate world food supplies of basic foodstuffs to sustain a steady expansion of food consumption and to offset fluctuations in production and prices. M.S. Swaminathan in 1986 defined food security in terms of "Nutrition Security" as "physical, economic and social access to balanced diet, clean drinking water, environment hygiene, primary health care and nutrition literacy". The activist approach of judiciary through its decisions in various cases gradually paved way for evolving food jurisprudence in India. Some significant verdicts by the Supreme Court of India proclaiming the right to food and allied rights guaranteeing food security of people are discussed hereunder this article. Population explosion, illiteracy, poverty and gender inequality are responsible for food insecurity in India. Effective implementation of the PDS can reduce food insecurity levels and restoration of joint family system to improve food security situation in India. Food security is guaranteed as a statutory right by the enactment of the National Food Security Act, 2013.

Key words: Food security, Nutrition Security, right to food, National Food Security Act, 2013, Judicial activism.

Introduction:

Hunger is not an issue of charity it I an issue of justice. - Jacques Diouf

Since independence India has struggled severely to achieve growth and development. India as a development nation has achieved severely milestones for the promotion of social welfare. In spite of reaching great heights, the nation still faces the basic hurdle of proving the basic necessities of life to its citizens. In spite to its various promises of equality and justice provided under the India constitution either in the form of directive principle of the state policy or the fundamental rights provided to its citizens, the country has failed to take care of the fundamental fights provided to its citizens, the country has failed to take care of the basic right i.e. Right to Food of its millions of citizens even today.

The GHI Report 2019 prepared jointly by Irish aid agency Concern Worldwide and German Organisation Welt Hunger Hilfe termed the level of hunger in India "Serious". India's ranking has dropped from out of 117 countries). India's masses are suffering hunger and malnutrition although there is surplus food grain production and lakhs of tons of food grain stored in FCL godowns. The causes of hunger and malnutrition cannot be attributed to simple natural and manmade disasters but they are enormously complex in nature. The right to food is violated when people suffer hunger and malnutrition. The prominent reasons are discrimination, political economic exclusion and social injustice. 0ften the hungry and malnourished are denied access to sufficient resources as well as adequate incomes such as land, water, livelihoods, etc., which enables them to take care of their families to lead a dignified life.

Food Security Meaning:

The dictionary meaning of the term "Food security" is "an economic and social condition of ready access by all members of a household to nutritionally adequate and safe food". The Merriam webster dictionary defines it as "the ability to consistently access or afford adequate food".

Food security - definition:

The first and foremost definition of "Food security" evolved in 1974 at The World Food Conference, Rome. It defines food security as "availability at all times of adequate world food supplies of basic foodstuffs to sustain a steady expansion of food consumption and to offset fluctuations in production and prices"

After a decade later in 1983 it Was and expanded by the Food and Agriculture Organization as "ensuring that all people at all times have physical and economical access to the basic food that they need".

The World Bank in 1986 defined it as "access of all people at all times to enough food for an active and healthy life".

M.S. Swaminathan in 1986 defined food security in terms of "Nutrition Security" as "physical, economic and social access to balanced diet, clean drinking water, environment hygiene, primary health care and nutrition literacy". This definition of food security not only stresses on nutrition security but also on livelihood security to achieve food security in the long run.

Constitutional and legal prospectives:

The progress of identifying the "Right to Food" as part of the right to life under Article 21 may be attributed to India's wholehearted commitment to implement the provisions of international conventions and declarations such as UDHR, ICESCR, CEDAW, CRC and UDEHM, harmonizing the directive principles of state policy and fundamental rights and adopting human- rights based approach to concept of food security on par with countries like Brazil, South Africa, Colombia, Guatemala, Cuba, Ukraine , Ecuador , Srilanka, ete.

Article 39(a) and (d) directs the state to frame policies to secure adequate means of livelihoods and equal pay for equal work to both men and women equally as they play a key role in the availability, accessibility and affordability of food ensuring food security to people.

India also made significant attempts to ensure food security through enactment of various piece- meal legislations. Some of them are

- The Prevention of Food Adulteration Act, 1954
- The Essential Commodities Act, 1955
- The Food Corporation of India Act, 1964
- The Maternity Benefit Act , 1961
- The Disaster Management Act,2005
- The Food Safety and Standards Act, 2006 etc..

However , with the heave by the decision of Super Court in People's Union for Civil Liberties Vs Union of India & others the National Food Security Act was enacted in 2013.

Judicial Prospectives towards ensuring Food Securities in India:

The activist approach of judiciary through its decisions in various cases gradually paved way for evolving food jurisprudence in India. Some significant verdicts by the Supreme Court of India pro-

claiming the right to food and allied rights guaranteeing food security of people are discussed hereunder.

Azad Rickshaw Puller's Union Vs State of Panjab & Ors

In this case the denial of grant of license to petitioners under the Punjab Cycle Rickshaws (Regulation of license) Act was challenged as violative of Article 14,19 (1) (g) and 21 of the Constitution of India. The Indian Judiciary in this case has showed concern to uphold claims of poor and weaker sections of society rather than fasten strictly to provisions of legislation determining their rights to ensure social justice. It also ordered to provide credit facilities for those people to own rickshaws ensuring food security freeing from poverty, hunger and bondage.

Crown Aluminium Works Vs Their Workmen:

The Supreme Court held that it is quite likely that in under -developed countries, where unemployment prevails on a very large scale, unorganized labour may be available on starvation wages; but the employment of labour on starvation wages cannot be encouraged or favored in a modern democratic welfare state. The employer must at least pay minimum wages guaranteeing to a worker who toil for fulfilling his basic necessities such as adequate food shelter and clothing to avoid starvation and poverty.

Sodan Singh Vs New Delhi Municipal Committee:

In this case the Supreme Court held that street trading is an age-old vocation adopted by human beings to earn living. The court observed that the right to fiid and food security of poor cab be realized only when livelihoods are protected.

Shantistar Builders Vs Narayan Khimalal Totame &Ors:

Justice K Ramaswamy held that the right to life would take within its sweep the right ti food, the right to clothing, the right to decent environment and a reasonable accommodation to live in.

P.G Gupta Vs State of Gujarat & Ors

In this case the government resolution excluding certain categories of employees for allotment of houses converted from rental to hire- purchase scheme was challenged as it violates Article 14, 19, and 21 of Indian Constitution. The Apex Court held that the protection of life assured under Article 21 of Indian Constitution includes the right to food, clothing and shelter.

Delhi Transport Corporation Vs D.T.C Mazdoor Corporation

The supreme court held that " employment is not a bounty from the State nor can its survival be at their mercy. Income is the foundation of many Fundamental Rights when work is the sole source of income, the right to work becomes as much fundamental." Food Security of people can be ensured only when their right to work is protected.

People's Union of Civil Liberties (PUCL) Vs Union of India

It is a landmark case in the history of Indian Judiciary realizing the right to food as an integral part of right to life. A PIL was filed highlighting about people going hungry while food grains stored in FCI go-downs were rotting and excessive food storage was there due to maladministration of food grains in these godowns. The court directed to the government to distribute food grains free of costs to starving poor people who cannot afford to purchase them.

It especially recognized the right to food of aged, infirm, disabled, destitute, pregnant and lactating mothers and children as part of right to life.

Inre Problems and Miseries of Migrant Labourers Vs Union of India

The Supreme Court Suo moto motto took cognizance of problems and miseries of migrant labourers during COVID -19 pandamic. The Apex court held that the ' right to life' confers the right to every human being to live a life of dignity with access to at least the bare necessities of life.

Gulshan Khatun & Ors Vs Delhi Urban Shelter Improvement Board & Ors

The Delhi High Court in this case had observed that it was of utmost importance to see that food is provided to the aged , inform , disabled , destitute women , destitute men who are in danger of starvation, pregnant and lactating women and destitute children, especially incases where they or members of their family do not have sufficient funds to provide food for them.

Conclusion:

Man's survival depends indispensably in food. In a narrow sense food is described as anything to fill hungry stomach. In broadest sense food means sufficient quantity and equality in terms of both calories and nutrients necessary for growth and development as well as health and wellbeing of human being. Initially food insecurity is described as physical unavailability of food at national, regional or household levels.

Indian Judiciary is playing an activist prudent role its various decisions incorporated several Directive Principles of State Policy into Fundamental rights and declared the right to food as an integral part of the right to life under Article 21 guaranteeing food security. Population explosion, illiteracy, poverty and gender inequality are responsible for food insecurity in India. Effective implementation of the PDS can reduce food insecurity levels and restoration of joint family system to improve food security situation in India. Food security is guaranteed as a statutory right by the enactment of the National Food Security Act, 2013. The Constitution of India has no expressed provision directly ensuring right to food security does not hold good as other provisions ensured food security in India.

Abstract

Child labor remains a pervasive violation of human rights, drawing global attention to the welfare of children. The 20th century marked a significant turning point in the advancement of child welfare, leading to heightened awareness of children's rights as distinct individuals. This study aims to assess the level of parental awareness regarding government welfare schemes designed to support female child laborers. Our findings reveal that 46.3% of respondents acknowledge that child labor forces children into premature adulthood, leaving them vulnerable to exploitation due to their vulnerability. Furthermore, 33.5% of respondents recognize that a sense of inferiority among child laborers stifles their courage and creativity. The creation of additional employment opportunities for unskilled and unemployed individuals in rural areas can contribute to economic growth. Implementing awareness generation programs focusing on child labor laws and involving various stakeholders such as government departments, youth associations, self-help groups (SHGs), and civil society members is crucial for reducing the prevalence of child labor.

Introduction

Child labor remains a pressing concern in India, with a pronounced presence in rural areas. Although legislative measures have been introduced worldwide to restrict the employment of children below a certain age and define acceptable conditions for minors working in various professions, the effectiveness of laws designed to protect children from hazardous labor is often lacking. In many instances, children find themselves aiding family members in agricultural endeavors, working as part of contractual family labor arrangements, or participating in plantation work. Rural India witnesses a common practice of school-aged children engaging in agricultural work as part of their family responsibilities. Regrettably, the implementation of Child Labor Laws at the state and district levels has been inadequate.

This study seeks to shed light on the perspectives of parents and employers regarding child labor issues, aiming to enhance their awareness, knowledge, and understanding of the prevalence and conditions of child labor within the study area. The situation of female child laborers is especially distressing due to gender discrimination prevalent in many Indian societies. Agriculture, which contributes three-fourths of the national income and supports over 75 percent of the population for subsistence, is heavily intertwined with child labor. Poverty and the absence of social security remain primary drivers of child labor, trapping children in work that offers limited opportunities for physical, social, and mental development. Both girls and boys are ensnared in the worst forms of child labor, but societal expectations, duties, and responsibilities imposed on girls often render them more susceptible to exploitation. Addressing the issue of female child labor is a complex challenge, compounded by the fact that the labor of female children is often unacknowledged or underrepresented in formal labor statistics. The absence of quality universal education further contributes to children dropping out of school and entering the labor force, making it difficult to accurately detect the true extent of child labor.

Welfare schemes for female child labor are essential in combating this pervasive violation of human rights. Child welfare has garnered global attention,

September 2023

particularly in the 20th century, with growing awareness of children's rights as independent entities. Article 18 of the United Nations Convention on the Rights of the Child in 1989 emphasizes the need to protect children from economic exploitation and hazardous work that interferes with their education, health, or overall development. The International Labor Organization (ILO) also opposes child labor, particularly in situations where children face educational and social disadvantages or work in exploitative conditions harmful to their well-being.

The Indian Government recognizes child labor because of poverty and has taken steps to address it through legislative measures. In 1986, the

Child Labor (Prohibition and Regulation) Act was enacted, replacing the Employment of Children Act of 1938. While the 1986 Act does not completely ban child labor, it focuses on "projecting" working children. The government has established unique schools to rehabilitate children engaged in dangerous or hazardous occupations, offering them education, vocational training, monthly stipends, and nutrition and health services.

The commitment of the Government of India to eradicate child labor is enshrined in the Constitution, which provides for the protection of children from engaging in economic activities unsuitable for their age. The Directive Principles of State Policy in the Constitution reinforce this commitment. The Central Labor Service (CLS), established in 1987, aims to improve industrial relations, labor welfare, and the enforcement of labor laws. Various schemes offering medical, housing, educational, recreational, water supply, and family welfare benefits are implemented for workers as part of the government's ongoing efforts to safeguard the welfare of children and laborers.

Material and Methodology

Objectives

The present study broadly aims at studying the socio-economic and social participation, employment support and knowledge on welfare schemes available to female child labors. The following are the main objectives of the present study:

Received: *2 September 2023*
Revised: *17 September 2023*

September 2023

- To study the level of knowledge on welfare schemes provided by the Government for girl child labor.
- To study the level of knowledge on girl child rights
- To examine the economic and social conditions of female child labor in the sample district.

Sample design and study area

The researcher has purposively selected the Kurnool district due to its proximity and familiarity. Stratified random sampling method was used in selection of study sample. The study has conducted in six Mandal's of three revenue divisions of the Kurnool district. Four villages from each Mandal were selected. 20 respondents each were selected at random in 24 villages and the total sample is comprises of 480 female child labor residing in agricultural families in the Kurnool district for the present study.

Results

Socio-Demographic Characteristics of the respondents

A study of the background characteristics of sampled population is an important task in the study. Several studies have been shown that there is a strong relationship between socio-economic status and Girl Child Labor in Agriculture Families.

Table No.1: Percentage Distribution of the respondents by their Socio-Demographic Characteristics (N=480)

Socio-Demographic Characteristics of the respondents	Frequency	Percent

Age plays an important role in measuring the respondent's perception on their present working condition. Data has been collected on the girls who involved in the agriculture labor to analyze the girl's working condition in the agriculture field. In the study area nearly two-thirds (66.3 %) of the respondents were in 12-14 years age group. One-fourth (24.0 %) of them were in 9-11 years and the remaining (9.8 %) were in the age group of 5-9 years. One half (50.4 %) of the respondents were Hindus, less than one-third (30.4 %) of them were Christians, 12.3 percent were Muslims and 6.9 percent belong to other religions. It is observed from the above table that more than one third (36.9 %) of the respondents have completed upper-primary education in the study area. More than one-fourth (28.5%) the girls had pre-school education and two-fifth (20.4 %) had primary education and 14.2 percent of the respondents had high school education. More than two-fourth (46.5 %) of the respondents were having ≤ 2 years of experience in the agriculture field, less than one-third (31.5 %) of them were working experience of 2-4 years and more than one-fifth (22.1 %) of them were working 4 years and above in the agriculture field. Almost all (96.7 %) of the respondents were getting a monthly income Rs. 5000 and above the study area. More than one-third (36.9 %) of the respondents' parents were having agriculture background, followed by allied labor (32.3%) and other types of activities (21.5 %).

crime and 28.8 percent of respondent's expressed that excessive workload and long hours of work in hazardous Work is heinous crime. Only one-third (29.4 %) of the parents were having knowledge on child labor laws as they expressed that the Child labor laws are failed in implementation and weak enforcement of law were the causes of child labor. Nearly one-third (32.3 %) of parents expressed that they have observed strict enforcement of child labor laws. 30% of the respondents were agreed that parents of the child labor should be punished under the child labor laws. More than one-third (34.8 %) of the respondents were aware that child labor is subject punishment under child labor laws. 42.1 percent of the respondents agreed that child labor shall be banned in all aspects. It is interesting to note that more than two-fifth (41.5 %) of the parents agreed that child labor is not an unethical and the employers of the child labor were giving an opportunity to get the financial source for those who are neglected by the governments.

The findings from the above table shows that majority of the parents were aware of the ill effects of the child labor and the laws and functioning of law enforcement authorities related to child labor.

Parent's knowledge on various welfare schemes implemented by the government to avoid Child Labor is presented in the table no. 5. Cent percent of the respondents (100 %) in the study area agreed that free education for girls up to higher education will help to eradicate the child labor. Higher proportion (85 %) of the respondent's expressed that Balika Sam Rakshana scheme is very useful to balance sex ratio and prevent gender discrimination and the scheme is also encouraging employment skills, opportunities and creates awareness on health and family life education to girl Child. More than one-half (51.7 %) of the respondents felt that Apana Beti Apne desh scheme is providing rehabilitation services for those who were rescued from child labor and brothel home. Similar percentage (62.5 %) of the respondents agreed that strict implementation of prenatal diagnostic technique act helps in reducing female feticides and the gender discrimination. The girl child agreed that implementing the constitutional provisions and human rights for girl child reduces gender discrimination (60 %) and welfare measures are sufficient to improve the girl child status provided by the government and non-government organizations (60.2 %). More than one-half (52.5 %) of the respondents agreed that national policy for children and legal enactment facilitates the development of girl child.

Conclusion

Equality of opportunities is the foundation of modern welfare states. The crucial role that education can play in the reduction of girl child labor and improvement in the economic wellbeing of individuals can go a long way in achieving such ends. In India, poverty remains the key determinant of children not being sent to school. Most of the parents are not able to afford to send them to school. The path to progress in terms reducing the number of girl child laborer's by taking into consideration the cultural and economic measures, their future will continue to remain bleak. The study suggests that promotions of non-agricultural economic activities like micro and small industries and

self-employment with the support of SHG groups (Women Groups) are the best alternatives to improve employment and income generation for the rural poor. Creation of more employment opportunities to the unskilled Unemployed will help to economic growth in rural areas. Through awareness generation programmes related to the Child Labor Laws with involvement of convergent departments, youth associations, SHGs, Civil Society members will be helping to decrease the number of child labors. Educate the parents of girl child on importance of sufficient nutritious food and proper education for the growth of girl child and its impact on future generations.

DESIGN AND IMPLEMENTATION OF TYPE-2 FUZZY LOGIC CONTROLLER FOR ANN BASED MPPT APPLIED TO SPVWPS USING BLDC MOTOR

K. SRAVANI[1], Dr. V. USHA REDDY[2]

[1]Mtech student, Dept of EEE, SRI VENKATESWARA UNIVERSITY COLLEGE OF ENGINEERING TIRUPATI-517502 (A.P) INDIA

[2]Associate Professor, Dept of EEE, SRI VENKATESWARA UNIVERSITY COLLEGE OF ENGINEERING TIRUPATI-517502 (A.P) INDIA

ABSTRACT:

Renewable energy sources are being used to lessen reliance on fossil fuels, which are deteriorating at an alarming rate. Renewable energy sources are therefore being prioritized in order to fulfill the increasing demand for power caused by the expanding human population. The goal is to create a novel solar-powered water pumping system that makes use of a Type-2 Fuzzy Logic Controller (T2FLC) to regulate a Brush Less DC (BLDC) motor. The torque ripples and noise of the BLDC motor are eliminated and the system's performance is enhanced with efficient and dependable water pumping under varied environmental circumstances by integrating a T2FLC into the current system. The device in question is a Voltage Source Inverter (VSI) that has a built-in decoder and a DC link voltage controller, also known as a PWM controller. The BLDC (Brush Less DC) motor's characteristics are controlled by the decoder, which executes electronic commutation by Hall signal detection. The system's performance is further confirmed using Proportional-Integral (PI), FLC/Type-1 FLC controllers. When tested in a MATLAB/SIMULINK setting, the suggested Type-2 FLC outperforms the other two controllers. In this study, we evaluated the BLDC motor's torque under static and dynamic irradiance circumstances to those of PI, Type-1, and Type-2 fuzzy logic controllers.

Keywords: ANN, type-2 Fuzzy, BLDC, VSI, SPV, irradiance, MPPT, Efficient operation, DC-DC converter.

I INTRODUCTION

As the world's population rises, so does the need for energy, putting a strain on our current conventional energy sources. As a consequence the focus is shifting from fossil fuel based energy generation to clean and green sources of energy generation.

Connecting solar photovoltaic systems on a larger scale also demonstrates a suitable alternative to conventional water pumps powered by non-renewable energy sources like oil and coal [1, 2]. To fulfill the water requirement, one option is to install a Solar Photovoltaic Water Pumping System (SPVWPS) that operates independently [1]. Irrigation, home usage, and industrial automation are some of the many areas that are giving this technology high marks. Keeping the DC connection voltage at its rated value allows the BLDC (Brush Less DC) motor to adjust its speed, which in turn is affected by changes in solar irradiation [2]. The ideal duty cycle is achieved by means of a DC-DC boost converter that runs in Continuous Conduction Mode (CCM) and is controlled by Maximum Power Point Tracking (MPPT) based on Artificial Neural Networks (ANNs) [4].

The literature discusses several Maximum Power Point Tracking (MPPT) approaches. When thinking about the water pumping system, two popular Maximum Power Point Tracking (MPPT) algorithms are Incremental Conductance (INC) and Perturb and Observe (P&O) [3, 5]. However, the control characteristics of a standalone SPVWPS (Solar Photovoltaic Water Pumping System) are heavily influenced by the step size of the MPPT (Maximum Power Point Tracking) approach [6, 9]. The literature discusses a number of DC-DC conversion strategies, including Boost, Boost Buck, Luo, and Landsman converter [7, 8, 10, 11]. A Boost Converter is used because of its excellent switching characteristics and the fact that its inductor acts as a ripple filter [1].

A water pumping system that uses SPV (Solar Photovoltaic) arrays with induction motors, synchronous reluctance motors, and switching reluctance motors also created [12][13]. The permanent magnet of a BLDC (Brush Less DC) motor allows it to outperform similarly sized motors in terms of torque-speed proportion, making it ideal for tasks where space and weight are paramount. It outperforms competing motors in terms of speed, torque, and expanded speed ranges [1][2][14]. Many industries rely on traditional P-I (Proportional Integral) controllers for controlling systems[15]. These controllers have a few drawbacks, such as being sensitive to controller gains, slow to respond to sudden disturbances (noise), and

having a hard time getting complex nonlinear systems with uncertainties to perform satisfactorily under control.

Type 1 fuzzy logic controllers are known as FLCs [16]. To handle the uncertainties of several complicated nonlinear systems, FLC, first suggested by Zadeh in 1965, may draw on human knowledge and experience. One of the main draws of FLC is simple to construct, doesn't need precise mathematical formulae, and may perform well depending on things like rules and membership functions [16, 17]. A torque ripple reduction mechanism called FLC has been developed and put into use for BLDC motors [17][18]. However, type-2 fuzzy logic controllers were introduced by Zadeh in 1975 as an expansion of type-1 fuzzy logic control (type-1 FLC) [18], as type-1 FLC was unable to manage greater uncertainties [18][19]. Type-2 fuzzy logic controllers combine the Upper and Lower membership functions of type-1 FLCs, and they have three dimensions, whereas type-1 FLCs only have two. This is the main difference between type-2 and type-1 fuzzy logic controllers [20]. A type-2 FLC was developed and put into operation to remove torque ripples from BLDC motors in the system.

II LITERATURE SURVEY

By including a DC-DC boost converter as an intermediary power conditioning unit into a Solar Photovoltaic (SPV) array fed Brushless DC (BLDC) motor powered water pump, Rajan Kumar and Bhim Singh [1] created a system that is economical, efficient, dependable, and environmentally friendly.

Brushless DC (BLDC) motor powered water pumps that use solar photovoltaic (SPV) electricity were first proposed by Bhim Singh and Ranjan Kumar, [2]. The pulse width modulation (PWM) control of the voltage source inverter (VSI) via the DC link voltage regulator is what allows the BLDC motor's speed to be adjusted.

In their extensive study, B. Subudhi and R. Pradhan [3] covered every method for maximum power point tracking (MPPT) in a PV power system. The advantages and disadvantages of each MPPT method are unique. Therefore, it is crucial to conduct a thorough evaluation of these methods.

For the purpose of improving efficiency and maximum power point tracking (MPPT) of PV arrays, ANN based MPPT was presented by M. Elobaid et.al. [4].

Although there is a simpler framework offered by standard MPPT approaches.

Since PV arrays have a nonlinear voltage-current characteristic with a distinct point where the power generated is maximized, MPPT algorithms are deemed required by Najet Rebei et.al. [5]. Solar irradiation, temperature, and load all have a role in the electricity that a solar panel produces. Various photovoltaic (PV) water pumping system performances were shown.

Water pumping for irrigation and drinking water may be accomplished using a cost-effective standalone Photovoltaic (PV) system that does not need batteries, as proposed by S.G. Malla et.al. [6]. Connected to this system is a Maximum Power Point Tracker (MPPT) algorithm-based perturb and observe (P&O) system with the aim of boosting system efficiency.

An efficient, simple, and inexpensive brushless DC (BLDC) motor drive for a water pumping system that is supplied by solar photovoltaic (SPV) arrays was suggested by B. Singh and R. Kumar [7]. No further control circuitry is needed for speed control of the BLDC motor since they used a DC Link converter in conjunction with fundamental frequency switching of the voltage source inverter (VSI).4

Researchers Rajan Kumar and Bhim Singh[8] examined a Solar Photovoltaic (SPV) array-based water pump powered by a permanent magnet brushless DC (BLDC) motor and how a Landsman converter may be used to detect the highest power point. In addition to providing a gentle and secure start for the BLDC motor, it maximizes the power output of the SPV array.

In their proposal for an independent solar pumping system, Songbai Zhang et al.[9] noted that the stability and dynamics of the system are significantly impacted by the step size in maximum power point tracking (MPPT) algorithms. The pump in this system is powered by an induction motor.

A boost-buck (BB) DC-DC converter was presented by Rajan Kumar et.al., [10], for use in water pumping systems that are supplied by solar photovoltaic (SPV) arrays and driven by permanent magnet brushless DC (BLDC) motors. Designing it with a cascade of DC-DC boost and buck converters allows it to soft start the BLDC motor and achieve maximum power point tracking (MPPT).

III PROPOSED SYSTEM

Industrial Engineering Journal
ISSN: 0970-2555
Volume : 53, Issue 3, March : 2024

The BLDC motor's rotor has permanent magnets, while the stator is equipped with windings. This rotor flux is created by permanent magnets. The rotor is attracted to and rotated by the stator windings, which generate electromagnetic poles. The problems associated with connecting electricity to the moving armature are eliminated with BLDC motors because the permanent magnets revolve around an immovable armature [1, 2]. Electronic controllers in BLDC motors cycle the winding phases many times. Instead of a brush and commentator combo, a solid-state circuit may be used to provide similarly timed power distribution from the controller. There are several stages to a BLDC motor's operation; the three-phase motor is the most common and well-liked because of its precise control, low torque output, and great efficiency [5, 6].

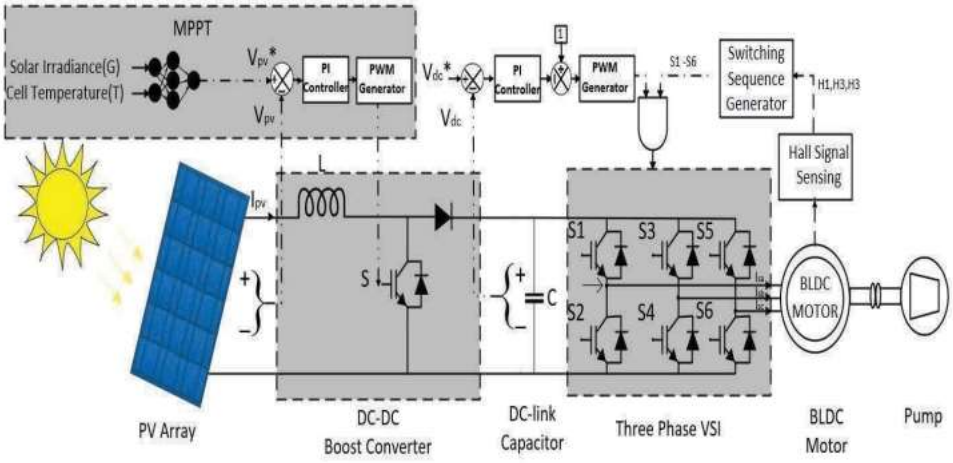

Fig.1. Topology of SPVWPS using PI Controller and BLDC motor

The methodology shown in Fig.1. is the most efficient way to control a Brushless Direct Current Motor (BLDC). Managing the bridge converter's input DC voltage is the foundation of the suggested approach. The motor windings generate a magnetic field, which controls the rotation of the motor, and the input DC voltage of the bridge converter is regulated in the same way [17]. The artificial neural network (ANN) with fuzzy controllers regulates the DC voltage input to the bridge converter. The integral and proportional gain parameters, which are the primary gains, are crucial [18]. All aspects of the ANN's performance while using fuzzy controllers are impacted by them. In this case, we use artificial neural networks (ANNs) with fuzzy controllers to get the same result—a non-integration output—from the input we provided [4]. The error computation for artificial neural networks (ANNs) with fuzzy

controllers is done by using and logic in the Sugeno FIS-Fuzzy Inference System Editor of T2FLC.

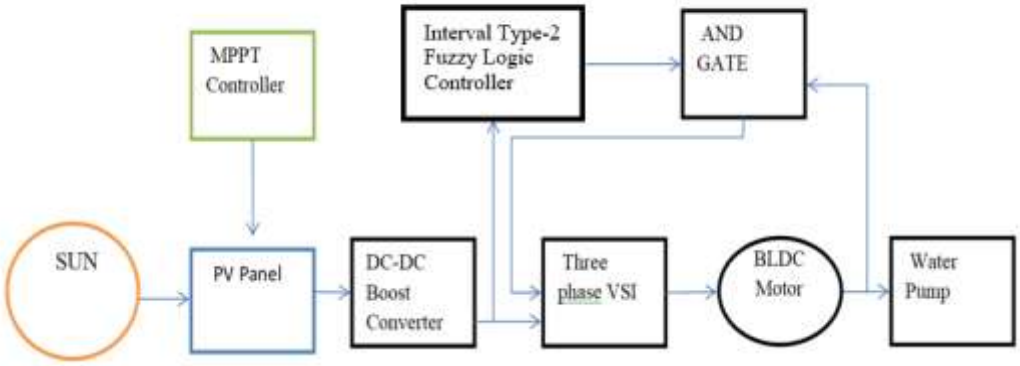

Fig.2. Proposed block diagram of SPVWPS using T2FLC with ANN

A PV array, an ANN-based MPPT driven DC-DC Boost converter, and a DC link capacitor are all components of the system shown in fig.2. The VSI and pump system are controlled by a PWM signal created via electronic commutation. For the DC-DC boost converter to function optimally and with CCM, the SPV array must be properly chosen [1, 2].

Controller being suggested:

Lotfi Zadeh invented the Type 2 Fuzzy Logic Controller (T2FLC) in the early 2000s [18], it is an upgraded version of the standard Fuzzy Logic Controller (FLC). Its introduction allowed for greater leeway in operating complicated systems and helped FLC overcome its shortcomings when dealing with uncertainty. A well-liked control system, fuzzy logic controllers (FLCs) employ fuzzy logic to convert inputs into outputs. Mathematically, fuzzy logic makes use of linguistic variables and fuzzy sets to describe information that is either imprecise or uncertain. A number of applications make use of FLC, including process control in manufacturing, temperature management, and speed control of electric motors [20].

Type 2 Fuzzy Logic Controllers (T2FLCs) basically work the same way as regular FLCs. On the other hand, T2FLC represents the uncertainty related to the input and output variables' membership functions using type 2 fuzzy sets. The fundamental procedures for operating a T2FLC are as follows.

Industrial Engineering Journal
ISSN: 0970-2555
Volume : 53, Issue 3, March : 2024

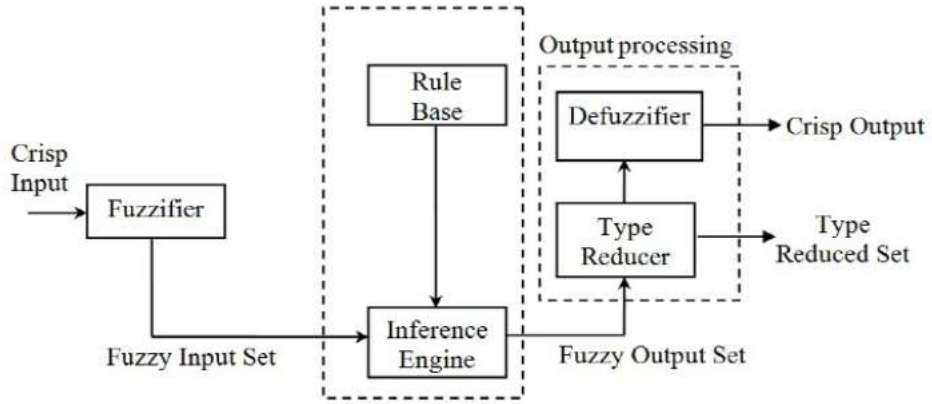

Fig.3. Type -2 Fuzzy Controller model.

Proposed controller methodology:

PI controller with ANN:

An innovative approach to solar-powered water pumping utilizing a brushless DC (BLDC) motor is introduced in this project maximum power point tracking (MPPT), which is based on artificial neural networks (ANNs) and does not need electrical input. We want to use neural networks to create a step-size independent maximum power point tracking (MPPT) for use in water pumping. To get the most juice out of the solar photovoltaic (SPV) array and to soft start the BLDC motor, we're using a DC-DC boost converter that's powered by an ANN-based MPPT. The BLDC motor's speed is controlled by pulse width modulation (PWM) of the voltage source inverter (VSI) using a DC link voltage controller. To carry out electrical commutation by hall signal detection, a pulse width modulation (PWM) signal is produced by means of the built-in encoder. The total system's efficiency is determined under different irradiation conditions after a BLDC motor driving pump system undergoes performance analysis in the MATLAB/Simulink environment.

FUZZY and ANN controller:

A water pumping system utilizes solar PV panels to keep costs down, The brushless dc motors used in this system are preferred over BDC motors due to their ease of maintenance, long lifespan, reduced noise, and high efficiency. The system is also easier to build [16][17]. Therefore a Fuzzy Logic Controller is used to overcome the drawbacks of PI Controller. The fuzzy logic control system is a mathematical framework for analyzing analogue input values and converting them into logic variables with continuous values between 1 and 0. These variables are used to control

the BLDC parameters using the boost converter's gate driver circuit. The boost converters used here are really just DCDC converters, and their purpose is to increase the amount of electricity consumed by the solar panels. Maximum power point tracking (MPPT) is used to manage the boost converters.

Type -2 Fuzzy controller with ANN:

To enhance the BLDC motor performance by eliminating torque ripples and to to get rated speed of BLDC motor, a Type-2 fuzzy logic controller (T2FLC) is integrated into the system. T2FLC handles with more uncertainty than FLC with its two dimensional membership functions and upper and lower limits. Therefore T2FLC reduced noise and energy consumption of BLDC motor. Optimal performance of BLDC motor has been achieved with T2FLC.

Table-1: Rules of T2FLC

N	D	N	A
A	N	A	A

The inputs of T2FLC in the system are e- error and **Δe-** delerror or change in error and the membership functions of the inputs are D-Depreciation, N-neutral, A-appreciation shown in Table-1.

IV SIMULATION & RESULTS

The models used for simulation are created using MATLAB/Simulink 2021a shown in fig.4. The input temperature is 25^{o}C and the first model is run with an irradiance constant of 1000W/m^2. An irradiance step signal of 1000W/m^2 and an input

temperature of 25ºC are used to run the second model. The building components and functioning of both simulation models are identical. The inputs used to train the models are the only differentiating factor. A constant input is used by the first simulation model. The inputs to the second simulation model are variable. By comparing its output with the voltage produced by the solar panel, V_{pv}, and using the non-electrical inputs of irradiance and temperature, ANN-MPPT supplies voltage to the boost converter. Inverters that are based on voltage sources are fed by boost converters. In addition, the Type-2 FLC (Fuzzy Logic Controller) and PWM (Pulse Width Modulator) are notified of the results after comparing them to the rated voltage of the BLDC motor. To power the BLDC motor, a voltage source based inverter (VSI) is used. A hall effect sensor determines the rotational position of BLDC motors. The Hall sensor output can be deciphered by the decoder. The AND block receives pulse width modulator (PWM) pulses and decoder output. For the BLDC motor to run smoothly, the AND block's output is sent to the VSI (Voltage Source based Inverter).

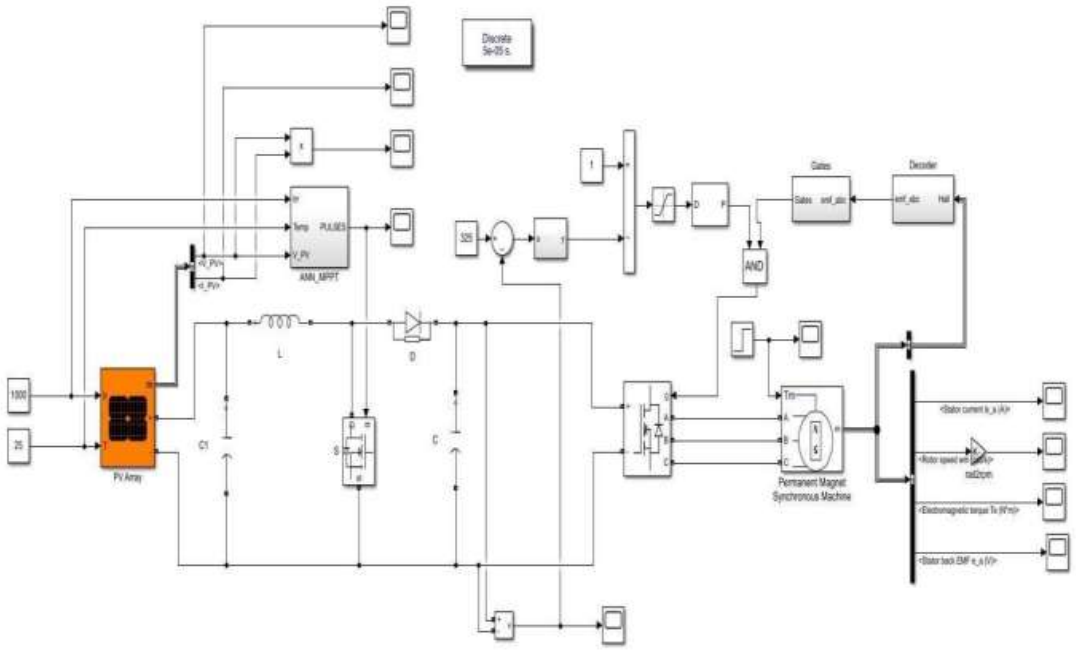

Fig.4. Simulation diagram

Fig.5 to Fig.9 displays the system-wide performance curve obtained from the simulation conducted in MATLAB/Simulink 2021a. As seen in the figure below, the SPV array performed well under STC conditions, with an ANN-based MPPT approach capable of tracking a maximum power of 2809 W, 270 V, and 10.38 A. Not only that, but the suggested MPPT has top-notch tracking efficiency. Boost converter

Industrial Engineering Journal
ISSN: 0970-2555
Volume : 53, Issue 3, March : 2024

performance while Vdc is held constant at 325 V. It is shown that CCM has favourable duty cycles. With the proposed Type-2 FLC Controller, the water pump may be driven by the BLDC motor at full load, which increases the rated speed and electromagnetic torque, Te. The speed and torque ~ time curves also show that the BLDC motor starts smoothly.

Comparison Of Torques of BLDC Motor with FLC And Type-2 FLC Under Static And Dynamic Conditions

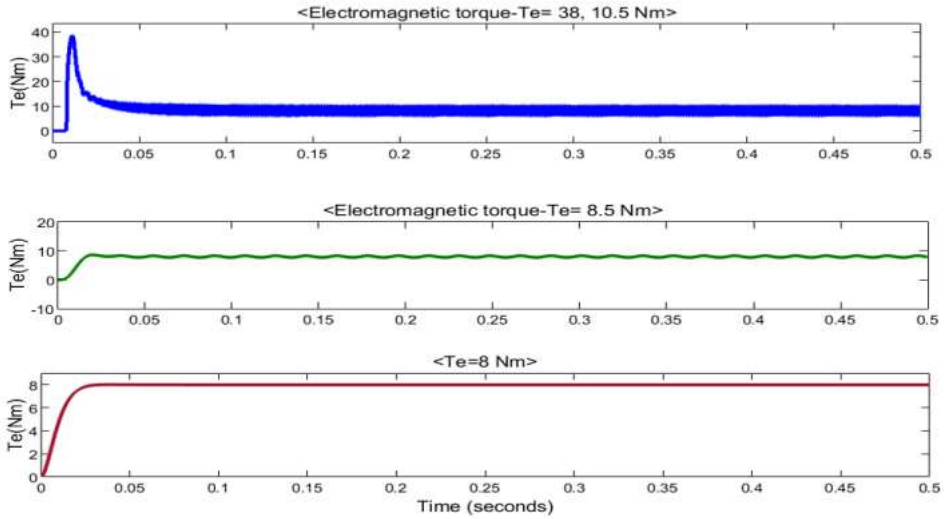

Fig.10 Torques of BLDC motor with PI, FLC, T2FLC under static condition with ANN

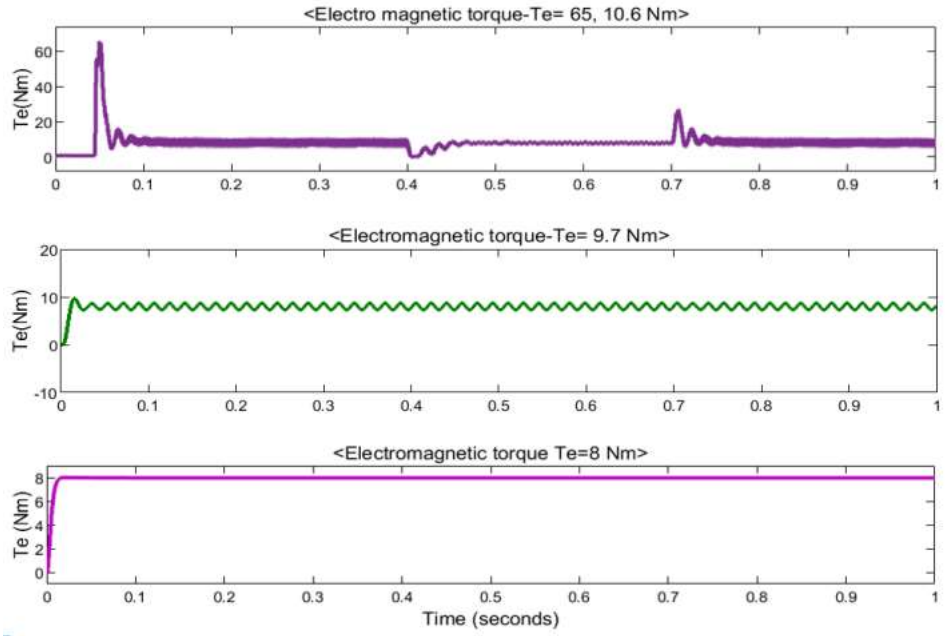

Fig.11 Torques of BLDC motor with PI, FLC, T2FLC under dynamic condition with ANN

Under dynamic conditions, ANN measures the torques of BLDC motors with PI, FLC, and T2FLC. Applying an ANN-based maximum power point tracking (MPPT) controller with PI, FLC, and T2FLC for a solar photovoltaic water pumping system with a BLDC motor produces good simulation results in both steady-state and transient scenarios shown in fig.10 to fig.11. Additionally, it is less complicated than existing controllers for reducing torque ripple in BLDC motors. Using a Fuzzy Logic Controller (FLC) instead of a Proportional Integral (PI) Controller has decreased ripples in the torque waveform. By switching to Type-2 FLC from FLC/T1FLC (Type-1 FLC), torque ripples have been eradicated.

CONCLUSION

For BLDC motor-powered solar water pumping systems, we provide an ANN MPPT that does not rely on electrical inputs. Using a PI controller, the system exhibits poor transient and steady-state performance over a broad spectrum of irradiances. Applying a Fuzzy Logic Controller (FLC) to the current setup lessens the swells in the system's output waveforms. The current system's torque output from the BLDC motor was smoothed out by adding a Type-2 Fuzzy Logic Controller (T2FLC) shown in table-2&3. As a result, the BLDC motor's jerky motions and vibrations will be lessened. The BLDC motor's noise level drops. The system's performance will be enhanced. The BLDC motor has a longer lifespan. Energy savings are achieved by reducing the power consumption of BLDC motors. The results show that the system is performing optimally and can keep water flowing continuously even when the irradiance is quite low. The suggested approach also accomplishes soft starting of BLDC motors, which is ideal for motor pump set smooth operation.

NEURAL NETWORK BASED SOLAR POWERED ELECTRIC VEHICLE CHARGING STATION

K. Kavitha, M. Tech, Dept. of EEE, SVUCE, Sri Venkateswara University, Tirupati, India
Dr. V. Usha Reddy, Associate Professor, Dept. of EEE, SVUCE, Sri Venkateswara University, Tirupati, India.

Abstract
This paper presents an overview about charging of electric vehicles by neural network based solar PV. Solar power is a clean, renewable and infinite energy source and doesn't produce any greenhouse gas emissions. The output of solar panels can be altered by using neural network. Here the power output of solar panels is increased by ANFIS MPPT which generates maximum power. This way sufficient power is generated to charge electric vehicles even on cloudy days. The development of electric vehicles is creating awareness on using pollution free vehicles which cause no harm to the environment. The rise in the use of electric vehicles has led to the increase in the electric vehicle charging stations. Though the electric vehicles produce zero emissions the charging of electric vehicle batteries are from the conventional energy sources which causes harm to the environment. This led to the development of solar PV powered electric vehicle charging stations. Solar powered electric vehicle charging station and a battery energy storage system with grid assistance is used to ensure that the charging station has uninterrupted power without putting additional burden on the grid. Adaptive Neuro-Fuzzy inference system with neural network technique is designed and evaluated in MATLAB/Simulink.
Keywords: EVCS- Electric vehicle charging station, battery energy storage system, Adaptive Neuro Fuzzy inference system, MPPT, neural network, alternative charging, grid connected, Electric vehicle battery charging, PV.

I. Introduction

The use of renewable energy resources has grown drastically due to the need to preserve fossil fuel reserves for future generations. They cause zero damage to the environment and are ecofriendly which are abundantly available in nature. The use of solar panels for energy generation is increasing rapidly due to its ease of operation and can even be used in remote places where the access to the grid is not possible. Solar cells absorb the light energy from the sun and converts it into electrical energy. The size of the solar panel will affect the energy generated from it. By 2050, solar power is predicted to be become the world's leading source of electricity, with solar photo voltaic along with concentrated solar Power contributing 16 and 11% respectively [1]. When compared to other non-conventional energy sources solar energy serves the best in charging electric vehicles. Due to the increase in the awareness towards clean environment the use of electric vehicles is also increasing as it does not cause harm to the environment by releasing harmful gases as in case of fuel powered vehicles. Due to the technological advancement in the field of solar energy, solar powered chargers are developed to charge electric vehicle batteries which also contribute to green environmental effect and also reduces the burden on the grid. MPPT is used to generate the maximum energy which supplies the demand even on cloudy days. Electric vehicles are expected to increase from 2% of global share in 2016 to 22% in 2030[2]. Electric vehicles have more efficient electric motors than internal combustion engines. So, this saves energy when compared to ICE vehicles. They can also be used to reduce transportation's reliance on oil as long as the electricity is supplied using non-oil fuels [3,4]. A neural network uses solar power output and state of charge of BESS parameters to control the power output of AC grid. During maximum irradiance, PV supplies power to charge EV and excess power is given to AC grid as well as to charge BESS. To ensure an uninterrupted power supply, sometimes the power will be drawn from the AC grid to charge EV and BESS. The proposed system has been simulated in MATLAB/Simulink.

II. Literature

The recent developments in electric vehicle have led to the development of different electric vehicle charging stations and various charging methods. This neural network based solar powered charging station is one among them. Global market outlook, EPIA[1], predicted solar power to be become the world's leading source of electricity, with solar photovoltaics along with concentrated solar Power contributing 16% and 11% respectively. Solar power generation is the fastest growing power generation method among the renewable energy sources that let to the advanced developments in solar power generation.

The standards of electric vehicle, battery charger and battery charging station was reviewed by Afida ayobet All[2]. The different types of charges used and their ratings are discussed for different types of electric vehicles. The type of charging will effect the charging time, efficiency of charging, performance of electric vehicles and the life span of electrical vehicles being charged. So, the type of charging should also be considered in electric vehicle charging station.

To increase the usage of electric vehicles as an alternative to diesel or petrol-powered vehicles R. Irle[3] concluded the global EV sales for the 1st half year of 2019. The electric vehicle sales and fuel powered vehicle sales are considered and compared to track the sales of electric vehicles.

A comprehensive review of DC fast charging stations with energy storage method was proposed by M. A H. Rafi, J. A. Bauman[5] which gives an overview of the charging stations which uses power converters for the conversion of energy. The electric vehicles are charging time is reduced by using different charging methods. DC charging methods are fast when compared to AC charging methods as the electric vehicle battery is a DC storage device.

III. Modelling of EV charging station

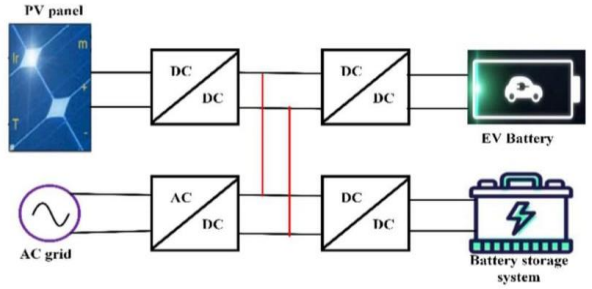

Figure 1: Representation of EV charging station.

Solar energy generation

When the sun light falls on the solar panel, the PV cells in the solar panel absorbs the sunlight and create the charges to move in response to the internal electrical field in the cell causing the flow of electricity. Here the solar photovoltaics are used to generate electricity to charge electric vehicles. However solar energy is highly dependent on temperature and climatic conditions. For higher voltages PV cells are connected in series and for higher currents PV cells are connected in parallel. The total amount of light that falls on the solar panel will not be converted into electrical energy as some light will be reflected back into the atmosphere due to the glass cover and frame of the solar panel. The output of the solar panel will be DC supply. A basic solar cell is the combination of current source and an inverted diode connected in parallel to it with its own shunt and series resistance. The series resistance is the diode resistance and the shunt resistance is due to the electron hole combination before it reaches load. Shading also effects the amount of power generated by the solar panel. The more the shading the less the energy generated. Shading is a phenomenon in which a part or complete solar panel is covered which reduces the amount of sunlight that fall on the solar panel.

PV array with boost converter

The charging station is designed using A 2000W PV panel with an open circuit voltage of 298.4V. Boost converter is used to step up the PV array voltage and to acquire the DC bus voltage of 400V. To

extract maximum power output from the PV array ANFIS voltage controller with Proportional-Integral controller is used.

Electric vehicle

All electric vehicles are generally referred to battery electric vehicles which have an electric motor instead of internal combustion engine. as it runs on electricity it uses a battery pack to power the electric motor and must be charged using a wall outlet or plugins. It does not contain any liquid fuel components such as fuel pump, fuel tank or fuel line and it does not emits from tailpipe. The power of electric vehicles motor is measured in kilowatts(kW). They deliver their maximum torque over wide RPM range.

Key components of electric vehicles

Battery:

All electric vehicles consist of a battery that provide electricity to power vehicle accessories.

Charge port:

It consists of a charge port that allows to connect to external power supply in order to charge the vehicle battery.

DC to DC converter:

It converts the high voltage DC from the battery charging port to the low voltage DC required to charge electric vehicle battery.

Electric traction motor:

This motor drives the vehicle wheels using power from the battery pack. Some vehicles have both drive and regeneration functions for motor operations.

Power electronics controller:

It controls the flow of electricity delivered by the traction battery controlling the speed and torque of electric motor.

Electric transmission:

It transforms mechanical power from the electric traction motor to drive wheels.

Electric vehicle battery

Electric vehicle battery is also called as traction battery. It is a rechargeable battery. These batteries are usually lithium-ion batteries and are designed for high power to weight ratio and energy density. These batteries are smaller, lighter, desirable and will have high performance. Lithium-ion batteries can be charged and recharged daily at any state of charge. The other type of rechargeable batteries used in electric vehicles include lead-acid battery, nickel-cadmium battery, nickel-metal hydride etc. lithium-ion batteries are used in electric vehicles due to their high energy density and long life cycle. For EV charging station a 240V, 7Ah battery is considered and it is charged from a 400V DC bus supply using a PI controller for DC-DC boost converter. For simulation purposes the incoming EV's battery is expected to have a minimum of 10% of SOC. The energy required for charging of EV battery (E_{ev}) can be calculated from the nominal voltage(V_n), ampere-hour rating of battery(Ah), %state of charge(SOC_r).

$$E_{ev}=\frac{V_n*SOC_r*Ah}{100}$$

Battery energy storage system (BESS) with bi-directional dc-dc boost converter

This battery storage is used to collect the extra energy generated from the PV array which is used to charge electric vehicles at night. The bi-directional DC-DC boost converter controls the charging and discharging of BESS. A BESS that can operate as a buffer between the EV charging station and the utility is another preferable approach [5-8].

Grid with inverter

A 230V, 50Hz AC grid is connected to the charging station for additional power requirements. In MATLAB/Simulink 230V AC source is used as grid. It is connected to a 400V DC bus using an

inverter. By taking output power of PV and %soc of BESS as input to BESS pulses are generated for inverter switches neural network Simulink model.

Table 1: Charging station data

Module Data	
Number of cells	60
Open circuit voltage	37.3 V
Short-circuit current	8.66 A
Voltage at MPPT	30.7 V
Current at MPPT	8.15 A
Array Data	
Parallel cells	1
Series connected modules per string	8
BESS Data	
Nominal voltage	240 V
Rated capacity	40 Ah
Battery type	Lithium-ion
EV Battery Data	
Nominal voltage	240 V
Rated capacity	7 Ah
The initial state of charge	9 %
Battery type	Lithium-ion
Boost Converter Data	
Switching frequency	10 kHz
Capacitance	4.0704 µF
Inductance	0.0153 H

Control methodology

ANFIS

An adaptive neuro fuzzy interface system is a network that mimics the behaviour of the neural and fuzzy inference systems. This doesn't have synaptic weights and will have only adaptive and non-adaptive nodes. It is simply converted into typical feed forward neural network and hence the name adaptive network[9]. Its structure is similar to the adaptive Takaji-Sugeno fuzzy network emulator. The input and output parameters of the ANFIS network are referred as linear and non-linear parameters.

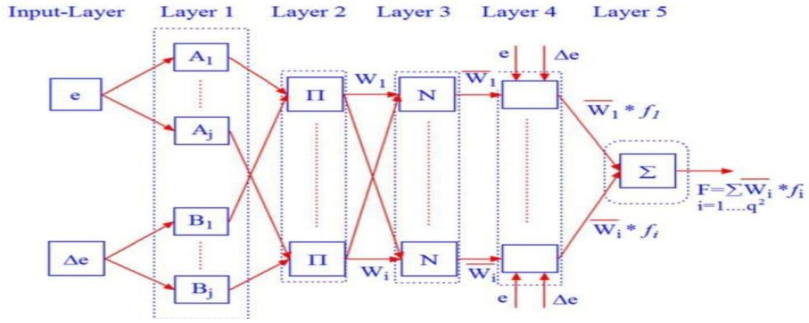

Figure 2: Five-layer ANFIS structure

Figure 2 depicts the five-layer ANFIS structure. The antecedent and succeeding parts are the two primary sections of the neural network.

Layer 1: Node 1 in this layer is called adaptive node and non-linear parameters of ANFIS network are the parameters of this layer. Here e and delta e are the layer 1 inputs. A_i and B_i are the membership functions of each node. Generally, the input variables are distributed using gaussian member ship function for each node.

Industrial Engineering Journal
ISSN: 0970-2555
Volume : 53, Issue 4, No. 1, April : 2024

Layer 2: It contains a fixed node with the nodes output coming from the product of layer 1 node signals. The output of each layer 2 node determines the rule base's firing strength.
Layer 3: This layer node is denoted by letter "N" and is referred to as fixed node. Its output is calculated by dividing each nodes value by the sum of all node values.
Layer 4: This node is flexible. During the learning phase the parameters of this layer are modified using least square approach.
Layer 5: This layer has a fixed node and is called as output layer. The output of this layer is calculated using weighted average technique.
A hybrid technique is used to update the non-linear and linear parameters of layer 2 and layer 4. This hybrid approach converges significantly faster than conventional back propagation algorithms[10,11].

Maximum power point tracking with ANFIS PI controller:

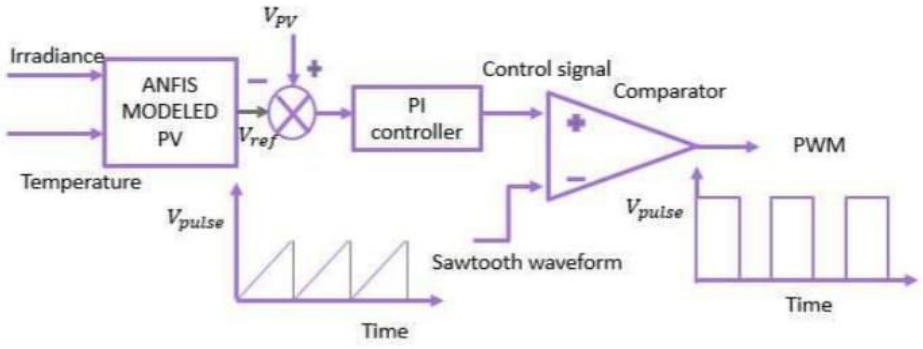

Figure 3: ANFIS voltage control MPPT

ANFIS is used to create a solar PV system model which is identical to the original MPPT structure. ANFIS is trained with two inputs (irradiance and temperature) and a single output voltage. The ANFIS systems output is taken as reference output and is compared with real PV voltage to generate error. The PI controller processes the error voltage and duty cycle is produced for PWM generator. Later PWM generator generates pulse for DC-DC boost converter to extract maximum power from solar array.

Neural network based AC grid:

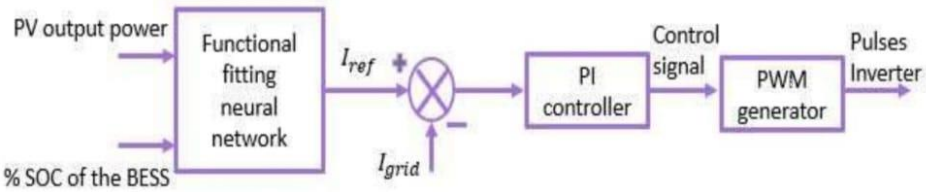

Figure 4: Block diagram of neural network

Figure 4 shows the trained neural network model for AC grid. The output power of PV array and SOC of the BESS are taken as inputs to build functional fitting neural network. The reference current is taken from neural network and is compared to grid current to produce error. The PI controller processes the error and gives a control signal to PWM generator to produce duty cycle for inverter.

Operating modes of charging station

The five modes of operation of neural network based electric vehicle charging station is detailed below:
Mode 1: in this mode EV battery is charged by PV array. Here the temperature is kept constant and the panels irradiance is changed and ANFIS voltage control method is used to extract maximum voltage.
Mode 2 : EV battery and BESS are charged using solar power by operating PV panel at MPPT by ANFIS and when BESS is connected to a DC bus.

Industrial Engineering Journal
ISSN: 0970-2555
Volume : 53, Issue 4, No. 1, April : 2024

Mode 3: both solar power and BESS are used to charge EV battery with a variation in irradiance. ANFIS ensures the highest amount of power extracted from solar array.
Mode 4: when the output of the PV array is zero during night, EV battery and BESS are charged using AC grid. The power flow from the AC grid is controlled by functional fitting neural network.
Mode 5: charging the EV battery by connecting BESS, AC grid and solar PV array and irradiance and temperature of the PV array is varied. Excess electricity is fed to AC grid.

IV. CONCLUSIONS

Many people are switching to solar since a solar system reduces electricity costs and protects the environment from carbon emissions. The grid-connected solar system is widely used for its various benefits. Although it has a few disadvantages, its benefits outweigh the cons. The solar power system enables the power system to provide electric grid with clean power that meets the utility grid power requirements and can be used for electric vehicle charging. PV cell, module and array are simulated and effect of environmental conditions on their characteristics is studied. Solar PV energy system with three phase grid connected electrical vehicle charging station has been studied and simulated. Both the systems are integrated and the solar PV system is used for battery charging and discharging. Number of expected vehicles doubling on the road in the near future increase the need for this alternative energy with evident and promising returns. This will lower our toxic emissions and localize greenhouse effects and increases the overall energy efficiency of vehicles. With the growing number of electric vehicles on the road, EV charging has become major issue. A charging station powered by PV array combined with a (BESS) battery energy storage system and a promising approach is enhanced by a grid support. By maintaining a steady DC bus voltage, the desired power can be obtained. The proposed station's power management is discussed and validated using MATLAB/Simulink in five distinct modes. This can be implemented with a significant power rating and capacity of power supply EV charging station at work.

EFFICIENT TECHNIQUES TO MITIGATE PACKET LOSS IN MANETs

Mr. B. Purushotham
Dr. Ch. D. V. Subba Rao

About the Authors

Mr. B. Purushotham
B.Tech, M.Tech, Ph.D

Mr. B. Purushotham has been working as Assistant Professor in the Dept of CSE, Annamacharya Institute of Technology and Sciences, Tirupati. He received B.Tech (CSE) from J N T University, Hyderabad in 2005 and M.Tech (CSE) from Sri Venkateswara University College of Engineering, Tirupati in the year 2007. Completed Ph.D (CSE) from Sri Venkateswara University College of Engineering, Tirupati. He has 15 years of teaching experience. He guided 26 B.Tech projects and 14 M.Tech theses. His areas of interests are Mobile Ad Hoc Networks, Computer Networks, Cloud Computing and Operating Systems.

Dr. Ch. D. V. Subba Rao
ME, PhD, FIETE, FIE

Prof. Ch. D. V. Subba Rao has been working as Professor in the Dept of CSE, Sri Venkateswara University since 1992. At present he is serving as Chairman, Board of Studies in CSE, S V University. Earlier he worked as a faculty in NIT, Warangal during 1991-92. His areas of interests include Distributed Systems, Peer to Peer Systems, Wireless Networks, and Advanced Computing. Prof Rao is a Fellow of IETE, New Delhi, Fellow of IE (India) Kolkata and senior member of CSI/New Delhi, ISTE/New Delhi, IAENG/Hong Kong, IACSIT/Singapore. He published 77 papers in International/ National Journals. His publications appear in IEEE, ACM, Elsevier and Springer digital libraries. He guided 7 PhD theses and 38 MTech theses and the work of 6 PhD theses are in progress. Prof Rao visited Austria, Hong-Kong, Netherlands, Belgium, Thailand, Germany and Singapore on academic works. He chaired the sessions of International Conferences viz. IEEE, IAENG and IASTED held in Austria, Hong-Kong and India. He served as Head, Dept of CSE (for two terms), Officer-in-Charge, Computer Centre of SVUCE and Coordinator, MSIT Program. He received 'Rashtriya Gaurav Award' from IIFS/New Delhi in 2011. His technical paper bagged best paper award in IAENG International Conference, Hong-Kong in 2008. Dr Rao is a recipient of DTA Excellence Award from the prestigious Delhi Telugu Academy (DTA), New Delhi in 2015.

Abstract

By 2030, pancreatic ductal adenocarcinoma is predicted to be the second most common cause of cancer deaths. In pancreatic cancers, T-cell numbers are limited in the tumor microenvironment without eliciting any anti-tumor activity. Recent studies showed that triggering T-cells to elicit anti-tumor activity may provide better outcomes in immunologically cold cancers like pancreatic cancer. To improve the outcome in a 5-year survival period of a pancreatic cancer patient, the identification of factors downregulating T cell activity in the tumor microenvironment plays an important role in the development of effective translational therapy. In this review, we summarized the role of T cells and their phenotypes in pancreatic cancer progression and pathogenesis, mechanisms behind T-cell exhaustion, and T-cell-based immunotherapies to understand the factors involved in T cell inactivation are crucial for the development of effective translational therapies.

Prof. T. Damodharam, joined the University service as Assistant Professor in Environmental Science in 1999 and promoted as Associate Professor in the year 2008 then promoted as Professor in the year 2014. At present heading the Department of Environmental Sciences. Research areas pollution monitoring, biodiversity conservation, environmental impact assessment and environmental toxicology and specialized in plant physiology. Published 61 research articles in reputed journals and authored one book and two book chapters. Guided six students for M. Phil., and sixteen students for Ph.D. Completed two MRP projects funded by UGC-New Delhi and one BRNS-DAE Collaborative project. Visited Srilanka for attending a seminar and awarded with Doctor of Science (DSC) from University of Colombo in 1997. Organized three National Seminars, one National Workshop, two Regional Seminars and one Webinar. Co-ordinator for two Refreshers courses in environmental studies in 2018 and 2019. Member of the Directorate of Community Development Cell of the University and Life member in ISCA, Kolkata. Presently acting as NSS Programme Co-ordinator for Sri Venkateswara University, Tirupati.

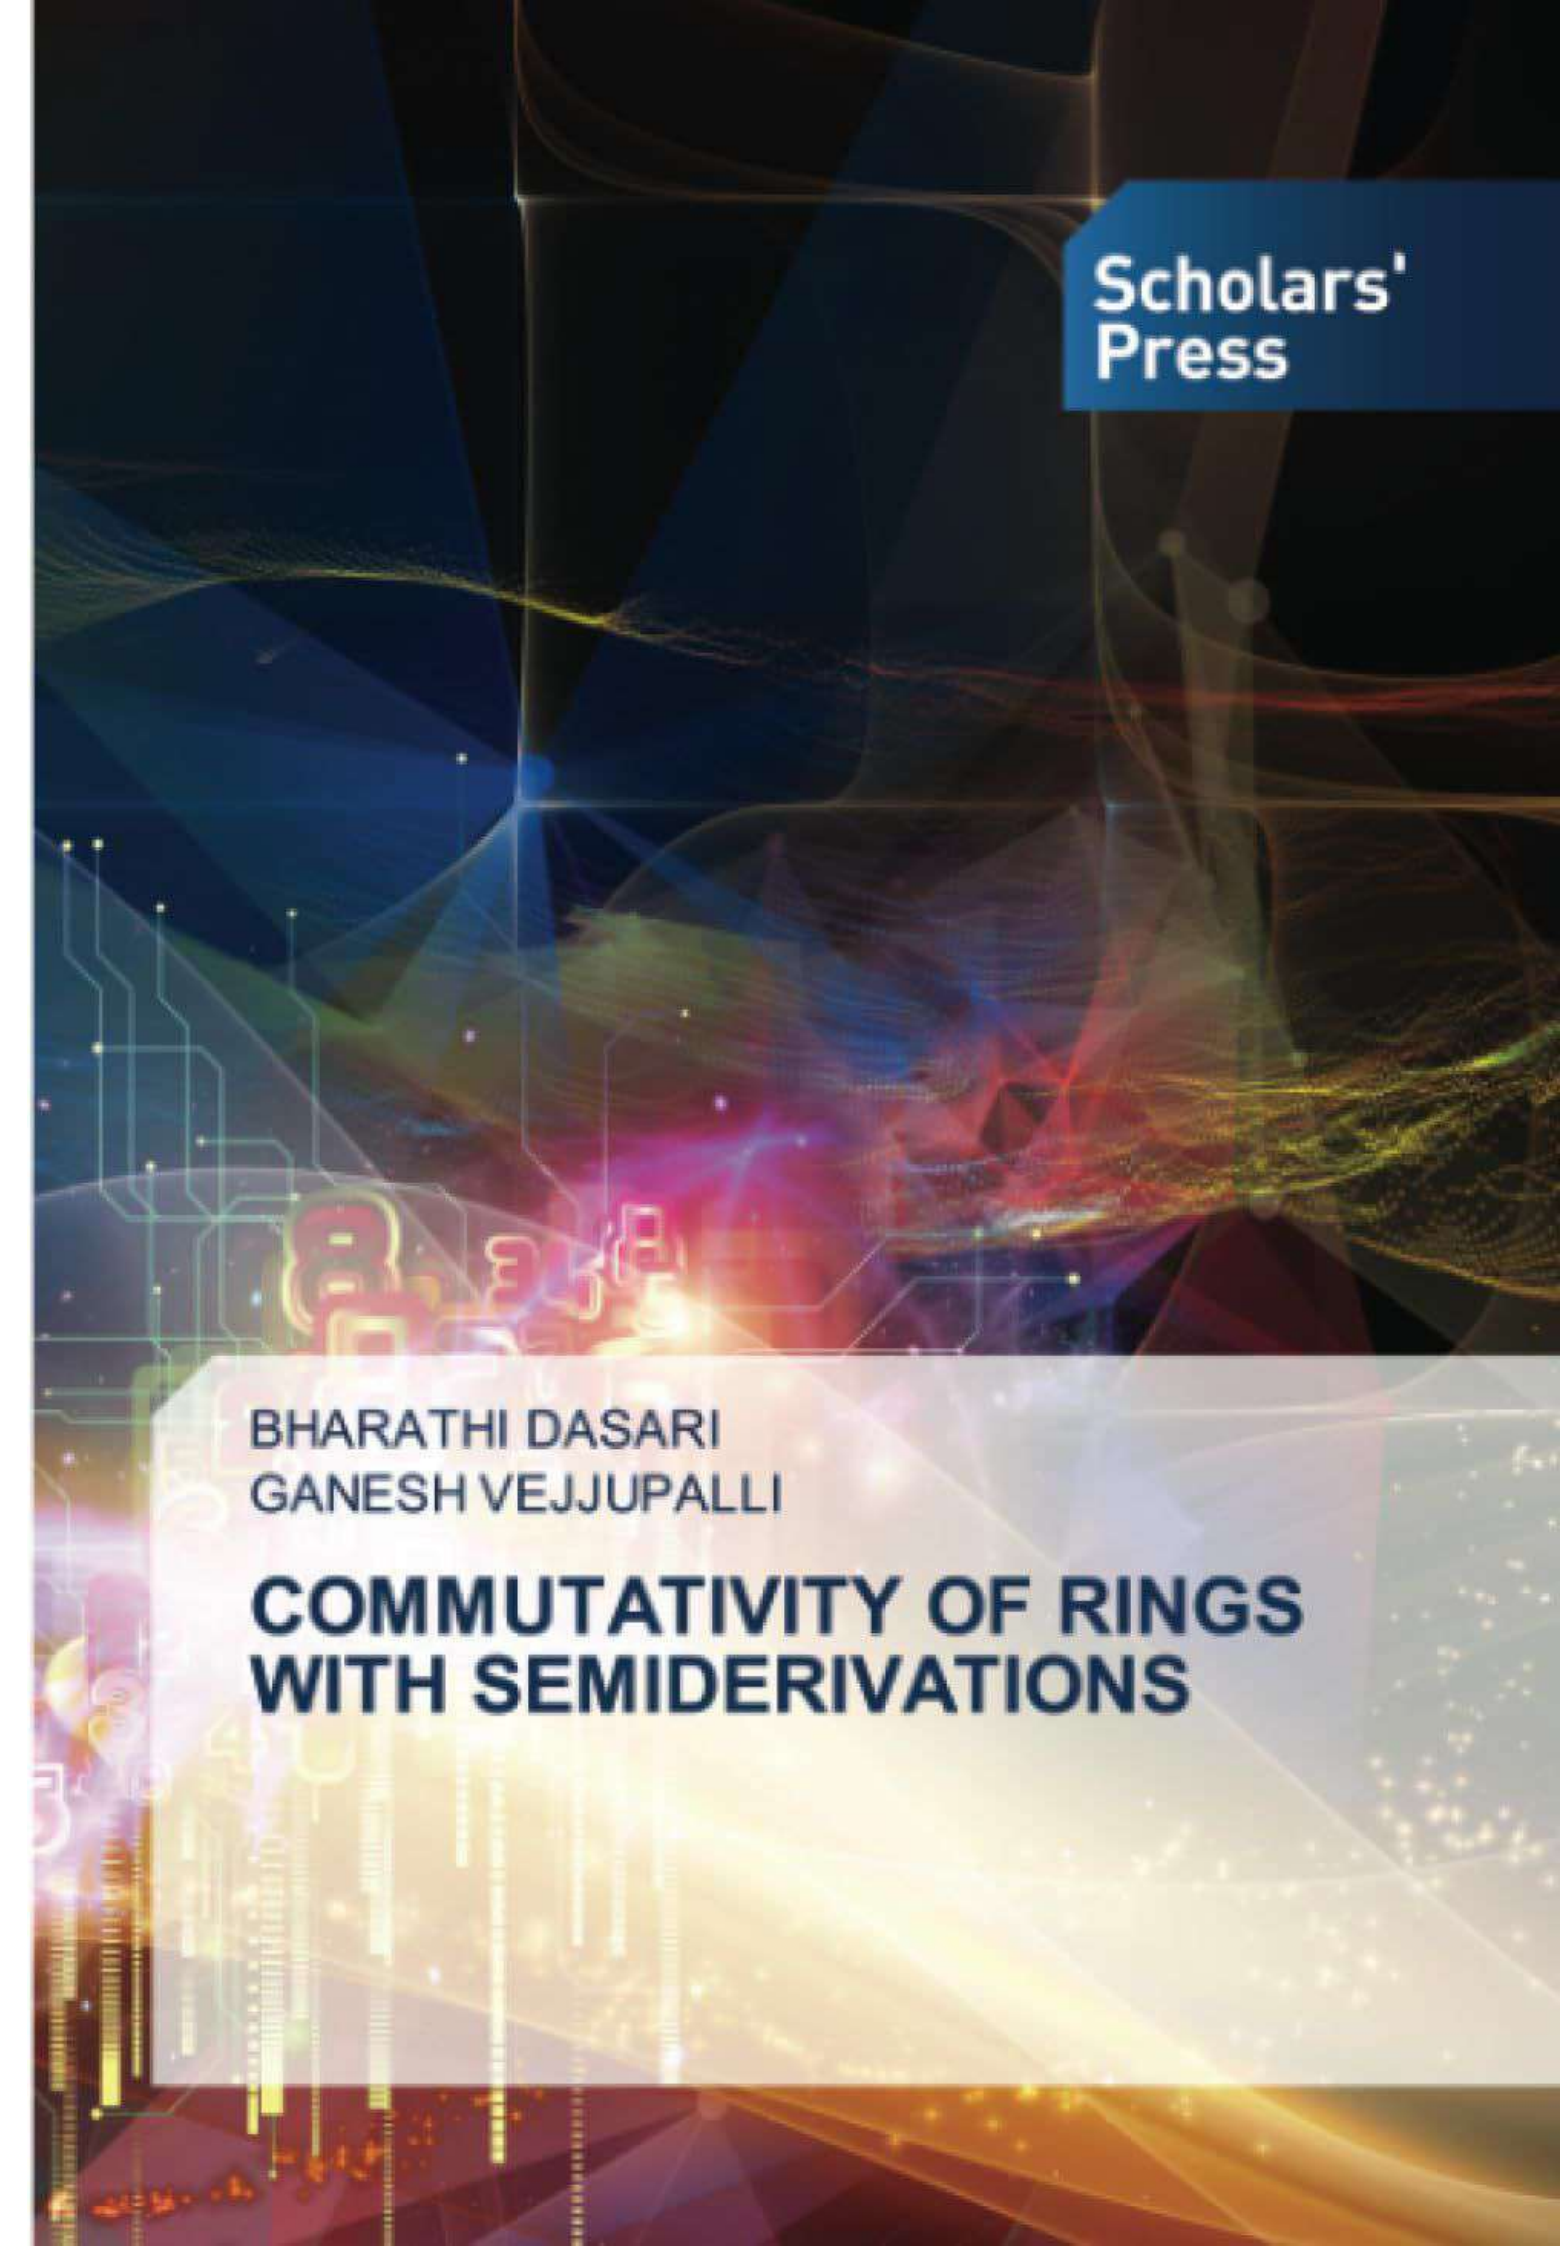
Abstract



India can create over $1 trillion of economic value from the digital economy in 2025, with half the opportunity originating in new digital ecosystems that can spring up in diverse sectors, says a report from Ministry of Electronics and Information Technology, in partnership with McKinsey. "The trillion dollar economy report is the symbol of opportunity that India offers," said Ravi Shankar Prasad, Minister of Information Technology. "Digital India is also an opportunity for people in digital space to do business in India. The size and scale that India offers is a big business opportunity for global companies," he added. 'Digitization' and 'digitalization' are two conceptual terms that are closely associated and often used interchangeably in a broad range of literatures. Digitization refers to "the action or process of digitizing; the conversion of analogue data into digital form." Digitalization, by contrast, refers to "the adoption or increase in use of digital or computer technology by an organization, industry, country. "Digital India is the beginning of digital revolution. It is a dream which is created by the Government of India to ensure that government services are made available to citizens electronically, even in remote areas, by improving online infrastructure and by increasing Internet connectivity. The programme have one mission and one target that is to take nation forward digitally and economically. The initiative will enable people to get engaged in the innovation process which is needed by the economy to move forward. If implemented properly, it will open various new opportunities for the citizens of the country. Currently, India's digital economy generates about $200 billion of economic value annually 8 per cent of India's GVA in 2017-18 largely from existing digital ecosystem comprising information technology and business process management (IT-BPM), digital communication services, e-commerce, domestic electronics manufacturing, digital payments, and direct subsidy transfers, the report said. "By 2025, India could create a digital economy of $800 billion to $1 trillion. The existing digital ecosystem could

COMMUTATIVITY OF RINGS WITH SEMIDERIVATIONS

In the theory of rings, the study of commutative rings has evoked great interest and assumed importance. In particular, the study of derivations, generalized derivations, semiderivations in rings has yielded many interesting results. These results have applications in other branches of algebra. Throughout this work a ring R is a synonym for an associative ring. In this work we present some properties of semiprime rings, prime rings, semiprime rings, 2 – prime rings which admit semiderivations and Generalized semiderivations. Prime rings with Left Generalized semiderivation We prove the commutativity of rings using the semiderivations and also we use symmetric bi-derivation or permuting tri-derivation instead of derivation in addition of Jordan generalized derivation.

Dr. D Bharathi, Professor is working in the department of Mathematics, Sri Venkateswara University, Tirupati, A.P. Dr. D.Bharathi is teaching Algebra, Commutative Algebra, Partial Differential Equations, Functional Analysis and Graph Theory to Post Graduate students and guiding research work to Ph.D students on Algebra, Graph Theory.

COMMUTATIVITY OF RINGS WITH SEMIDERIVATIONS

AQUACULTURE ADVANCES IN NANOTECHNOLOGY

Dr. P. Nagajyoti
Department of Aquaculture
S.V. University, Tirupati

Abstract

Aquaculture is one of the fastest rising sectors in the world today. An Aquaculture system is diversified as fresh, brackish and marine water culture systems. The growth of aquaculture as an industry has accelerated over the past decades, this has resulted in environmental damages and low productivity of various crops .The need for increased disease resistance, growth of aquatic organisms, and feed efficiency has brought about the use of probiotics in aquaculture practices. The first application of probiotics occurred in 1986, to less their ability to increase growth of hydrobionts (organisms that live in water). Probiotics were used to improve water quality and control of bacterial infections. Now a day there is documented evidence that probiotics can improve the digestibility of nutrients, increase tolerance to stress, and encourage reproduction. Currently, there are commercial probiotic products prepared from various bacterial species such as Bacillus sp., Lactobacillus sp., Enterococcus sp., Carnobacterium sp., and the yeast Saccharomyces cerevisiae among others, and their use is regulated by careful management recommendations. The present paper shows the current knowledge of the use of probiotics in aquaculture, its antecedents, and safety measures to be carried out and discusses the prospects for the study in this field.

Introduction

"Nanotechnology is dealing with specific size dependent functional properties of the individual sub-units or of a system of those". Nanotechnology is the future big excitement in the field of Science and Technology.

Nanotechnology manipulates matter at the nanoscale (1-100 nm) (Moore, 2006 and Nel *et al.*, 2006) producing nanoproducts and nanomaterials (NMs) that can have novel and size-related physico-chemical properties differing

significantly from those from larger particles. Recently, anthropogenic sources have also produced nano-sized materials unintentionally from combustion by- products and intentionally as manufactured nanomaterials. Nanotechnology is undoubtedly one of the most important technologies of the 21st century. With an estimated $147 billion worth of so-called 'nano-enabled' commercial and consumer products sold in 2007 and a projected value of $3.1 trillion by 2015. Nanotechnology has been referred to as the next industrial revolution (Schmidt, 2009). This technology promises scientific advancement for many sectors such as medicine, consumer products, and energy. Governments and investors around the world are therefore keen to explore and exploit the exceptional properties of nanomaterials opportunities which exist within nearly every industrial and technological sector.

Nano–Concept and History

Nanotechnology is defined as the "design, characterisation, production and application of structures, devices and systems by controlling shape and size at nanometre scale" (Williams *et al.*, 2005). In principle, therefore, any product using compounds that exist as, or are manufactured to, these specifications can be considered as nanomaterials.

Table 1: Comparison of sizes of biological molecules and structures in nanometers (Gupta and Kompella, 2006)

Object	Size (nm)
Carbon atom	0.1
DNA double helix (diameter)	3
Ribosome	10
Virus	100
Bacterium	1,000
Red blood cell	7,000
Human hair (diameter)	80,000

General Vo Nguyen Giap renowned for the victories, over France and the United States, in the heroic national struggle for liberation and unification of the country. He was a self-trained military commander, who went on to become one of the Vietnamese heroes and great personalities of the World. General Giap adopted both unconventional and guerrilla warfare tactics in which he preferred to lay new organizational policies and strategies. Taking an experimental approach, he blended local talent and resources and used his practical insight and patriotism to bring triumph to the country as a brilliant military strategist and savvy leader. It was his military genius as well as his gradual plan to bring liberation, paved the way for the reunification of Vietnam.

Dr. M. Prayaga is Director and Associate Professor, Centre for Southeast Asian and Pacific Studies, Sri Venkateswara University, Tirupati. He was the recipient of Prof. Saiyid Nurul Hassan's Prize in 1989 for his First Rank in M.A. History. He qualified the UGC- Junior Research Fellow & UGC-Lectureship. In addition to securing M.Phil. and Ph.D. degrees on topics concerning the contemporary Vietnam, his areas of research include International Relations, Indo-Pacific, India-ASEAN relations and India-Vietnam Studies. He has been teaching Southeast Asian History, Politics and Tourism to the Post-Graduate students. Dr. Prayaga has Two books and 28 articles to his credit and attended more than forty five National and International Conferences/ Seminars. Dr. M. Prayaga visited Malaysia, Singapore, Thailand, Indonesia and Vietnam for his field work, attending conferences and to deliver lectures. Institute of Strategic and International Studies (ISIS), Malaysia, had granted Internship to conduct research. He is the Editor for the periodical, *Area Studies: A Journal of International Studies and Analyses*. He is also a reviewer for journals. He is a member of BOS in S.V. University and Rashtriya Sanskrit Vidyapeetha, Tirupati, University of Madras as well as member in a number of professional bodies.

Editor
Lt. Dr. M.Venkataramanaiah

About the Editor

Lt. Dr. Venkataramanaiah Malepati is a top- notch academician, presently working as an Assistant Professor in Commerce at S.G.Government Degree and PG College, Piler. He has obtained his M.Com, MBA, M.Phil and Ph.D. from S.V .University, Tirupati and MBA from Pondicherry University. He has got through National Eligibility Test (NET) in Commerce and Management and SET in Commerce with distinction. He has bagged National Merit Scholarship in Graduation and Gold Medal in M.Com. He has also bagged Centrally Administrated Doctoral Fellowship from ICSSR, New Delhi for his research during 2010-13. Dr. Malepati has the rich experience of 18 years in both teaching and research. Being the passionate researcher and teacher, he traveled widely and tried out his wings in various positions in teaching across the countries. Dr. Malepati started his career as a lecturer in Dravidian University. Later he rendered his services in various capacities in the Premier Institutions like University of Gondar, Ethiopia, KMM Group of Institutions, Tirupati, Vignanasudha Institute of Management and Technology, Chittoor, University of Kurdistan, Iraq and Golden Valley Group of Institutions, Madanapalli. Being the top-notch researcher, he contributed significantly to the areas of Capital Markets, Agri Finance, MSMEs and Micro-finance. To his credit, there are 41 research papers published in National and International Journals listed in UGC Care List, Scopus Indexed and Web of Sciences. He has also been credited with four chapters in Edited Books. In addition to these, he has also 10 completed Edited Books and one edited book in the pipeline to his credit.

ABSTRACT

Gig Economy is identified as a pattern of work engagement where there is a consumer or service speaker, on one hand, reflecting demand for a particular task while on the other end is a gig worker who can work for a specific period and provide the required work. The development of the tech-enabled platforms contributes to connecting the consumer to the gig worker wherein the former can hire services from the latter based on a fixed period. The gig workers include people of different categories like self-employed, freelancers, part-time workers and also independent contributors. India's gig economy has fundamentally changed the perception of education today. The idea of continuing education is not just to get a degree or certificate that will only add weight to your resume, but to acquire the various industry skills you need to get a job. The growth of social commerce in the country is positively impacting employment opportunities for millions of gig workers. According to a 2019 World Bank report, digital platforms are scaling faster and cheaper than traditional businesses. The penetration of online retail in the report's year was 4.7%. It is expected to reach 10.7% by 2024. India has emerged as one of the largest flexible staffing countries in the world. Simply put, gig jobs have simplified the country's employment landscape and changed its structure for the better. However, in the gig economy, freelancers have to be self-sufficient in their learning. They have to decide what knowledge they lack, where to get it, how to fit their day, and how to pay for it. Free options (as in MOOCs and other online opportunities) are growing in popularity. The flexibility, availability, and constraints of scheduled courses appeal to motivated learners. Gig workers earn money based on their performance on specific tasks rather than focusing on earning a set salary.

Keywords: *Gig economy, Gig workers, Education, and Startups.*

Introduction

Gig employment is considered to be the major source of income in markets like the United States, Germany, Sweden, the United Kingdom, and Spain, however, it is considered to be a secondary or alternative source of income in nations like India and Brazil. Future gig economy developments in the latter will include the introduction of new occupations and skills, expanding talent gaps, adjustments to legal requirements, and shifting attitudes concerning labour itself.

Over three million successful gig workers, such as contract workers in transportation, logistics, construction, and home-based services, are employed informally in India, but COVID-19 has sparked an increase in this industry. The country's gig economy, which ASSOCHAM-India estimates will grow at a compound annual rate of 17% to reach $455 billion by 2023, has the potential to support up to 90 million jobs in India's non-farm sectors (roughly 30%), transact over $250 billion in a volume of work, and contribute 1.25% to the country's gross domestic product (GDP) over the long term. Nearly 24 million employments in skilled, semi-skilled, and shared services professions can be created in the short- to medium term, according to studies by BCG and the Michael & Susan

Abstract

The words "gig economy" has attracted wide attention from both scholars and the popular media. Much of this attention has been devoted to jobs worked through various online platforms. The new technology is producing an accelerated pace of change in the organization of work which has developed interest to know how these changes might affect both workers and firms. Gig economy is an approach in the labour market which is characterized by the prevalence of short-term contracts or freelance work in contrast to permanent jobs. The gig workers are independent workers or temporary contract workers who enter into formal/informal agreements with on-demand companies to provide their services. Rather than employing full-time/permanent employee's companies may utilize gig workers as per the demand and work burden, which can minimize the costs incurred in managing permanent employees. However,this paper provides a technology of work arrangements and reviews how different arrangements, and especially role of gig technology in hospitality, travel and tourism, banking, insurance, health care, logistics, education etc are captured in existing data.

Purpose:The purpose of this study is to identify role,Prospects and importance of gig technology on hospitality, travel and tourism, banking, insurance, health care, logistics, education and leadershipetc., and the issues involved.

Keywords: Hospitality, travel and tourism, banking insurance, health care, logistics and education, Prospects, gig economy.

I. INTRODUCTION

By upgrading or augmenting skills, equipping modern tools for better efficiency, people at gig jobs can earn more, some becoming even micro-entrepreneurs.India is experiencing a seismic shift in its work culture today. Young people don't want to be stuck in jobs where they have to work long hours for minimal pay. These individuals are finding sustainable employment opportunities in the country's rapidly growing gig economy. Some more aspirational are becoming micro-entrepreneurs.India has always had a large reserve of informal gig workers. The pandemic pushed a lot of them out of work. Just between March and April 2020, CMIE data showed that a whopping 113.6 million people lost their jobs.As people went searching for new jobs, with many industries being down in the doldrums, the gig

ABSTRACT

The financial addition of women is particularly important for gender equivalency and women's profitable commission. With lesser control over their financial lives, women can help themselves and their families to come out of poverty; reduce their threat of falling into poverty; exclude their exploitation from the informal sector; and increase their capability to completely engage in measurable and productive profitable conditioning. Social Justice remains a vital foundation of our constitution. Within the contradiction of development and justice, one shouldn't ignore the core liabilities of the state. As far as development is solely concerned, on- state actors are sufficiently equipped with the coffers and wherewithal to carry out experimental conditioning, still more sustainable addition can only be realized with the intervention of the state.A practicable policy armed with inclusive growth is the need of the hour and the present government is successfully executing several schemes and programmes on this premise.India has traditionally defended colourful chops and crafts similar to shoe timber, embroidery, polishing, handlooms, etc. In the area of Skill Development, one must evolve ways to match the chops sets amongst citizens with the ever-adding demands of the globalized world.National Strategy for Financial Addition for India 2019- 2024 has been prepared by RBI under the aegis of the financial Addition Advisory Committee and is grounded on the inputs and suggestions from the Government of India, other Financial Sector Controllersviz., Securities Exchange Board of India (SEBI), Insurance Regulatory and Development Authority of India (IRDAI) and Pension Fund Regulatory and Development Authority of India (PFRDA).

FINANCIAL INCLUSION

Financial inclusion is decreasingly being honoured as a crucial motorist of profitable growthand poverty relief the world over. Access to formal finance can boost job creation, reduce vulnerability to profitable shocks and increase investments in mortal capital. Without acceptable access to formal financial services, individuals and enterprises need to calculate on their limited coffers or calculate on expensive informal sources of finance to meet their financial requirements and pursue growth openings. At a macro position, lesser financial addition can support sustainable and inclusive socio-profitable growth for all. There has been a growing substantiation of how financial addition has a multiplier effect in boosting overall profitable.

A STUDY ON INITIATIVES TAKEN BY THE CENTRAL GOVERNMENT TO ACHIEVE FINANCIAL INCLUSION

ABSTRACT

Being a welfare country, one of the prime objectives of government policy in India has been to enable financial inclusion and to reduce poverty through interventionist public policies. One such approach is the Direct Benefits Transfer (DBT) initiative. Various government programmes such as loans at low interest rates, subsidies and other various incentives for startup entities entitlements, student scholarships, and wages for MGNREGA workers fall under the DBT initiative where the money is transferred to the respective beneficiaries' bank accounts. However, the beneficiaries face many hurdles in accessing their money. For example, in rural areas, beneficiaries have to travel miles and wait for several hours to make one banking transaction. These hurdles are broadly referred to as "last mile challenges". These challenges have widened the distance between the rights holder and their entitlements, which must be urgently resolved. An all-inclusive financial system is essential because it enhances efficiency and welfare by providing scope for secure and safe saving practices and by facilitating a wide range of efficient financial services. The present study will focus on the opportunities of financial inclusion in India.

KEYWORDS: Finance, banking habits, rural areas, financial inclusion.

INTRODUCTION - LENDING POLICIES AND GUIDELINES (LPG)

BACKGROUND

National Safai Karamcharis Finance & Development Corporation (NSKFDC) is a wholly owned Govt. of India Undertaking under the Ministry of Social Justice & Empowerment, set up on 24th January 1997 as a Company "Not for Profit" under Section 8 of the Companies Act, 2013. It is in opera the all round socio-economic upliftment of the Safai Karamcharis (including wastepickers), Manual Scavengers and their dependants throughout the Country through its various loan and non implemented through State Channelizing Agencies (SCAs) nominated by the State Governments & Regional Rural Banks (RRBs)/Public Sector Banks (PSBs) and the Skill Development Training Programmes (SDTP) are implemented through Govt. Sector Training Institutions across the Country.

OBJECTIVES

The major objectives of the Corporation as per Memorandum and Articles of Association are as under:-

Abstract

The concept of Financial inclusion started in 2005 in India by RBI, presently its importance is rapidly increasing in making India to be one of the best growing economies of the World.

Financial inclusion is essential for sustainable social development as it provides individuals and communities access to formal financial services, such as savings accounts, pensions, micro credit and insurance in an affordable manner.This enables them to manage their money effectively, build assets, and protect themselves against risks. Financial inclusion also promotes economic growth by increasing productivity and employment generation. This paperconcentrates on the importance of role of financial inclusion in sustainable social development and the challenges that need to be addressed to achieve it. This paper also providesan insight on therole of technology in promoting financial inclusion and the potential of innovative solutions, such as digital finance and mobile money, to reach underserved populations. Ultimately, financial inclusion is crucial to creating a more equitable and just society, where everyone has the opportunity to participate in and benefit from economic growth.

Keywords: Financial inclusion, Sustainable social development, Economic growth, Productivity, Job creation, Mobile money, Underserved.

INTRODUCTION

Financial inclusion is a critical component of sustainable social development. Financial inclusion is a key enabler in reducing poverty and boosting prosperity. Access to basic financial services enables the less fortunate and more vulnerable in the society to step out of the vicious cycle of poverty and empower themselves and their families.

Despite of the benefits of financial inclusion, however, millions of people worldwide remain excluded from formal financial systems. The lack of access to financial services often results in lower incomes, reduced economic opportunities, and limited ability to save and invest ineducation, healthcare, and other critical needs.

Few schemes such as SWABHIMAN, Atal Pension Scheme, Pradhan Mantri Mudra Yojana, Pradhan Mantri Jan Dhan Yojana, Ayushman Bharat were launched as a part of contributionand meeting the Sustainable Social Development in India.This paper will explore the importance of financial inclusion for sustainable social development, highlighting the benefits and challenges in achieving it.Finally, this paper deals with the potential of financial

M.Com., MBA., M.Phil., Ph.D., PGDCA
Professor & Head, Department of Commerce
Sri Venkateswara University, Tirupati – 517502
Andhra Pradesh, India

Prof. M.Venkateswarlu was born in Karavadi Village, Prakasam District. He obtained B.A. (AES) Degree in 1985, M.Com. Degree in 1987, M.Phil. Degree in the year 1990 and Ph.D. Degree from S.V. University in the year 1994. He was appointed as Lecturer in S.V.University, Tirupati in October 1992, was promoted as Associate Professor in 2001, and subsequently, became Professor in 2009. He got his PGDCA and MBA Degree's in the years 2011, and 2013 respectively. He is having 30 years of P.G. teaching experience, 07 M.Phil. Degree's, 25 Ph.D. Degree's and 10 Post-Doctoral Fellows under his able guidance. He has published 11 books. He has published 147 articles in various reputed National and International Journals. He has attended 53 National and International Conferences and also attended 16 online Webinars.

He has completed one UGC MRP and one ICSSR Research Project. He has organized two National Seminars and also worked as Co-ordinator for M.Com (A&F) Course. He is a Member of the Board of Studies at Davanagere University and Bangalore North University. He is an editorial board member for SELP Journal in Tiruchirapalli. He is a life member of professional bodies like the All India Commerce Association and All India Accounting Association. He worked as a Director, Directorate of Admissions (DOA) at Sri Venkateswara University, Tirupati from 01-01-2020 to 07-05-2021. He worked as BoS, Chairman (PG) from 01- 06-2021 to 11-08-2022. At present he is Head, Department of Commerce, Sri Venkateswara University, Tirupati. He received Andhra Pradesh Best Teacher Award on 05-09-2022 from the Chief Minister Sri Y.S. Jaganmohan Reddy.

Effect of Ultrasound in the enhancement of Protein Metabolism and Enzyme Activities in the Fat body of Fifth Instar Silkworm, *Bombyx mori L*.

P. Naga Jyothi [a*]

DOI: 10.9734/bpi/rabs/v7/1584B

ABSTRACT

Under the influence of ultrasound, protein metabolism parameters such as total, soluble proteins, free amino acids, and activity levels of protease, glutamate dehydrogenase, aspartate amino transferase, and alanine aminotransferase were measured in the fat body of the fifth instar larva of the silkworm, Bombyx mori. On these parameters, ultrasonography generally has an elevating effect. The events of histogenesis and histolysis connected to the metamorphosis of the silkworm are correlated with changes in the levels of certain biochemical components. Under the impact of ultrasound, the metabolism of proteins is accelerated, resulting in increased spinning activity, increased protein turnover in silk, and increased sericultural production. Enhancement of proteins by ultrasound clearly documented the induction of severe proteolysis and transamination of amino acids.

Keywords: Amino acids; aminotransferases; glutamate dehydrogenase; protease.

1. INTRODUCTION

All living cells require proteins as a fundamental building block. Protein metabolism is a representation of life itself if carbohydrate metabolism is life's energy source. In essence, proteins are in charge of preserving the structural and functional structure of cells. They are essential for breathing, enzyme catalysis, material transport, and the control of metabolism, mobility, and body defence. The total protein content of the cell includes both structural and soluble portions, of which the former plays main role in cellular architecture and the latter in cellular metabolism.

Proteins have always been an interesting biochemical tool for insect biochemists because of their prominent role in development, morphogenesis and the intermediary metabolic pathways in insects. Mihaeslu et al. [1] observed biochemical difference in the eggs of *Bombyx mori* and *Philosamia ricini* with regard to their total proteins and amino acids. The first ever observation on insect haemolymph proteins was made by Lauffer [2] in the silkworm *B. mori.* Subsequently a series of detailed physico-chemical studies on haemolymph proteins of B*. mori* appeared [3].

Tojo et al. [4] made a detailed account of storage proteins while Sasaki et al. [5] investigated the intracellular transport and secretion of fibroin in the posterior fat body of *B. mori.* A novel approach in silkworm research is the manipulation of biochemical machinery through exogenous modulators that could boost the silk production. The development of the worm is depending on metamorphosis process which is a dynamic biochemical process [6]. The growth of silkworm during metamorphosis is accompanied by the increase in the bodyweight and accumulation of various biochemical constituents like proteins, aminoacids and enzymes like proteases, glutamate dehydrogenase and aminotransferases [7]. Since, the silkworm is an economically important insect, several insect physiologists attempted to elucidate the role of biochemical constituents in silk protein synthesis and egg formation [8]. More importantly, the parameters of protein metabolism have been extensively examined because of their role in development, morphogenesis and in the intermediary metabolism [9,10]. A novel approach in silkworm research is the manipulation of biochemical machinery through exogenous modulators that could boost the silk production. This obviously, included the administration of certain neuro-humoral factors, vertebrate hormones and various other chemicals like cyclic AMP and prostaglandins, which could have a profound influence on the growth rate, larval life cycle and fecundity [11,12]. Significantly, the positive impact of vertebrate thyroxine on silkworm biology, especially in improving the pre- and post cocoon parameters is well documented [13]. Another vertebrate hormone, namely prolactin induced improvement in the growth and reproductive potential of silkworms [12]. The dietary administration of vertebrate sex hormones like ethynyl estradiol and norethindrone to the silkworm increased the larval weight, cocoon and shell weights, female pupal and adult weights, but the larval, pupal periods and the egghatchability were significantly reduced [14]. Studies on protein metabolism are considered most important in silkworm physiology because of its vital role in the determination of chemical characteristics of silk proteins [15,16].

These investigations opened up alternative strategies for improving the economic parameters of the sericulture industry by regulating the biochemical machinery. One such option is the ultrasound, whose impact on larval life in Drosophila has been reported [17]. Further, it was reported that ultrasound irradiation does not cause any detectable deterioration in behavioral responses such as mating, oviposition, larval development and pupation in insects [18]. In view of its harmless nature, ultrasound has been used as an exogenous modulator in the present investigation for the manipulation of protein metabolism in the fat body

silkworm and to examine the possibility of its utility in sericulture [19]. The silkworm, Bombyx mori L, secretes silk, a continuous and lustrous fibre having high value. The larval development and silk secreting ability of silkworm depend on the nutritional composition of food, the mulberry (Morus spp.) [20,21]. Generally, the mulberry leaves contain the required amount of nutrients essential for the optimal growth and development of silkworms.

2. MATERIALS AND METHODS

Multivoltine x bivoltine hybrid variety of the silkworm, (Pure Mysore x NB_4D_2) *Bombyx mori* L used in the present investigation were obtained from the Central Seed Farm at Tondavada, a suburb of Tirupati, A.P., India.

2.1 Ultrasound Treatment

Silkworm eggs were irradiated with ultrasound waves, 10-12 h after hatching (blue-egg stage) by water bag method used as experimental samples while those not exposed to Ultrasound waves were treated as Controls. Prior to exposure, the eggs were kept in a sealed, water-filled polythene cover, smeared with gel so as to prevent the diversion of ultrasonic waves by water bag method. The larvae that emerged from the exposed (experimental) and unexposed (control) eggs were used for the experiment. Biochemical assays were carried out on the fifth instar larvae because of their large size and easy isolation of tissues in adequate quantities since it is the stage that culminates in cocoon- spinning. The duration of exposure was standardized by exposing the eggs to varying intensities of ultrasound weaves, at different time intervals, viz. 2, 5, 10, 15, 20, 25, and 30 minutes. Promising results were obtained at 1 MHz, continuous wave of ultrasound at an intensity of $9W/Cm^2$ for 2 minutes. The larvae that emerged from the exposed (experimental) and unexposed (control) eggs were used in the investigation.

2.2 Tissue Separation

Fat body was isolated by dissecting the larvae in icecold silkworm Ringer [22] were used for the biochemical assay.

2.3 Analysis of Protein Metabolism and Enzyme Assay

Day-to-day changes in biochemical parameters of protein metabolism such as total, soluble proteins and free amino acid, the activity levels of protease, aminotransferases, and glutamate dehydrogenase were examined in the fifth instar larvae. The protein content was estimated by the method of Lowry *et al.* [23], the free amino acid content by the method of Moore and Stein [24] as described by Colowick and Kaplan [25] and the protease activity by the method of Davis and Smith [26]. The activities levels of aminotransferases, viz, aspartate aminotransferase (AAT) and alanine aminotransferase (AlAT) were estimated by the method of Reitman and Frankel [27] as described by Bergmeyer and Bruns

[28] and the activity of Glutamate dehydrogenase (GDH) was assayed by the method of Lee and Lardy [29].

2.4 Statistical Analysis

Standard deviation was calculated using the following formula:

$$\frac{\sum x1^2 - [\sum x1]^2 n}{n - 1}$$

Where,
$\sum$ x = individual observation n = total number of observations Student's 'T' test was calculated by using the following formula:

$$t = \frac{X_1 - X_2}{\sqrt{s^2\,[1/n_1+1/n_2]}}$$

$$S_2 = \frac{1}{n_1+n_2-2}[n_1s_1^2+n_2s_2^2]$$

Where,
X_1 = mean of the first set of observations
X_2 = mean of the second set of observations S_1 = standard deviation of the first set of observations
S_2 = standard deviation of the second set of observations
n_1 = number of observations of the first set n_2 = number of observations of the second set

3. RESULTS AND DISCUSSION

The levels of total and soluble proteins recorded an increasing trend in the fat body from day 1 to day 6 during the development of fifth instar larvae. The levels of total proteins increased from 43.48 mg to 81.07 mg in fat body (26% rise). Ultrasound has an elevatory effect on total protein content (Table 1). The levels of soluble proteins increased from about 27.77 mg to 60.04 mg. Ultrasound in general caused an elevation in the levels of soluble proteins also, with varying intensities (Table 1). The levels of free amino acids showed a similar trend during fifth instar. The impact of ultrasound on free amino acid levels is positive (Fig. 1).
The activity levels of protease recorded an upward trend through out the fifth instar. The elevation is more pronounced in the fat body (0.053 to 0.08 µmoles). Ultrasound caused an elevation in the enzyme activity in the selected tissue (Table 2). The activity levels of aspertate aminotransferase enzyme activity decreased in fat body (0.58 to 0.46 µmoles of pyruvate formed/mg protein/h). The impact of ultrasound is elevatory (Table 2). Alanine aminotransferase activity showed a similar trend during fifth instar development. The enzyme activity decreased from 2.33 to 1.96 µmoles of pyruvate formed/mg protein/h in the fat body. Ultrasound caused an elevation in the activity not withstanding its minor fluctuations in controls. The glutamate dehydrogenase (GDH) activity was

decreased in the fat body (0.44 to 0.22 µmoles of formazon formed/mg protein/h) during the fifth instar development. Ultrasound caused an elevation in GDH activity levels (Fig. 2).

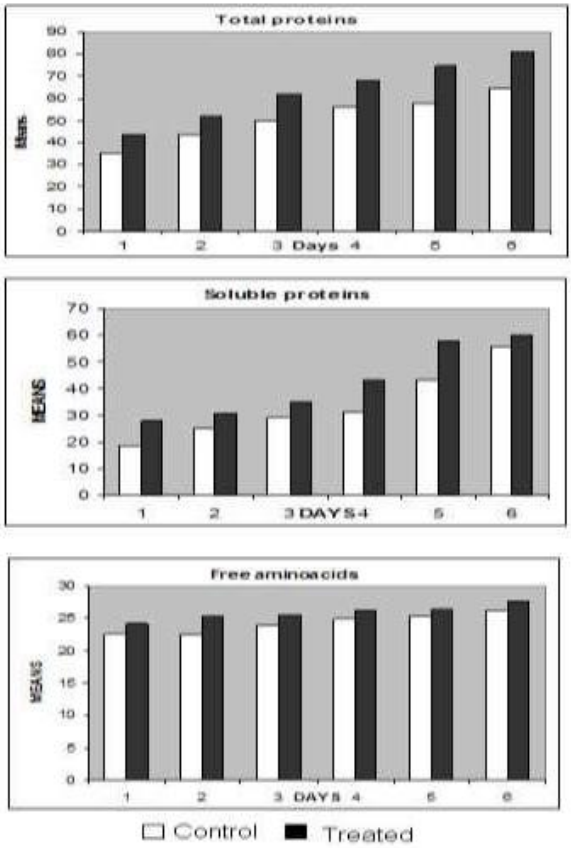

Fig. 1. Impact of ultrasound (9W/Cm^2 for 2 minutes) on fatbody protein metabolism in the silkworm *Bombyx mori* during fifth instar development

The impact of ultrasound on protein metabolism is profound as evidenced by upsurge in the levels of all the biochemical parameters examined. Though, increased levels of proteins were observed in silkworm tissue, these parameters were not analyzed with reference to ultrasound. However, some earlier investigations [30] attempted to elucidate the effect of ultrasound on protein synthesis. Obviously, the intensification of these two behaviors is of paramount importance for the fifth instar larvae. In fat body, the proteins are used for the synthesis of silk proteins, viz, fibroin and sericin [31]. The Increased levels of total, soluble and structural proteins in silkworm tissue indicates the growth-

promoting nature of ultrasound when applied in lower dosages and indicate a promising future for the sericultural industry. Apparently, ultrasound seems to enhance the protein synthesis in general, with a bias towards the silk proteins in fatbody. Amino acids are the building blocks of the proteins. Ultrasound irradiation caused an elevation in the levels of free amino acids. The silkworm and other lepidopteran insects are known to contain unusually large amounts of free amino acids [32]. Insect metamorphosis is a dynamic process involving both histogenesis and histolysis [33]. Obviously, the amino acid pool in silkworm is derived both from proteins through histolysis and from nonprotein sources like carbohydrates and lipids through *de novo* synthesis. Continuous increase in the levels of free amino acids following ultrasound-treatment is attributable to the synthesis of amino acids from nonprotein sources like glucose and fatty acids [34]. Protease activity levels recorded a continuous increase throughout the fifth instar development as reported earlier in silkworm and other insects [35]. The positive impact of ultrasound on enzyme activity indicates its ability to degrade proteins by activating proteolytic enzymes. Histolysis seems to be more pronounced in fat body as evidenced by increased turn over of amino acids. This could probably bring about the degeneration of fat body during pupal stage,

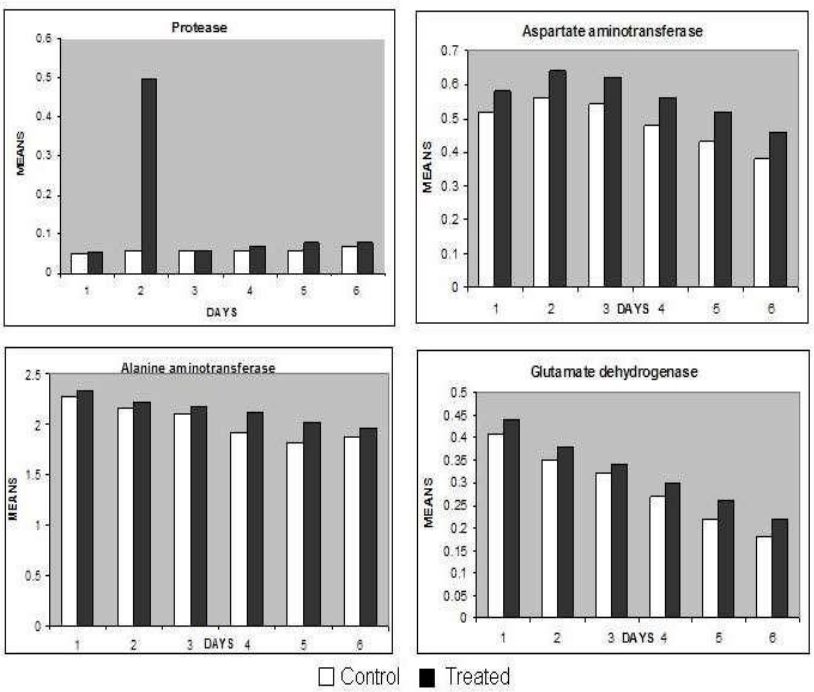

Fig. 2. Impact of ultrasound (9W/Cm^2 for 2 minutes) on fatbody enzyme activities in the silkworm *Bombyx mori* during fifth instar development

leaving the fatbody that forms the bulk of pupal weight. The presence of aspartate (AAT) and alanine (AlAT) aminotransferase activity was detected in fat body of silkworm as reported in earlier investigations [36]. Ultrasound caused an elevation in the activity levels of both AAT and AlAT in silkworm tissues (Table 2), indicating the increased turnover of amino acids and glutamate formation during metamorphosis in silkworm. The higher levels of free amino acids observed in the present investigation (Table 1) support this assumption. Ultrasound has an elevatory effect on GDH activity in all the tissue of silkworm (Table 2). Some reports are available on GDH activity in silkworm, *Bombyx mori* [36]. The enhanced activity of GDH in fat body is indicative of increased oxidation of glutamate in this tissue. The α-ketoglutarate generated by this enzyme is probably used-up in ensuring sperm mobility in silkworm [37]. The actual mechanism of ultrasound irradiation on protein metabolism is not clear.

4. CONCLUSION

The role of ultrasound in protein metabolism needs special mention in economically viable insects like the silkworm, in view of its profound and positive impact on biochemical parameters. Under its influence entire biochemical machinery in silkworm is geared up to synthesise silk proteins in fat body during fifth instar development. While the former are used up as the raw materials for the cocoon, the latter are used for generating a muscular mechanism necessary for spinning the cocoon at the end of fifth instar. The increase in the concentration of amino acids with concomitant increase in the levels of total and soluble proteins in fat body under the impact of ultrasound reflects this fact. Metabolically fat body seems to occupy a pre-eminent position during metamorphosis in silkworm. It may be concluded that under the impact of ultrasound protein metabolism is stimulated to achieve greater turnover of silk proteins, greater spinning activity, and consequently greater sericultural output.

Biography of author(s)

Dr. P. Naga Jyothi
Department of Fishery Science and Aquaculture, Sri Venkateswara University, Tirupati, India.

She joined as Assistant Professor in the year 2007. She has obtained Ph.D in the field of Insect Biochemistry, Physiology and Biotechnology. Topic of Research is “Protein metabolism and economic parameters in the Silkworm Bombyx mori with reference to the effect of ultrasound”. She has 15 years of teaching (both UG & PG) and 15 years of research experience. She attended more than 100 conferences, workshops and seminars courses, one induction programme. Her area of research interest is fish Physiology, nutrition, Biochemistry, Breeding and Genetics. She has been working as Assistant Professor, Head & Chairperson BOS, Department of Fishery Science and Aquaculture, College of Sciences, Sri Venkateswara University, Tirupati. She Obtained her M.Sc, and Ph.D in Sri Padmavathi Mahila Vishwa Vidhyalayam, Tirupati, India in 2006. She guided one student for M.Phil and two P.hD. She has to her credit 37 research articles published in various national and International scientific research journals and edited one International Book. She got two Awards. She presented several papers in various conferences, seminars, and workshops. She is also working as Deputy Warden in Sri Venkateswara University Women s Hostel. She is BOS Ex-officio member in the Department of Fishery Science & Aquaculture.

Effect of Ultrasound in the enhancement of Protein Metabolism and Enzyme Activities in the Fat body of Fifth Instar Silkworm, *Bombyx mori L*.

P. Naga Jyothi [a*]

DOI: 10.9734/bpi/rabs/v7/1584B

ABSTRACT

Under the influence of ultrasound, protein metabolism parameters such as total, soluble proteins, free amino acids, and activity levels of protease, glutamate dehydrogenase, aspartate amino transferase, and alanine aminotransferase were measured in the fat body of the fifth instar larva of the silkworm, Bombyx mori. On these parameters, ultrasonography generally has an elevating effect. The events of histogenesis and histolysis connected to the metamorphosis of the silkworm are correlated with changes in the levels of certain biochemical components. Under the impact of ultrasound, the metabolism of proteins is accelerated, resulting in increased spinning activity, increased protein turnover in silk, and increased sericultural production. Enhancement of proteins by ultrasound clearly documented the induction of severe proteolysis and transamination of amino acids.

Keywords: Amino acids; aminotransferases; glutamate dehydrogenase; protease.

1. INTRODUCTION

All living cells require proteins as a fundamental building block. Protein metabolism is a representation of life itself if carbohydrate metabolism is life's energy source. In essence, proteins are in charge of preserving the structural and functional structure of cells. They are essential for breathing, enzyme catalysis, material transport, and the control of metabolism, mobility, and body defence. The total protein content of the cell includes both structural and soluble portions, of which the former plays main role in cellular architecture and the latter in cellular metabolism.

Proteins have always been an interesting biochemical tool for insect biochemists because of their prominent role in development, morphogenesis and the intermediary metabolic pathways in insects. Mihaeslu et al. [1] observed biochemical difference in the eggs of *Bombyx mori* and *Philosamia ricini* with regard to their total proteins and amino acids. The first ever observation on insect haemolymph proteins was made by Lauffer [2] in the silkworm *B. mori.* Subsequently a series of detailed physico-chemical studies on haemolymph proteins of B*. mori* appeared [3].

Tojo et al. [4] made a detailed account of storage proteins while Sasaki et al. [5] investigated the intracellular transport and secretion of fibroin in the posterior fat body of *B. mori.* A novel approach in silkworm research is the manipulation of biochemical machinery through exogenous modulators that could boost the silk production. The development of the worm is depending on metamorphosis process which is a dynamic biochemical process [6]. The growth of silkworm during metamorphosis is accompanied by the increase in the bodyweight and accumulation of various biochemical constituents like proteins, aminoacids and enzymes like proteases, glutamate dehydrogenase and aminotransferases [7]. Since, the silkworm is an economically important insect, several insect physiologists attempted to elucidate the role of biochemical constituents in silk protein synthesis and egg formation [8]. More importantly, the parameters of protein metabolism have been extensively examined because of their role in development, morphogenesis and in the intermediary metabolism [9,10]. A novel approach in silkworm research is the manipulation of biochemical machinery through exogenous modulators that could boost the silk production. This obviously, included the administration of certain neuro-humoral factors, vertebrate hormones and various other chemicals like cyclic AMP and prostaglandins, which could have a profound influence on the growth rate, larval life cycle and fecundity [11,12]. Significantly, the positive impact of vertebrate thyroxine on silkworm biology, especially in improving the pre- and post cocoon parameters is well documented [13]. Another vertebrate hormone, namely prolactin induced improvement in the growth and reproductive potential of silkworms [12]. The dietary administration of vertebrate sex hormones like ethynyl estradiol and norethindrone to the silkworm increased the larval weight, cocoon and shell weights, female pupal and adult weights, but the larval, pupal periods and the egghatchability were significantly reduced [14]. Studies on protein metabolism are considered most important in silkworm physiology because of its vital role in the determination of chemical characteristics of silk proteins [15,16].

These investigations opened up alternative strategies for improving the economic parameters of the sericulture industry by regulating the biochemical machinery. One such option is the ultrasound, whose impact on larval life in Drosophila has been reported [17]. Further, it was reported that ultrasound irradiation does not cause any detectable deterioration in behavioral responses such as mating, oviposition, larval development and pupation in insects [18]. In view of its harmless nature, ultrasound has been used as an exogenous modulator in the present investigation for the manipulation of protein metabolism in the fat body

silkworm and to examine the possibility of its utility in sericulture [19]. The silkworm, Bombyx mori L, secretes silk, a continuous and lustrous fibre having high value. The larval development and silk secreting ability of silkworm depend on the nutritional composition of food, the mulberry (Morus spp.) [20,21]. Generally, the mulberry leaves contain the required amount of nutrients essential for the optimal growth and development of silkworms.

2. MATERIALS AND METHODS

Multivoltine x bivoltine hybrid variety of the silkworm, (Pure Mysore x NB_4D_2) *Bombyx mori* L used in the present investigation were obtained from the Central Seed Farm at Tondavada, a suburb of Tirupati, A.P., India.

2.1 Ultrasound Treatment

Silkworm eggs were irradiated with ultrasound waves, 10-12 h after hatching (blue-egg stage) by water bag method used as experimental samples while those not exposed to Ultrasound waves were treated as Controls. Prior to exposure, the eggs were kept in a sealed, water-filled polythene cover, smeared with gel so as to prevent the diversion of ultrasonic waves by water bag method. The larvae that emerged from the exposed (experimental) and unexposed (control) eggs were used for the experiment. Biochemical assays were carried out on the fifth instar larvae because of their large size and easy isolation of tissues in adequate quantities since it is the stage that culminates in cocoon- spinning. The duration of exposure was standardized by exposing the eggs to varying intensities of ultrasound weaves, at different time intervals, viz. 2, 5, 10, 15, 20, 25, and 30 minutes. Promising results were obtained at 1 MHz, continuous wave of ultrasound at an intensity of $9W/Cm^2$ for 2 minutes. The larvae that emerged from the exposed (experimental) and unexposed (control) eggs were used in the investigation.

2.2 Tissue Separation

Fat body was isolated by dissecting the larvae in icecold silkworm Ringer [22] were used for the biochemical assay.

2.3 Analysis of Protein Metabolism and Enzyme Assay

Day-to-day changes in biochemical parameters of protein metabolism such as total, soluble proteins and free amino acid, the activity levels of protease, aminotransferases, and glutamate dehydrogenase were examined in the fifth instar larvae. The protein content was estimated by the method of Lowry *et al.* [23], the free amino acid content by the method of Moore and Stein [24] as described by Colowick and Kaplan [25] and the protease activity by the method of Davis and Smith [26]. The activities levels of aminotransferases, viz, aspartate aminotransferase (AAT) and alanine aminotransferase (AlAT) were estimated by the method of Reitman and Frankel [27] as described by Bergmeyer and Bruns

[28] and the activity of Glutamate dehydrogenase (GDH) was assayed by the method of Lee and Lardy [29].

2.4 Statistical Analysis

Standard deviation was calculated using the following formula:

$$\frac{\sum x1^2 - [\sum x1]^2 n}{n - 1}$$

Where,
$\sum$ x = individual observation n = total number of observations Student's 'T' test was calculated by using the following formula:

$$t = \frac{X_1 - X_2}{\sqrt{s^2\,[1/n_1+1/n_2]}}$$

$$S_2 = \frac{1}{n_1+n_2-2}[n_1s_1^2+n_2s_2^2]$$

Where,
X_1 = mean of the first set of observations
X_2 = mean of the second set of observations S_1 = standard deviation of the first set of observations
S_2 = standard deviation of the second set of observations
n_1 = number of observations of the first set n_2 = number of observations of the second set

3. RESULTS AND DISCUSSION

The levels of total and soluble proteins recorded an increasing trend in the fat body from day 1 to day 6 during the development of fifth instar larvae. The levels of total proteins increased from 43.48 mg to 81.07 mg in fat body (26% rise). Ultrasound has an elevatory effect on total protein content (Table 1). The levels of soluble proteins increased from about 27.77 mg to 60.04 mg. Ultrasound in general caused an elevation in the levels of soluble proteins also, with varying intensities (Table 1). The levels of free amino acids showed a similar trend during fifth instar. The impact of ultrasound on free amino acid levels is positive (Fig. 1).
The activity levels of protease recorded an upward trend through out the fifth instar. The elevation is more pronounced in the fat body (0.053 to 0.08 µmoles). Ultrasound caused an elevation in the enzyme activity in the selected tissue (Table 2). The activity levels of aspertate aminotransferase enzyme activity decreased in fat body (0.58 to 0.46 µmoles of pyruvate formed/mg protein/h). The impact of ultrasound is elevatory (Table 2). Alanine aminotransferase activity showed a similar trend during fifth instar development. The enzyme activity decreased from 2.33 to 1.96 µmoles of pyruvate formed/mg protein/h in the fat body. Ultrasound caused an elevation in the activity not withstanding its minor fluctuations in controls. The glutamate dehydrogenase (GDH) activity was

decreased in the fat body (0.44 to 0.22 µmoles of formazon formed/mg protein/h) during the fifth instar development. Ultrasound caused an elevation in GDH activity levels (Fig. 2).

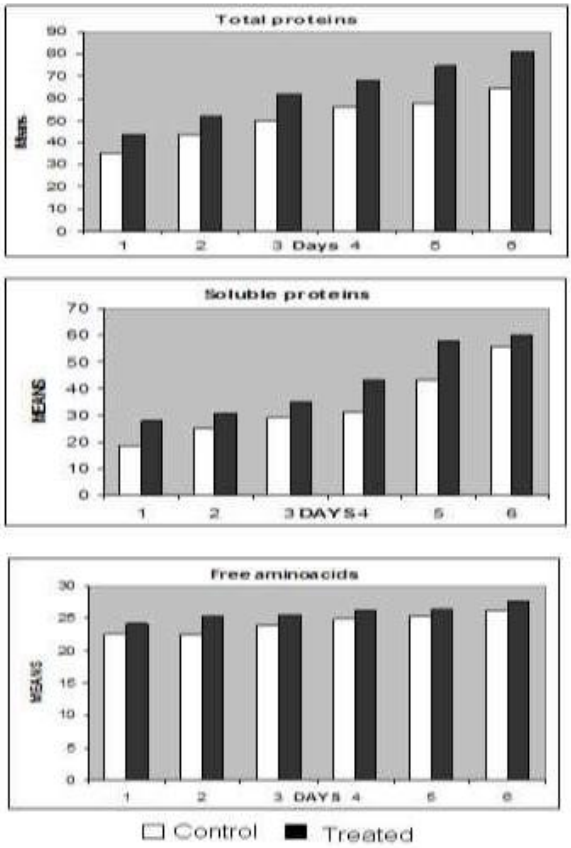

Fig. 1. Impact of ultrasound (9W/Cm^2 for 2 minutes) on fatbody protein metabolism in the silkworm *Bombyx mori* during fifth instar development

The impact of ultrasound on protein metabolism is profound as evidenced by upsurge in the levels of all the biochemical parameters examined. Though, increased levels of proteins were observed in silkworm tissue, these parameters were not analyzed with reference to ultrasound. However, some earlier investigations [30] attempted to elucidate the effect of ultrasound on protein synthesis. Obviously, the intensification of these two behaviors is of paramount importance for the fifth instar larvae. In fat body, the proteins are used for the synthesis of silk proteins, viz, fibroin and sericin [31]. The Increased levels of total, soluble and structural proteins in silkworm tissue indicates the growth-

promoting nature of ultrasound when applied in lower dosages and indicate a promising future for the sericultural industry. Apparently, ultrasound seems to enhance the protein synthesis in general, with a bias towards the silk proteins in fatbody. Amino acids are the building blocks of the proteins. Ultrasound irradiation caused an elevation in the levels of free amino acids. The silkworm and other lepidopteran insects are known to contain unusually large amounts of free amino acids [32]. Insect metamorphosis is a dynamic process involving both histogenesis and histolysis [33]. Obviously, the amino acid pool in silkworm is derived both from proteins through histolysis and from nonprotein sources like carbohydrates and lipids through *de novo* synthesis. Continuous increase in the levels of free amino acids following ultrasound-treatment is attributable to the synthesis of amino acids from nonprotein sources like glucose and fatty acids [34]. Protease activity levels recorded a continuous increase throughout the fifth instar development as reported earlier in silkworm and other insects [35]. The positive impact of ultrasound on enzyme activity indicates its ability to degrade proteins by activating proteolytic enzymes. Histolysis seems to be more pronounced in fat body as evidenced by increased turn over of amino acids. This could probably bring about the degeneration of fat body during pupal stage,

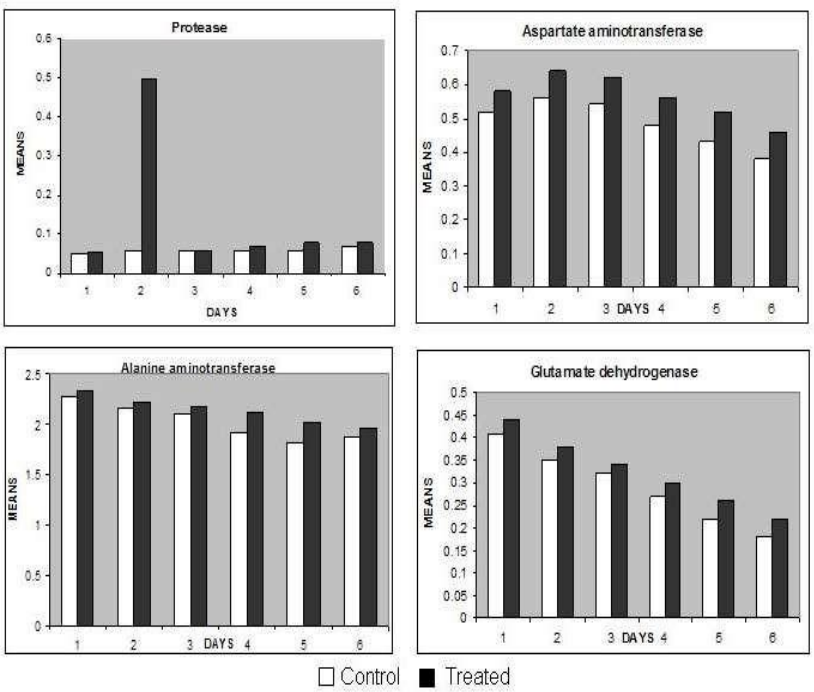

Fig. 2. Impact of ultrasound (9W/Cm^2 for 2 minutes) on fatbody enzyme activities in the silkworm *Bombyx mori* during fifth instar development

Table 1. Day-to-day changes in fatbody protein metabolism during the 5th instar of *Bombyx mori* under the impact of ultrasound (9W/Cm^2 for 2 minutes). Each value is the mean ± Standard Deviation (SD) of six separate observations. For each observation, tissue from at least 10 larvae was pooled. The percent changes for all days were calculated taking control as the reference

leaving the fatbody that forms the bulk of pupal weight. The presence of aspartate (AAT) and alanine (AlAT) aminotransferase activity was detected in fat body of silkworm as reported in earlier investigations [36]. Ultrasound caused an elevation in the activity levels of both AAT and AlAT in silkworm tissues (Table 2), indicating the increased turnover of amino acids and glutamate formation during metamorphosis in silkworm. The higher levels of free amino acids observed in the present investigation (Table 1) support this assumption. Ultrasound has an elevatory effect on GDH activity in all the tissue of silkworm (Table 2). Some reports are available on GDH activity in silkworm, *Bombyx mori* [36]. The enhanced activity of GDH in fat body is indicative of increased oxidation of glutamate in this tissue. The α-ketoglutarate generated by this enzyme is probably used-up in ensuring sperm mobility in silkworm [37]. The actual mechanism of ultrasound irradiation on protein metabolism is not clear.

4. CONCLUSION

The role of ultrasound in protein metabolism needs special mention in economically viable insects like the silkworm, in view of its profound and positive impact on biochemical parameters. Under its influence entire biochemical machinery in silkworm is geared up to synthesise silk proteins in fat body during fifth instar development. While the former are used up as the raw materials for the cocoon, the latter are used for generating a muscular mechanism necessary for spinning the cocoon at the end of fifth instar. The increase in the concentration of amino acids with concomitant increase in the levels of total and soluble proteins in fat body under the impact of ultrasound reflects this fact. Metabolically fat body seems to occupy a pre-eminent position during metamorphosis in silkworm. It may be concluded that under the impact of ultrasound protein metabolism is stimulated to achieve greater turnover of silk proteins, greater spinning activity, and consequently greater sericultural output.

Biography of author(s)

Dr. P. Naga Jyothi
Department of Fishery Science and Aquaculture, Sri Venkateswara University, Tirupati, India.

She joined as Assistant Professor in the year 2007. She has obtained Ph.D in the field of Insect Biochemistry, Physiology and Biotechnology. Topic of Research is “Protein metabolism and economic parameters in the Silkworm Bombyx mori with reference to the effect of ultrasound”. She has 15 years of teaching (both UG & PG) and 15 years of research experience. She attended more than 100 conferences, workshops and seminars courses, one induction programme. Her area of research interest is fish Physiology, nutrition, Biochemistry, Breeding and Genetics. She has been working as Assistant Professor, Head & Chairperson BOS, Department of Fishery Science and Aquaculture, College of Sciences, Sri Venkateswara University, Tirupati. She Obtained her M.Sc, and Ph.D in Sri Padmavathi Mahila Vishwa Vidhyalayam, Tirupati, India in 2006. She guided one student for M.Phil and two P.hD. She has to her credit 37 research articles published in various national and International scientific research journals and edited one International Book. She got two Awards. She presented several papers in various conferences, seminars, and workshops. She is also working as Deputy Warden in Sri Venkateswara University Women s Hostel. She is BOS Ex-officio member in the Department of Fishery Science & Aquaculture.

Abstract

The excessive accumulation of reactive oxygen species (ROS)/free radicals can lead to abnormal oxidation of biomolecules such as proteins, lipids, fats, carbohydrates and nucleic acids in human organisms. Accordingly, endogenous oxidative stress induces the progressive development of various chronic diseases like rheumatoid arthritis, cancers, cardiovascular risks, diabetes, digestive ulcers, hypertension, obesity, neurological disorders, and age-related complications. Therefore, anti-oxidant defense mechanisms are needed to control/prevent the unbalanced molecular oxidative damage. Indeed, the oxidative stress arises from both endogenous and exogenous factors such as smoking, alcohol, medications, air pollution, sunlight, lifestyle disorders, and metabolic processes. Therefore, consumption of fruits, vegetables, grains, beverages, and leafy vegetables rich in antioxidants may inhibit or treat oxidative damage accompanying diseases. From this aspect, dietary foods are rich in various antioxidant metabolites such as flavonoids, vitamin A, C, E, phenolic acids, curcumin, stilbenes, anthocyanins, etc., which promote healthy life and nutritional benefits. Additionally, various studies have also proven that foods rich in antioxidants interact with reactive species to prevent cell damage(s) or therapeutic pathways for diseases. Although, there are various myths about the antioxidant mechanism(s), the optimal dosage of antioxidants can show beneficial pharmacological activities against various molecular oxidation paths.

Gamma Irradiation of Mushrooms and its Impact on Bioactive Components

Kalyani Bandi [a*] and Manjula Kola [a]

DOI: 10.9734/bpi/cpafs/v1/17678D

ABSTRACT

Mushrooms are widely recognized as a high-nutritional food and are gaining popularity as a functional food. For vegetarians, mushrooms are the only natural source of vitamin D. Radiation is a novel and promising food processing technology. Irradiating mushrooms can be a safe and cost-effective way to increase shelf life while also ensuring hygienic and sensory quality. Mushrooms are well-known purposeful foods because of the presence of a large amount of nutraceutical components. These are well recognized as organic foods importance to high protein, low fat and low energy contents. These are made in minerals such as iron, phosphorus, also as in vitamins like riboflavin, thiamine, ergosterol, niacin, and ascorbic acid. They also contain bioactive constituents like secondary metabolites (terpenoids, acids, alkaloids, sesquiterpenes, polyphenolic compounds, lactones, sterols, ester analogues, vitamins, and metal chelating agents) and polysaccharides in the main β-glucans and glycoproteins. Since, the incidences of biologically active substances like hepatoprotective, immune-potentiating, anti-cancer, antiviral, hypocholesterolemic agents and natural antioxidants helpful in reducing aerophilous damages. However, mushrooms remained underutilized, despite their wide organic process and bioactive potential [1,2,3]. Novel inexperienced techniques are being explored for the extraction of bioactive elements from edible mushrooms. Main objectives of the study were to know the impact of gamma irradiation, shelf life and bioactive components of mushrooms. In the current study low dose of gamma irradiation i.e., 0.25 and 0.75 kGy was employed for mushrooms. Vitamin-D content was estimated in irradiated mushrooms at 0.75 kGy, was 3.92 µg, at 0.25 kGy was, 1.44µg and 2.77µg non-irradiated mushrooms. Other bioactive components, such as antioxidant activity, were increased during storage, and irradiated mushrooms retained more vitamin C and folic acid than non-irradiated mushrooms. The gamma irradiation process increases the bioavailability of vitamin-D, making it a good source of vitamin-D while also extending the shelf life of the mushroom. Gamma irradiation boosts vitamin D levels in mushrooms by converting endogenous ergosterol to ergocalciferol (Vitamin D2).

1. INTRODUCTION

The most popular variety, button mushroom (Agaricusbisporus), commands a high price and continues to dominate the Indian and international markets. It accounts for approximately 90% of total country output and approximately 40% of global output. Furthermore, macrofungi have a long history of use in oriental therapies, and modern clinical practices still rely on mushroom-derived preparations. Mushrooms are potential sources of protein, essential amino acids, minerals and fiber are really valuable, excellent sources of most B-vitamins, key natural sources of ergosterol or pro-vitamin-D, antioxidant and anticancer components, and they are used as food, food additives and as supplements. They accumulate a variety of bioactive metabolites e.g. phenolic compounds, polyketides, terpenes, steroids and polysaccharides. Presently, mushroom has been recognized universally as a highly nutritive food and is getting more importance as medicinal/functional food [4,5].

Mushrooms are the only non-animal-based food containing vitamin D in the form of pro-vitamin D_2 (ergosterol), hence natural vitamin D sources for vegetarians was mushrooms. Vitamin D consists of two different compounds, vitamin D_2 from ergosterol and vitamin D_3 from 7-dehydrocholesterol. Vitamin D present in mushrooms converts the endogenous ergosterol to ergocalciferol (vitamin D_2) enhances through the use of artificial or exposure to UV light can increase vitamin D_2 content in mushrooms.

$$\text{Ergosterol} \longrightarrow \text{Pre-vitamin } D_2 \longrightarrow \text{Vitamin } D_2 \text{ (ergocalciferol)}$$

Vitamin D_2 is the form of vitamin D that could be provided from mushrooms, and this form has some remarkable advantages over vitamin D_3. Vitamin D_2 is more effective for bone mineralization than vitamin D_3, and vitamin D_2 is less toxic compared with vitamin D_3 [6]. Vitamin D is one of the important vitamins; it plays a key role in muscle function and immune system. The active form of Vitamin D is known as vitamin D_3, or 1,25-dihydroxycholecalciferol. This is derived either from diet or ultraviolet B (UVB) light conversion of 7-dehydrocholesterol in the skin, which is then hydroxylated to 25-hydroxyvitamin D in the liver, and then further hydroxylated to 1,25-dihydroxycholecalciferol in the kidneys. The main dietary source of vitamin D has long been thought to be cod liver oil and oily fish. Edible mushrooms have been shown to be abundant in ergocalciferol, which can then be hydroxylated to 25-hydroxyvitamin D in the liver. This can be further hydroxylated to the active form, 1,25dihydroxyvitamin D, in the kidneys. It is known that ingestion of edible mushrooms can result in an increase in serum vitamin D levels in humans, and it is also known that irradiating mushrooms with UVB light leads to an increase in their vitamin D content. Furthermore, in vivo studies in rats have shown an increase in both serum 25-hydroxyvitamin D levels and bone mineral density following ingestion of UVB-irradiated mushrooms [7].

Mushrooms are internationally regarded as poor man's meat because they are good substitute for meat which peasants cannot afford. The demand for

mushrooms is growing day by day. But due to their perishable nature they spoiled very quickly. The maximum shelf life of mushrooms is 2-6 days at refrigeration (4^0c) temperature [8]. Their shelf-life is short due to postharvest changes, such as browning, cap opening, strip elongation, cap diameter increase, weight loss and texture changes, to their high respiration rate and lack of physical protection to avoid water loss or microbial attack. Thus prolonging postharvest storage, while preserving their quality, would benefit the mushroom industry as well as consumers. Based on the mushrooms nutritional importance and medicinal value, there is a need to increase the shelf life of mushrooms by using advanced technology without affecting the functional components [9].

There has been extensive research on finding the most appropriate technology for mushrooms preservation. Chemical treatments, refrigeration, coating, modified/controlled atmosphere packaging, use of humectants, use of tyrosine inhibitors and ozone treatment are frequently applied methods. Moreover, the majority of food preservation techniques operate by slowing down or inhibiting the growth of microorganisms. In contrast, Gamma, electron-beam and UV irradiation have been shown to be potential tools in extending the postharvest shelf-life of fresh mushrooms, inhibit or inactivate microbial growth completely, resulting in commercially sterile and shelf-stable food.

Food irradiation technology has unique merits over conventional methods of preservation as this process does not lead to loss of flavor, odor, texture, and freshness. Unlike chemical fumigants, irradiation does not leave any harmful toxic residues in food and is more effective. It is efficient and can be used to treat pre-packed commodities. Export development authorities, commodity boards, food industry, farmers, traders, and exporters of agricultural commodities can be benefited from the use of radiation processing technology.

Now a day's people are showing more interest on fresh fruits and vegetable consumption due to the presence of functional components which helps in treating/reducing the risk of diseases, and they act as functional foods. By irradiation processes the valuable functional components can be retained in natural form and also extend the shelf life of mushrooms. Gamma-irradiation alone or in combination with refrigeration has been shown to prolong shelf-life through reducing moisture loss and improving color and appearance [10].

As Food irradiation is one of the best and safest food preservation techniques designed to ensure the provision of better quality with an extended shelf life. Keeping in view of the above points, the present study carried out to study the effect of radiation processing on functional components and shelf life of Mushrooms.

2. METHODOLOGY

2.1 Sample Collection

Freshly harvested, mature mushrooms (*Agaricusbisporus)* of similar size and free from physical defects were obtained from commercial mushroom growers.

Immediately after harvesting, mushrooms were cleaned and then packed in high density polyethylene covers each with 200 g due to light weight and also to avoid the damage of mushrooms during storage and processing.

2.2 Irradiation of Mushrooms

The irradiation was done in gamma irradiation plant at food irradiation unit at Quality control lab, Acharya N.G. Ranga Agricultural University; Hyderabad. The equipment used for radiation processing was Gamma (δ) Irradiation chamber, Model- GC-5000. The source for the radiation processing was cobalt -60. In the present work low dose levels were used for radiation processing i.e., 0.25 kGy and 0.75 kGy.

2.3 Functional Components

The functional parameters were analyzed for non-irradiated and irradiated mushrooms. The predominant functional components such as vitamin-C, folic acid, vitamin-D and total antioxidants activity of mushrooms were analyzed. Vitamin-C and folic acid was estimated by procedure followed by Ranganna [11]. Total Antioxidant Activity in mushrooms was estimated by using TBARS method. Vitamin-D content in the mushrooms was estimated by using Ultra-High-Performance Liquid Chromatography/Tandem Mass Spectrometry First Action 2011, AOAC method No.2011.11 (LC-MS/MS).

2.4 Experimental Period

The irradiated mushrooms at 0.25 kGy (I_1), 0.75 kGy (I_2) and non-irradiated mushrooms (NI) was stored for a period of 21 days. The analysis was done at initially (Initial phase) and at the end of the experimental period (Final phase). The results of the experiment was compared between the initial and final phase of the study and discussed in results and discussion.

3. RESULTS AND DISCUSSION

Proximate components did not alter or typically not much dissimilarity was observed during processing, by this reason this study was majorly focused on functional components. Vitamin-C, folic acid, vitamin-D and total antioxidants activity of Mushrooms were analysed in the present study and the results were discussed in following heads.

3.1 Vitamin-C

Vitamin-C (mg/100 g) in vegetables has varietal and functional factors. The vitamin-C of Mushrooms was analysed in non-irradiated and irradiated samples during initial and final phase of the experimental period. A sharp decrease in vitamin-C content was observed in non-irradiated Mushrooms (6.42 mg to 5.67 mg) and irradiated mushrooms at 0.25 (5.20 mg to 4.87mg) and 0.75 kGy (4.58 mg to 4.00 mg) from initial to final phase of the experimental period. The difference in vitamin-C content between and among irradiated samples (0.25 and 0.75 kGy) and non-irradiated samples was significant ($p<0.05$) from initial to final phase of the experimental period.

Vitamin-C was in the form of ascorbic acid. The reason for accelerated decrease of Vitamin-C in irradiated and non-irradiated samples might be enhanced respiration result in increased enzymatic activity causing rapid degradation of ascorbic acid. The changes in reduced ascorbic acid are due to its role as a radical scavenger. Thayer and Rajjkowski (1999), revealed that irradiation oxidized a portion of total ascorbic acid to dehydro form and both of these forms of vitamins are biologically active, suggesting minimal nutritional impact.

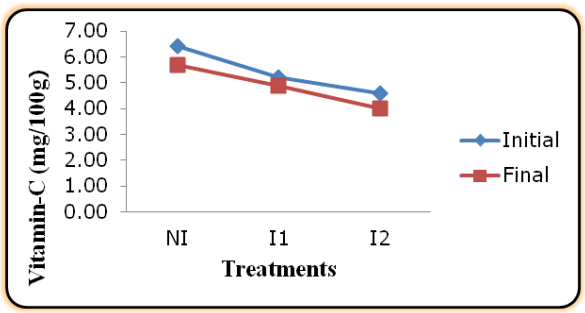

Fig. 1. Effect of gamma irradiation on vitamin-C content of mushrooms

Similar trend was observed by Hajara et al. [12], in their study on radiation processing of minimally processed carrot and cucumber. The minimally processed carrot and cucumber at a dose of 2 kGy was carried out over a storage period of 16 days at 8^0C and 10^0C. During storage both the control as well as the irradiated samples showed significant decrease in vitamin-C content.

The vitamin-C content decreased in all the samples on storage. Loss of vitamin-C was more in non-irradiated samples and even though the loss of vitamin-C was observed in irradiated Mushrooms it was comparatively less when compared to non-irradiated Mushrooms. The stability and variation of ascorbic acid not only depends on the irradiation treatment and doses, but also environmental factors such as storage, temperature etc.

Vitamin-C (ascorbic acid) exhibits a high degree of sensitivity to ionizing radiation. Furthermore, it is known to be readily oxidized to dehydro ascorbic acid on irradiation [13,14].

3.2 Folic Acid

The folic acid (µg/100g) of Mushrooms was estimated in non-irradiated and irradiated samples.Folic acid content of Mushrooms was estimated at initial and final phase of the experimental period and the results. The decrease in folic acid content of Mushrooms was observed in all the treated and non-treated samples from initial to final phase of the experimental period (Fig. 2) and it was statistically significant ($p<0.01$) in non-irradiated Mushrooms, whereas in irradiated Mushrooms it was not significant. At the end of the experimental period no significant difference was observed in folic acid content of Mushrooms irrespective of the treatments.

Table 1. Effect of gamma irradiation on functional components of mushrooms

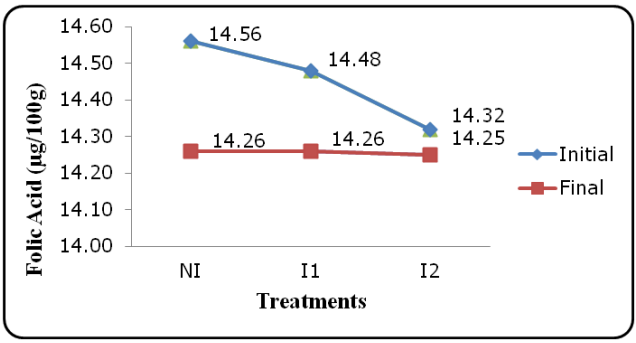

Fig. 2. Effect of Gamma Irradiation on Folic acid content of Mushrooms

These findings are in support with the results of Lester et al. [15], in his study on the effect of gamma-irradiation on ascorbic acid, carotenoids, folate, α-tocopherol and phylloquinone concentrations of baby-leaf spinach. There is no evidence in the literature that transient sunlight exposure increases folate levels in Mushrooms or other plants. However, all folates are to various degrees unstable and are particularly sensitive to oxidation. Despite the fact that folates are good absorbers of UVB and UVA light, these compounds are believed to be relatively stable to UV light exposure, but degradation of 5-methyltetrahydrofolate in the presence of UV light has been reported in the presence of photo sensitizers such as riboflavin [16].

In the present study, folic acid content of Mushrooms is not affected by irradiation processing. Initially slight decrease in irradiated Mushrooms was noticed and at final phase the maximum retention of folic acid was observed in irradiated Mushrooms.

3.3 Vitamin-D

Mushrooms are the only vegetative source of vitamin-D. Immediately after irradiation, significant difference was showed between non-irradiated and irradiated samples of Mushrooms. The Vitamin-D analysis was done at initial and final phase of the experimental period as indicated in Table 1 for both irradiated and non-irradiated Mushroom. The decrease of vitamin-D was more in non-irradiated (2.77µg to 1.97µg) when compared to irradiated Mushrooms at 0.25(1.44µg to 1.28µg) and 0.75 kGy (3.92µg to 3.02µg) from initial to final phase of the experimental period. Statistically a significant difference was observed in vitamin-D content of both non-irradiated and irradiated Mushrooms during the experimental period from initial to final phase. At the end of experimental period significant difference ($p<0.01$) was observed in vitamin-D content of Mushrooms between the treatments [17,18].

The increasing trend of vitamin-D was observed with the increase of dosage in Mushrooms. The increase of vitamin-D was more in Mushrooms irradiated at 0.75 kGy followed by 0.25 kGy and non-irradiated Mushrooms (Fig. 3).

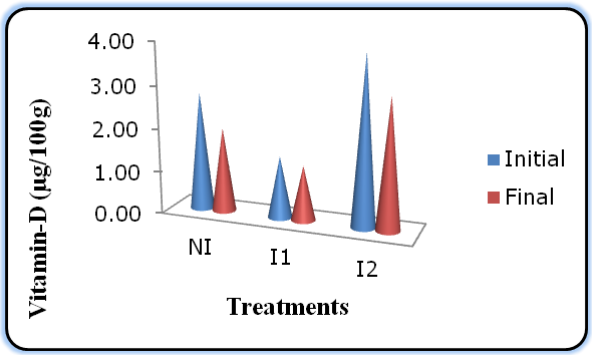

Fig. 3. Effect of Gamma Irradiation on Vitamin-D content of Mushrooms

The temperature and exposure time of irradiation plays an important role in the conversion and this may be one of the reasons. Irradiation also contributes to an oxidative atmosphere and prolonged exposure of vitamin-D to UV radiation may result in photo-degradation at vitamin-D_2. Another important factor is moisture, at low moisture levels, the specific surface area of the tissue is increased, results in the oxidation of vitamin-D_2. Furthermore, irradiation also contributes to oxidative atmosphere, and photo–degradation of vitamin-D_2 may occur.

These findings are in support with the results of Jasinghe and Perera [6]. They conducted a study on Distribution of ergosterol in different tissues of Mushrooms and its effect on the conversion of ergosterol to vitamin-D_2 by UV irradiation. In this study, highest ergosterol content was found in button Mushrooms (7.80 mg/g DM) while the lowest was in enoki Mushrooms (0.68 mg/g DM). The conversion of ergosterol to vitamin D_2 was about four times higher when gills were exposed to UV-A irradiation than when the outer caps were exposed to the same.

Kalaras et al. [19], carried out a study on Effects of Postharvest Pulsed UV Light treatment of White Button Mushrooms (Agaricusbisporus) on Vitamin D_2 Content and Quality Attributes. In this study, dose-response suggests a non-linear relationship between PUV irradiation dose and vitamin-D_2 content of fresh Mushrooms. The initial levels of vitamin D_2 in untreated Mushrooms were less than 0.005 µg/g DW, and rapidly increased to 12.6 µg/g DW after 3 pulses. The D_2 produced with 3 pulses decreased after 3 days of storage.

Souci et al. [20], reported that ergosterol contents and the conversion rate of ergosterol to vitamin D_2 in different types of Mushrooms were varied. Button Mushrooms have lower vitamin D_2 content compared to other types of edible Mushrooms. This may be due to the gill was not exposed. The gill of sliced

button Mushroom was exposed to UV-B; therefore, Vitamin-D_2 concentration of sliced button Mushrooms was higher than that of whole Mushroom [21].

Irradiation shows significant effect on vitamin-D content in Mushrooms. The increase of vitamin-D was more in irradiated Mushrooms at 0.75 kGy than other samples. The conversion of vitamin-D was more in 0.75 kGy irradiated Mushroom. A slight decrease was observed during the experimental period. The conversion was affected by many factors. Exposure time, temperature, dosage of Irradiation and type or mode of raw material significantly affected the vitamin-D content in Mushrooms.

3.4 Total Antioxidant Activity

The antioxidants are recognized as bio-active compounds that act against possible ill effects of free-radical damages in humans. The antioxidant activity of a compound has been attributed to various mechanisms.

At initial and final phase of the experimental period total antioxidant activity was estimated in Mushrooms and given in Table 1. The high increasing trend of total antioxidant activity was observed in irradiated Mushrooms at 0.25 kGy (35.80% to 52.02%), whereas a very minute increase was there in irradiated Mushrooms at 0.75 kGy (41.73% to 52.05%) when compared with the non-irradiated (43.02% to 45.60%) from initial to final phase of experiment. The significant difference was observed among all the samples of Mushrooms during the experimental period at initial and final phases.

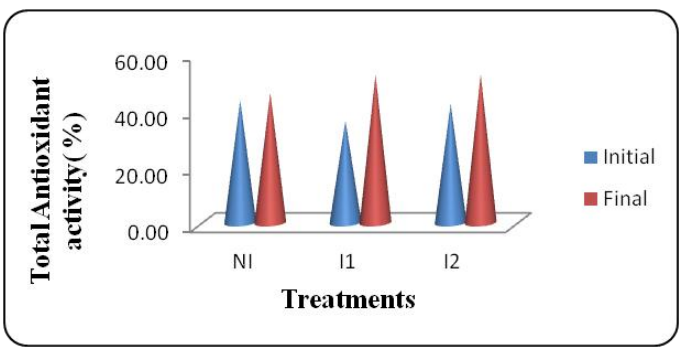

Fig. 4. Effect of Gamma Irradiation on Total Antioxidant activity of Mushrooms

Irradiation increased the antioxidant activity during the experimental period (Fig 4), it is also possible that the increased antioxidant capacity is related to tissue browning. Another reason for improved antioxidant activity could be due to formation of novel compounds having antioxidant activity during processing. Non-enzymatic browning reaction products might be formed during prolonged exposure with the improvement of antioxidant activity in Mushrooms.

An another reason for the increase of total antioxidant activity might be due to the fact that the irradiation disrupt the cell wall and liberate antioxidant compounds from insoluble portion of Mushroom, which in turn, increase the pool of bio accessible antioxidant compounds.

Song et al. [14], reported that the total phenols analyzed in irradiated Kale Juice immediately after the irradiation, was significantly lower than the control. However, the phenolic compound level of the irradiated sample becomes higher after one day than that of the control. The phenomenon was attributed to the immediate oxidation of the phenolic compounds, thus playing an antioxidant role by reducing the free radicals and the reactive oxygen species induced by irradiation.

Adamo et al. [22], have opined that the destructive processes of oxidation and γ-irradiation are capable of breaking the chemical bonds of polyphenols, thereby releasing soluble phenols of low molecular weights, leading to an increase of antioxidant-rich phenolics. The decrease of antioxidants is attributed to the formation of radiation-induced degradation products or the formation of free radicals.

Mami et al. [23], carried out a study on Improvement of shelf-life and postharvest quality of white button Mushroom by ^{60}Co γ-ray irradiation. Five different doses of gamma irradiation, including: 0 as control, 0.5, 1, 1.5 and 2 kGy were used. Irradiation increased both phenolics content and antioxidant capacity, suggesting the increased phenolics synthesis contributed to the total antioxidant capacity. It is also possible that the increased antioxidant capacity is related to tissue browning. It is well known that irradiation inactivates food borne pathogens in various vegetables, resulting in improved microbial food safety of fresh-cut vegetables.

In the current study irradiation has significant effect on total antioxidant activity of Mushrooms. The decrease of total antioxidant activity was observed initially in irradiated Mushrooms which might be due to immediate oxidation of the phenolic compounds. On storage the total antioxidant activity was increased more in irradiated Mushrooms than non-irradiated Mushrooms. A reason for improved antioxidant activity could be due to pool of bio accessible antioxidant compounds.

The mushrooms have extensive potential to be used in the diet for taking advantage of the nutraceutical properties of the bioactive compounds. Edible mushrooms, due to lower fat and higher protein contents, need to be used for the preparation of low-calorie and high protein diets. Besides, their use as therapeutic foods can be helpful in the preclusion of lifestyle diseases, such as diabetes, hypertension, cancer, hypercholesterolemia, and cardiovascular diseases [24,25]. Functional characteristics of these edible mushrooms are primarily due to the occurrence of antioxidants, dietary fibres, lectins, anti-microbial agents, and other bioactive components. Due to their richness in immune-modulating polysaccharides, these can be incorporated into health-promoting supplements. The approach for extraction of secondary metabolites

from edible mushrooms is yet to be discovered. The exploration of new edible mushrooms and extraction of their valuable bioactive and their further incorporation for the preparation of value-added functional foods and their use in prevention, as well as the treatment of various lifestyle diseases, will continue to be the major attention of research into future prospects. Therefore, more research efforts are required to enhance resource efficiency, minimize waste generation, and avoid resource over-exploitation. Further studies are required to improve the biological properties of the existing nutritional components of several mushroom varieties through structural modifications, as recently it has been reported that a few naturally present nutrients show minimal biological activity, however, it can be improved by certain chemical modifications. Also, mushroomderived prebiotics is the other recent attention of researchers worldwide, particularly for the relationship between the regulation of gut microbiota and host health, including gut-immune function, gut inflammation, obesity, colonic cancer, and neurological diseases.

4. CONCLUSION

The current study reveals that the effect of gamma irradiation at low doses of functional components of mushrooms was analyzed at initial and final phases of experiment. Mushrooms irradiated at 0.75 kGy was more optimum in improving the vitamin-D and total antioxidant activity, no vast discrepancy or loss was noticed in vitamin-C and folic acid content of mushrooms when compared with initial to final phase of experiment. They were least affected by irradiation and retention of nutrients was observed during storage period. It was quite evident that gamma irradiation improves the shelf life of the vegetables as well as improves their quality in terms of physical, nutritional, functional and safety aspects.

INVESTIGATION OF JORDAN REVERSE GENERALIZED DERIVATIONS AND COMMUTATIVITY IN PRIME AND SEMIPRIME RINGS

DR. A. SIVA KAMESHSWARA KUMAR
DR. K. SUBBARAYUDU
DR. C. JAYA SUBBA REDDY

a2+b2=c2

This work investigates various types of derivations in prime and semi prime associative rings, particularly focusing on Jordan generalized reverse derivations and left generalized derivations. Notable contributions from mathematicians like E.C. Posner and I.N. Herstein and C. Jaya Subba Reddy have advanced the field significantly. The research presents new findings on lie ideals, symmetric reverse bi-derivations, and the commutativity of left generalized derivations. Specific results include demonstrating conditions under which Jordan generalized reverse derivations become generalized reverse derivations, and proving commutativity in rings with certain derivation properties. The study also explores the properties of prime and semi prime rings under these derivations, providing detailed proofs and extending previous results in the literature. Definitions of key terms such as commutator, anti-commutator, prime ring, semi prime ring, and various types of derivations are included to clarify the theoretical framework.

Dr. A.Sivakameshwara kumar, Associate Professor of Mathematics in Basic Science at Santhiram Engineering College (Autonomous), Nandyal, A.P., has 20 years of teaching experience. With an M.Sc., M.Phil. and Ph.D., in Algebra his scholarly endeavors including eight publications and active participations in publications, workshops and conferences. He holds multiple administrative roles, showcasing his commitment to academia.

Dr. K. Subbarayudu, Lecturer in Mathematics at Government Polytechnic, SIMHADRIPURAM, KADAPA(Dist), A.P. possesses 22 years of teaching experience, holding an M.Sc B.Ed., and Ph.D., He joined as S.G.Asst in 2002, later joined as School Assistant (Mathematics) in 2005 and he got polytechnic lecturer in 2013. His scholarly endeavors include eight publications and active participation in workshops and conferences.

Prof. C. Jaya Subba Reddy, with 21 years of research and 17 years of teaching experience, is a Professor of Mathematics at Sri Venkateswara University. He specializes in Algebra and Graph Theory, has published 135 research papers, authored 4 books, and supervised 12 Ph.D. and 10 M.Phil students. Prof. Reddy organized 12 national and international events and attended 163 conferences and workshops. He received awards including the Best Paper Award-2016, Rajiv Gandhi Excellence Award-2015, Bharat Jyothi Award-2014, and Shiksha Rattan Puraskar-2014. He serves as the General Secretary of Andhra Pradesh & Telangana Society for Mathematical Sciences (2022-2024).

AQUACULTURE ADVANCES IN NANOTECHNOLOGY

Dr. P. Nagajyoti
Department of Aquaculture
S.V. University, Tirupati

Abstract

Aquaculture is one of the fastest rising sectors in the world today. An Aquaculture system is diversified as fresh, brackish and marine water culture systems. The growth of aquaculture as an industry has accelerated over the past decades, this has resulted in environmental damages and low productivity of various crops .The need for increased disease resistance, growth of aquatic organisms, and feed efficiency has brought about the use of probiotics in aquaculture practices. The first application of probiotics occurred in 1986, to less their ability to increase growth of hydrobionts (organisms that live in water). Probiotics were used to improve water quality and control of bacterial infections. Now a day there is documented evidence that probiotics can improve the digestibility of nutrients, increase tolerance to stress, and encourage reproduction. Currently, there are commercial probiotic products prepared from various bacterial species such as Bacillus sp., Lactobacillus sp., Enterococcus sp., Carnobacterium sp., and the yeast Saccharomyces cerevisiae among others, and their use is regulated by careful management recommendations. The present paper shows the current knowledge of the use of probiotics in aquaculture, its antecedents, and safety measures to be carried out and discusses the prospects for the study in this field.

Keywords: *Aquaculture, Probiotics, water quality, Disease Control, Growth promoters, reproduction.*

Introduction

"Nanotechnology is dealing with specific size dependent functional properties of the individual sub-units or of a system of those". Nanotechnology is the future big excitement in the field of Science and Technology.

Nanotechnology manipulates matter at the nanoscale (1-100 nm) (Moore, 2006 and Nel *et al.*, 2006) producing nanoproducts and nanomaterials (NMs) that can have novel and size-related physico-chemical properties differing

significantly from those from larger particles. Recently, anthropogenic sources have also produced nano-sized materials unintentionally from combustion by- products and intentionally as manufactured nanomaterials. Nanotechnology is undoubtedly one of the most important technologies of the 21st century. With an estimated $147 billion worth of so-called 'nano-enabled' commercial and consumer products sold in 2007 and a projected value of $3.1 trillion by 2015. Nanotechnology has been referred to as the next industrial revolution (Schmidt, 2009). This technology promises scientific advancement for many sectors such as medicine, consumer products, and energy. Governments and investors around the world are therefore keen to explore and exploit the exceptional properties of nanomaterials opportunities which exist within nearly every industrial and technological sector.

Nano–Concept and History

Nanotechnology is defined as the "design, characterisation, production and application of structures, devices and systems by controlling shape and size at nanometre scale" (Williams *et al.*, 2005). In principle, therefore, any product using compounds that exist as, or are manufactured to, these specifications can be considered as nanomaterials.

Table 1: Comparison of sizes of biological molecules and structures in nanometers (Gupta and Kompella, 2006)

Object	Size (nm)
Carbon atom	0.1
DNA double helix (diameter)	3
Ribosome	10
Virus	100
Bacterium	1,000
Red blood cell	7,000
Human hair (diameter)	80,000

Table 2: Percentage surface molecules in particles of different diameters (Gupta and Kompella, 2006).

Particle Size (nm)	Surface Molecules %
1	100
10	27.1
100	2.97
1,000	0.3
10,000	0.03

Furthermore, as the size of a particle decreases to the nanoscale, the physical properties of the particle are altered, rules of quantum mechanics, which determine the behavior of matter and light at the atomic and subatomic level, begin to dominate as particles shrink to the nanoscale.

Oxide Nanoparticles in the Aquatic Environment

Nanotechnology has grows with the number of nanomaterial types and applications increase, so does the likelihood that they will be released into the environment, and in significant quantities, a fact that has been met with increasing concern over their safety in terms of human health and the environment (Dowling *et al.*, 2004; Williams *et al.*, 2005). Sources to the aquatic environment include waste water discharges, accidental release from factories, and the degradation and wear of products containing oxide nanomaterials. Due to their extremely small size and unique physical properties the behaviour of oxide nanomaterials in the environment, their uptake, distribution and effects within the bodies of living organisms are likely to be different when compared to conventional xenobiotics. To date, however, there is a lack of data and understanding about their environmental fate, bioavailability and biological effects. Therefore an urgent need to fill the gaps in our understanding

and for research and regulatory activities to ensure these compounds do not pose any significant hazard to human and environmental health. This type of study form vital to ensure the sustainability of the industry.

Nanotoxicology

Nanotoxicology is a branch of bionanoscience, which deals with the study and application of the toxicity of nanomaterials. Nanotoxicological studies are used to determine whether and to what extent these properties may pose a threat to the environment and to human health. Nanoparticles play a remarkable role in toxicity, which is important for the toxicologists.

The rapid development of the nanotechnology industry has been fueled by the unusual properties that materials possess at the nanoscale. However it is also these properties that are in part fuelling concern regarding their potential toxicity and ecotoxicology. In addition, their small size means they may be able to bypass barriers that usually prohibit the entry of other xenobiotics and enter the cells of living organisms, passing through membranes and junctions between cells. This coupled with their improved reativity may mean oxide nanomaterials have the potential to induce adverse cellular effects and harm to living organisms. To date however, there are relatively few studies investigating the effects of exposure to oxide nanomaterials on living organisms, especially those living in aquatic environments. Nanotoxicology would expected to make an important and timely contribution to the development of a sustainable and safer use of nanotechnology for the welfare of mankind. Nanotoxicology research not only provide data for safety evaluation of synthetic nanoparticles, and devices but also will help to advance the field of nanomedicine by providing information about their undesirable properties and means to avoid them.

The history of development of nanomaterials started at 1959 with an exciting lecture of **Richard Feynman** - the scientist engaged in construction of atomic bomb, teacher, raconteur, and musician - entitled "**There is a plenty of room at the bottom**". However, it has been only an idea of creating any object by putting together single atoms or molecules. The word "nanoscience" was coined by Dr. Eric Drexier, a famous American engineer. The term nanotechnology was first adopted by Professor Norio Taniguchi of the Tokyo Science University in his paper, "On the Basic Concept of 'Nanotechnology'", presented at a meeting of the Japan Society of Precision Engineering in 1974.

The advent of cluster science (the study of aggregates of molecules and how their properties contribute to the characteristics of a bulk solid) and the invention of the scanning tunnelling microscope (STM) in the 1980s and later the atomic force microscope, heralded the beginning of practical nanoscience and led to the discovery of fullerenes in 1985 (Kroto *et al.*, 1985) Since then, nanotechnology has grown into the multi-billion dollar industry, with a seemingly limitless array of particle types being developed with potential applications within all industrial sectors.

Nanoparticles

Nanoparticles include ultrafine particles of metals, metal oxides, non- metals and ceramics. They can be spherical, tubular, or irregularly shaped and can exist in fused, aggregated or agglomerated forms. Nano-sized materials are naturally present from forest fires and volcanoes, viral particles, biogenic magnetite, and even protein molecules such as ferritin. Oxide nanoparticles such as zinc oxide (ZnO), titanium dioxide (TiO_2) and silicon dioxide (SiO_2) are some of the common industrial additives and have various

applications. The behaviour of nanoparticles in surface waters will therefore be dominated by the same physicochemical principles as those that determine the behaviour of natural colloids in soil. The aquatic environment is a sink for pollutants from both the atmosphere and lithosphere entering the water system besides autochthonous sources. All suggests that the aquatic environment is particularly vulnerable to contamination due to the extensive use/applications of oxide nanoparticles.

Properties of Nanoparticles

In recent years, nanomaterials have become increasingly important in various fields because they exhibit better optical, mechanical, physical, chemical, thermal and electrical properties and magnetic susceptibility than its microcrystalline materials. There are obvious advantages associated with being able to scale down the size of various technologies and products and they include saving space and reducing production and transportation costs. Nanotechnology, involving the manipulation and creation of molecules to exact specifications, also allows for the creation of novel materials that function more effectively and can perform new roles. This is primarily because various physical qualities set nanoparticles apart from larger materials of the same chemical composition. These qualities have largely fuelled the interest in their potential uses. Due to their small size, nanoparticles have a very large surface area to volume ratio. Therefore an increasing number of the atoms that make up the particle are present on the particle's surface compared with a larger particle of the same chemical composition (Table -2). Nanosized particles are therefore be chemically more reactive per unit mass than their bulk sized counterparts.

Conclusion

Nanotechnology is considered as an innovative and highly promising revolution in science and technology. The application of nanotechnology in biomedical science, electronics, cosmetics, and pharmaceutical industry has potential to increase the release of nanoparticles into environment. Environmental release of nanoparticles may pose a significant risk to life within the aquatic ecosystem. Thus nanotoxicology is the study of the toxicity of nanomaterials on biologicals. Because of quantum size effects and large surface area, nanomaterials have unique properties compared with their larger counterparts.

Nanotoxicological studies are intended to determine whether and to what extent these may pose a threat to the environment and to human.

An understanding of the underlying biological mechanisms responsible for the consequences of exposure observed is also required in order to provide information that will allow the informed design of future nanomaterials, ensuring their biocompatibility and minimising potential adverse health risks. This information may prove critical in aiding the progression of the nanotechnology industry, so that it is able to realise the great benefits it promises.

Abstract

India can create over $1 trillion of economic value from the digital economy in 2025, with half the opportunity originating in new digital ecosystems that can spring up in diverse sectors, says a report from Ministry of Electronics and Information Technology, in partnership with McKinsey. "The trillion dollar economy report is the symbol of opportunity that India offers," said Ravi Shankar Prasad, Minister of Information Technology. "Digital India is also an opportunity for people in digital space to do business in India. The size and scale that India offers is a big business opportunity for global companies," he added. 'Digitization' and 'digitalization' are two conceptual terms that are closely associated and often used interchangeably in a broad range of literatures. Digitization refers to "the action or process of digitizing; the conversion of analogue data into digital form." Digitalization, by contrast, refers to "the adoption or increase in use of digital or computer technology by an organization, industry, country. "Digital India is the beginning of digital revolution. It is a dream which is created by the Government of India to ensure that government services are made available to citizens electronically, even in remote areas, by improving online infrastructure and by increasing Internet connectivity. The programme have one mission and one target that is to take nation forward digitally and economically. The initiative will enable people to get engaged in the innovation process which is needed by the economy to move forward. If implemented properly, it will open various new opportunities for the citizens of the country. Currently, India's digital economy generates about $200 billion of economic value annually 8 per cent of India's GVA in 2017-18 largely from existing digital ecosystem comprising information technology and business process management (IT-BPM), digital communication services, e-commerce, domestic electronics manufacturing, digital payments, and direct subsidy transfers, the report said. "By 2025, India could create a digital economy of $800 billion to $1 trillion. The existing digital ecosystem could

Lt. Dr. Venkataramanaiah Malepati is a top- notch academician, presently working as an Assistant Professor in Commerce at S.G.Government Degree and PG College, Piler. He has obtained his M.Com, MBA, M.Phil and Ph.D. from S.V .University, Tirupati and MBA from Pondicherry University. He has got through National Eligibility Test (NET) in Commerce and Management and SET in Commerce with distinction. He has bagged National Merit Scholarship in Graduation and Gold Medal in M.Com. He has also bagged Centrally Administrated Doctoral Fellowship from ICSSR, New Delhi for his research during 2010-13. Dr. Malepati has the rich experience of 18 years in both teaching and research. Being the passionate researcher and teacher, he traveled widely and tried out his wings in various positions in teaching across the countries. Dr. Malepati started his career as a lecturer in Dravidian University. Later he rendered his services in various capacities in the Premier Institutions like University of Gondar, Ethiopia, KMM Group of Institutions, Tirupati, Vignanasudha Institute of Management and Technology, Chittoor, University of Kurdistan, Iraq and Golden Valley Group of Institutions, Madanapalli. Being the top-notch researcher, he contributed significantly to the areas of Capital Markets, Agri Finance, MSMEs and Micro-finance. To his credit, there are 41 research papers published in National and International Journals listed in UGC Care List, Scopus Indexed and Web of Sciences. He has also been credited with four chapters in Edited Books. In addition to these, he has also 10 completed Edited Books and one edited book in the pipeline to his credit.

Abstract

Growing population and technological advancement are continuously putting a strain on the environment and on a country's natural resources. Over-exploitation of the country's natural resources like land, water, air, fuel etc. has resulted in degradation of natural resources mainly due to industrial wastes, soil erosion, cutting of forests (deforestation) and migration from rural to urban (urbanization). Hence, it is most important to conserve and promote natural resources and the environment. Women have an important role for direct contact with natural resources like fuel, food and fodder, flora, water, air and land especially in rural areas where 73% of Indian population reside and directly dependent upon natural resources. Women are also responsible for using these resources to satisfy the basic needs of their families. Before 18th and 19th century, it was considered that women have no role in natural resources protection and promotion, as well as they were avoided in all major aspects of social life. After spreading awareness about their rights and duties and taking cognizance of their surroundings they consciously tried to raise voice against environment degradation. Women play an important role in managing natural resources on family and community levels and are most affected by environmental degradation. This paper focuses on how women participated in conservation of natural resources for preserving them for the future generations.

Key Words: Environment, Natural Resources, Over Exploitation, Deforestation, Urbanization.

Introduction

Since time immemorial, women are traditionally involved in protecting and conserving their natural resources in hilly areas. With their extraordinary skills and traditional knowledge, women have proved how land, water, forest, air and other natural resources can be used and managed. Besides, that woman even played a leadership role for conservation and enhancement of environment. In communities around the world, women manage water, sources for fuel, and food, as well as both forests and agricultural terrain. From the high level to the grassroots, the 1992 UN Earth Summit, India's Chipko movement and Kenya's

Abstract

Education plays a pivotal role in all our lives and paves the way for all of us to reach our highest potential. When we talk about the importance of education in life, it is extremely important to understand what education is. In this blog, we explore the importance of education in life, the significance of contemporary learning and its many aspects. The stakeholders of education, namely, governments, organizations and students themselves agree on its multidimensional essentiality. High-quality education, particularly tertiary education is a major catalyst of development in families across the income spectrum. Further, with the integration of multidimensional goals, the importance of education has been accentuated and individuals have grown more conscious towards the environment and society developing an awareness lacking in previous generations. Published on the World Bank blog, the article "Education is Fundamental to Development and Growth" appropriately summarizes the fact that education, through various methods, carries the potential to transform people's lives. On the other side, illiteracy affects an individual in all areas of their life. An illiterate individual cannot read and write, and thus cannot join the workforce or may work as unskilled labour, lack awareness to make an informed decision which affects them and their community. So there is a need to promote alternative ways to eradicate illiteracy.

Key Words: Education, Development, Multi- Dimensional Development, Illiteracy.

Introduction:

Article 26 of the Universal Declaration of Human Rights, proclaimed by the General Assembly of the United Nations in 1948, states in its opening paragraph: "Everyone has the right to education. Education shall be free, at least in the elementary and fundamental stages. Elementary education shall be compulsory. Technical and professional education shall be made generally available and higher education shall be equally accessible to all based on merit."

Health Care Programmes for Children in Andhra Pradesh- A Study

*- Dr. V. Jagadeeswari **

Abstract

Health influences all activities and shapes the destiny of the people. Without health, there is no foundation for man's happiness. Since "Good health leads long life", traditionally it has been prized as goals of the mankind and health information flew from generation to generation. Information of health has a great social, political and economic importance. Information of health should reach the people in right time, to prevent the damage to human life. To have relevant information, it means to have basis for timely reporting, basis for action, and prerequisites for success. The purpose is to produce and use adequately appropriate information about health status, health risks and health outcomes in order to establish priorities. Health information should be useful and easily accessible to all potential users at every moment i.e., from health care providers to the public. Health indicators, as aggregated health statistical data, present measure instruments in this process. Basic set of relevant and measurable indicators should be found on different aspects of health and health care viz. health promotion, diseases prevention, clinical treatment, rehabilitation, monitoring and evaluation as a part of every day's routine in health sector. It should be a continuous process with the involvement of not only health and medical staff but also para medical staff including lab technicians. Governments are executing different health promotion programmes.

Keywords : Health, human life, health status, health risks, health indicators, health promotion programmes.

Introduction

According to World Health Organization (1948) health is 'A condition or quality of the human organisms expressing the adequate functioning of the organism in given conditions, genetic (or) environmental".

The Millennium Development Goals placed health at the heart of development and represent enrichment by the governments throughout the world. This is to reduce poverty, to tackle ill health, access to clean water and so on. Andhra Pradesh Government is implementing several health awareness and health promotion programmes to people especially to downtrodden communities including women and children. Health is the fundamental right of every human being. Health is related deeply to life style. Ideal health will however, always remains an illusion, because everything in our life is subject to change. Health is a dynamic

A Study on the Significance of Property Rights to Women

Dr. V. Jagadeeswari

Abstract

In a country like India where 73.2% of rural women workers are engaged in agriculture, women own only 12.8% of land holdings. Land serves as security and shelter. The land ownership changes the position of women as decision maker thus whole family will be benefited. Children will be much safer, healthier, educated. Anita Pagare, a women's rights activist based in Nashik said 'Land acts as a bargaining tool for women'. "With no land to their name, women are completely at the mercy of their husbands or their family." The 2005 Hindu Succession Act was legislated to protect women's rights to an equal share in ancestral property, including land. But in reality, land is not at all registered in the name of women.

KeyWords: *Women Workers, Agriculture, Land Ownership, Bargaining Tool, De Jure and De Facto, etc.*

Introduction

Land ownership acts as a bargaining tool for women. Findings of different studies established that women who own land have better economic and social security. According to United Nations Report 2013 "By diminishing the threat of forced eviction or poverty, direct and secure land rights boost women's bargaining power in the home and improve their levels of public participation". "With no land to their name, women are completely at the mercy of their husbands or their family." The 2005 Hindu Succession Act was legislated to protect women's rights to an equal share in ancestral property, including land. But in reality, land is not at all registered in the name of women. That means De Jure of women's property rights.

There is a view which is widely prevalent that, inequality between the sexes never existed in the age of hunting, in the period of domestication of animals, in the times of fruit gathering and even during the centuries of agriculture with weed. But a look at various socio-economic indicators

Savitribai Phule- the First Generation Modern Indian Feminists: Case Study

Dr. V. Jagadeeswari

Abstract

Savitribai Phule, the first female teacher in India and a pioneering social reformer of the 19th century, passionately championed the rights of women and lower castes while challenging the oppressive social systems of Pune, advocating for truth, equality, and humanity. Savitribai Phule, born on January 3, 1831, in Maharashtra, emerged as an influential social reformer and women's rights activist, using her education to combat the deeply entrenched patriarchy and caste system in Pune alongside her husband, Jyotirao Phule. On the third of January 1831, she was born in Naigaon, Satara, Maharashtra. Her parents were from the Bamako Community, which is currently classified as one of the Other Backward Classes (OBC). She was schooled by Jyotirao Phule, her husband, after they were married at the age of nine. She subsequently used this education to combat social injustice, inequality, and graded patriarchy that were common in Maharashtra, particularly Pune. This paper discusses about her contributions to the welfare of backward community.

Keywords: First female teacher, Social reformer, Women's rights activist, Equality and humanity.

Introduction

At that time, the caste system and patriarchy defined Pune. Savitribai Phule became determined after reading about Jyotirao Phule's

Government Support for Emancipation of Women and Girls - An Overview

Dr. V. Jagadeeswari
Dr. K. Kishore Kumar Reddy
Dr. K. Vijaya Kumari

Abstract

The women population add more than 49% of the country. Enabling women free in decision making is important as they are alike chief of the ship and having the responsibility of the family viz. balancing the economic condition of the family and educating the children. Nations, businesses, communities and groups may benefit from the implementation of programs and policies accomplished for women empowerment. Empowerment of women not only enhances the quantity of workforce but also their quality which is needed for the growth of any country.

Since children will be the nation's future citizens, empowering them is also necessary for the country's wealth. The welfare of the youth is crucial to the country's future. The only people who can influence the leadership are those who are in good physical and mental health. The concept of women's and children's empowerment also encompasses social and economic advancement, which is a key driver of national development. Since, India is primarily an agricultural nation, it stands to reason that women's and children's empowerment should be given top priority. 50% of the population is made up of women and children, and by supporting other women in their endeavors, women make up the workforce.

Keywords : Empowerment, Development, Leadership, Endeavors, Welfare of the youth.

11. Empowerment of Women and Girls through Sustainable Development Goals

Dr. V. Jagadeeswari and

Mrs. D. Jahnavi

Abstract

Globalization should lead to the promotion of shared understanding, values and cooperative actions on a transnational and trans-societal level. It would be a movement that recognizes and respects the diversity, variety and richness of local discourses, codes and practices, while developing viewpoints and the understanding that facilitates cooperation and coordination to achieve gender equality which is very important for sustainable development. It is a process that continues life long and therefore takes place in global environments. The ultimate objective is 'a better future for all irrespective of gender'.

One of the challenges of sustainable development is gender inequality and gender discrimination. There have been several recent initiatives designed to foster the gender equality at home and workplace in different fields for sustainable development. Education as a qualitative attribute of the population is one of the most important indicators of achieving gender equality through socio-economic and political development of a society. It is a major component of human resource development and is thus basic to any programme of social and economic progress. The role of education in the life cycle of an individual affirms and enables the individuals to adapt to and deal with new challenges and changes in their lives and their surrounding environment. It supports all forms of experiences which can help prepare or engage individuals in purposeful interaction with their own environment by developing their knowledge, skills and their critical thinking

MGNREGA- A Source of Employment Generation in Rural Areas

The Indian Government over the years has executed and implemented several Rural Employment generation programmes viz. National Rural Employment Programme (NREP) in 1980, Rural Landless Employment Guarantee Programme (RLEGP) in 1983, Jawahar Rozgar Yojana (JRY) in the last year of 7th Five Year Plan, Employment Assurance Scheme (EAS) in 1993, Jawahar Gram Samridhi Yojana (JGSY) in 1999, Sampoorna Grameen Rozgar Yojana (SGRY) in 2001, National Food for Work Programme (NFFWP) 2004, Mahatma Gandhi National Rural Employment Guarantee Act(MGNREGA) in 2005 which is known as National Rural Employment Guarantee Act (NREGA), etc. MGNREGA implemented Mahatma Gandhi National Rural Employment Guarantee Scheme (MGNREGS) which is an envisaged template modification from all precedent Wage Employment Programmes (WEP) operating in the country since 1980. With this locale the authors attempted to study MGNREGA and MGNREGS as source of employment to rural people, its impact on the lives and creation of assets in rural areas. The data collected from the beneficiaries has been documented by the authors with the title "MGNREGA- A Source of Employment Generation in Rural Areas"- A Study.

Dr. V. Jagadeeswari working as Academic Consultant in the Centre for Women's Studies, Sri Venkateswara University, Tirupati obtained M.A. (Gold Medal), M. Phil and Ph.D. degrees in Adult Education, M.A.W.G.S., M.Com, M.L., M.Ed., B.L.I.Sc., P.G. Dip. in G&C and COBOL Certificate and also qualified APSET.

A STUDY ON KNOWLEDGE REGARDING THE EFFECT OF JUNK FOOD ON HEALTH AMONG ADOLESCENT GIRLS

***Dr. D. Raja Rajeswari**, Academic Consultant, Centre for Women's Studies, S.V. University, Tirupati, Andhra Pradesh.

****Dr. D. Ramana**, Academic Consultant, Centre for Women's Studies, S.V. University, Tirupati, Andhra Pradesh.

Abstract

Food is necessary for energy, for growth, for repair, and for health. Our health depends on what we eat daily. These days, most people like junk food, which is very popular among adults as well as children. Socio-economic trends, such as longer work hours, more women employed outside the home, and a high number of single-parent households, have changed the way families obtain their meals. In today's world scenario, junk food has become a prominent feature of diets for adolescents. The rapidly changing food consumption pattern and diet transition are emerging in society due to economic growth and new lifestyle choices. Today, many adolescents like to eat junk food, but they do not know about the harmful effects of junk food on their health. People have forgotten that the primary reason for eating is nourishment. Lifestyle changes have compelled us so much that we have so little time to really think about whether what we are eating is right! Junk foods are quick, tasty, convenient, and fashionable. Objectives of the study to study the socio-economic demographic profile of the respondents to assess the knowledge regarding the effects of junk food on health. Among adolescent girls The present investigation was carried out in the Tirupati urban area of Chittoor, Andhra Pradesh. The sampling unit for the study was adolescent girls of the same age. Group of 13 to 14 years. A total of 50 samples were selected for the study, 50 from 8^{th} and 9^{th} grade adolescent girls. Sri Padmavathi Girls High School in Tirupati. A random sampling procedure was followed in the selection of the respondents.

WOMEN'S PARTICIPATION IN GREEN JOBS FOR DEVELOPMENT OF GREEN ECONOMY IN INDIA

Dr. D. Ramana

Academic Consultant, Centre for Women's Studies, S. V. University, Tirupati

ABSTRACT

India's G20 presidency, the country has introduced the 'LiFE' (Lifestyle for Environment) Mission to promote responsible consumption. India emerging as one of the world leaders, has the potential to create 35 million green jobs by 2047. The green jobs help to protect ecosystems by reducing energy, materials, and water consumption through high-efficiency strategies. Reduce all forms of waste and pollution for sustainable development. This mechanism helps to create an efficient green economy through the creation of green jobs.

Green occupations for women could be such a solution, but there are several hurdles to overcome first. Green jobs for women can combat the climate crisis and boost equality. Women are underrepresented in high-potential climate-friendly sectors Women continue to be underrepresented, underpaid, undervalued, and sometimes completely unseen in the labor market. Women may be excluded from the green economy due to gender-segregated employment, discrimination, and traditional attitudes. The lack of gender equality is decreasing the access of women to green positions in the primary, secondary, and tertiary sectors. Although they are the foundation of sustainable households, women agricultural workers in poor countries are a marginalized group. Most green jobs are expected to be in the secondary sectors of construction, manufacturing, and energy production, where women are significantly underrepresented. Women may fare better in the tertiary division where most are now employed. However, men dominate the better-paid jobs in engineering, financial, and business services, where the bulk of green service positions are likely to be created.

Achieving sustainability depends on equal attention to economic, environmental, and social factors and their integration through sustainable development strategies. Green economy initiatives that aim at creating more environmentally sound economies may not fully incorporate fundamental social requirements such as income equity, job quality, and gender equality. If they do not take account of these social factors, they may maintain or even aggravate the negative social and distributive trends of the traditional economy including existing inequalities and gender gaps. Upward environmental awareness and economy-linked

Political Participation of Women in Rayalaseema Region in Andhra Pradesh: A Brief Analysis of 2004 to 2019 State Legislative Assembly Elections

Dr. D. Ramana

Abstract

Empowerment of women takes place through structural changes in women's lives such as provision of land rights, promotion of non-farm employment, self-employment and support to unleash their potential of leadership abilities and their input in decision making at various levels. The Political inequalities prevalent within the semi-feudal and rural societies are balance the power structure ultimately (Agarwal, 2018). Political representation is a tool to achieve the social equality and personal privileges of women in elsewhere the society.

The current study aimed to analyse of the Women's Political participation in Rayalaseema region of Andhra Pradesh. Secondary source of data method was followed to collect the data produced from 2004, 2009, 2014 and 2019 Legislative Assembly Elections.

***Key words** : Political Participation, Women Empowerment, Political inequalities*

Introduction

The days have changed women from which they have arrested by four parapets of the kitchen and to look after the members of the family to the days where women are showing their talent in all fields. Veracious from the origin of the Andhra Pradesh Legislative Assembly, women as

Optimal Placement of D. G. Units & E. V. C. S. In Distribution Systems

978-620-6-76883-8

The primary objective of this book is to introduce various methods for the optimal placement of Distributed Generation (D.G.) Units and Electric Vehicle (E.V.) Charging Stations within radial distribution systems. This book explores the impact of Electric Vehicle Charging Stations (EVCS) on distribution systems and delves into the optimal placement of multiple DG units of different types, along with EV charging stations. The operations of these units in both Grid-to-Vehicle (G2V) and Vehicle-to-Grid (V2G) modes are investigated, focusing on loss reduction and voltage profile improvement within radial distribution systems. The book comprises six chapters.

LOSS REDUCTION METHODS IN ELECTRICAL DISTRIBUTION SYSTEMS

978-620-6-17677-0

The main objective of this book is to present some of the loss reduction methods in Electrical distribution systems. There are many different ways to reduce the losses and improve the performance of the distribution systems. Within the scope of this book, optimal capacitor placement, network reconfiguration and the two hybrid methods are presented. The introductory aspects related to Electrical distribution systems, factors affecting distribution system losses, loss reduction methods and literature survey in this area are presented in Chapter-1. Chapter-2 introduces an efficient branch current method to obtain the load flow solution of radial distribution systems. The findings of the proposed branch current load flow method tested on different static load models namely constant power load model, constant current load model, constant impedance load model and exponential load model are reported. Load growth is also considered. Chapter-3 presents different methods developed for the optimal capacitor placement problem. A two-stage methodology is used for the optimal capacitor placement.

OPTIMAL U.P.Q.C. PLACEMENT IN RADIAL DISTRIBUTION SYSTEMS

OPTIMAL UNIFIED POWER QUALITY CONDITIONER PLACEMENT IN RADIAL DISTRIBUTION SYSTEMS

978-620-6-76894-4

The main objective of this book is to present some of the Optimal Placement methods of Unified Power Quality Conditioner (U.P.Q.C.) in Radial Distribution Systems. Within the scope of this book, the optimal UPQC placement problem is solved for the objective of Power Loss Minimization (PLM) and Voltage Deviation Minimization (VDM) and analyzed with various optimization methods. This book is divided into five chapters.

Abstract. Slurry Infiltrated Fibrous Concrete (SIFCON), a modified version of Fiber Reinforced Concrete (FRC), addresses the challenge of increased fiber volume fractions. Commercially produced steel fibers are typically used in FRC and SIFCON. Efforts to reduce energy use in making commercial steel fibers have led to seeking alternative sources. Vehicular tires are typically recycled when no longer usable, yielding steel fibers among the products. Emphasis lies in recovering steel fibers from used tires as part of resource recovery from waste. Experimental work explored flexural strength in SIFCON with waste steel fibers at volumes from 4% to 7%. The study extended to assess SIFCON's flexural strength with commercial steel fibers at similar volumes, aiming to correlate with those from waste steel fibers. M20 grade concrete and SIFCON slurry matrix specimens were cast as reference mixes for comparison. The flexural strength of SIFCON specimens with waste steel fibers recovered from used tires notably surpasses that of reference mixes and is comparable to SIFCON specimens with commercial steel fibers. Additionally, the two-layer technique proves effective in SIFCON using waste steel fibers from used tires, up to 6% volume. The test results show successful production of SIFCON from waste steel fibers recovered from used tires.

Keywords: Slurry Infiltrated Fibrous Concrete, Flexural strength, Waste steel fibers, Aspect ratio.

1 Introduction

Globally, energy crises and their impact on the environment are significant challenges faced in the present scenario. These issues arise due to the increase in population, rapid urbanization, and the generation of substantial quantities of solid waste. The production of automobiles and trucks has significantly increased to meet the growing demand, leading to a proportional increase in the generation of waste tires. In today's modern world, the use of

vehicles for the transportation of people and materials is steadily rising, resulting in a problem with the disposal of scrap tires at the end of their life [1, 2, 3]. Less than 40% of the embedded energy in tires that have been scrapped can be recovered as fuel energy, based upon studies [4]. The majority of discarded tires are utilized as a source of energy for cement kilns because of the high carbon content in tires [5]. It is better to embrace the concept of reusing and recycling to obtain resources from waste, which offers environmental benefits [6, 7]. Rubber recovered from scrap tires in recycling plants is used as a source of energy in industries, and the steel fibers with high strength that were extracted from scrap tires serve as raw materials for steel manufacturing plants. The focus has been made on extracting steel fibers with high strength from used tires as a concept of resource recovery from waste, reducing the need for using high-strength manufactured commercial steel fibers. Pyrolysis methods, cryogenic methods, or mechanical methods are generally employed for the recovery of rubber and steel fibers from scrap tires [8, 9]. Steel fibers extracted from used tires may not have a straight or definite aspect ratio, unlike manufactured commercial steel fibers.

It has been demonstrated that steel fibers with various aspect ratios that are extracted from used tires may be used as an alternative material while producing steel fiber-reinforced concrete. [10]. However, due to the balling effect, there is a limitation in using higher amounts of fibers in the preparation of fiber-reinforced concrete. A special form of steel fiber-reinforced concrete is Slurry Infiltrated Fibrous Concrete (SIFCON), a high-performance cementitious composite [11, 12]. The production of SIFCON is different from the conventional fiber-reinforced concrete, wherein molds are prepacked with the fibers and infiltrates the cement mortar slurry matrix. Due to the procedure of prepacking, higher amounts of fibers can be used in the manufacture of SIFCON using cement mortar slurry matrix with a low water-cement ratio, resulting in higher energy absorption or toughness compared to conventional steel fiber-reinforced concrete, as well as higher post-cracking strength. In the production of SIFCON, the fibers are placed by hand and infiltrated with a cement mortar slurry matrix, in which the balling of fibers will not be a limitation and facilitates the convenient use of the waste steel fibers extracted from scrap tires. Furthermore, waste steel fibers extracted from scrap tires are less expensive than industrial steel fibers, which is also an added advantage for SIFCON applications. Studies regarding the usage of waste steel fibers in the production of SIFCON are limited based on the available literature [13, 14, 15, 16, 17].

The maximum flexural strength of SIFCON is obtained at 9% of fiber volume with an aspect ratio of 80, and it is noted that SIFCON's flexural strength, split tensile strength, and compressive strength are optimum at 9% fiber content [18]. It is proved that the three-layer technique with hand tamping is effective in prepacking fibers in the casting of SIFCON specimens. It was observed that beyond 10% volume of hooked-end steel fibers with an aspect ratio of 70 and a length of 35 mm, the placement of fibers manually in the mold is very tedious [19]. It was shown that the compression, split tensile, and flexural strengths of SIFCON specimens will increase with an increase in the volume of the steel fiber fraction [20]. SIFCON slab specimens show superior performance in load-carrying capacity, stiffness, and energy absorption compared to fiber-reinforced concrete and plain cement concrete slab specimens in flexure [21]. Higher levels of waste fibers in SIFCON have improved its splitting and flexural strengths. However, the use of waste steel fibers had no effect on compressive strength. Waste steel fibers have the potential to be a desirable substitute in the manufacture of SIFCON, as shown by multi-objective optimization. [22]. It has been concluded adding SIFCON to regular concrete reduces the possibility of cracks spreading, improves strength, ductility, load carrying capacity, and energy absorption capability (toughness) [23].

Steel fibers are being utilized in the manufacturing of steel fiber-reinforced concrete in the construction industry. Slurry Infiltrated Fibrous Concrete (SIFCON) has been termed 'the

advanced version of Fiber-Reinforced Concrete (FRC)' due to the increased volume fraction of fibers, which contributes to improved hardened properties such as strength, toughness, and impact resistance. Generally, the fibers used in the preparation of SIFCON offer benefits similar to what reinforcing bars offer in Reinforced Cement Concrete (RCC). The improved properties of SIFCON elements depend on the type, geometry, shape, and orientation of the fibers utilized in experimental work. The main aim of this experimental work is to study the flexural strength of SIFCON, which is produced using waste steel fibers recovered from used tires.

2 Materials

2.1 Binding material

Grade 43 Ordinary Portland Cement (OPC) has been used as the binding material throughout the experimental work and conforms to Indian standards [24]. Tests were conducted on the cement used in the experimental study to determine its fineness, specific gravity, consistency, and initial-final setting times. The physical properties of the cement are shown in Table 1.

Table 1. Physical properties of Cement

Physical Properties	Test Result	Test method	Requirement
Specific gravity	3.13	IS 4031 (Part II):1988	-----
Fineness [m^2/Kg]	311.5	IS 4031 (Part II):1988	Min. 225
Normal consistency	33%	IS 4031 (Part IV):1988	-----
Initial setting time [minutes]	47	IS 4031 (Part V):1988	Min. 30
Final setting time [minutes]	252	IS 4031 (Part V):1988	Max. 600

2.2 Fine aggregate

Natural sand obtained from the riverbed has been used throughout the experimental work for the preparation of the reference mix and SIFCON specimens. However, a maximum aggregate size of 0.60 mm has been considered and used in the preparation of the SIFCON slurry matrix, and this size has been kept constant for the production of SIFCON throughout the experimental work. The fineness modulus, specific gravity, bulk density, and water absorption of the aggregates were determined according to IS codes. Table 2 shows the physical properties of the fine aggregate utilized in the experiment. However, natural sand obtained from the riverbed, conforms to Indian standards has been used fine aggregate in the preparation of M20-grade concrete.

Table 2. Fine Aggregate Test Results

Type of Test	Fine Aggregate
Fineness Modulus [%]	2.80
Specific Gravity	2.65
Water Absorption [%]	0.25
Bulk density [kg/m^3]	1750

2.3 Coarse aggregate

The maximum size of 20 mm obtained from the granite quarry, which conforms to Indian standards, has been used as coarse aggregate in the preparation of M20-grade concrete in the experimental work.

2.4 Mixing water

The laboratory's potable water has been utilized for mixing the SIFCON slurry matrix, reference mix, and curing of the specimens.

2.5 Chemical admixture

To achieve the necessary workability and flowability of the SIFCON slurry matrix, a high-range water-reducing admixture (superplasticizer) of polycarboxylic ether has been used. Manufacturer's data have been considered for the chemical admixture used in the study. Properties of the superplasticizer, i.e., AURAMIX 450 from M/s. FOSROC Chemicals, are shown in Table 3.

Table 3. Characteristics of Super plasticizer (AURAMIX 450)

Appearance	Light yellow colour liquid
pH value	Minimum 6.0
Volumetric mass @ 20°C	1.09 to 1.11
Chloride Content	Nil

2.6 Steel fibers

A survey was conducted to obtain waste steel fibers from used tires. Fibers recovered from scrap tires through a mechanical process at the recycling plant were used in this experimental study for preparing the SIFCON specimens. In the tire recycling plant, initially, collected scrap tires are shredded into small pieces using industrial shredders. After shredding, the tire pieces undergo a process called magnetic separation, in which powerful magnets are used to attract and separate the steel fibers from the shredded rubber. The shredded material is then passed through screens or filters to further separate any remaining steel fibers from the rubber particles. The steel fibers obtained from the recycling plants contained a small quantity of textiles and rubber fragments, which were manually removed to the extent possible before being used in the preparation of SIFCON. The waste steel fibers obtained from the recycling plant are irregular in shape. Waste steel fibers recovered from the used tires utilized in the study were tested to determine the diameter, length, aspect ratio, etc. Fig. 1 displays the waste steel fibers chosen for the experimental program. The length and diameter of the waste steel fibers, measured on randomly selected fibers, are shown in Table 4. Furthermore, round crimped steel fibers have been used as the commercial steel fibers in the experimental work. Manufacturer's data have been considered for the commercial steel fibers used in the study and are shown in Table 5. Fig. 2 displays the commercial steel fibers that were selected for the experiment.

3 Methodology

M20 grade concrete was designed in accordance with the guidelines specified in Indian Standards. [25]. The proportions of ingredients for the M20 grade concrete are presented in Table 6.

Table 6. Mix proportions of M20 grade design mix concrete

	Water	Cement	Fine Aggregate	Coarse Aggregate	20 mm CA	10 mm CA
By Weight [kg]	160	320	667	1131	679	452
By Volume [m^3]	0.50	1	2.08	3.53	2.12	1.41

A flow test was conducted using a mini flow cone, as recommended by EFNARC [26]. The mini flow cone measures 60 mm in height, 70 mm in the top inner dimension, and 100 mm in base inner dimension. The equipment used in this study for the mini flow test is shown in Fig. 3. The SIFCON slurry was poured into the mold, lifted, and the spread diameter of the slurry matrix was measured. The slump flow ranged between 240 mm and 260 mm, in accordance with the guidelines stipulated in EFNARC [26]. Another test conducted on the fresh SIFCON slurry matrix is the mini v-funnel test. Fig. 3 illustrates the dimensions and form of the equipment utilized in this study. The SIFCON slurry was poured into the test equipment, and the time to empty the equipment was measured. The time to empty the test equipment ranged from 7 seconds to 11 seconds, in accordance with the guidelines stipulated in EFNARC [26].

Fresh tests, as described above, have been conducted using cement and fine aggregate in the proportion of 1:1, with a water-cement ratio varying from 0.30 to 0.40 in increments of 0.01 and superplasticizer from 0.50% to 2.00% by weight of cement, in increments of 0.1%. The procedures for the flow test and mini v-funnel tests are shown in Fig. 4 and Fig. 5, respectively. After detailed test trials, it was decided to use the SIFCON slurry matrix with a proportion of 1:1 (cement: fine aggregate) using a water-cement ratio of 0.33 and a superplasticizer content of 0.80% by weight of cement. The mix proportion of the SIFCON slurry matrix is provided in Table 7.

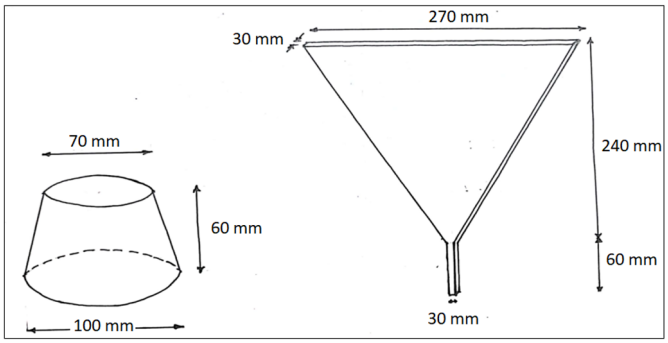

Fig. 3. Equipment for mini slump and v-funnel tests.

Fig. 4. Mini slump test.

Fig. 5. Mini v-funnel test.

Table 7. Mix proportion of SIFCON slurry matrix

Cement	Fine aggregate	W/C ratio	Super plasticizer
1	1	0.33	0.80 % by weight of cement

Upon finalizing the ratio of the SIFCON slurry matrix, the production process for SIFCON is as follows: The molds used for specimen production will be cleaned and coated with waste oil to facilitate easy demolding. Cement and fine aggregate, in a 1:1 proportion, are to be dry mixed. Subsequently, water and superplasticizer, as per the finalized ratios, are to be added to the dry mix. The total slurry must be mixed for a minimum of 2 minutes to ensure proper mixing of the slurry matrix.

A two-layer technique is employed for filling the fibers in the molds to ensure proper compaction and prevent honeycombing. Accordingly, 50% of the volume fraction of fibers is randomly hand-spread as the first layer in the mold. Once the first layer is in place, the prepared SIFCON slurry matrix is poured onto the fiber bed and compacted using hand tamping and a table vibrator.

Subsequently, a second layer of fibers is also randomly spread, followed by pouring of the SIFCON slurry matrix and compaction. The cast samples are left for 24 hours at room temperature. On completion of this time, the samples are demolded and placed in a curing chamber for the designated curing periods. Difficulties were encountered during the production of SIFCON specimens with a 6% volume fraction of steel fibers due to the irregular shape of waste steel fibers and their random placement. In consideration of this, a three-layer technique has been employed for the production of SIFCON specimens with 7% steel fibers. Fig. 6 depicts the production process of the SIFCON.

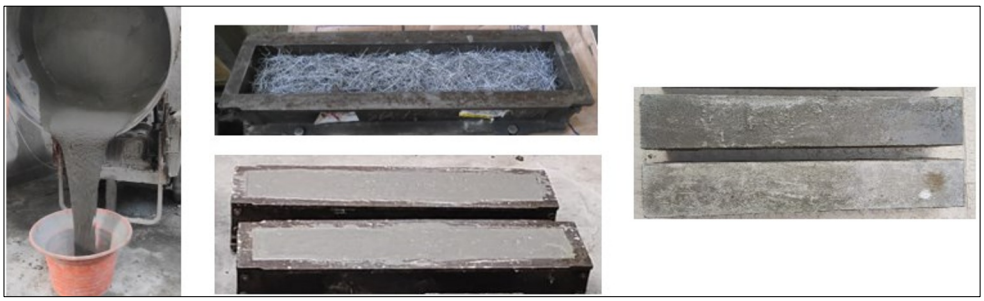

Fig. 6. Production process of SIFCON.

4 Experimental Programme

Flexural elements of 100x100x500 mm, with various volume percentages of waste steel fibers, commercial steel fibers, and reference elements, are casted. The quantity of fiber content used in the preparation of SIFCON specimens, corresponding to 4%, 5%, 6%, and 7% of the concrete volume, is 314 kg/m^3, 392.50 kg/m^3, 471 kg/m^3, and 549.50 kg/m^3, respectively. The designations for the specimens are provided in Table 8.

Table 8. Designation of specimens.

Type of Prism	Cross Section [mm]	Steel fibers		No. of speci-men	Designation
		Type	Vol.		
M 20 grade	100x100x500	----	----	9	RMPM20-1 to RMPM20-9
SIFCON slurry	100x100x500	----	0%	9	RMPF0-1 to RMPF0-9
SIFCON with fibers	100x100x500	Waste steel fibers	4%	9	S1PWF4-1 to S1PWF4-9
			5%	9	S1PWF5-1 to S1PWF5-9
			6%	9	S1PWF6-1 to S1PWF6-9
			7%	9	S1PWF7-1 to S1PWF7-9
SIFCON with fibers	100x100x500	Commer-cial steel fibers	4%	9	S1PMF4-1 to S1PMF4-9
			5%	9	S1PMF5-1 to S1PMF5-9
			6%	9	S1PMF6-1 to S1PMF6-9
			7%	9	S1PMF7-1 to S1PMF7-9

All specimens were tested for flexural strength using two-point loading. The universal testing machine has been used for testing the specimens, and the tests were carried out in accordance with the procedures outlined in IS: 516-1959. Fig. 7 depicts the test setup of the flexural strength. At the ages of 3, 7, and 28 days, tests were performed on the specimens. All necessary safety precautions have been followed during testing of the specimens.

Fig. 7. Test setup of flexural strength.

5 Results and Discussions

In Table 9, the flexural strength results of SIFCON specimens at 3, 7, and 28 days of age, produced with various percentages of waste and commercial steel fibers and the reference mixes, are displayed.

Table 9. Flexural strength of specimens

Sl. No.	Type of Specimen	Steel Fibers		Specimen designation	Average Flexural strength [N/mm^2]		
		Type	Per-centage		3 days	7 days	28 days
I	M20 grade prism	----	----	RMPM20	2.98	4.32	5.77
II	SIFCON slurry prism	----	0 %	R1MPF0	3.89	5.61	7.19
III	SIFCON prism	Waste steel fibers	4 %	S1PWF4	5.33	9.95	10.96
IV	SIFCON prism		5 %	S1PWF5	8.24	10.77	12.52
V	SIFCON prism		6 %	S1PWF6	11.66	12.97	13.42
VI	SIFCON prism		7 %	S1PWF7	16.33	16.21	15.04
VII	SIFCON prism	Commer-cial steel fibers	4 %	S1PMF4	17.17	21.64	21.98
VIII	SIFCON prism		5 %	S1PMF5	24.24	25.58	27.59
IX	SIFCON prism		6 %	S1PMF6	25.59	27.60	28.83
X	SIFCON prism		7 %	S1PMF7	27.53	29.91	32.49

From Table 9 and Fig. 8, it is observed that the average flexural strength of the M20 grade reference mix and the SIFCON slurry matrix at 3 days is 2.98 N/mm^2 and 3.89 N/mm^2 respectively. Additionally, at 7 days, the average flexural strength of the M20 grade reference mix and the SIFCON slurry matrix is 4.32 N/mm^2 and 5.61 N/mm^2 respectively. Furthermore, at 28 days, the average flexural strength of the M20 grade reference mix and the SIFCON slurry matrix is 5.77 N/mm^2 and 7.19 N/mm^2 respectively. The higher difference in flexural strength in the SIFCON slurry matrix is due to the increased amount of binding material and the absence of coarse aggregate.

From Table 9 and Fig. 8, it is observed that the average flexural strength of SIFCON with 4%, 5%, 6%, and 7% waste steel fibers at 3 days is 5.33 N/mm², 8.24 N/mm², 11.66 N/mm², and 16.33 N/mm² respectively. Similarly, the average flexural strength of SIFCON with the same fiber percentages at 7 days is 9.95 N/mm², 10.77 N/mm², 12.97 N/mm², and 16.21 N/mm² respectively. Furthermore, at 28 days, the average flexural strength of SIFCON with 4%, 5%, 6%, and 7% waste steel fibers is 10.96 N/mm², 12.52 N/mm², 13.42 N/mm², and 15.04 N/mm² respectively.

The results indicate that at 3 days of age, SIFCON produced with 4%, 5%, 6%, and 7% waste steel fibers exhibits flexural strengths 79%, 177%, 291%, and 448% higher than M20 grade concrete, and 37%, 112%, 200%, and 320% higher than the SIFCON slurry matrix respectively. Similarly, at 7 days of age, SIFCON produced with 4%, 5%, 6%, and 7% waste steel fibers shows flexural strengths 130%, 149%, 200%, and 275% higher than M20 grade concrete, and 77%, 92%, 131%, and 189% higher than the SIFCON slurry matrix

respectively. Furthermore, at 28 days of age, SIFCON produced with 4%, 5%, 6%, and 7% waste steel fibers exhibits flexural strengths 90%, 117%, 133%, and 161% higher than M20 grade concrete, and 52%, 74%, 87%, and 109% higher than the SIFCON slurry matrix respectively. The increase in flexural strength of SIFCON produced with waste steel fibers, compared to reference mixes, is attributed to the SIFCON slurry matrix with various percentages of fiber volume fraction.

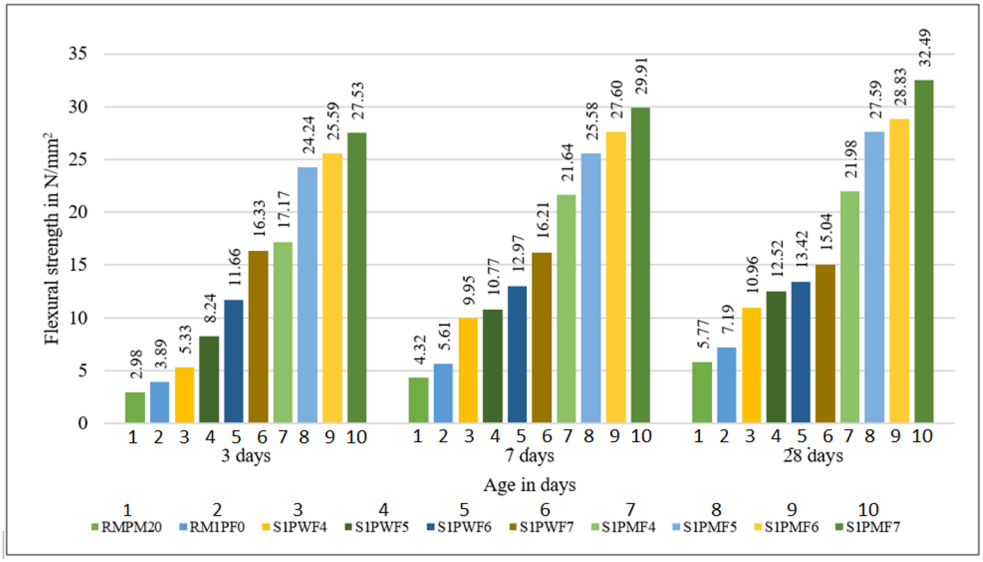

Fig. 8. Comparison of Flexural strength of SIFCON and reference mixes.

From Table 9 and Fig. 8, it is observed that the average flexural strength of SIFCON with 4%, 5%, 6%, and 7% commercial steel fibers at 3 days is 17.17 N/mm², 24.24 N/mm², 25.59 N/mm², and 27.53 N/mm² respectively. Similarly, the average flexural strength of SIFCON with the same fiber percentages at 7 days is 21.64 N/mm², 25.58 N/mm², 27.60 N/mm², and 29.91 N/mm² respectively. Furthermore, at 28 days, the average flexural strength of SIFCON with 4%, 5%, 6%, and 7% commercial steel fibers is 21.98 N/mm², 27.59 N/mm², 28.83 N/mm², and 32.49 N/mm² respectively.

The results indicate that at 3 days of age, SIFCON produced with 4%, 5%, 6%, and 7% commercial steel fibers exhibits flexural strengths 476%, 714%, 759%, and 824% higher than M20 grade concrete, and 341%, 523%, 558%, and 608% higher than the SIFCON slurry matrix respectively. Similarly, at 7 days of age, SIFCON produced with 4%, 5%, 6%, and 7% commercial steel fibers shows flexural strengths 401%, 492%, 539%, and 592% higher than M20 grade concrete, and 286%, 356%, 392%, and 433% higher than the SIFCON slurry matrix respectively. Furthermore, at 28 days of age, SIFCON produced with 4%, 5%, 6%, and 7% commercial steel fibers demonstrates flexural strengths that are 281%, 378%, 400%, and 463% higher than M20 grade concrete, and 206%, 284%, 301%, and 352% higher than the SIFCON slurry matrix respectively. The increase in flexural strength of SIFCON produced with commercial steel fibers, compared to reference mixes, is attributed to the SIFCON slurry matrix with various percentages of fiber volume fraction.

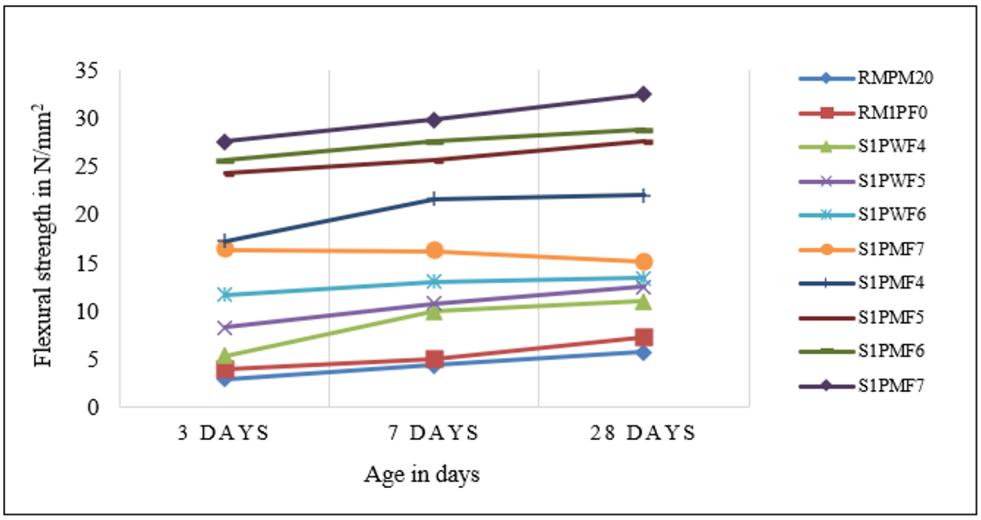

Fig. 9. Comparison of Flexural strength of SIFCON and reference mixes.

From the results, it is observed that at 3 days of age, SIFCON produced with 4%, 5%, 6%, and 7% waste steel fibers exhibits flexural strengths 69%, 66%, 54%, and 41% less than SIFCON produced with 4%, 5%, 6%, and 7% commercial steel fibers, respectively. Similarly, at 7 days of age, SIFCON produced with 4%, 5%, 6%, and 7% waste steel fibers shows flexural strengths 54%, 58%, 53%, and 46% less than SIFCON produced with 4%, 5%, 6%, and 7% commercial steel fibers, respectively. Furthermore, at 28 days of age, SIFCON produced with 4%, 5%, 6%, and 7% waste steel fibers demonstrates flexural strengths that are 50%, 55%, 53%, and 54% higher than SIFCON produced with 4%, 5%, 6%, and 7% commercial steel fibers, respectively. The increase in flexural strength of SIFCON produced with commercial steel fibers, compared to SIFCON produced with waste steel fibers, is attributed to the shape and aspect ratio of the waste steel fibers utilized in the experimental program.

6 Summary and Conclusions

The experimental work has been conducted in order to find out the flexural strengths of the SIFCON produced with waste steel fibers recovered from used tires and commercial steel fibers. Waste steel fibers recovered from used tires can be utilized in the production of Slurry Infiltrated Fibrous Concrete (SIFCON), despite their irregular shape and varying aspect ratios.

The slurry matrix used for the production of SIFCON exhibits flexural strengths that are 31%, 30%, and 25% higher than M20 grade concrete at 3, 7, and 28 days respectively. This increase in strength is attributed to the absence of coarse aggregate in the SIFCON slurry matrix and its richness in cementitious material.

It has been demonstrated that the flexural strength of SIFCON produced with 4% to 7% waste steel fibers increases by 90% to 161% compared to the M20 grade reference mix at the age of 28 days. Furthermore, it has been shown that the flexural strength of SIFCON produced with 4% to 7% waste steel fibers increases by 52% to 109% compared to the SIFCON slurry reference mix at the age of 28 days.

It has been demonstrated that the flexural strength of SIFCON produced with 4% to 7% commercial steel fibers increases by 281% to 463% compared to the M20 grade reference mix at the age of 28 days. Furthermore, it has been shown that the flexural strength of

SIFCON produced with 4% to 7% waste steel fibers increases by 206% to 352% compared to the SIFCON slurry reference mix at the age of 28 days.

It has been exhibited that the flexural strength of SIFCON produced with 4% to 7% waste steel fibers has a decrease of 50% to 54% with respect to SIFCON produced with 4% to 7% commercial steel fibers at the age of 28 days. The decrease in flexural strength of SIFCON produced with waste steel fibers, with respect to SIFCON produced with commercial steel fibers, is due to small fragments of rubber present on the surface of the waste steel fibers, their irregular shape, different aspect ratio, and fiber orientation.

From the experimental study, it can be mentioned that 6% of waste steel fibers with the two-layer technique is found optimal in producing SIFCON with waste steel fibers. The flexural strength of SIFCON produced with waste steel fibers recovered from used tires significantly increases compared to reference mixes and is comparable to SIFCON produced with commercial steel fibers. Waste steel fibers recovered from used tires can be effectively utilized up to a fiber volume fraction of 6% with a two-layer technique in the production of SIFCON.

It can be summarized that the waste steel fibers recovered from used tires exhibit significant variations in their geometrical properties, with lengths ranging from 3 to 73 mm and diameters from 0.14 to 0.47 mm. The dimensional diversity and bulk nature of the waste steel fibers have been shown not to be a concern in the production of SIFCON. There is a significant increase in the flexural strength of SIFCON produced with waste steel fibers, making it suitable for applications where there are flexural stresses that need to be handled. The cost-effectiveness of SIFCON elements with waste steel fibers is approximately 67% lower than that of SIFCON elements with commercial steel fibers. The multiple benefits confirm that the waste steel fibers recovered from used tires are an alternative reinforcement in the production of SIFCON.

Abstract. Slurry Infiltrated Fibrous Concrete (SIFCON), a modified version of Fiber Reinforced Concrete (FRC), addresses the challenge of increased fiber volume fractions. Commercially produced steel fibers are typically used in FRC and SIFCON. Efforts to reduce energy use in making commercial steel fibers have led to seeking alternative sources. Vehicular tires are typically recycled when no longer usable, yielding steel fibers among the products. Emphasis lies in recovering steel fibers from used tires as part of resource recovery from waste. Experimental work explored flexural strength in SIFCON with waste steel fibers at volumes from 4% to 7%. The study extended to assess SIFCON's flexural strength with commercial steel fibers at similar volumes, aiming to correlate with those from waste steel fibers. M20 grade concrete and SIFCON slurry matrix specimens were cast as reference mixes for comparison. The flexural strength of SIFCON specimens with waste steel fibers recovered from used tires notably surpasses that of reference mixes and is comparable to SIFCON specimens with commercial steel fibers. Additionally, the two-layer technique proves effective in SIFCON using waste steel fibers from used tires, up to 6% volume. The test results show successful production of SIFCON from waste steel fibers recovered from used tires.

Keywords: Slurry Infiltrated Fibrous Concrete, Flexural strength, Waste steel fibers, Aspect ratio.

1 Introduction

Globally, energy crises and their impact on the environment are significant challenges faced in the present scenario. These issues arise due to the increase in population, rapid urbanization, and the generation of substantial quantities of solid waste. The production of automobiles and trucks has significantly increased to meet the growing demand, leading to a proportional increase in the generation of waste tires. In today's modern world, the use of

vehicles for the transportation of people and materials is steadily rising, resulting in a problem with the disposal of scrap tires at the end of their life [1, 2, 3]. Less than 40% of the embedded energy in tires that have been scrapped can be recovered as fuel energy, based upon studies [4]. The majority of discarded tires are utilized as a source of energy for cement kilns because of the high carbon content in tires [5]. It is better to embrace the concept of reusing and recycling to obtain resources from waste, which offers environmental benefits [6, 7]. Rubber recovered from scrap tires in recycling plants is used as a source of energy in industries, and the steel fibers with high strength that were extracted from scrap tires serve as raw materials for steel manufacturing plants. The focus has been made on extracting steel fibers with high strength from used tires as a concept of resource recovery from waste, reducing the need for using high-strength manufactured commercial steel fibers. Pyrolysis methods, cryogenic methods, or mechanical methods are generally employed for the recovery of rubber and steel fibers from scrap tires [8, 9]. Steel fibers extracted from used tires may not have a straight or definite aspect ratio, unlike manufactured commercial steel fibers.

It has been demonstrated that steel fibers with various aspect ratios that are extracted from used tires may be used as an alternative material while producing steel fiber-reinforced concrete. [10]. However, due to the balling effect, there is a limitation in using higher amounts of fibers in the preparation of fiber-reinforced concrete. A special form of steel fiber-reinforced concrete is Slurry Infiltrated Fibrous Concrete (SIFCON), a high-performance cementitious composite [11, 12]. The production of SIFCON is different from the conventional fiber-reinforced concrete, wherein molds are prepacked with the fibers and infiltrates the cement mortar slurry matrix. Due to the procedure of prepacking, higher amounts of fibers can be used in the manufacture of SIFCON using cement mortar slurry matrix with a low water-cement ratio, resulting in higher energy absorption or toughness compared to conventional steel fiber-reinforced concrete, as well as higher post-cracking strength. In the production of SIFCON, the fibers are placed by hand and infiltrated with a cement mortar slurry matrix, in which the balling of fibers will not be a limitation and facilitates the convenient use of the waste steel fibers extracted from scrap tires. Furthermore, waste steel fibers extracted from scrap tires are less expensive than industrial steel fibers, which is also an added advantage for SIFCON applications. Studies regarding the usage of waste steel fibers in the production of SIFCON are limited based on the available literature [13, 14, 15, 16, 17].

The maximum flexural strength of SIFCON is obtained at 9% of fiber volume with an aspect ratio of 80, and it is noted that SIFCON's flexural strength, split tensile strength, and compressive strength are optimum at 9% fiber content [18]. It is proved that the three-layer technique with hand tamping is effective in prepacking fibers in the casting of SIFCON specimens. It was observed that beyond 10% volume of hooked-end steel fibers with an aspect ratio of 70 and a length of 35 mm, the placement of fibers manually in the mold is very tedious [19]. It was shown that the compression, split tensile, and flexural strengths of SIFCON specimens will increase with an increase in the volume of the steel fiber fraction [20]. SIFCON slab specimens show superior performance in load-carrying capacity, stiffness, and energy absorption compared to fiber-reinforced concrete and plain cement concrete slab specimens in flexure [21]. Higher levels of waste fibers in SIFCON have improved its splitting and flexural strengths. However, the use of waste steel fibers had no effect on compressive strength. Waste steel fibers have the potential to be a desirable substitute in the manufacture of SIFCON, as shown by multi-objective optimization. [22]. It has been concluded adding SIFCON to regular concrete reduces the possibility of cracks spreading, improves strength, ductility, load carrying capacity, and energy absorption capability (toughness) [23].

Steel fibers are being utilized in the manufacturing of steel fiber-reinforced concrete in the construction industry. Slurry Infiltrated Fibrous Concrete (SIFCON) has been termed 'the

advanced version of Fiber-Reinforced Concrete (FRC)' due to the increased volume fraction of fibers, which contributes to improved hardened properties such as strength, toughness, and impact resistance. Generally, the fibers used in the preparation of SIFCON offer benefits similar to what reinforcing bars offer in Reinforced Cement Concrete (RCC). The improved properties of SIFCON elements depend on the type, geometry, shape, and orientation of the fibers utilized in experimental work. The main aim of this experimental work is to study the flexural strength of SIFCON, which is produced using waste steel fibers recovered from used tires.

2 Materials

2.1 Binding material

Grade 43 Ordinary Portland Cement (OPC) has been used as the binding material throughout the experimental work and conforms to Indian standards [24]. Tests were conducted on the cement used in the experimental study to determine its fineness, specific gravity, consistency, and initial-final setting times. The physical properties of the cement are shown in Table 1.

Table 1. Physical properties of Cement

Physical Properties	Test Result	Test method	Requirement
Specific gravity	3.13	IS 4031 (Part II):1988	-----
Fineness [m^2/Kg]	311.5	IS 4031 (Part II):1988	Min. 225
Normal consistency	33%	IS 4031 (Part IV):1988	-----
Initial setting time [minutes]	47	IS 4031 (Part V):1988	Min. 30
Final setting time [minutes]	252	IS 4031 (Part V):1988	Max. 600

2.2 Fine aggregate

Natural sand obtained from the riverbed has been used throughout the experimental work for the preparation of the reference mix and SIFCON specimens. However, a maximum aggregate size of 0.60 mm has been considered and used in the preparation of the SIFCON slurry matrix, and this size has been kept constant for the production of SIFCON throughout the experimental work. The fineness modulus, specific gravity, bulk density, and water absorption of the aggregates were determined according to IS codes. Table 2 shows the physical properties of the fine aggregate utilized in the experiment. However, natural sand obtained from the riverbed, conforms to Indian standards has been used fine aggregate in the preparation of M20-grade concrete.

Table 2. Fine Aggregate Test Results

Type of Test	Fine Aggregate
Fineness Modulus [%]	2.80
Specific Gravity	2.65
Water Absorption [%]	0.25
Bulk density [kg/m^3]	1750

2.3 Coarse aggregate

The maximum size of 20 mm obtained from the granite quarry, which conforms to Indian standards, has been used as coarse aggregate in the preparation of M20-grade concrete in the experimental work.

2.4 Mixing water

The laboratory's potable water has been utilized for mixing the SIFCON slurry matrix, reference mix, and curing of the specimens.

2.5 Chemical admixture

To achieve the necessary workability and flowability of the SIFCON slurry matrix, a high-range water-reducing admixture (superplasticizer) of polycarboxylic ether has been used. Manufacturer's data have been considered for the chemical admixture used in the study. Properties of the superplasticizer, i.e., AURAMIX 450 from M/s. FOSROC Chemicals, are shown in Table 3.

Table 3. Characteristics of Super plasticizer (AURAMIX 450)

Appearance	Light yellow colour liquid
pH value	Minimum 6.0
Volumetric mass @ 20°C	1.09 to 1.11
Chloride Content	Nil

2.6 Steel fibers

A survey was conducted to obtain waste steel fibers from used tires. Fibers recovered from scrap tires through a mechanical process at the recycling plant were used in this experimental study for preparing the SIFCON specimens. In the tire recycling plant, initially, collected scrap tires are shredded into small pieces using industrial shredders. After shredding, the tire pieces undergo a process called magnetic separation, in which powerful magnets are used to attract and separate the steel fibers from the shredded rubber. The shredded material is then passed through screens or filters to further separate any remaining steel fibers from the rubber particles. The steel fibers obtained from the recycling plants contained a small quantity of textiles and rubber fragments, which were manually removed to the extent possible before being used in the preparation of SIFCON. The waste steel fibers obtained from the recycling plant are irregular in shape. Waste steel fibers recovered from the used tires utilized in the study were tested to determine the diameter, length, aspect ratio, etc. Fig. 1 displays the waste steel fibers chosen for the experimental program. The length and diameter of the waste steel fibers, measured on randomly selected fibers, are shown in Table 4. Furthermore, round crimped steel fibers have been used as the commercial steel fibers in the experimental work. Manufacturer's data have been considered for the commercial steel fibers used in the study and are shown in Table 5. Fig. 2 displays the commercial steel fibers that were selected for the experiment.

Fig. 1. Waste steel fibers recovered from used tires.

Fig. 2. Commercial steel fibers.

Table 4. Properties of waste steel fibers

Diameter of Fiber [mm]	Length of Fiber [mm]	Average Aspect ratio	Contribution of Fibers (% by weight)
0.15 ± 0.01	26 ± 23	173	9.70 %
0.19 ± 0.01	13 ± 2	68	3.20 %
0.27 ± 0.02	37 ± 17	137	11.30 %
0.31 ± 0.01	45 ± 28	145	46.80 %
0.34 ± 0.01	30 ± 15	88	11.30 %
0.39 ± 0.03	46 ± 19	118	12.90 %
0.46 ± 0.01	68 ± 4	148	4.80 %

Tensile Strength	1260 MPa

3 Methodology

M20 grade concrete was designed in accordance with the guidelines specified in Indian Standards. [25]. The proportions of ingredients for the M20 grade concrete are presented in Table 6.

Table 6. Mix proportions of M20 grade design mix concrete

	Water	Cement	Fine Aggregate	Coarse Aggregate	20 mm CA	10 mm CA
By Weight [kg]	160	320	667	1131	679	452
By Volume [m^3]	0.50	1	2.08	3.53	2.12	1.41

A flow test was conducted using a mini flow cone, as recommended by EFNARC [26]. The mini flow cone measures 60 mm in height, 70 mm in the top inner dimension, and 100 mm in base inner dimension. The equipment used in this study for the mini flow test is shown in Fig. 3. The SIFCON slurry was poured into the mold, lifted, and the spread diameter of the slurry matrix was measured. The slump flow ranged between 240 mm and 260 mm, in accordance with the guidelines stipulated in EFNARC [26]. Another test conducted on the fresh SIFCON slurry matrix is the mini v-funnel test. Fig. 3 illustrates the dimensions and form of the equipment utilized in this study. The SIFCON slurry was poured into the test equipment, and the time to empty the equipment was measured. The time to empty the test equipment ranged from 7 seconds to 11 seconds, in accordance with the guidelines stipulated in EFNARC [26].

Fresh tests, as described above, have been conducted using cement and fine aggregate in the proportion of 1:1, with a water-cement ratio varying from 0.30 to 0.40 in increments of 0.01 and superplasticizer from 0.50% to 2.00% by weight of cement, in increments of 0.1%. The procedures for the flow test and mini v-funnel tests are shown in Fig. 4 and Fig. 5, respectively. After detailed test trials, it was decided to use the SIFCON slurry matrix with a proportion of 1:1 (cement: fine aggregate) using a water-cement ratio of 0.33 and a superplasticizer content of 0.80% by weight of cement. The mix proportion of the SIFCON slurry matrix is provided in Table 7.

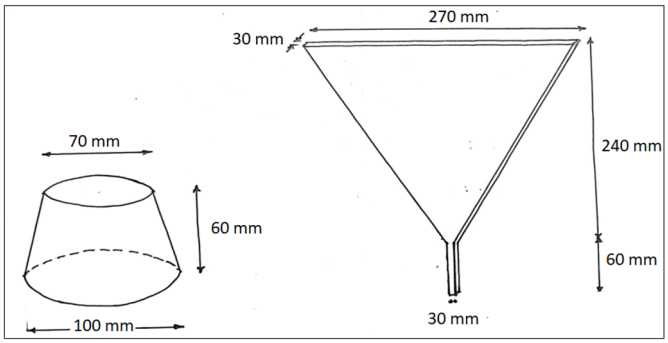

Fig. 3. Equipment for mini slump and v-funnel tests.

Fig. 4. Mini slump test.

Fig. 5. Mini v-funnel test.

Table 7. Mix proportion of SIFCON slurry matrix

Cement	Fine aggregate	W/C ratio	Super plasticizer
1	1	0.33	0.80 % by weight of cement

Upon finalizing the ratio of the SIFCON slurry matrix, the production process for SIFCON is as follows: The molds used for specimen production will be cleaned and coated with waste oil to facilitate easy demolding. Cement and fine aggregate, in a 1:1 proportion, are to be dry mixed. Subsequently, water and superplasticizer, as per the finalized ratios, are to be added to the dry mix. The total slurry must be mixed for a minimum of 2 minutes to ensure proper mixing of the slurry matrix.

A two-layer technique is employed for filling the fibers in the molds to ensure proper compaction and prevent honeycombing. Accordingly, 50% of the volume fraction of fibers is randomly hand-spread as the first layer in the mold. Once the first layer is in place, the prepared SIFCON slurry matrix is poured onto the fiber bed and compacted using hand tamping and a table vibrator.

Subsequently, a second layer of fibers is also randomly spread, followed by pouring of the SIFCON slurry matrix and compaction. The cast samples are left for 24 hours at room temperature. On completion of this time, the samples are demolded and placed in a curing chamber for the designated curing periods. Difficulties were encountered during the production of SIFCON specimens with a 6% volume fraction of steel fibers due to the irregular shape of waste steel fibers and their random placement. In consideration of this, a three-layer technique has been employed for the production of SIFCON specimens with 7% steel fibers. Fig. 6 depicts the production process of the SIFCON.

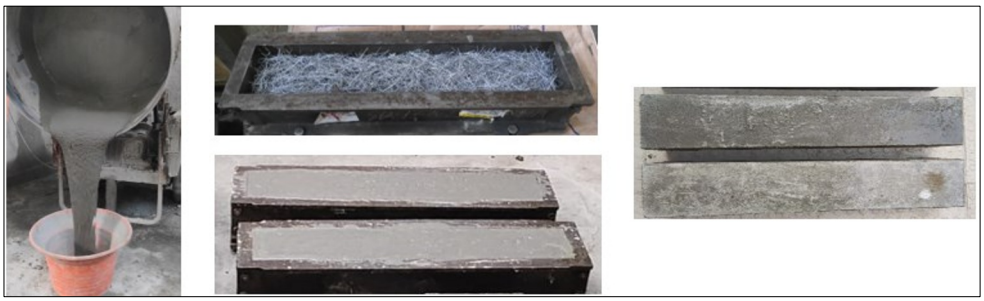

Fig. 6. Production process of SIFCON.

4 Experimental Programme

Flexural elements of 100x100x500 mm, with various volume percentages of waste steel fibers, commercial steel fibers, and reference elements, are casted. The quantity of fiber content used in the preparation of SIFCON specimens, corresponding to 4%, 5%, 6%, and 7% of the concrete volume, is 314 kg/m^3, 392.50 kg/m^3, 471 kg/m^3, and 549.50 kg/m^3, respectively. The designations for the specimens are provided in Table 8.

Table 8. Designation of specimens.

Type of Prism	Cross Section [mm]	Steel fibers		No. of speci-men	Designation
		Type	Vol.		
M 20 grade	100x100x500	----	----	9	RMPM20-1 to RMPM20-9
SIFCON slurry	100x100x500	----	0%	9	RMPF0-1 to RMPF0-9
SIFCON with fibers	100x100x500	Waste steel fibers	4%	9	S1PWF4-1 to S1PWF4-9
			5%	9	S1PWF5-1 to S1PWF5-9
			6%	9	S1PWF6-1 to S1PWF6-9
			7%	9	S1PWF7-1 to S1PWF7-9
SIFCON with fibers	100x100x500	Commer-cial steel fibers	4%	9	S1PMF4-1 to S1PMF4-9
			5%	9	S1PMF5-1 to S1PMF5-9
			6%	9	S1PMF6-1 to S1PMF6-9
			7%	9	S1PMF7-1 to S1PMF7-9

All specimens were tested for flexural strength using two-point loading. The universal testing machine has been used for testing the specimens, and the tests were carried out in accordance with the procedures outlined in IS: 516-1959. Fig. 7 depicts the test setup of the flexural strength. At the ages of 3, 7, and 28 days, tests were performed on the specimens. All necessary safety precautions have been followed during testing of the specimens.

Fig. 7. Test setup of flexural strength.

5 Results and Discussions

In Table 9, the flexural strength results of SIFCON specimens at 3, 7, and 28 days of age, produced with various percentages of waste and commercial steel fibers and the reference mixes, are displayed.

Table 9. Flexural strength of specimens

Sl. No.	Type of Specimen	Steel Fibers		Specimen designation	Average Flexural strength [N/mm^2]		
		Type	Per-centage		3 days	7 days	28 days
I	M20 grade prism	----	----	RMPM20	2.98	4.32	5.77
II	SIFCON slurry prism	----	0 %	R1MPF0	3.89	5.61	7.19
III	SIFCON prism	Waste steel fibers	4 %	S1PWF4	5.33	9.95	10.96
IV	SIFCON prism		5 %	S1PWF5	8.24	10.77	12.52
V	SIFCON prism		6 %	S1PWF6	11.66	12.97	13.42
VI	SIFCON prism		7 %	S1PWF7	16.33	16.21	15.04
VII	SIFCON prism	Commer-cial steel fibers	4 %	S1PMF4	17.17	21.64	21.98
VIII	SIFCON prism		5 %	S1PMF5	24.24	25.58	27.59
IX	SIFCON prism		6 %	S1PMF6	25.59	27.60	28.83
X	SIFCON prism		7 %	S1PMF7	27.53	29.91	32.49

From Table 9 and Fig. 8, it is observed that the average flexural strength of the M20 grade reference mix and the SIFCON slurry matrix at 3 days is 2.98 N/mm^2 and 3.89 N/mm^2 respectively. Additionally, at 7 days, the average flexural strength of the M20 grade reference mix and the SIFCON slurry matrix is 4.32 N/mm^2 and 5.61 N/mm^2 respectively. Furthermore, at 28 days, the average flexural strength of the M20 grade reference mix and the SIFCON slurry matrix is 5.77 N/mm^2 and 7.19 N/mm^2 respectively. The higher difference in flexural strength in the SIFCON slurry matrix is due to the increased amount of binding material and the absence of coarse aggregate.

From Table 9 and Fig. 8, it is observed that the average flexural strength of SIFCON with 4%, 5%, 6%, and 7% waste steel fibers at 3 days is 5.33 N/mm², 8.24 N/mm², 11.66 N/mm², and 16.33 N/mm² respectively. Similarly, the average flexural strength of SIFCON with the same fiber percentages at 7 days is 9.95 N/mm², 10.77 N/mm², 12.97 N/mm², and 16.21 N/mm² respectively. Furthermore, at 28 days, the average flexural strength of SIFCON with 4%, 5%, 6%, and 7% waste steel fibers is 10.96 N/mm², 12.52 N/mm², 13.42 N/mm², and 15.04 N/mm² respectively.

The results indicate that at 3 days of age, SIFCON produced with 4%, 5%, 6%, and 7% waste steel fibers exhibits flexural strengths 79%, 177%, 291%, and 448% higher than M20 grade concrete, and 37%, 112%, 200%, and 320% higher than the SIFCON slurry matrix respectively. Similarly, at 7 days of age, SIFCON produced with 4%, 5%, 6%, and 7% waste steel fibers shows flexural strengths 130%, 149%, 200%, and 275% higher than M20 grade concrete, and 77%, 92%, 131%, and 189% higher than the SIFCON slurry matrix

respectively. Furthermore, at 28 days of age, SIFCON produced with 4%, 5%, 6%, and 7% waste steel fibers exhibits flexural strengths 90%, 117%, 133%, and 161% higher than M20 grade concrete, and 52%, 74%, 87%, and 109% higher than the SIFCON slurry matrix respectively. The increase in flexural strength of SIFCON produced with waste steel fibers, compared to reference mixes, is attributed to the SIFCON slurry matrix with various percentages of fiber volume fraction.

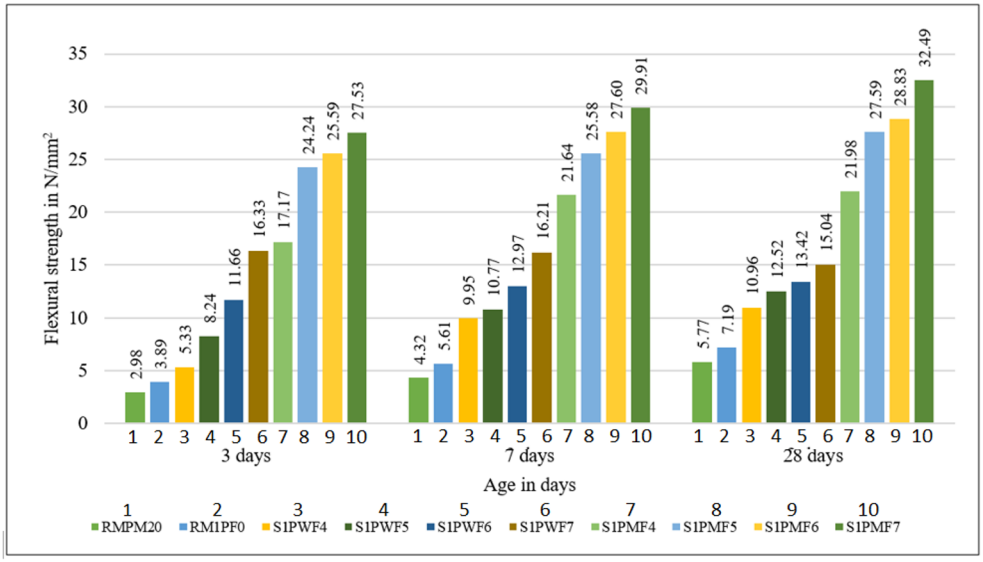

Fig. 8. Comparison of Flexural strength of SIFCON and reference mixes.

From Table 9 and Fig. 8, it is observed that the average flexural strength of SIFCON with 4%, 5%, 6%, and 7% commercial steel fibers at 3 days is 17.17 N/mm², 24.24 N/mm², 25.59 N/mm², and 27.53 N/mm² respectively. Similarly, the average flexural strength of SIFCON with the same fiber percentages at 7 days is 21.64 N/mm², 25.58 N/mm², 27.60 N/mm², and 29.91 N/mm² respectively. Furthermore, at 28 days, the average flexural strength of SIFCON with 4%, 5%, 6%, and 7% commercial steel fibers is 21.98 N/mm², 27.59 N/mm², 28.83 N/mm², and 32.49 N/mm² respectively.

The results indicate that at 3 days of age, SIFCON produced with 4%, 5%, 6%, and 7% commercial steel fibers exhibits flexural strengths 476%, 714%, 759%, and 824% higher than M20 grade concrete, and 341%, 523%, 558%, and 608% higher than the SIFCON slurry matrix respectively. Similarly, at 7 days of age, SIFCON produced with 4%, 5%, 6%, and 7% commercial steel fibers shows flexural strengths 401%, 492%, 539%, and 592% higher than M20 grade concrete, and 286%, 356%, 392%, and 433% higher than the SIFCON slurry matrix respectively. Furthermore, at 28 days of age, SIFCON produced with 4%, 5%, 6%, and 7% commercial steel fibers demonstrates flexural strengths that are 281%, 378%, 400%, and 463% higher than M20 grade concrete, and 206%, 284%, 301%, and 352% higher than the SIFCON slurry matrix respectively. The increase in flexural strength of SIFCON produced with commercial steel fibers, compared to reference mixes, is attributed to the SIFCON slurry matrix with various percentages of fiber volume fraction.

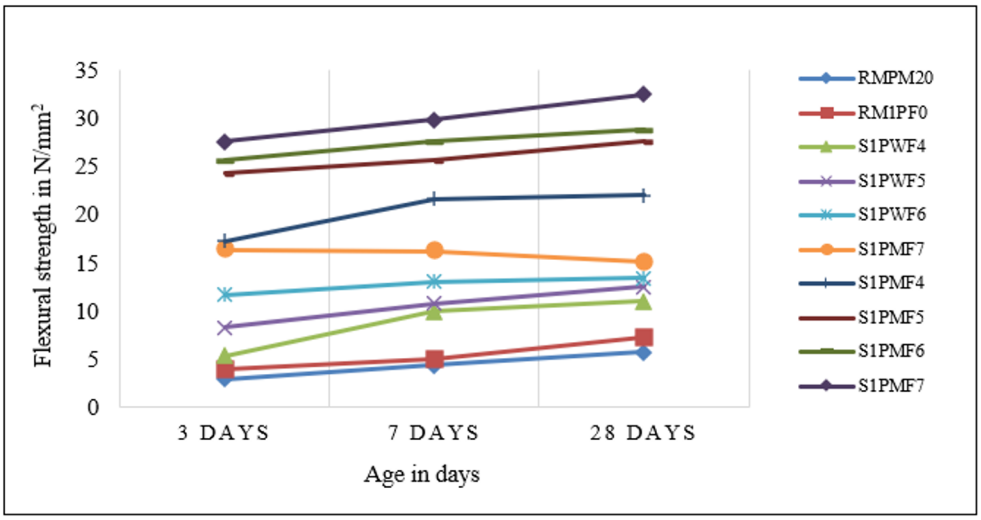

Fig. 9. Comparison of Flexural strength of SIFCON and reference mixes.

From the results, it is observed that at 3 days of age, SIFCON produced with 4%, 5%, 6%, and 7% waste steel fibers exhibits flexural strengths 69%, 66%, 54%, and 41% less than SIFCON produced with 4%, 5%, 6%, and 7% commercial steel fibers, respectively. Similarly, at 7 days of age, SIFCON produced with 4%, 5%, 6%, and 7% waste steel fibers shows flexural strengths 54%, 58%, 53%, and 46% less than SIFCON produced with 4%, 5%, 6%, and 7% commercial steel fibers, respectively. Furthermore, at 28 days of age, SIFCON produced with 4%, 5%, 6%, and 7% waste steel fibers demonstrates flexural strengths that are 50%, 55%, 53%, and 54% higher than SIFCON produced with 4%, 5%, 6%, and 7% commercial steel fibers, respectively. The increase in flexural strength of SIFCON produced with commercial steel fibers, compared to SIFCON produced with waste steel fibers, is attributed to the shape and aspect ratio of the waste steel fibers utilized in the experimental program.

6 Summary and Conclusions

The experimental work has been conducted in order to find out the flexural strengths of the SIFCON produced with waste steel fibers recovered from used tires and commercial steel fibers. Waste steel fibers recovered from used tires can be utilized in the production of Slurry Infiltrated Fibrous Concrete (SIFCON), despite their irregular shape and varying aspect ratios.

The slurry matrix used for the production of SIFCON exhibits flexural strengths that are 31%, 30%, and 25% higher than M20 grade concrete at 3, 7, and 28 days respectively. This increase in strength is attributed to the absence of coarse aggregate in the SIFCON slurry matrix and its richness in cementitious material.

It has been demonstrated that the flexural strength of SIFCON produced with 4% to 7% waste steel fibers increases by 90% to 161% compared to the M20 grade reference mix at the age of 28 days. Furthermore, it has been shown that the flexural strength of SIFCON produced with 4% to 7% waste steel fibers increases by 52% to 109% compared to the SIFCON slurry reference mix at the age of 28 days.

It has been demonstrated that the flexural strength of SIFCON produced with 4% to 7% commercial steel fibers increases by 281% to 463% compared to the M20 grade reference mix at the age of 28 days. Furthermore, it has been shown that the flexural strength of

SIFCON produced with 4% to 7% waste steel fibers increases by 206% to 352% compared to the SIFCON slurry reference mix at the age of 28 days.

It has been exhibited that the flexural strength of SIFCON produced with 4% to 7% waste steel fibers has a decrease of 50% to 54% with respect to SIFCON produced with 4% to 7% commercial steel fibers at the age of 28 days. The decrease in flexural strength of SIFCON produced with waste steel fibers, with respect to SIFCON produced with commercial steel fibers, is due to small fragments of rubber present on the surface of the waste steel fibers, their irregular shape, different aspect ratio, and fiber orientation.

From the experimental study, it can be mentioned that 6% of waste steel fibers with the two-layer technique is found optimal in producing SIFCON with waste steel fibers. The flexural strength of SIFCON produced with waste steel fibers recovered from used tires significantly increases compared to reference mixes and is comparable to SIFCON produced with commercial steel fibers. Waste steel fibers recovered from used tires can be effectively utilized up to a fiber volume fraction of 6% with a two-layer technique in the production of SIFCON.

It can be summarized that the waste steel fibers recovered from used tires exhibit significant variations in their geometrical properties, with lengths ranging from 3 to 73 mm and diameters from 0.14 to 0.47 mm. The dimensional diversity and bulk nature of the waste steel fibers have been shown not to be a concern in the production of SIFCON. There is a significant increase in the flexural strength of SIFCON produced with waste steel fibers, making it suitable for applications where there are flexural stresses that need to be handled. The cost-effectiveness of SIFCON elements with waste steel fibers is approximately 67% lower than that of SIFCON elements with commercial steel fibers. The multiple benefits confirm that the waste steel fibers recovered from used tires are an alternative reinforcement in the production of SIFCON.

Solar P V system analysis in different configurations

The rapid emergence and evolution of renewable energy sources such as solar energy has become a vital component of the global effort to meet the energy needs of the future. The major concerns for continuous solar photovoltaic (PV) generation are partial shading conditions (PSC's), Hotspots, Degradation Rate, Bifacial PV Panels etc. These factors leads to increase in PV mismatch losses, decrease in fill factor and efficiency. One of the simplest solutions is the PV configurations. Hence in this book Series Parallel (SP), Bridge Link (BL), Triple Tied (TT) and Spider Web Tie (SWT) configurations are implemented on KC200GT 200 W PV system. Impact of Various factor such as Partial Shaded Conditions, Hotspots, Degradation Rate, Bifacial PV Panels are analysed. Optimal SMA and PSO MPPT Controller are evaluated for all SP, BL, TT and SWT configurations. The effectiveness of the Spider Web Tie (SWT) Configuration is evaluated in comparison with Series/Parallel (SP), Bridge-Link (BL), Triple-Tied (TT) configurations.

Mechanical Properties

ABSTRACT

The concrete industry has consistently pushed for sustainable development. This investigation aims to examine the characteristics of flyash-based self-compacting geopolymer concrete (SCGPC) made with varying NaOH molarities both while it is fresh and when it has hardened. The NaOH molarity is varied from 8 M to 16 M at an interval of 2 M. Sodium silicate (Na_2SiO_3) to sodium Hydroxide (NaOH) is kept at a constant ratio of 2. For the geopolymer process, the alkaline solution to Binder ratio (L/B) was kept at 0.45. Fresh properties like Slump flow, T_{50cm} slump flow, L-Box and V-funnel have been done to assess the fresh properties of flyash based SCGPC confirming to EFNARC guidelines. Mechanical Strength properties such as Compressive, split-tensile, and flexural strength of the flyash based SCGPC were also determined at various ages. Prior to testing, all specimens are cured under ambient curing. Results indicate that the hardened properties of flyash based SCGPC are enhanced by the increase in molarity from 8 M to 16 M. Furthermore, as the molarity tends to rise, it is shown that the fresh properties slightly decrease.

1. Introduction

Concrete is one of the most widely utilised building materials in the globe. It is the next commonest used resource in communities worldwide after water [1]. It is normally produced using ordinary Portland cement (OPC), that consumes a lot of energy and releases an equal amount of carbon dioxide (CO_2) into the atmosphere [2]. As a result of this carbon dioxide emission, the greenhouse effect increases, causing global warming. Davidovits developed geopolymer concrete, which totally replaces cement with industrial by-products [3]. Industrial waste materials possessing a high alumina and silica content, such as flyash, metakaolin, GGBS, etc., are polymerized to manufacture geopolymer concrete. Through polycondensation, these aluminosilicate compounds become a dimensionally stable structure at low temperatures [4 5]. Fresh concrete must be compacted and placed in the formwork by skilled workers. To achieve a uniform mix with no voids (honey-comb), this compaction principally attempts to reduce the entrapped air within freshly laid concrete. Normal vibrating concrete might not be able to display the necessary fresh and hardened qualities once the concrete is being poured and compacted at the construction area. Skilled work is necessary to achieve proper compaction in freshly mixed concrete. Introducing self-compacting concrete (SCC) stands one way to solve this issue [6 7]. Modern concrete that could compact under its own weight in deep, narrow segments that are heavily reinforced to fill the formwork is known as self-compacting concrete (SCC)[8]. This study examines how the properties of flyash-based SCGPC are influenced by the molarity of sodium hydroxide in both the fresh and hardening states.

2. Materials

2.1. Flyash

In the present investigation, Class – F flyash is used which is collected from Rayalaseema Thermal Power Plant (RTTP), Kadapa, India. Flyash is confirming to IS: 3812:2003 [9]. The flyash has a specific gravity of 2.24. It has Blaine's fineness about 310 m^2/kg. Table 1 provides information on the chemical composition of fly ash.

Table 1
Chemical Composition of Flyash.

Component	SiO_2	Al_2O_3	Fe_2O_3	CaO	MgO	TiO_2	SO_3	L.O. I	K_2O	Na_2O
Flyash (%)	65.60	20.86	4.98	1.0	0.55	0.5	0.2	0.16	0.82	0.20

2.2. Alkaline activation solution

In the current investigation, sodium hydroxide and sodium silicate solutions are employed to produce alkaline activators. While the ratios of sodium silicate to sodium hydroxide (Na_2SiO_3/NaOH) was kept at 2, the sodium hydroxide solution molarity (NaOH) is altered from 8 M to 16 M. To reduce the amount of heat created during the mixing procedure, the prepared alkaline solution is given 24 h to cool and mature.

2.3. Aggregates

In the current study, all of these flyash-based SCGPC mixtures contained fine aggregate made of natural river sand from the Tungabhadra River bed and a coarse aggregate of 12.5 mm downsize. Both the jelly and river sand are available locally. The used fine aggregate and coarse aggregate had specific gravities of 2.60 and 2.64, respectively. In accordance with the results of the sieve analysis, the fine and coarse aggregates utilised in this work both meet the requirements of IS: 383–1970 [10 11].

2.4. Superplasticizer

The Master Glenium series superplasticizer was utilised in the current investigation. It is a modified polycarboxilic ether-based admixture. It was created to improve the qualities of newly-poured and hardened high performance concrete. Given that it is free of chlorides and alkalis, it is suitable with all types of cement. Since it is devoid of chlorides and alkali, it can be used with any type of cement. Its relative density is approximately 1.09, in accordance with IS 9103:1999 [12].

3. Mix design of flyash based self compacting geopolymer concrete

Flyash based SCGPC mix design is solely distinct from cement concrete. The trial-and-error process was employed to produce flyash based SCGPC mix. Five flyash based SCGPC mixes were made by raising the molarity of Sodium Hydroxide (NaOH) solution from 8 M until16M. The total binder content was fixed at 496.55 kg/m^3, and the Liquid-to-binder (L/B) mass ratio was kept at 0.45. In line with the binder's molarities by mass, as stated in Table 2, a superplasticizer (S.P.) content of 1.5% and additional water content were used.

3.1. Mixing, casting and curing

In the pan mixer, the dry components of flyash based SCGPC i.e., fine aggregate, coarse aggregate and flyash were mixed about 2–3 mins. Then the liquid portion of the mixture i.e., The NaOH along with Na_2SiO_3 solution is mixed in the proportion of 1:2 (by weight) to produce alkali activator fluid. Super Plasticizer and Water are added at last for the perfect blending of flyash based SCGPC[5]. These all materials are allowed to mix for another 2–3 min. The newly mixed fresh concrete was examined for fresh flowability properties before being placed into the moulds. Prior to testing, all specimens are stored at room temperature (27 ± 2 °C).

3.2. Testing methods

3.2.1. Fresh properties

The fresh properties of flyash-based SCGPC mixes are assessed using slump flow, T_{50cm} slump flow, L-box, and V-funnel tests. The filling capacity of new concrete was determined by using slump flow test. The T_{50cm} slump flow test was used to determine a mixture's filling capacity by measuring how long it took for the mixture to expand to a diameter of 50 cm. The L-box test was used to determine whether concrete could withstand the reinforcement. The concrete heights at the horizontal component's (H_2) and the vertical section's (H_1) leading ends are measured for the L-box test. The viscosity and filling capacity of the concrete were evaluated using the V-funnel test. Each test was performed in compliance with the recommendations of the EFNARC [13].

3.2.2. Mechanical properties

Using the IS 516 (1959), IS 5816 (1999), and IS 516 (1959) standards, the compressive strength, split tensile strength, and flexure strength were assessed [14 15]. The cube compression, flexural strength and splitting tensile strengths of the flyash-based SCGPC were evaluated using three 150 mm × 150 mm cubes, three 500 mm × 150 mm prisms and three 150 mm × 300 mm cylinders.

4. Results and discussion

4.1. Slump flow and T_{50cm} slump flow test

Table 3, Fig. 1 and Fig. 2 clearly show the values for the rheological properties (slump flow values and T_{50cm} slump flow) of flyash based SCGPC mixes. The slump flow values and T_{50cm} slump flow for flyash based SCGPC mixes were in the ranging of 690 to 720 mm and 2.3 to 3.51 sec, respectively. At 8 M the maximum slump was measured, and the lowest slump was measured at 16 M. When the level of NaOH concentration was increased from

4	M4	14 M	695	3.2	8.2	0.86
5	M5	16 M	690	3.51	8.4	0.84

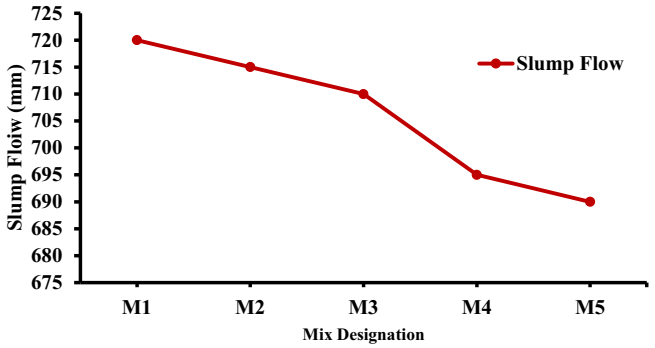

Fig. 1. Variation of Slump flow with different Sodium Hydroxide solution molarities.

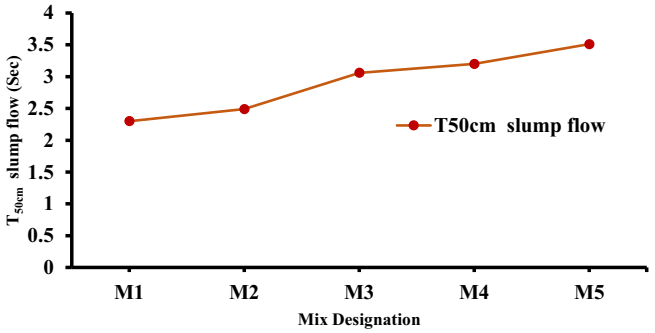

Fig. 2. Variation of T_{50cm} slump flow with different Sodium Hydroxide solution molarities.

8 M to 16 M, the slump flow was found to be reduced. All of the mixes constituted with higher molarity concentrations had lower slump flows. High T_{50cm} slump flow readings were also a result of a higher NaOH molar content. It has been observed that as the NaOH concentration rises, the slump value gradually decreases. This might be caused by the alkaline activator solution's high viscosity [16 17]. All mixes, however, conformed with the EFNARC, 2002[13].

4.2. V-funnel test

Table 3 tabulates the time taken for the V-funnel test and presented in Fig. 3, which shows that the time rose from 7.5 to 8.4 sec. As the concentration of NaOH rose from 8 M to 16 M, All V-funnel values were found to be less than 12 s and within the range of EFNARC, 2002.[13].As the amount of sodium hydroxide in the solution rises, so does its viscosity. Flyash-based self-compacting geopolymer concrete's flowability reduced as sodium concentration rose. As a result, the flow period of the V-funnel was extended.

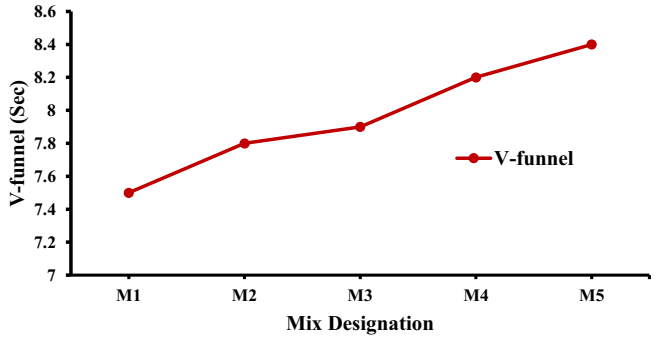

Fig. 3. Variation of V-funnel with different Sodium Hydroxide solution molarities.

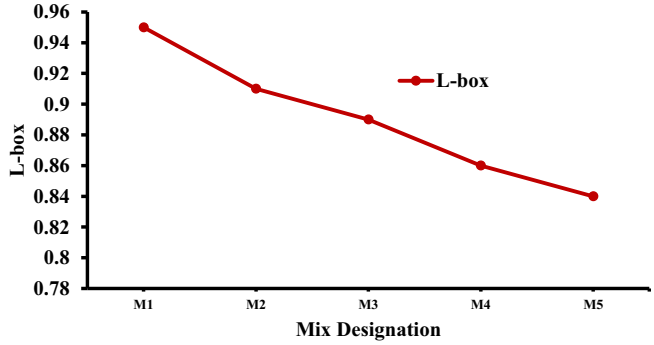

Fig. 4. Variation of L-Box with different Sodium Hydroxide solution molarities.

4.3. L-box test

The passing-ability (L-box) values are presented in Table 3 and Fig. 4. The results indicate that, regardless of the sodium hydroxide concentration, all flyash-based SCGPC mixes satisfied the L-Box ratio requirements of EFNARC [13]. The ratio of L-box dramatically declines with increased sodium hydroxide solution concentrations, as indicated in Table 3. For different concentrations of Sodium Hydroxide between 8 M and 16 M, the L-Box values varied from 0.95 to 0.84, respectively. The L-Box test results from the previous researchers' studies of three different sodium hydroxide solution concentrations (8 M, 10 M, and 12 M) in SCGPC combinations were very similar [16]. It was noticed that the L-Box values significantly decreased when sodium hydroxide concentration and molarity increased.

4.4. Compressive strength test

The results of the compressive strength test are listed in Table 4 and Fig. 5 shows how, after 7,28 days, the molarity of the NaOH solution influenced the compressive strength of the flyash-based SCGPC. The test findings demonstrated that the molarity of the sodium hydroxide solution has a significant impact on the flyash-based self-compacting geopolymer concrete. The flyash-based

Table 4
Hardened Properties of flyash based SCGPC mixes.

S.No.	Mix Designation	Molarity	Compressive Strength (MPa)		Split Tensile Strength (MPa)	Flexural Strength (MPa)
			7 days	28 days		
1	M1	8 M	17.15	25.74	2.56	3.22
2	M2	10 M	19.34	28.56	2.79	3.52
3	M3	12 M	22.34	31.94	3.12	4.05
4	M4	14 M	22.84	33.63	3.29	4.12
5	M5	16 M	23.33	34.9	3.42	4.22

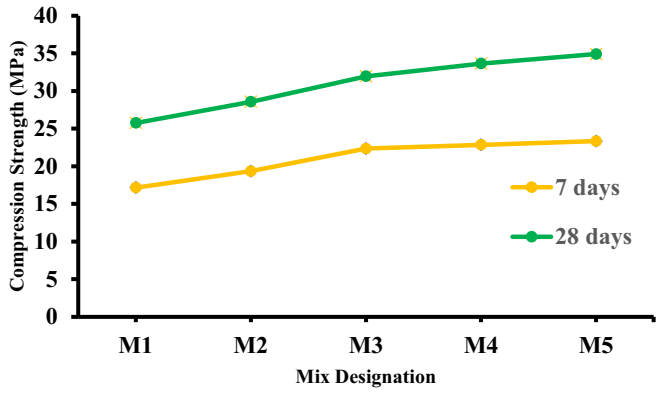

Fig. 5. Effect of NaOH solution molarity on Compressive Strength of SCGPC.

SCGPC gets harder when NaOH molar concentration rises from 8 Molarity to 16 Molarity. At 28 days, the combination with 16 M showed the highest compressive strength (34.9 MPa). When compared to flyash based SCGPC mix of 8 M, compressive strength increased by 10.95%, 24.08%, 30.65%, and 35.58%, respectively, for flyash based SCGPC mixes of 10 M, 12 M, 14 M, and 16 M. This might be the case because raising the molarity of NaOH enhances the pace at which aluminosilicate minerals dissolve, which enhances the geopolymerization process. This improvement in compressive strength characteristics is consistent with a number of previous research [18].

4.5. Split tensile strength test

Fig. 6 and Table 4 depicts the flyash-based SCGPC's split tensile strength test outcomes after 28 days. This graph clearly illustrates that as the molarity of the sodium hydroxide solution increases, the split tensile strength of the flyash-based SCGPC also increases. When compared to flyash-based SCGPC mix of 8 M, the improvement in split tensile strength is approximately 8.98%, 21.87%, 28.51%, and 33.59% for mixtures of 10 M, 12 M, 14 M, and 16 M, respectively. The split tensile test results validate the behaviour of the compressive strength test results.

4.6. Flexure strength test

At 28 days after casting, the results of the flexural strength test for the flyash-based SCGPC are displayed in Fig. 7 and Table 4. This graph unequivocally demonstrates that the flyash-based SCGPC's flexural strength increases as the molarity of the sodium hydroxide solution rises. Flyash-based SCGPC mixes of 10 M, 12 M, 14 M, and 16 M each had an increase in flexural strength of about 9.31%, 25.77%, 27.95%, and 31.05% when compared to flyash-based SCGPC mixes of 8 M. The behaviour of the compressive strength test findings is complemented by the flexural strength test results.

4.7. Effect of NaOH solution molarity

The workability of the mixture is found to be significantly reduced by a molarity rise. This is due to the alkaline activators (NaOH and Na_2SiO_3) greater viscosity in comparison to water. The viscosity of the NaOH solution increased as the molarity of NaOH increased. Additionally, the decrease in water levels caused by raising the molarity of NaOH lowers the workability of SCGPC. Increased sodium hydroxide solution concentrations hasten the polymeric reaction, which decreases workability by expediting the setting and hardening process [19]. This may also be because flyash based SCGPC that was sticky and cohesive was produced when the little fly ash particles were combined with viscous alkaline activators. Similar findings were reported by the previous researchers [20,21].

5. Conclusions

1. Flyash based SCGPC blends made by varying NaOH solution concentrations varying from 8 M to 16 M has achieved the desired fresh properties confirming to EFNARC guidelines[13].

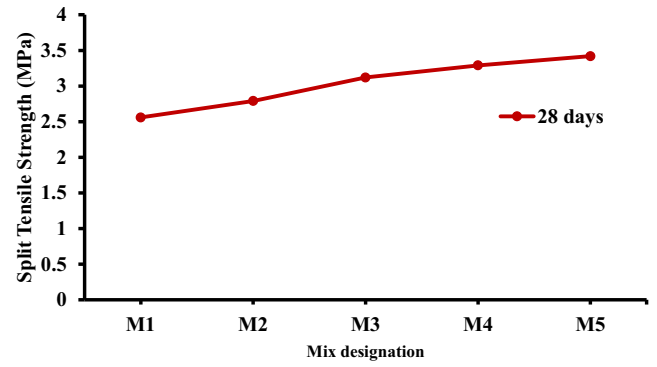

Fig. 6. Variation of Split Tensile Strength w.r.t different Molarities.

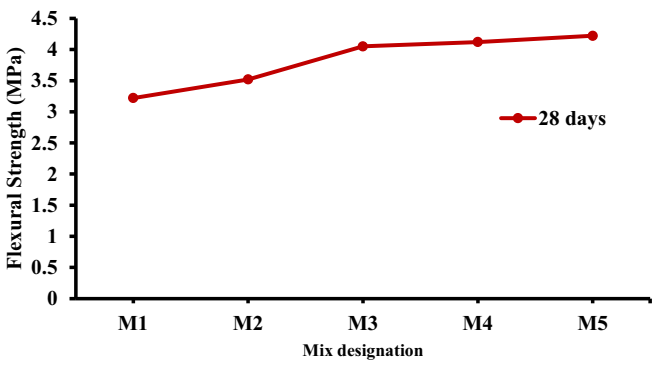

Fig. 7. Variation of Flexural Strength w.r.t different Molarities.

2. The molarity of the NaOH solution had a substantial impact on the strength of flyash-based SCGPC that was cured at room temperature.
3. The compressive strength of flyash based SCGPC increased by approximately 35.58% when the molar concentration of the NaOH was rose from 8 M to 16 M.
4. However, as the molar concentration of NaOH rose from 8 M to 16 M, the splitting tensile strength and flexural strength of flyash-based SCGPC improved by around 33.59% and 31.05%, respectively.

Data availability

ABSTRACT In India, *Plumbago zeylanica* is a beneficial medicinal herb. The current study examines the antibacterial, and antifungal properties and phytochemical analysis of *Plumbago zeylanica* leaf extract. Using the well diffusion technique, the antibacterial activity was evaluated against gram-positive and gram-negative microorganisms. the antifungal activity was carried on *Aspergillus niger*. The study's findings imply that the plant leaf extract possesses an inhibitory effect on both gram-positive and gram-negative bacteria and fungi and it could be used as phytomedicine for bacterial and fungal diseases

KEYWORDS :

INTRODUCTION:

Plumbago zeylanica is an herbaceous plant with ascending, prostrate, or erect glabrous stems. Additionally, the ovate petiolate or sessile leaves have leaves. It belongs to the *Plumbago* genus and the family *Plumbaginaceae*. Tropical and subtropical areas across the world support the growth of the native *Plumbago zeylanica* plant. Deciduous woodland in (Australia, and India). The herb has a variety of therapeutic benefits [1-4]. Chitrak, chitramoolam, plumbago, Ceylon leadwort, doctor bush, or wild leadwort are some of the native names for the plant. Chitra is the name in Hindi, while Chitramoolam is the name in Tamil [5,6]. Molubda scandens (L.) Raf., Plumbagidium scandens (L.) Spach, Plumbago scandens L., and Plumbago zeylanica var. glaucescens Boiss are some synonyms for the plant [7,8].

The *P. zeylanica* plant grows to a height of 0.5–2 meters. The leaves are simple, alternating, elliptic, or oblong, 0.5–12 cm long, with a tapering base, and sometimes have a hairy edge. They can also be ovate or ovate-lanceolate. Young leaves lack stipules and have a thin petiole with tiny auricles. The inflorescence has numerous flowers and is of the terminal raceme type, measuring 6 to 30 cm in length [4-7]. White flowers are produced in terminal and axillary elongated spikes. They are pentamerous, pedicellate, bisexual, regular, and sweet-scented. Free and included are the stamens. The ovary is superior and single-celled, and the style is filiform with five elongated stigma lobes. The flowers also have a tubular calyx with glandular trichomes (hairs) that secrete gooey mucilage, which is another distinguishing feature [3]. The plant blooms all year round, and insects are the main pollinators. The mucilaginous glands facilitate animal fruit distribution and insect capture. The plant's fruit is a single-seeded, oblong capsule with five ridges. Each seed has an oblong shape, is 5–6 mm long, and ranges in color from reddish-brown to dark brown. Roots are at least 30 cm long, smooth, branching, or unbranched, with or without secondary roots, and 6 cm in diameter. When they are young, they are light yellow, and as they dry, they turn reddish-brown. The roots taste caustic and bitter and have a potent, distinctive smell [7].

Description:

The generic name comes from the Latin words plumbum, which means lead since this plant was thought to be able to treat lead poisoning and eye illness. The particular plant comes from Sri Lanka and is known as Ceylon. In India, the plant *Plumbago zeylanica* is also known as Chitrak, and it has several conventional and effective medical applications. The plant's blossoms may be eaten and are used to adorn salads, desserts, and cold beverages. The plant thrives in West Bengal, Madhya Pradesh, and Chhattisgarh. It also grows in a variety of soil types, including deep soil, deep black soil, and red literate soil. It may be quickly propagated via stem cuttings [8].

including cardiotoxicity, atherogenicity prevention, and cardiotonic neuroprotection. It may also be used to lower blood cholesterol levels and improve the poor density of lipoproteins. Diabetes, cancer, skin infections, rheumatoid arthritis, constipation, asthma, and muscle discomfort are all treated with this herb [9].

Growth and Development:

The plant *Plumbago zeylanica* is a wild species that grows in many locations and has a variety of medicinal uses. The plants are cultivated in tropical and subtropical areas where it rains throughout the rainy season [10]. To identify the numerous bioactive substances that are significant from a pharmacological standpoint, including alkaloids, steroids, flavonoids, phenolic compounds, and many more, a phytochemical examination was carried out. The plant's bioactive components are a source for making medicines [11]. The bioactive substances are known to behave as microbial inhibitors [12]. The hunt for novel structural medications to replace synthetic antioxidants that are reportedly harmful has led researchers to explore plants in the present [13].

MATERIALS AND METHODS:

Collection of plant material:

The plant *Plumbago zeylanica* was harvested from the Nallamala forest in the Kurnool district, Andhra Pradesh, India. The gathered plant leaves are divided into bits, let to air dry for 10 days, and then ground into a fine powder for use in further research.

Preparation of plant leaf extract:

Up to 10 gms of the dried leaf powder were used, and 100 ml of distilled water was used to dissolve it. The leaf extract that had been dissolved was utilized to analyze phytochemicals and test the antibacterial and antifungal activities.

Phytochemical analysis of leaf extract of *Plumbago zeylanica*:

The phytochemical examination of the *Plumbago zeylanica* leaf extract was used to identify the bioactive components, such as alkaloids, flavonoids, tannins, phenolic compounds, and saponins [14].

Test for carbohydrates:

Molisch's test:

Plant leaf extract (2ml) was mixed with 1ml of Molisch's reagent and a few drops of concentrated H_2SO_4: the production of a violet color at the intersection of the two layers shows the presence of carbohydrates.

Test for reducing sugars:

Benedict's test:

Keywords: Natural Dyes, Extraction, Characterization, Dyeing, Synthetic chemical dyes

Abstract

Indians were thought to be forerunners in the technique of natural dyeing. Although indigenous knowledge systems have been practiced for many years, the usage of natural dyes has declined over generations owing to a lack of documentation and accurate understanding of the extraction and dyeing processes. As a result, natural dyes aren't commercially viable. Currently, all ecologically hazardous synthetic chemical dyes are utilized to colour textile fabrics. They are nonbiodegradable, carcinogenic, and cause water contamination and waste disposal issues. Natural colours provide a viable answer to these issues. Natural dyes are used to colour textiles, meals, medicines, and cosmetics. Dyes are also used in small amounts to colour paper, leather, shoe polish, wood, cane, candles, and other materials. Historically, dyes were obtained only from natural sources. Natural dyes, on the other hand, suffer from the inherent limitations of uniform application and dye standardization, since dyes obtained from comparable plants or natural sources are impacted and exposed to the vagaries of climate, soil, cultivation practices, and so on. As a result, standardization procedures play a critical and essential role for natural dyes to be ir[illegible]ialized and compete with synthetic dyes. This study is all about natural dyes, their [illegible]haracterization, applications, and their uses.

Abstract

Background and purpose: Metal nanoparticles are essential due to their unique catalytic, electrical, magnetic, and optical characteristics, as well as their prospective use in sensing, catalysis, and biological research. In recent years, researchers have focused on developing cost-effective and eco-friendly biogenic practices using the green synthesis of metal nanoparticles (AgNP).

Experimental approach: In the present study, the aqueous extracts prepared from the leaf, stem, bark, and flower of *Neolamarkia cadamba* were used for the synthesis of silver nanoparticles. Synthesized silver nanoparticles were characterized using UV-Visible spectroscopy, zeta potential, dynamic light scattering, scanning electron microscope (SEM), and EDAX.

Key results: The current study showed absorption of synthesized AgNPs at 425, 423, 410, and 400 nm. Dynamic light scattering of AgNPs Showed size distribution of AgNPs synthesized from leaf, stem, and flower aqueous extracts ranges from 80-200 nm and AgNPs prepared from bark extract ranges from 100-700 nm. Zeta-potential of the biosynthesized AgNPs was found as a sharp peak at -23.1 mV for the leaf, -27.0 mV for the stem, -34.1 mV for the bark, and -20.2 mV for the flower. Silver nanoparticles and crude extracts of *Neolamarkia cadamba* showed effective antibacterial, antifungal, and antioxidant activities.

Conclusion: Silver nanoparticles have substantial antibacterial activity against Gram-positive bacteria and also exhibit the utmost antifungal activity against *Aspergillus niger*. The study concludes that the green synthesis of silver nanoparticles from *N. cadamba* leaf, stem, bark, and flower extract is a reliable and eco-friendly technique.

Keywords: Antibacterial activity; antifungal activity; antioxidant activity; electron microscopy.

Abstract

Silver nanoparticles are nano-sized metallic particles widely used in various fields, including medicine, pharmaceutical, food, and agriculture. This study carried out the green synthesis of AgNPs using leaf extracts from *Azadirachta indica* (Neem) and *Ficus religiosa* (Peepal) plants. The silver nanoparticles were characterized using sophisticated instruments. UV-visible spectroscopy confirmed the formation of AgNPs, while FTIR identified biomolecules (amino and carboxyl groups) acting as stabilizing agents. SEM determined the size and morphology of AgNPs. Particle size analysis was conducted using DLS, and zeta potential measurements provided information on the size and charge of the silver nanoparticles. The AgNPs were tested for antibacterial efficacy against Gram-positive (*S. aureus*) and Gram-negative (*E. coli*) bacteria. Similarly, the AgNPs exhibited high fungicidal activity against the fungal strain *A. niger*. The free radical scavenging activities of nanoparticles were studied using DPPH and Hydrogen Peroxide in vitro assays. The antiviral activity of AgNPs was investigated against the *Sesbania mosaic virus* (SeMV), which infects *Sesbania* plants. The AgNPs exhibited excellent antiviral properties, decreasing the viral infection in Sesbania plants, indicating the antiviral efficacy of silver nanoparticles in the agricultural sector.

ABSTRACT

Sustainability is increasingly a prerequisite for all civil engineering projects due to depletion of natural resources and escalating pollution levels. Several researchers have suggested a wide range of sustainable solutions for various applications in the civil engineering. Among them, geopolymer cement concrete is one of the sustainable approaches which can reduce the high amounts of CO_2 by replacing Portland cement concrete. Further, the presence of deleterious materials in conventional concrete revealed a reduction in performance of concrete structures, But, the studies related to the influence of deleterious materials on properties of geopolymer concrete are limited. So, the present study is aimed to evaluate the influence of black cotton soil as a deleterious material on mechanical behavior of geopolymer concrete. The strength of concrete is evaluated in terms of compressive strength, split tensile strength, flexural strength, shear strength and bearing strength while durability is measured by using chloride intrusion test. The results showed a contrast behavior as compared to the conventional concrete. The presence of clay in geopolymer concrete has showed an increase in strength up to 5% of clay. The same was conformed through the chloride intrusion test conducted on geopolymer concrete

Keywords: Deleterious material, clay, geopolymer concrete, strength, elevated temperature, durability.

INTRODUCTION

Concrete is typically made of cement, water, coarse particles, and fine aggregates. The strength and durability of concrete constructions can be negatively impacted by the presence of any components, including lignite, coal, pyrites, mica, shale or similar minerals, clay, alkali, soft pieces, marine shells, and organic impurities. Often, these substances are referred to as deleterious materials. The strength and durability of concrete can be dramatically decreased if these components are present in excess of permitted levels. The permitted limits for each type of deleterious material are provided in standard codes for conventional concrete, but the corresponding limits for geopolymer concrete must be obtained through a systematical and focused research in order to prevent the performance of concrete structures from being reduced. Hence, the present article is aimed to evaluate the influence of clay as a deleterious material on strength and durability of geopolymer concrete. French scientist "Joseph Davidovits" first used the phrase "geopolymer concrete" in 1972. Since no Portland cement is utilised in the geopolymer concrete, it is often referred to as zero-cement concrete. Alkali activating solution and silica-alumina rich source materials, including flyash, ground granulated blast furnace slag (GGBS), metakaolin, etc., are used to create geopolymer concrete. In order toprepare geopolymer cement or binder, alkali activating solutions were used to activate the silica-alumina source materials [1]. The composition of geopolymer concrete is shown in figure 1.

Geopolymer mix components including the alkali solution concentration [3, 5, 9, 10, 11, 12], the ratio of silicate solution to hydroxide solution [2, 6, 7, 8], and the ratio of solids to activating solution [4] all have a significant impact on the strength of the mixture. Due to its lower price, sodium hydroxide solution was suggested over potassium hydroxide solution for the preparation of alkali activating solutions. Few research examined the relationship between sodium hydroxide solution concentration and the strength of geopolymer concrete, and they found that increasing sodium hydroxide solution concentration increased the strength of geopolymer concrete.

MATERIALS AND METHODOLOGY

In the present study, the geopolymer binder was prepared by using alkali activating solution (NaOH solution and sodium silicate solution) and flyash. In this study, a powder to liquid ratio of 2.5 and sodium silicate to NaOH ratio of 2 was considered. 15% of geopolymer binder (by weight of mix) is used for preparation of geopolymer concrete. Two series of mixes were prepared using geopolymer binder and ordinary portland cement. Both the concrete mixes were incorporated with black cotton soil (clay) at a dosage of 0, 2.5, 5, 7.5 and 10% by weight of coarse aggregates. A set of cubic specimens, cylindrical specimens and prismatic specimens were prepared with these concrete mixes and subjected to compressive, split tensile and flexural strengths were evaluated. In addition, shear strength, bearing strength of geopolymer concrete and traditional concrete were evaluated. The influence of elevated temperature (200^{o}C) on compressive strength of both geopolymer and traditional concrete was studied. Finally, the effect of clay on durability of concrete (in terms of compressive and flexural strength) was investigated through chloride intrusion of concrete specimen.

RESULTS AND DISCUSSIONS

Compressive strength

A set of 30 cubic specimens (150mm size) were prepared with different dosages of clay for each series of concrete mix and subjected to uniaxial compression as per IS:516-1959. The specimens were cured for a period of 28 and 180 days. The corresponding compressive strengths of geopolymer and traditional concrete specimens are compared as shown in figure 2(a) and 2(b). The results showed a maximum 28-days compressive strength of 49.1MPa and 45.6MPa for geopolymer concrete and traditional concrete respectively. The addition of clay content showed an adverse effect on compressive strength of traditional concrete while the addition of clay content up to 5% showed a positive effect on compressive strength of geopolymer concrete. But, the addition of clay beyond 5% caused a

considerable reduction in compressive strength. The addition of 2.5% clay reduced the compressive strength (28-days) of traditional concrete by 8% while a reduction of 33% was observed with an addition of 10% clay. The addition of 2.5% and 5% clay increased 28-day compressive strength by 3.4% and 11.1% respectively. The alumino-silicate compounds in clay up to 5% played a key role and reacted with alkali activated solution and beyond this dosage the clay acted as a foreign material and become detrimental to the geopolymer concrete. Due to this reason, the strength was increased up to 5% of clay and then started declining. But, this has to be confirmed by the microstructural studies using scanning electron microscopy, X-ray diffraction. Similarly, the same trend was observed in case of 180-days compressive strength.

Split tensile strength

A set of 30 cylindrical specimens (150mm diameter and 300mm height) were prepared with different dosages of clay for each series of concrete mix and subjected to split tensile load as per IS:5816-1999. The specimens were cured for a period of 28 and 180 days. The corresponding split tensile strengths of geopolymer and traditional concrete specimens are compared as shown in figure 3(a) and 3(b). The results showed a maximum 28-days split tensile strength of 4.72MPa and 4.02MPa for geopolymer concrete and traditional concrete respectively. The addition of clay content showed an adverse effect on tensile strength of traditional concrete as similar to compressive strength of traditional concrete. In case of geopolymer concrete, the addition of clay content up to 5% showed a positive effect on tensile strength of geopolymer concrete.

Flexural strength

A set of 30 prismatic specimens (150mm x 150mm x 700mm) were prepared with different dosages of clay for each series of concrete mix and subjected to 4 point bending as per IS:516-1959. The specimens were cured for a period of 28 and 180 days. The corresponding flexural strengths of geopolymer and traditional concrete specimens are compared as shown in figure 4(a) and4(b). The results showed a maximum 28-days flexural strength of 5.41MPa and 4.67MPa for geopolymer concrete and traditional concrete respectively. The addition of clay content showed an adverse effect on flexural strength of traditional concrete as similar to compressive strength of traditional concrete. In case of geopolymer concrete, the addition of clay content up to 5% showed a positive effect on tensile strength of geopolymer concrete by increasing 10.6%. The addition of 10% clay caused a reduction of 20.4% and 17.1% for geopolymer and traditional concrete respectively.

Shear strength and bearing strength

A set of 15 concrete specimens were prepared for each series of concrete mix at different dosage of clay as specified. The specimens were cured for a period of 28 days and then subjected to shear loading. Similarly, a set of 15 concrete specimens for each series of mix were subjected to bearing strength test. The corresponding results are presented figure 5 and 6 for shear and bearing strengths respectively. The results showed a maximum 28-days shear strength of 3.67MPa and 3.38MPa for geopolymer concrete and traditional concrete respectively. The addition of clay content showed a considerable decrease in shear strength of traditional. In case of geopolymer concrete, the addition of clay content up to 5% showed a positive effect on tensile strength of geopolymer concrete by increasing 6.4%. The addition of 10% clay caused a reduction of 16.2% and 14.8% for geopolymer and traditional concrete respectively. Similarly, the addition of clay (10%) reduced the bearing strength by 22.1% and 5.8% for traditional concrete and geopolymer concrete respectively.

Effect of elevated temperature

A set of 30 cubic specimens (150mm) were prepared for each series of concrete mix at different dosage of clay as specified. The specimens were cured for a period of 28 days and then subjected to uniaxial compression at an elevated temperature of 200^{o}C. The results showed the same trend for both traditional and geopolymer concrete as described in the compressive strength of these two mixes (figure 7). The elevated temperature reduced the compressive strengths in the range of 17.7-21.4% and 18.2-23.5% for geopolymer concrete and traditional concrete respectively.

Durability characterization

In this study, the durability of traditional and geopolymer concrete was evaluated in terms of reduction in strength (compressive and flexural) of concrete subjected to chloride intrusion. The results showed same trend of strength with addition of clay for geopolymer concrete and traditional concrete as described in the cases without chloride intrusion. The results are presented in figure 8 and 9 for compressive and flexural strengths respectively. The results showed a reduction of compressive strength in the range of 11.1-15.5% and 12.9-16.0%for geopolymer concrete and traditional concrete respectively. In case of flexural strength, a range of 14.7-18.3% and 14.1-21.2% for geopolymer concrete and traditional concrete respectively.

CONCLUSIONS

- The addition of clay content showed an adverse effect on the strength of traditional concrete while the addition of clay content up to 5% showed a positive effect on the strength of geopolymer concrete. But, the addition of clay beyond 5% caused a considerable reduction in the strength.
- The elevated temperature reduced the compressive strengths in the range of 17.7-21.4% and 18.2-23.5% for geopolymer concrete and traditional concrete respectively.
- The durability studies revealed a reduction of compressive strength in the range of 11.1-15.5% and 12.9-16.0%for geopolymer concrete and traditional concrete respectively. In case of flexural strength, a range of 14.7-18.3% and 14.1-21.2% for geopolymer concrete and traditional concrete respectively.
- Finally, a maximum of 5% of clay can be recommended for geopolymer concrete without compromising the strength and durability of concrete.

Abstract
The primary goal of the present research is to look into the rheological, mechanical as well as microstructural characteristics of flyash based self-compacting geopolymer concrete (SCGPC) comprised of the combination of fly ash and ground-granulated slag from blast furnaces (GGBS), that is cured at room temperature. GGBS is incorporated together with flyash from 0 to 50% with intervals of 10% binder concentration to make GGBS blended SCGPC. The rheological properties of GGBS blended SCGPC mixes which include slump flow, T_{50cm} slump flow, L-Box, and V-funnel are evaluated for various mixes in accordance with the EFNARC guidelines. For various GGBS blended SCGPC mixtures, mechanical characteristics such compressive strength test, split tensile strength test, and flexural strength test are also evaluated. The replacement of GGBS is optimised in accordance with the findings of mechanical and rheological characteristics. In compliance with the EFNARC guidelines, the outcomes revealed that each of the GGBS blended SCGPC mixes satisfied the fresh properties requirements, and that when GGBS was replaced with 40% of the binder, the resulting strength properties was superior to that of other GGBS blended SCGPC mixes. This article also discusses how X-ray diffraction (XRD), scanning electron microscopy (SEM) with EDAX, and Fourier Transform Infrared Spectroscopy (FTIR) techniques were carried out in order to assess the structural, morphological also mechanical characteristics of the SCGPCs. Findings show that replacement of GGBS enabled a greater degree of geopolymerization, which in turn caused the geopolymer matrix to become denser and enhance the attributes of GGBS blended SCGPC when compared to Flyash based control SCGPC.

1 Introduction

Concrete, which has become essential in the construction sector, is mostly made of cement [1]. Making cement emits greenhouse gases onto the earth's atmosphere [2]. Cement production harms the environment because it is a major source of greenhouse gases entering the atmosphere [3]. The production of one tonne of cement (OPC) results in the release of an equal amount of carbon dioxide into the atmosphere, which accounts for roughly between five and seven percent of the global emissions of carbon dioxide (CO_2) [4]. Because of the alarming situation, There was a critical need for the cement manufacturing industry to decrease emissions of carbon dioxide (CO_2) [5]. To combat global warming, many researchers have concentrated their research to replace cement with cementitious materials. Davidovits created Geopolymers, in which cement was entirely replaced by industrial by-products [6, 7]. Geopolymers are produced by polymerizing an alkaline solution with a silicon- and aluminum-based primary material, which has the same chemical makeup as zeolites but a different kind of internal structure [8]. For the production of alumina and silica-based binders, Green Geopolymers uses binders made from inexpensive ingredients or byproducts of certain industries which include fly ash, GGBS and

metakaolin [9]. These raw materials react with alkali-activating solvents to form a tri-alumino-silicate chain. Compounds like sodium aluminosilicate and calcium silicate hydrate are also formed during this geopolymerization which enhances mechanical characteristics, while sodium silicate hydrate creates a tetrahedral network with SiO_4 and AlO_4 [10, 11]. A shift from amorphous to semi-crystalline structures occurs as a result of a complicated chemical reaction involving binders and activators [12]. According to reports, the entire process is accelerated by curing at an elevated temperature [13, 14]. Fly ash is a type of industrial waste produced when thermal coal is burned in electricity-generating facilities [15]. Fly ash can lower carbon dioxide emissions in geopolymer concrete by a proportion of 25–45% as a result of the utilization of the combustion of coal waste [16, 17]. The majority of the byproduct material for GGBS comes from iron manufacturing facilities. CaO, MgO, SiO_2, and Al_2O_3 are all present in GGBS, a granular substance. During the activation of GGBS, the main reaction result is gel composed of calcium silicate hydrate (C-S–H gel) [18], This results in the development of adequate strength regardless of ambient curing conditions [19]. GGBS and fly ash have been extensively utilized as SCMs for research purposes due to their benefits to the mechanical characteristics of GPC, the environment, and the economy as a whole [20, 21]. The formwork must be compacted and filled with fresh concrete by trained personnel. To obtain a homogenous mixture without voids (honeycomb), The main goal of this compaction is to release the trapped air in freshly laid concrete. Normally, when being poured and consolidated at the construction location, normal vibrating concrete couldn't be capable demonstrate the appropriate fresh and toughened characteristics. In freshly mixed concrete, proper compaction requires skilled labour. One approach to resolving this problem is to use self-compacting concrete (SCC) [22, 23]. Self-compacted concrete (SCC) is an improved form of concrete owing to its own weight and can be entirely consolidated into frameworks corners. The main objective of SCC development is to achieve the best compaction and to make it easier to place concrete in crowded areas and small apertures [24–26]. The primary features of SCC is its mobility, fill and passage without any indication of separation and bleeding. Flyash based SCGPC is a pioneering concept in the building sector. As can be seen in Fig. 1, it is an upgraded form of concrete which combines all the advantages from both geopolymer concrete as well as SCC [27–29].

For instance, Flyash prolongs the time needed for the mix to set while GGBS slows down FA's development of strength. As a result, an investigation has been carried out on the control samples consisting of 100% flyash and blended mixes with FA replaced with GGBS at various percentages to a maximum of 50%. In this study, FA and GGBS will be combined in different amounts in order to produce GGBS blended SCGPC and analyse the synergistic effects of this combination. Initially, rheological and mechanical properties were assessed. Later, Microstructural experiments involving

XRD, SEM, and FTIR were conducted to investigate the structural and morphologies of the flyash based control SCGPC and GGBS blended SCGPC.

2 Materials

2.1 Flyash

In this study, flyash produced by the Rayalaseema Thermal Power Generating Station (RTTP) in Kadapa, India, and compliant with Indian Standard IS: 3812:2003 [30] was used. Its widespread availability causes disposal issues in many nations, necessitating the utilization of flyash in concrete with the objective to lower the amount of CO_2 in the atmosphere. In the creation of GGBS blended SCGPC, the present study replaces cement with Class F flyash. The physical and chemical attributes of the flyash employed in the current investigation can be found Table 1. The results demonstrate that the fly ash contains silicate glass with a significant silica concentration and considerable levels of the crystalline phases quartz, mullite, and magnetite. It may be used to create SCGPC due to its SiO_2 and Al_2O_3 composition. The XRD analysis was employed to identify the crystalline phase and composition of flyash, as illustrated in Fig. 2. In the Fig. 3a SEM micrograph was used to determine the morphological characteristics of Flyash.

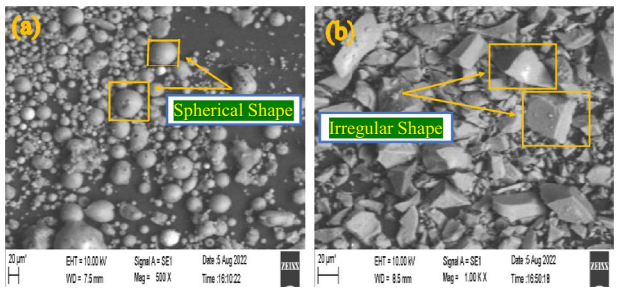

Fig. 3 SEM micrographs of **a** Flyash, **b** GGBS

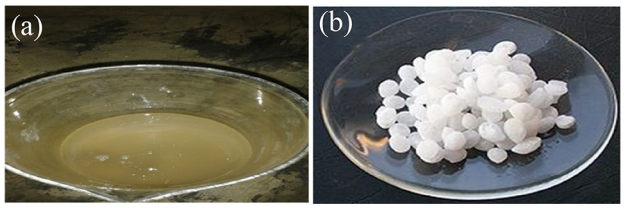

Fig. 4 **a** Sodium silicate, **b** Sodium hydroxide

2.2 GGBS

The by-product of the steel and iron processing sectors is known as GGBS. GGBS would be off-white and have better cementitious properties than other fillers. The supplier of GGBS was JSW Steel Ltd. in Bellary, Karnataka, India. It is referred to as ASTM C 989 and has high silicate and alumina content to improve the material's properties. The physical and chemical characteristics of the GGBFS provided by JSW Steel Ltd. are displayed in Table 1. As seen in Fig. 2 The crystalline structure and phase of the GGBS were determined using the XRD approach. The morphological characteristics of GGBS were determined by capturing micrographs using SEM, as illustrated in Fig. 3b.

2.3 Alkaline activator

In the current experiment, Sodium-based activators were used to produce alkaline activators, including sodium hydroxide (NaOH) and sodium silicate (Na_2SiO_3) solutions from a dealer of the chemical manufacturer Astrra Chemicals in Chennai as shown in Fig. 4. while maintaining a 2:1 ratio of Na_2SiO_3 to NaOH. To lessen the amount

of heat that is generated throughout the blending process, the prepared alkaline fluid is left for twenty-four hours to settle as well as cool.

2.4 Aggregates

All of these GGBS blended SCGPC mixtures in the present study included a fine aggregate consisting of naturally existing river sand collected from the Tungabhadra Riverbank as well as coarse aggregate with an average size of approximately 12.5 mm as shown in Fig. 5. Using the findings of a sieve examination, it was discovered that the coarse and fine aggregates looked to have specific gravities of 2.64 and 2.60, respectively, and that they complied with IS: 383–1970 [31, 32]. Local suppliers provided the fine and coarse aggregates.

2.5 Super plasticizer

In the current investigation, a superplasticizer from the Master Glenium series was used. It's an admixture made of polycarboxylic ether. This was intended to develop the characteristics of recently laid, extremely efficient concrete. It works effectively with any kind of cement since it doesn't include chlorides or alkalis. A superplasticizer is used to enhance the workability and fluidity of GGBS mixed SCGPC blends without reducing the final product's strength and durability. According to IS 9103:1999 [33], its relative density is roughly 1.09.

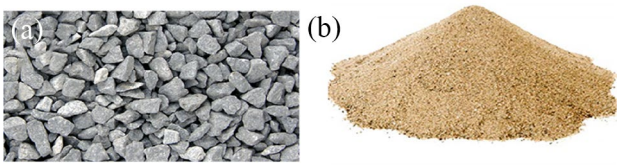

Fig. 5 **a** Coarse aggregate, **b** Fine aggregate

3 Mix proportioning

Six SCGPC blends with GGBS were created by raising the GGBS from 0 to 50%. Liquid to binder ratio was maintained at 0.45, and the total quantity of binder was maintained at 496.55 kg/m^3. In line with the mass of the binder, a superplasticizer (S.P.) with a dosage of 2% and additional water content was used can be seen in Table 2.

3.1 Blending, casting process and curing

Flyash, GGBS and aggregates were all the dry components of the flyash based SCGPC that were mixed together for two to three minutes in a pan mixer. Then, to create alkali activator fluid, the mixture's liquid component, consisting of NaOH and Na_2SiO_3 solution, is combined in a ratio of 1:2 (by weight). In order to complete the perfect blending of GGBS blended SCGPC, Super Plasticizer and Water were provided. For an additional two to three minutes, let these materials mix together. Before being placed onto the moulds, the freshly poured concrete was tested for its rheological characteristics. Before testing, each sample is kept at 27 °C, or room temperature.

3.2 Experimental program

3.2.1 Rheological properties

The rheological characteristics of the GGBS blended SCGPC blends were evaluated utilising slump flow, T_{50cm} slump flow, L-box, and V-funnel experiments. To ascertain the freshly poured concrete's capability for filling, a slump flow experiment was performed. The filling capacity of the mix was determined by timing how long it took the mix to reach a 50 cm diameter employing the T_{50cm} slump flow test. To ascertain if concrete could survive the reinforcing, the L-box test was performed. The vertical section (H_1) and horizontal component's (H_2) leading ends' concrete heights are taken into account for the L-box examination. The V-funnel

50FAG50	248.2	248.2	924	756	74.5	148.9	2	12

experiment was used to gauge the concrete's consistency and filling capacity. Each experiment was conducted in conformity with the guidelines provided by the EFNARC [34].

3.2.2 Mechanical properties

For mechanical characteristics of the GGBS blended SCGPC blends, compressive strength was assessed at 3, 7, and 28 days. Splitting tensile strength and strength in flexural were evaluated after 28 days. Three 150 mm × 150 mm × 150 mm cubes are utilised for the compression strength test in line with IS 516 (1959), and three 500 mm × 150 mm prisms and three 150 mm × 300 mm cylinders were employed for the splitting tensile and flexural strength examinations in compliance with IS 5816 (1999) and IS 516 (1959) standards, respectively [35, 36].

3.2.3 Micro Structural Studies

3.2.3.1 XRD analysis The method that is most frequently employed is X-ray diffraction analysis (XRD), which utilises diffraction patterns to identify the phases and structures of compounds present in a material. By using XRD analysis, the various mineral phases and compounds existing in both the source materials and hardened SCGPC samples were detected. Only the optimal hardened concrete samples (100FAG0and 60FAG40) were pulverised using an agate mortar and sieved using an IS 75-micron sieve prior to examination because the raw materials were already in powder form. Using the fifth-generation Rigaku Miniflex 600 and the programme X'Pert High Score Plus, the test and phase identification were carried out.

3.2.3.2 SEM Analysis For improved visibility and image clarity, several polishing cloths and papers were used to polish the broken GGBS blended SCGPC samples. The samples were then given a final polish with diamond polish before being coated with platinum. For this analysis, an EVO MA18 with Oxford EDS(X-act) was used. This piece of equipment is capable of operating from 100 V and 30 kV especially offers a resolution range of 1–4 nm.

3.2.3.3 FTIR Analysis Employing a Perkin Elmer Spectrometer 2000 in transmission mode having an operating frequency range about 4000 cm-1 to 400 cm-1 and a resolution of 4 cm-1, Fourier infrared spectroscopy analysis (FTIR) was utilised to detect the various functional groups of the developed GGBS blended SCGPC samples. The samples were assessed using pellets of potassium bromide (KBr).

4 Results and Discussion

4.1 Fresh SCGPC properties

Due to qualities including ability to pass, ability to fill, and ability to resist segregation, fresh SCGPC is a very workable concrete. Four tests—Slump flow, T_{50cm} Slump flow, V funnel test, U-box and L-box were performed in order to determine the qualities of fresh SCGPC [34]. Table 3 displays the test outcomes for the newly poured GGBS blended SCGPC characteristics.

4.2 Compressive strength

When evaluating the performance as well as the quality of almost any type of concrete, compressive strength is a key characteristic. Figure 6 illustrates the compressive strengths of the GGBS blended SCGPC samples after 7, 14, and 28 days. In the Fig. 6, The graph illustrates how the compressive strength rises as the percentage of GGBS rises. In comparison to the mixes without GGBS, the GGBS blended SCGPC composites with 10, 20, 30, 40, and 50% GGBS of the total binder, respectively, had compressive strengths that were 21, 33, 53, 65, and 49% higher at 28 days. This increase is in line with the prior research investigation [37]. This rise in strength is attributable to the synthesis of Calcium Alumino Silicate Hydrate gel (C-A-S–H gel) along with Sodium Alumino Silicate Hydrate gel (N-A-S–H gel), that increased the microstructure's compactness [38, 39]. The compressive strength graph demonstrates that mix with 40% GGBS, it increases from 35. 79 MPa at three days and then increases up to52.6 MPa at28 days of curing. This outcome

Table 3 Rheological Properties of GGBS blended SCGPC mixes

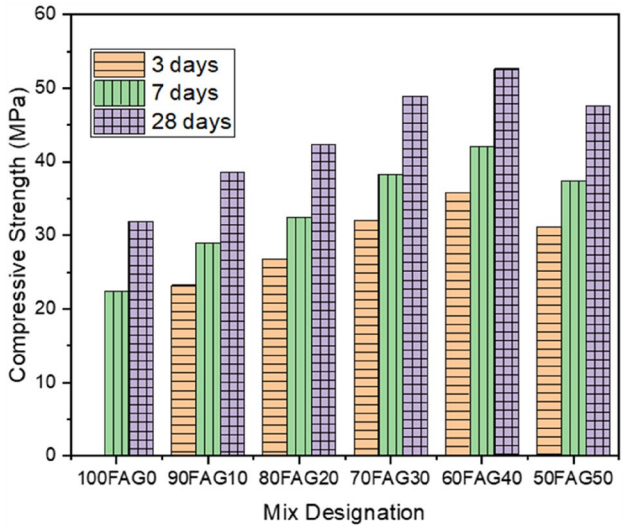

Fig. 6 Compressive strength of SCGPC mixes

is in line with the previous research investigation already in existence [40].

4.3 Split tensile strength

At 28 days, Fig. 7 depicts the outcomes of the splitting tensile strength tests conducted on the GGBS blended SCGPC. The splitting tensile strength of the GGBS blended SCGPC is shown in this graph to be directly proportional to the percentage of GGBS replacement up to 40%. The improvement in splitting tensile strength of GGBS-blend SCGPC mix over flyash-based control SCGPC is roughly 20, 27, 40, 58 and 50% for mixtures of replacement of 10, 20, 30, 40, and 50%, respectively. The outcomes of the splitting tensile assessment support the performance of the compressive strength assessment outcomes.

4.4 Flexure strength test

The outcomes of the flexural strength evaluation for the GGBS blended SCGPC after 28 days after casting are depicted in Fig. 8. The flexural strength of the GGBS blended SCGPC rises as the percentage of GGBS does, as this graph clearly shows. In comparison with the flyash-based control SCGPC mix (100FAG0), the flexural strength of GGBS blended SCGPC mixes of 10, 20, 30, 40, and 50% increased by roughly 16.36, 34.52, 40.47, and 48.21%, respectively. The behaviour of the compressive strength outcomes is enhanced by using the results of the flexural strength evaluation.

4.5 XRD analysis

By using XRD analysis, the mineralogical properties of fly-ash based control SCGPC (100FAG0) and GGBS blended SCGPC incorporated with 40% of GGBS (60FAG40) were inspected after 28 days of healing. Figure 9 displays the XRD pattern. Aluminosilicate substances with an amorphous structure are the primary polymerization products produced in geopolymer (N-A-S–H and C-A-S–H). Thus, a wide amorphous hump of aluminosilicate ($2\Theta = 25°–32°$) and a low crystalline C-S–H gel make up the majority of the 60FAG40 XRD pattern. In fly ash, It is also observed that only the glassy components will react and hence the primary crystalline peak found is quartz (SiO_2) and mullite ($3Al_2O_3$-SiO_2) [41]. Fly ash's reactive glassy fraction and

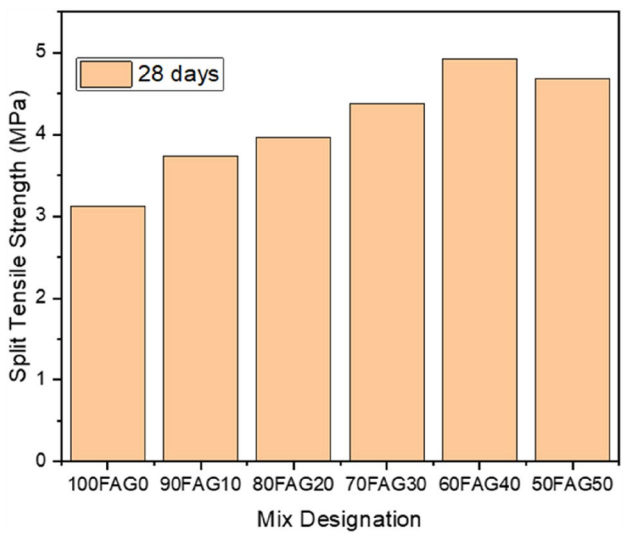

Fig. 7 Splitting tensile strength of SCGPC mixes

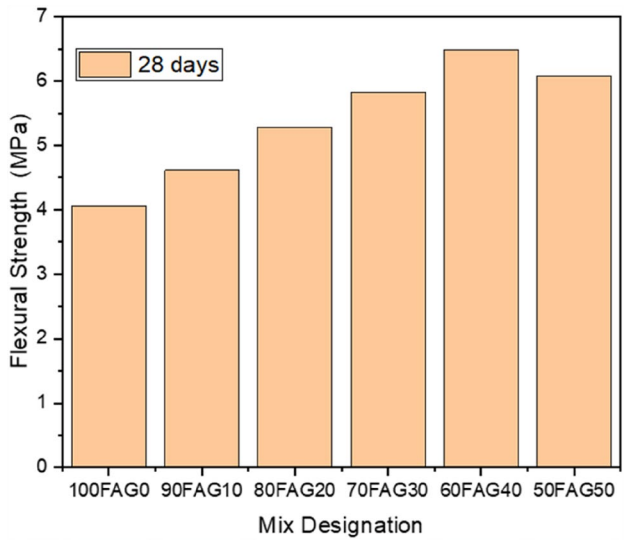

Fig. 8 Flexure strength of SCGPC mixes

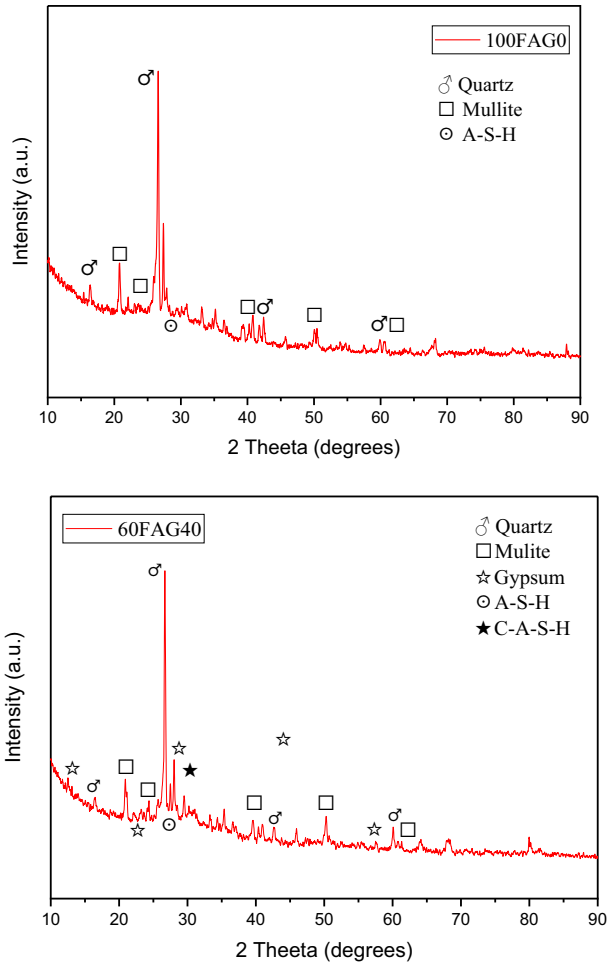

Fig. 9 XRD analysis of SCGPC samples

GGBS reacted to form reaction products that ranged from amorphous to imperfectly crystalline phases. It is crucial to note that only reactive glass participates in geopolymerization, while the fly ash's glass content also includes refractory glass. A wide and dispersed background peak with maximum of around 10° is produced by the hydrotalcite (Mg_6A_{l2}-$CO_3OH_{16}4H_2O$) short-range order which increases C-(N)-A-S–H gel polymerization and a reduction in the available Al element [42, 43].Each sample that included GGBS had detectable peaks at 30° and 50° that belonged to the A-S–H and C-S–H gels. It needs to be noticed that the Peak crystalline phase's intensity reduces as the GGBS increases [44].

4.6 SEM with EDS

Figure 10 displays the SEM images of the control flyash based SCGPC (100FAG0) and the GGBS blended SCGPC with 40% GGBS replacements (60FAG40). The images shown here clearly demonstrate that the mixture of 60% FA and 40% GGBS has a denser microstructure, a matrix that has almost completely reacted, and some cenosphere and plerosphere FA particles that have not yet completely reacted. According to a report, the unreacted particles in the combination did not function as filler but instead gradually increased the matrix's strength alternatively.This is in line with the compression outcomes and the prior literature-reported outcomes [45]. An aluminosilicate gel (N-A-S–H) gets formed when alkali-activation was applied to flyash based control SCGPC (100FAG0). On the other hand, the Calcium ions from GGBS take the place of sodium ions in GGBS mixed SCGPC (60FAG40) with a high pH (> 12), causing C-A-S–H or C-S–H to precipitate till the calcium ions have been used up. Thus, N-A-S–H, C-S–H, and C-A-S–H were identified within the GGBS blended SCGPC (60FAG40) sample [46].The reason why the fly ash particles in Fig. 10 have needle-like shapes is most likely due to the mixture's high activator solution content. This unreacted alkali solution precipitated during the geopolymerization process as minute needle particles in the mixture [47][47].

Based on EDS tests carried out on a selected area in both samples, the primary components of the SCGPC samples, which belong to the N–C-S–H, N-A-S–H, C-S–H, and Mg $(OH)_2$binders type, are Aluminium, silica magnesium, calcium, oxygen, and Sodium. As shoen in Table 5, Higher Si/Al ratios, especially Si/Al > 2.5, are necessary for the creation of 3D networked polysialate- siloxo and polysialatedisiloxo polymers. In addition to calcium and sodium, 3D networks (Ca,K) polysialate-sililoxane also need small quantities of silicon, oxygen, and aluminum. [49].

4.7 FTIR analysis

The FTIR spectra of the 100FAG0 and 60FAG40 mix sample are depicted in Fig. 11. The strong signals seen at 3369and 3432 cm^{-1} in the 100FAG0 and 60FAG40, respectively, are caused by symmetrical bending vibrations of water molecule-associated H–O-H bonds [50]. The C-H groups are responsible for the small bands at 2816 and 2882 cm^{-1} on the spectra of the 100FAG0 and 60FAG40, indicating an existence of organic molecules from super plasticizers [50]. The bands at a distance of 1637–1793 cm^{-1} are also attributable to the stretching and bending vibrations of O–H bonds, which show the water molecules attached to the geopolymer network [51].The efflorescence phenomenon [52], which results from the geopolymerization process between unreacted Na^+ and ambient CO_2, is linked to the splitting of absorption bands in the ranges of 1446–1476 cm^{-1} and 1422–1482 $cm^{-1}$is observed on the 100FAG0 and 60FAG40,respectively. This finding suggests that degenerescency caused by distortion has been eliminated [53]. It is possible that this area may be linked to the silica and

alumina connections (C-A-S–H and N-A-S–H) that drive polymerization during the geopolymerization process [54].

5 Conclusions

In this current research, the impact of GGBS on the flyash based SCGPC's performance in both the fresh, hardened phases and Microstructural properties were examined. The following Results were attained;

- The results showed that up to 40% FA was successfully substituted for GGBS as a precursor binder in SCGPC's producing outstanding fresh and mechanical qualities that satisfied the EFNARC standards for SCC.
- With an increase in GGBS quantity in the binder, the workability of the fresh GGBS blended SCGPC's reduced. The reason for this is mainly due to the calcium reacting more

quickly and to the angular shape of the slag in contrast to the spherical shape of the fly ash particles.

- As compared to control SCGPC (100FAG0), the mix with 40% GGBS blended SCGPC (60FAG40) which does not require heat curing, exhibits the highest compressive strength increased by 40.26 and 33.97%after 7 days and 28 days.
- However, when the GGBS grew from 0 to 50%, both the splitting tensile strength and flexural strength of the GGBS blended SCGPC enhanced by about 33.59 and 31.05%, respectively.
- The results of the XRD-based microstructural analysis of SCGPCs revealed a decrease in the number of crystalline phases when the GGBS content was raised as a partial substitute for Flyash. Consequently, the porosity decreased while the density and C, N-(A)-S–H gel were enhanced.
- As shown by SEM and EDAX analysis, the GGBS increased the degree of polymerization and polycondensation, which subsequently improved the densification of the entire system and increased its strength. Cristobalite and stishovite, which are unreacted FA/GGBS, function as fillers by saturating pore spaces, which raises the packing density of the binder phase.
- When the proportion of GGBS is raised, FTIR data revealed shifts in geopolymer process and the development of C-S–H gel, which enhance the strength qualities.

Sri Venkateswara University College of Engineering, Tirupati, Andhra Pradesh, India

ABSTRACT: Geopolymer technology represents a significant advancement in concrete production, especially in mitigating the environmental concerns that arise from the use of conventional cement materials that emit significant amounts of CO_2. By substituting cement with alternative ingredients such as Fly ash and Ground Granulated Blast Furnace slag (GGBFS), a more environmentally friendly approach is possible. Geopolymer concrete, utilizing a synthetic resin binder that reacts with alkaline solutions like sodium hydroxide and sodium silicate, emerges as a viable alternative. This project aims to enhance the properties of fly ash and slag-based Geopolymer concrete by incorporating composite fibers. It seeks to investigate the effects of Crimped steel, Polypropylene, and Glass fibers on the compressive, split tensile, and flexural strength of Geopolymer concrete. By introducing varying proportions of fibers, ranging from 0.5% to 1.5% of the concrete volume, the study intends to determine their impact on the mechanical properties of concrete. These investigative efforts hold significant potential for broadening the application of Geopolymer concrete, providing an efficient alternative to traditional cement concrete for a wide range of construction applications.

***Key words*: Crimped steel fibers, Fly ash, Geopolymer concrete, Ground Granulated Blast Furnace Slag (GGBFS), Glass fibers, Polypropylene fibers, Sodium silicate, Sodium hydroxide.**

I. INTRODUCTION

Concrete, a fundamental material in global construction, relies heavily on cement. However, cement production contributes significantly to greenhouse gas emissions. To address this, researchers have explored alternative binding materials, including non-crystalline alkali-aluminosilicate geopolymers. Geopolymer concrete, made from byproduct waste, reduces direct carbon dioxide emissions during production. Geopolymer concrete is an innovative alternative to traditional cement-based concrete, where pozzolanic materials rich in silica and alumina, such as fly ash or blast furnace slag, are activated by alkaline liquids to act as binders. This substitution reduces the carbon footprint of concrete production. Geopolymerization, the chemical process behind geopolymer concrete, involves exposing alumina-silicate materials to high-alkaline environments, typically sodium or potassium hydroxide solutions. This results in the formation of a strong binder characterized by a Si-O-Al structure. The reaction involves breaking valency bonds between silicon, aluminium, and oxygen atoms, leading to the formation of three-dimensional polymeric chains and ring structures. Alkaline cations like sodium and potassium compensate for charge imbalances caused by aluminium in the gel product. The rate of dissolution and the resulting properties of geopolymers are influenced by factors such as the quantity and content of materials used and the pH of the activating solution. Geopolymer concrete utilizes thermally activated natural resources or industrial by-products as sources of silicon and aluminium. Despite its advantages, geopolymer concrete exhibits brittleness. To overcome this limitation, we turn to fibers. By reinforcing geopolymer concrete with fibers, we aim to enhance its toughness, durability, and applicability across a wide range of construction scenarios. This review sheds light on the promising future of fibre-reinforced geopolymer concrete and emphasizes the need for standardized manufacturing processes.

The objective of this journal paper is to present the results of an experimental investigation on Geopolymer concrete, formulated using fly ash and Ground Granulated Blast Furnace Slag (GGBFS), along with sodium silicate, sodium hydroxide, crimped steel fibers, polypropylene fibers, glass fibers, and a chemical admixture. Specifically, the study utilizes the PCE-based super plasticizer AURAMIX 450 to achieve the desired properties of Geopolymer concrete. The chemical admixture is dosed at 1.4% by weight of binder content based on a trial method, while maintaining a constant water-to-binder ratio of 0.45. The mix design and proportioning of ingredients for the Geopolymer concrete involve maintaining a fixed ratio of 2 for sodium silicate and sodium hydroxide, along with the use of a 12M alkaline solution. The mechanical properties under investigation include compressive strength, split tensile strength, and flexural strength of the concrete specimens. To further enhance the mechanical properties and observe changes, crimped steel fibers, polypropylene fibers, and glass fibers are added in varying percentages (0%, 0.5%, 0.75%, and 1%) collectively. This addition aims to investigate the effects of fiber reinforcement on the Geopolymer concrete's performance. By systematically varying the fiber content and assessing the resulting mechanical properties, the study aims to provide insights into the optimization of Geopolymer concrete formulations for enhanced performance and durability in various engineering applications.

II. OBJECTIVES

The following are the objectives of this experimental investigation:

1. To find the optimum percentage of Steel fibers in developing the strength of the Geopolymer concrete and to mitigate the brittleness of GPC
2. To develop the strength of Geopolymer concrete using Steel fibers and Polypropylene fibers in various percentages from the optimum percentage of Steel fibers and to observe the changes in properties of GPC.
3. To develop the strength of Geopolymer concrete using Steel fibers and Glass fibers in various percentages from the optimum percentage of Steel fibers and to observe the changes in properties of GPC.
4. To determine the mechanical properties of Geopolymer concrete such as compressive strength, split tensile strength and flexural strength by the addition of various percentages of fibers in Geopolymer concrete.
5. To compare the properties of Geopolymer concrete with fibers and without fibers.

III. MATERIALS

In this experimental investigation the following materials are used

3.1 Fly Ash

Fly ash, derived from the combustion of pulverized coal in coal-fired thermal power plants, is a by-product extensively utilized in hydraulic-cement concrete. Class F fly ash, specifically chosen for this experimental investigation, possesses a specific gravity of 2.12.

3.2 Ground Granulated Blast Furnace Slag (GGBFS)

Ground Granulated Blast Furnace Slag (GGBS) is a by-product of the iron-making process in blast furnaces. With a specific gravity ranging between 2.80 and 3.00, slag holds the distinction of having the highest specific gravity among all mineral admixtures. As a processed material, its fineness can be finely adjusted to meet specific requirements. In numerous applications, the fineness of slag closely resembles that of cement. GGBS primarily consists of calcium silicates and alumino-silicates. Its specific gravity is measured at 2.9.

3.3 Fine Aggregate

River sand sourced locally, adhering to the IS: 383-1970 specifications, was utilized as the fine aggregate in the concrete mix. The sand particles pass through a 4.75mm sieve and are retained on a 75µm sieve. Table 3.1 provides details regarding the physical properties of the fine aggregate.

Table 3.1: Physical properties of Fine aggregate

Particulars	Values
Specific gravity	2.58
Fineness modulus	3.15
Grading	Zone II

3.4 Coarse aggregate

For this investigation, well-graded coarse aggregate consistent with the specifications outlined in IS: 383-2016 will be utilized. The coarse aggregate, sourced from local quarry units and conforming to IS: 383-1970 standards, has been selected for this study. The maximum size of the coarse aggregate employed is 12.5mm. The physical properties of the coarse aggregate are detailed in Table 3.2.

Table 3.2: Physical properties of Coarse aggregate

Particulars	Values
Specific gravity	2.60
Fineness modulus	6.30
Water absorption (%)	0.72

3.5 Sodium Hydroxide Flakes

Sodium hydroxide (NaOH) is commonly available in solid forms such as pellets or flakes. Its price varies based on purity. Solutions of NaOH are prepared by dissolving pellets in water to achieve different molarities. It is advised to prepare the NaOH solution at least 24 hours before use and to use it within 36 hours to prevent it from solidifying.

3.6 Sodium Silicate

Sodium metasilicate, also referred to as sodium silicate, is an industrial-grade compound containing 31.12% SiO_2 and 14.2% Na_2O by mass. Manufacturers commonly utilize it as a bonding agent in detergent and textile industries. Sodium silicate is typically found in liquid form.

3.7 Chemical Admixture

Polycarboxylate ether (PCE) based superplasticiser AURAMIX 450 was used.

3.8 Crimped steel fibers

In this study, crimped steel fibers with a length of 35mm and a diameter of 0.5mm are utilized, resulting in an aspect ratio of 70.

3.9 Polypropylene fiber

In this study, FIBERCRETE MF, a synthetic monofilament fiber is used. Polypropylene fibers with a length of 12mm and a diameter of 0.02 mm are utilized, resulting in an aspect ratio of 600.

3.10 Glass fibers

In this study, glass fibers with a length of 12mm and a diameter of 0.014mm are utilized, resulting in an aspect ratio of 857.

IV. EXPERIMENTAL INVESTIGATION

4.1 Mix proportions

In this experimental investigation, the binder content, obtained from a mix design referenced in prior literature, is 496 kg/m^3. This composition consists of 80% fly ash and 20% GGBFS. For the 12M solution, the NaOH content is measured at 74.5 kg/m^3, while the Na_2SiO_3 content is taken as 149 kg/m^3. To achieve the desired fresh properties of Geopolymer concrete, a water-to-binder ratio of 0.45 is selected, alongside a chemical admixture dosage of 1.4% by weight of the binder content, determined through trials. The study assesses the impact of crimped steel fibers on Geopolymer concrete, identifying the optimal percentage, and then explores substitutions with glass and polypropylene fibers at varying proportions of 0.5%, 0.75%, and 1% by weight of the binder content. Table 6 summarizes the concrete mixture proportions for Geopolymer concrete.

Table 6: Mix proportions of Geopolymer concrete addition with percentage of Crimped Steel fibers, Polypropylene fibers &Glass fibers

4.2 Mix procedure

For the experimental investigation, materials such as fly ash, GGBS, aggregates, sodium silicate, and sodium hydroxide are procured and tested to determine the properties such as specific gravity and water absorption. Mix design for Geopolymer concrete (GPC) is done, considering the desired proportions of the materials. Additionally, different volumes of fibers are incorporated into the mix to assess their impact on the concrete's performance. Following the mix design, concrete samples in the form of cubes, cylinders, and prisms are casted and cured for 24 hours before demolding. Subsequently, the specimens undergo an air-curing process at ambient temperature for durations of 7, 28, and 56 days to facilitate concrete strength development. Mechanical properties including compressive strength, split tensile strength, and flexural strength are then determined at the designated curing ages of 7, 28, and 56 days to analyze the performance of the Geopolymer concrete specimens.

4.3 Test procedure on Hardened concrete

The following tests are conducted to find the mechanical properties on hardened concrete:

Compressive Strength: The compressive strength of Geopolymer concrete is determined by casting the specimens of size 100*100*100mm. These samples undergo testing at ages of 7, 28, and 56 days using a compressive testing machine (CTM) with a capacity of 3000kN, as per IS 516:1959, as shown in Fig 1a.

Split Tensile Strength: The split tensile strength of Geopolymer concrete is determined by casting the cylinders of size 100*200mm. These samples undergo testing at 28 days using a compressive testing machine (CTM) with a capacity of 3000kN, as per IS 516:1959, as shown in Fig 1b.

Flexural Strength: The flexural strength of Geopolymer concrete is determined by casting the beam specimens of size 100*100*500mm. These samples undergo testing at 28 days, as per IS 516:1959, as shown in Fig 1c.

Fig. 1a Compression test

Fig. 1b Split tensile

Fig. 1c Flexure test

V. RESULTS AND DISCUSSION

5.1 Mechanical properties of Geopolymer concrete:

The following are the test results of compressive, split tensile and flexural strength tests to determine the mechanical properties of Geopolymer concrete.

5.1.1 Compressive strength test

Figure 2 illustrates the compressive strength variations of Geopolymer concrete mixes denoted as M1 to M9, each incorporating different types of fibers including crimped steel, polypropylene, and glass fibers. For the control mix (M1), the compressive strength at 7, 28, and 56 days was determined as 34.88, 39.15, and 40.8 N/mm^2, respectively. Upon introducing crimped steel fibers in mix M2, a notable increase in strength was observed compared to the control mix. Of note, mixes M2 and M8 exhibit nearly equal compressive strengths. This suggests that the combination of steel and glass fibers in mix M8 yields a compressive strength similar to that achieved with crimped steel fibers alone.

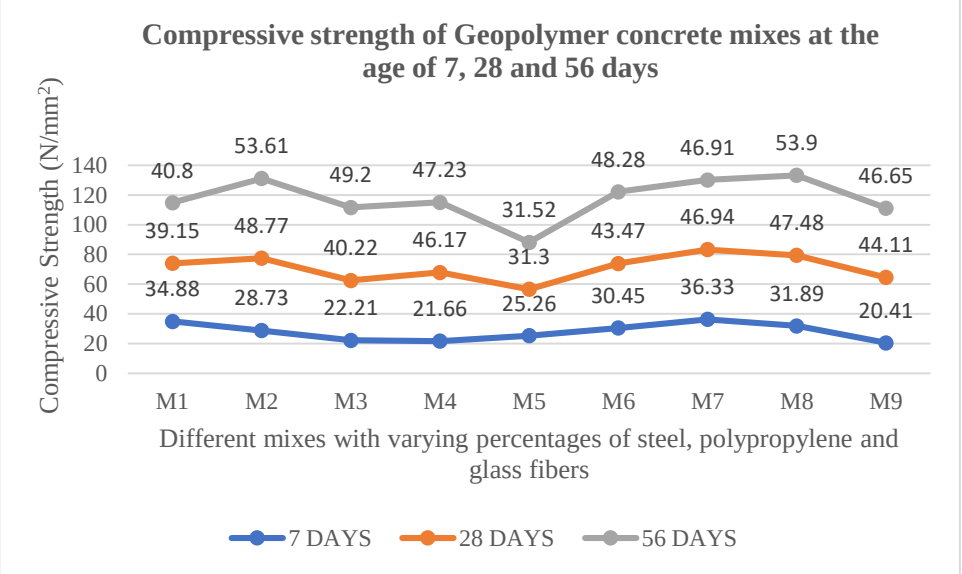

Fig. 2 Variation compressive strength of different mixes

5.1.2 Split tensile strength test

Figure 3 displays the split tensile strength variations of Geopolymer concrete mixes denoted as M1 to M9, incorporating different types of fibers such as crimped steel, polypropylene, and glass fibers. For the control mix, denoted as M1, the 28-day split tensile strength was recorded as 1.705N/mm^2. With the addition of 1.5% crimped steel fibers (the optimum percentage), this strength increased to 4.605 N/mm^2 in mix M2. Remarkably, mix M8 exhibits a split tensile strength similar to that of mix M2. This suggests that the combination of steel and glass fibers in mix M8 yields a split tensile strength comparable to that achieved with crimped steel fibers alone.

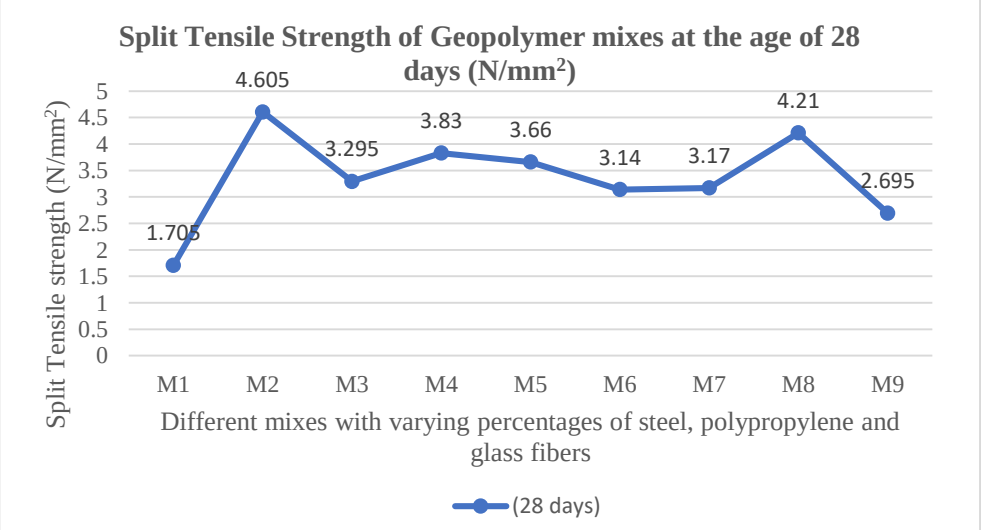

Fig. 3 Variation Split tensile strength of different mixes

5.1.3 Flexural strength test

Figure 4 displays the flexural strength variations of Geopolymer concrete mixes denoted as M1 to M9, incorporating different types of fibers such as crimped steel, polypropylene, and glass fibers. For the control mix, denoted as M1, the 28-day flexural strength was recorded as 4.27 N/mm^2. With the addition of 1.5% crimped steel fibers (the optimum percentage), this strength increased to 6.69 N/mm^2 in mix M2. Remarkably, mix M8 exhibits a flexural strength similar to that of mix M2. This suggests that the combination of steel and glass fibers in mix M8 yields a flexural strength comparable to that achieved with crimped steel fibers alone.

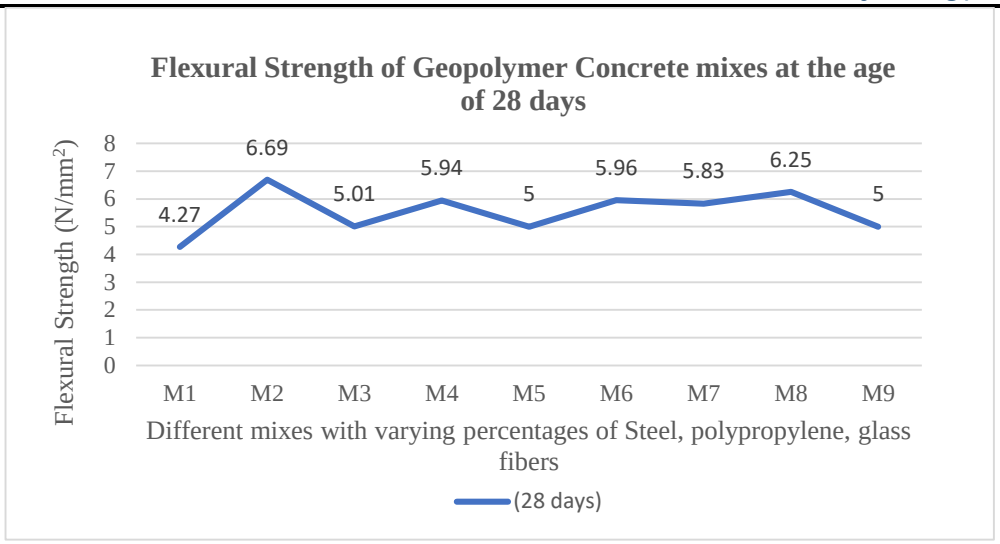

Fig. 4 Variation Flexural strength of different mixes

VI. CONCLUSIONS

In this research work, nine different mixes of Geopolymer concrete were considered to investigate their strength characteristics, including compressive strength, flexural strength, and split tensile strength, with the incorporation of various fiber types such as crimped steel, polypropylene, and glass fibers.

1. The partial replacement of 20% GGBFS in the Geopolymer concrete mixture effectively mitigates setting delays, particularly during air curing at ambient temperatures.
2. Through experimental analysis, a Geopolymer concrete mix design with a liquid binder ratio of 0.45 and an alkaline solution ratio of 2 was identified, exhibiting desirable strength properties and advantageous environmental and economic benefits.
3. Cube compressive strength assessments revealed that mixes M1 and M2, augmented with crimped steel fibers, demonstrated increased strength at 28 and 56 days, with values escalating from 39.15 MPa to 48.77 N/mm^2 and from 40.8 N/mm^2 to 53.69 N/mm^2, respectively. Optimal performance was achieved with a 1.5% addition of crimped steel fibers. Similar strength outcomes were observed in mix M8, which featured a combination of 0.5% crimped steel and 1% glass fibers.
4. Split tensile strength evaluations exhibited a similar trend, with mixes M1 and M2 registering enhancements from 1.705 N/mm^2 to 4.605 N/mm^2 at 28 days upon the incorporation of crimped steel fibers. The optimal mix again featured a 1.5% addition of these fibers, with mix M8 showing comparable results due to the combination of 0.5% crimped steel and 1% glass fibers.
5. Flexural strength assessments followed suit, with mixes M1 and M2 displaying increases from 4.27 N/mm^2 to 6.69 N/mm^2 at 28 days with the inclusion of crimped steel fibers. The optimal mix was identified at a 1.5% addition of crimped steel fibers, mirroring the results of mix M8, which combined 0.5% crimped steel and 1% glass fibers.
6. The overall analysis suggests that Geopolymer concrete incorporating 1.5% crimped steel fibers achieves optimal strength performance. Additionally, composite fiber mixes, particularly those combining steel and glass fibers, exhibit superior performance compared to combinations of steel and polypropylene fibers.
7. Despite the enhanced strength provided by steel fibers, their weight and cost implications prompt consideration of alternatives. Replacement of 1% steel fibers with glass fibers yields lighter, more cost-effective Geopolymer concrete with strength levels approaching those of Geopolymer concrete with optimal steel fiber content.

Application of Preformed Floc Adsorbents in the Removal of Acid Dye from an Aqueous Solution

Preformed flocs prepared by using coagulants, i.e. $Fe_2(SO_4)_3$, $MnSO_4.4H_2O$, and $MnCl_2.4H_2O$, were applied as adsorbents for the decolorization of an aqueous C.I. Acid Red 1 dye solution. In order to determine the decolorizing efficiency of different adsorbents, kinetic and equilibrium studies were carried out at the optimum pH. Excellent color removal of 87 % was obtained with $Fe_2(SO_4)_3$ at pH 4, good color removal of 65 % was achieved with manganese sulfate at pH 10, and moderate color removal of 58 % was obtained with manganese chloride at pH 10, at an optimum sorbent dose of 500 mg L^{-1} and an equilibrium contact time of 15 min. The sorption data of the equilibrium studies fitted well to the Langmuir isotherm, stating the occurrence of monolayer formation in the adsorption process of dye color removal. The maximum adsorption capacities of ferric sulfate and manganese sulfate are 47.619 and 23.474 mg g^{-1}, respectively. The data of the kinetic studies fitted well to the pseudo-second-order equation, stating that chemisorption is the rate-limiting step.

1 Introduction

Dyes are used in many industries, such as in textile, paper pulp, tannery, cosmetics, leather, plastics, printing, rubber, food, and pharmaceuticals production [1–5]. Dyes are aromatic amines with different types of organic functional groups and with heavy metals embodied in the basic structure, like chromium, copper, and cobalt [6]. The presence of such metals retards biological treatment. Their discharge into water bodies causes pollution due to their recalcitrant nature. The toxicity of dyes causes serious problems for the environment, aquatic life, and human and animal health [7].

The presence of coloring matter in significant quantities in receiving water would not only reduce light penetration and photosynthetic activity, but would also render their appearance unaesthetic [8, 9]. Furthermore dyes may impart toxicity to aquatic and plant biota and may be mutagenic and carcinogenic, causing severe damage to human life, such as misfunctioning of the kidneys, brain, liver, reproductive system, and central nervous system [10]. A majority of the used dyes are azo dyes, which are bright in color due to the presence of one or several azo (–N=N–) groups associated with substituted aromatic structures [11–13], and consist of more stable organic compounds that are carcinogenic, also causing allergic responses after exposure to them [7]. Therefore, it becomes mandatory that color should be removed from dye effluents before disposal of the effluent. Treatment processes such as physical, physicochemical, chemical, and biological methods have been investigated and proved to be effective, but to varying degrees of success [14]. Michaels and White [15] observed that treatment through biological methods cannot reduce the chemical oxygen demand (COD) and color, even though it reduces the biochemical oxygen demand (BOD). Chemical coagulation seems to be a very efficient method in the removal of color from dye wastewater [14, 16–19]. Coagulation and flocculation of the inorganic coagulants such as ferric sulfate, manganese sulfate, alum, and iron salts have been used in the decolorization of dye color over many years. But the main disadvantages of coagulation treatment are the process control and the sludge production, for which settling, dewatering, and converting to a cake for land filling is needed [20]. Among different methods, the adsorption process has good potential in removing dyes from effluents, due to its simplicity of design, ease of operation, wide adaptability, high efficiency, and economic viability [21]. The adsorption process produces good-quality effluent and it is

Abstract:
Nickel polluted wastewater is directly or indirectly discharged into the environment increasingly, especially in developing countries. It is difficult to remove nickel from wastewater using conventional methods. Efficient method like advanced oxidation process is an important breakthrough in the removal of nickel. This method is referred to as ultrasound assisted advanced oxidation process in the removal of nickel. This study investigated the use of Hydrogen peroxide, Fenton Reagent, ultrasound homogenously and heterogeneously. The removal efficiency of homogenous process and heterogenous process along with the process parameters like concentration of oxidant, effect of pH, Optimum dosage of Oxidants and time taken were investigated. Results indicated that removal efficiency is strongly dependent on the optimal pH and the dose of the oxidant. All the oxidants can removal nickel effectively from the wastewater but the maximum removal which provides desirable nickel quantity after treatment was obtained by heterogenous processes. At optimal pH:11Fenton reagent and Ultrasound process in combination with Hydrogen peroxide and Fenton reagent has shown 98%, 100% and 100% removal respectively.

I. Introduction

Growing industrial development is leading to the production of contaminants that are seriously threatening the ecosystem and the contamination of water resources has been a worldwide environment problem. Heavy metals are the elements having atomic weights between 63.5 and 200.6 and specific gravity greater than 5 which are non bio-degradable. Toxic heavy metals of particular concern in treatment of industrial wastewater include copper, zinc, nickel, mercury, cadmium, lead and chromium. Among these different heavy metals, nickel is extensively utilized in the modern industry.

The tolerance limit of nickel in drinking water is 0.01 mg/L, and for industrial wastewater it is 2.0 mg/L. However, effluents of different industries contain higher concentrations of nickel than its acceptable limit. Nickel is well known heavy metal pollutant, which is present in effluents of electroplating industries to the tune of 20 – 200 ppm (Piyush kant pandey et al., 2007).

The intake of nickel in considerable concentrations may cause formation of free radicals in body tissue which leads to various DNA complications, serious lung and kidney problems, gastrointestinal distress, pulmonary fibrosis, headache, dizziness, dry cough, vomiting, extreme weakness, and direct exposition to nickel cause skin dermatites. So it is very essential to remove Nickel from soil, industrial wastewater and effluents.

Generally, the nickel wastewater is amenable to physical, chemical and biological treatment but is inefficient and involves high cost in removal of nickel. In this sense, procedure known as Advanced Oxidation Process (AOP) are being studied and applied to mineralize non-biodegradable organic compounds or oxidize bio degradable compounds, that converts them completely into CO_2 and H_2O (Hoffman et al., 1995). Advanced Oxidation Process (AOP) is defined as aqueous phase oxidation processes which are based primarily on the intermediacy of the hydroxyl radicals in the mechanism resulting in the destruction of target pollutant (Poulopoulos et al., 2006).

In the present work, synthetic nickel wastewater was prepared by Nickel Ammonium Sulphate for the concentration of 200 mg/L and was treated by Advanced Oxidation Process (AOP). The processes were carried out with Hydrogen Peroxide (H_2O_2), Fenton Reagent, and Ultrasound and with a combination of US + H_2O_2 and US + Fenton Reagent Further removal of nickel has been studied. Various process parameters like concentration of oxidant, effect of pH, Optimum dosage of Oxidants and time taken were investigated.

Effect of Fly ash & Microbes on Strength properties of Subgrade soil for Pavements

Thokalapudi Suresh, K.Bhavitha,Ch.Sudharani*

Department of Civil Engineering Sri Venkateswara University College of Engineering India-517501

**Corresponding author: sudhagowtham@gmail.com*

Abstract: This work investigates the utilization of microbial-induced calcite precipitation (MICP) treatment to improve the stability of soil by introducing Class F fly ash and Bacillus subtilis microbes. Various experiments were carried out using soil that was readily available in the vicinity area. The primary tasks consisted of mixing fly ash and subsequently utilizing varying quantities of fly-ash. The experiment involved the incorporation of fly ash at varying ratios, specifically 5%, 10%, 15%, 20%, 25%, and 30%.The soil's characteristics are influenced by the presence of fly ash, as evidenced by the following tests: reduction in liquid limit, increase in UCC and CBR values, analysis of soil compaction under high pressure, measurement of unconfined compressive strength (UCC) at various time intervals (0, 3, 7, 14, and 21 days), and assessment of California bearing ratio (CBR) for soil samples with varying amounts of fly ash. The most favorable results are obtained by integrating 25% fly ash into the soil, surpassing all other quantities. Following the introduction of Bacillus subtilis C4nc8 bacteria, the OMC is blended with a mixture consisting of 25% fly ash and soil. In addition, it is shown that the optimal values for CBR (2.2 times higher than that of soil) and UCC (6.5 times higher than that of pure soil) are attained by blending soil with 25% fly ash and microorganisms. Ultimately, the addition of soil, 25% fly ash, and microorganisms has been discovered to significantly improve the CBR strength of the subgrade.

Abstract. Soil stabilization is critical in civil infrastructure, acting as a cornerstone for sustainable and resilient building practices. It enables the construction of strong foundations capable of withstanding enormous loads and adverse conditions, assuring the safety and lifespan of structures such as buildings and roads. The utilization of industrial by products for enhancing the qualities of locally expanding soils has become increasingly popular, mostly due to its low carbon emissions and cost-effectiveness. The present investigation focused on the effect of the addition of Ground Granulated Blast furnace Slag (GGBS) and Geopolymer solution to expansive soil in order to reduce the erosion of slopes. Unconfined compressive strength tests were performed and found that 10% GGBS is the optimum amount for stabilization. SEM studies were conducted to know the microstructure before and after stabilization. The study determined that the rate of rainfall erosion on the stabilized slope was lower compared to the untreated soil, and the load-carrying capacity of the stabilized slope was much greater.

Keywords: Geopolymer Stabilization; GGBS; SEM; Physical Model; Slopes.

1.0 Introduction

Soils that show volumetric variations due to fluctuations in their moisture content are commonly known as expansive soils. The observed behaviour of swelling when exposed to moisture and shrinking when subjected to drying is commonly attributed to seasonal variations in moisture levels. Various parameters, including mineralogy, fabric structure, moisture content, density, and loading circumstances, impact expansive soils volume instability. Nevertheless, the main contributing factor can be attributed to minerals such as montmorillonite [1]. In the montmorillonite structure, the oxygen and hydroxyl groups at the tips of the tetrahedra are shared with the octahedral sheet, forming a monolayer. The rapid infiltration of water and exchangeable cations into the structure, leading to the separation of primary layers, is attributed to the charge shortfall inside the structure and weaker Vander Waals bonds between succeeding silica sheets [2]. Hence, the propensity of soil rich in montmorillonite to retain moisture renders it more susceptible to swelling. Correspondingly, as the water undergoes evaporation, it is susceptible to significant contraction, resulting in observable settlement and shrinkage.

Expansive soils demonstrate significant volumetric expansion and contraction in response to variations in seasonal moisture levels. The challenges associated with the variation in volume of global entities have garnered significant attention [3-5]. Moreover, expansive soils pose significant structural and geotechnical difficulties in various tough scenarios across the globe. Soil deformations, namely

Abstract

Expansive soils pose serious issues because to their insufficient bearing capacity and trivial deformation characteristics. These soils must be made suitable for engineering projects by soil improvement in the present scenario due to non availability of appropriate sites. The addition of industrial by products to locally expansive soils has gained popularity due to low carbon emissions and low incurring cost for improving soil properties. At present excellent bonding properties of geopolymers have been recognised as superior sustainable Alkali activated binders for soil stabilization. The paper discusses the effect of addition of Ground Granulated Blast furnace Slag(GGBS) with Geopolymer in combination to a selected high expansive nature soil properties varying GGBS proportions from 5% to 20% and Geopolymer solution from 0.6 Molarity to 1.0 Molarity (0.6M to 1.0M). Series of tests were conducted for Plasticity characteristics, Compaction characteristics, Unconfined Compressive strength test and Consolidation characteristics. From the test results optimum amount of GGBS is 10% and Geopolymer is 1.0M, at this

ABSTRACT

Expansive soils challenge the stability of several civil engineering structures. Because of the presence of Montmorillonite clay mineral, they have the inherent property of swelling and shrinking upon wetting and drying. Researchers proposed several ground improvement and foundation techniques to enchase the properties of these soils. Cushion materials, particularly Cohesive Non– Swelling (CNS) cushions, attracted the attention of civil engineers due to their simplicity and long-term stability. To avoid the problem of the non-availability of required soil, a technique is presented in this study to convert local expansive soils into suitable CNS materials via chemical stabilisation. The study uses clayey sand from the Tirupati region of Andhra Pradesh. Admixtures such as fly ash and lime chemically modify native soils into CNS materials. The effectiveness of these prepared CNS materials in reducing expansive soil heave is investigated using model test tanks. SEM and XRD analyses are also used to determine changes in soil microstructure. According to the findings, 5% lime and 20% fly ash are optimal for preparing CNS material. The microstructure of the stabilised soil revealed the formation of cementation compounds, which improved the strength of the native soil stabilization using fly ash.

1. Introduction

The Due to a lack of fulfilling the required geotechnical qualities, utilizing locally accessible soil as a construction material is not always appropriate. Several additions have been considered for modifying the geotechnical qualities of inappropriate soils to match specific needs, a process known as soil stabilization . Preloading, vertical drainage, reinforcing materials, and mechanical stabilization are among the techniques. However, increasing soil qualities with industrial byproducts such as fly ash, steel slag, and rice husk is gaining favor because it is both cost- effective and reduces waste disposal regions . On the other hand, the majority of India is covered with expansive soil, which undergoes significant volumetric variations according to the water content of the soil . These soils create a worldwide problem that civil engineers must address. Pavements, roads, building foundations, embankments, and canals constructed with these soils are susceptible to cracking or rusting. Large soil deposits are found in the world's arid and semiarid regions. If annual evaporation surpasses annual precipitation at a particular place, expansive soils expand and contract as water evaporates from the surface. The anomalous behaviour is due to the existence of Montmorillonite.

In addition, growing urban sprawl has reduced the availability of appropriate land. Therefore, it will be required to frequently assess inappropriate land sites, for construction projects. Diverse researchers conducted analyses to determine a safe and cost-effective construction method for these sites. These techniques include surcharge application, soil replacement, physical and chemical change of the soil minerals use of cohesive, non-swelling soil cushion materials (CNS). Among the numerous remedial strategies, CNS was the most effective in accommodating the expansive soils' uplift. Prof. R. K. Katti designed and implemented the CNS layer approach as a nicotine alternative to the conventional sand cushion technique . According to him, the Saturation of expansive soils causes the formation of cohesive forces up to a depth of approximately 1 to 1.2 m, which counteract heave. This approach is utilized extensively in India, particularly for river valley projects. S. Oruh and O. N. Ergun looked into the safe and effective way to get rid of zinc waste leachate using fly ash, phosphogypsum, and red mud as lining materials . According to the

Abstract
Mineralogical identification of clay minerals is essential as clays exhibit different degrees of expansivity based on the minerals present. Montmorillonite clays have high swelling and shrinkage characteristics, followed by Illite and Kaolinite. The presence of such clays affects the stability of the foundation and thus the structure as a whole. Therefore, the geotechnical engineer has to ascertained the presence of expansive clays before design foundation system. XRD and differential thermal analysis are intricate and expensive techniques for identifying clay minerals. Identifying the clay minerals with the help of their index properties is an indirect and inexpensive approach. In machine learning, classification is a predictive modelling problem. The current study examines the suitability of liquid limit and plastic limit/plasticity index as input features for eight classification models viz. Logistic Regression, K Nearest Neighbourhood, Support Vector Machine, Naive Byes, Decision Tree, Random Forest, XG Boost and Artificial Neural Networks. Scikit learning libraries are used for classification models in Python. K-fold cross-validation is used for each classification model to evaluate the training set and accuracy score, and ROC curves evaluate test data performance. The current study found that Montmorillonite clays can be classified with the highest degree of accuracy, followed by Kaolinite and Illite.

Keywords Kaolinite · Illite · Montmorillonite · Classification

Introduction

Majority of clays have Kaolinite, Illite and Montmorillonite as minerals in them. Swelling and shrinkage characteristic of clays are very much dependent on dominant clay minerals present. Expansive soil is typically defined as any soil whose volume variations are moisture sensitive. Due to their adverse effects on the stability of the buildings they support, expansive soils are viewed as problematic (Asuri & Keshavamurthy, 2016). The study of the physico-chemical behaviour of the soils has indicated that clays having Montmorillonite are more expansive followed by Illite and Kaolinite. X-ray diffraction, differential thermal analysis, scanning electron microscopy etc. are promising technics to establish clay minerology. However, for the purpose of soil investigation from geotechnical engineering applications these methods are unfeasible as not many geotechnical labs equipped with these facilities, also such investigations demand skilled workforce.

Many researchers and codes have come up with degree of expansivity of clays by experimental results of index properties such as liquid limit, plastic limit, shrinkage limit, free swelling index and free swelling ratio. Chen and Snethan et al. have suggested liquid limit ranges and the corresponding swelling potential. Holtz and Gibs and Chen have labelled four swelling potentials viz. Low, Medium, High and Very high based on plasticity index. Based on the shrinkage limit, Holtz and Gibbs and Altmeyer have recommended volume changes for expansive soils. Considering percent clay size fraction, Chen and Holtz and Gibbs have proposed four degrees of expansivity for clayey soils. Sridharan and Prakash have suggested clay type, swell potential and dominant clay mineral type based on free swell ratio. Cation exchange capacity, total surface area are also quite instrumental in identifying the clay minerals. Therefore, every clay mineral is a function of Atterberg limits,

percentage clay fraction, cation exchange capacity and total surface area. Identification of clay minerals can also be carried out with these test results with a reasonably good accuracy rather than more sophisticated tests such as X-Ray diffraction, scanning electron microscope etc. The most challenging part of identifying the clay minerals with the help of index properties is, there is no standard procedure established for this purpose.

Machine learning is a subset of artificial intelligence that focuses on the development of adaptive computing systems that can enhance their performance through the use of experience-based data. (Jasmina Dj et al., 2017). The three types of machine learning algorithms are supervised, unsupervised, and reinforcement learning. The task of developing a capacity from the prepared knowledge is referred to as supervised learning. The preparation information comprises of a lot of perceptions together with its result. Supervised learning can be further separated into classification and regression. Classification methods are utilized to foresee categorical values and Regression methods are utilized to anticipate numerical qualities (Johnson et al., 2019).

Medical research, medication design, astronomy, atmospheric science, agronomy, manufacturing, telecommunications, marketing, business decision making, image processing, traffic design, and road safety are all examples of where classification algorithms are applied.

In the present study, all the eight classification algorithms viz. (1) Logistic Regression (LR), (2) K Nearest Neighbourhood (KNN), (3) Support Vector Machine (SVM), (4) Naive Bayes (NB), (5) Decision Tree (DT), (6) Random Forest (RF), (7) XG Boost (XGB), (8) Artificial Neural Networks (ANN) are applied on the three types of clay sample data collected from various reputed journals viz. Kaolinite, Montmorillonite and Illite with input features liquid limit, plastic limit/plasticity index for the prediction of clay mineral present.

The two main objectives of present work are as follows:

1. To check suitability of liquid limit & plastic limit (also plasticity index) data for classifying clays based on mineralogical composition.
2. To identify appropriate classification model useful in identification clays minerals.

Collection of data

The soil property data of three types of clays considered in the current study viz. Kaolinite, Illite and Montmorillonite is obtained from 152 research articles published in more than 15 reputed journals and a couple of conferences. All the journals have substantiated their claims on mineralogical composition of clays with XRD and other investigation reports.

In the present study the 175 sample data of Kaolinite, 117 sample data of Illite and 192 sample data of Montmorillonite clays accounting to 484 are considered. Liquid limit and plastic limit values for the three types of clays considered are shown in the three independent plasticity charts as shown in the Figs. 1, 2, and 3.

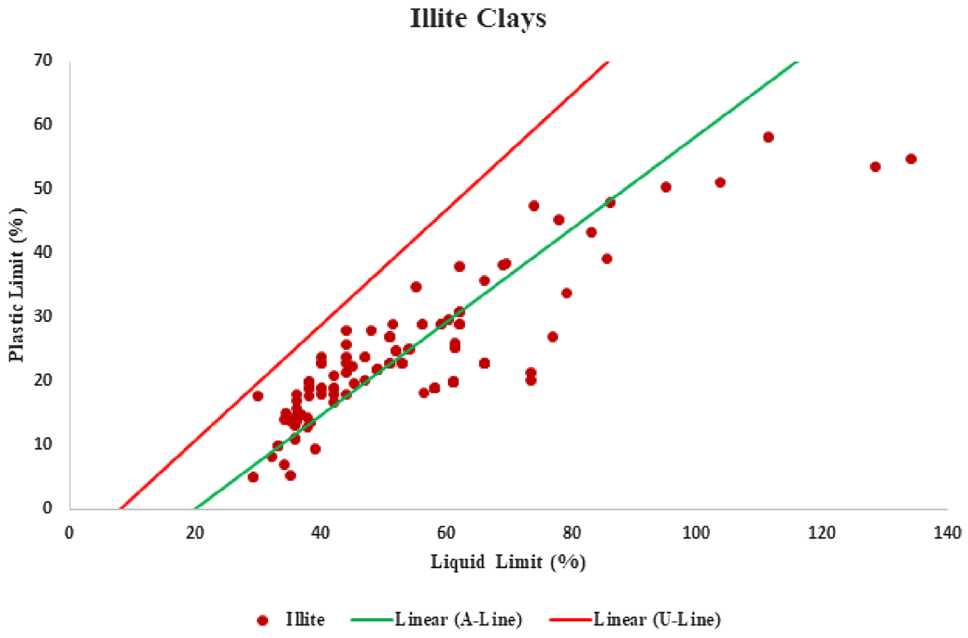

Fig. 2 Illite clay data on plasticity chart

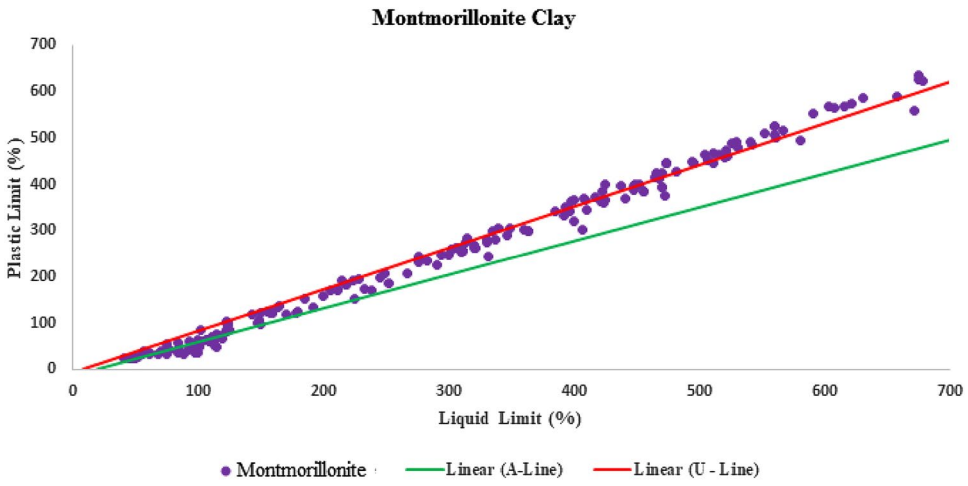

Fig. 3 Montmorillonite clay data on plasticity chart

Methodology

The data is organized into six binary and two multiclass (three class) datasets. Six binary datasets, out of which three have input features as liquid limit and plastic limit, and the remaining three have input features liquid limit and plasticity index. The three having liquid limit and plastic limit as input features are designated as 'A' group, and the remaining three having liquid limit and plasticity index as input features are designated as 'B' group. For '1A' and '1B' datasets, output variables are Kaolinite and Illite. For '2A' and '2B' datasets, the output variables are Illite and Montmorillonite. Similarly, the output variables are Kaolinite and Montmorillonite for '3A' and '3B' datasets. Two multiclass datasets have input features as liquid limit and plastic limit, and the other one has liquid limit and plasticity index and is designed as '4A' and '4B', respectively. For both '4A' and '4B', the output variables are Kaolinite, Illite and Montmorillonite. The details of datasets, input features, output variables and applied classification techniques are shown in Table 1.

In all the eight classification techniques applied on eight datasets, 80% of the data is used to train the model, and 20% is for testing. On each of the datasets, eight classification models are applied viz. (1) Logistic Regression, (2) K Nearest Neighbourhood, (3) Support Vector Machine, (4) Naive Bayes, (5) Decision Tree, (6) Random Forest, (7) XG Boost and (8) Artificial Neural Networks. K-Fold Cross-Validation is used to assess the model performance and is applied to training set data. Each classification model is

evaluated on test data with the help of matrices derived from the confusion matrix and by drawing Receiver Operating Characteristic (ROC) curve to measure the Area Under the Curve (AUC). The better model on each dataset is selected by comprehending K-Fold Cross-Validation, matrices from confusion matrix and AUC of ROC curve.

Implementation and results

Classification models

The eight classification techniques used the present study are briefed below:

Logistic regression

The process of modelling the likelihood of a discrete result given an input variable is called logistic regression. Binary outcomes, such as true/false, yes/no, and other outcomes with only two possible values, are most frequently modelled by logistic regression. Multiple discrete outcomes in a given scenario can be modelled using multinominal logistic regression. (Thomas & David, 2017).

K Nearest Neighbourhood

K Nearest Neighborhood is a classification method that classifies a given example based on the votes of its neighbours. The observation is put in the same category as its nearest K neighbours. The model's input data determines the value of K. In general, the bigger the value of K, the less impact noise or classification errors have. (Johnson et al., 2019).

Support vector machine

The goal of the support vector machine algorithm is to locate an N-dimensional hyperplane (where N is the number of features) that categorizes the data points. Numerous potential hyperplanes might be selected to divide the two classes of data points. The objective of an SVM is to locate a plane with the most significant margin or the most excellent separation between data points from both classes. (Rohith, 2018).

Naive Bayes

A probabilistic classifier called the Naive Bayes classifier, which is based on the Bayes theorem, assumes that each feature contributes equally and independently to the target class. The naive Bayes classifier assumes that each feature is separate from the others and does not interact; therefore, each feature independently and equally influences the likelihood that a sample belongs to a particular class.

For a binary classification problem having two features say, X1 and X2, the probability of a class yi is expressed as (Misra & Li, 2020)

$$P(yi|X1, X2) = \frac{P(X1|yi)P(X2|yi)}{P(X1)P(X2)}$$

Decision tree

A tree-like decision structure with a root node and numerous leaves is produced by the decision tree classifier after processing the training dataset. Internal nodes are all located between the root node and the leaves. Each node is divided into internal nodes and/or leaves so that the dataset becomes purer due to the division; specifically, each split should result in the dataset being divided into groups with samples predominately from one class (Misra & Li, 2020).

Random Forest

An ensemble technique called Random Forest classifier trains several decision trees concurrently with bootstrapping, aggregation, and bagging (Misra & Li, 2020).

XG Boost

XGBoost is a robust machine learning algorithm, specifically where speed and accuracy are concerned.

Content courtesy of Springer Nature, terms of use apply. Rights reserved.

XGBoost implements a gradient-based decision tree designed for speed and performance that dominates competitive machine learning.

Artificial neural networks

ANN stands for artificial neural network which is a computing system that works in parallel and is designed to emulate the human brain processes and analyzes the information. By utilizing data from past experiences, it can model, classify, recognize, and predict a wide range of problems (Kaveh & Iranmanesh, 1998). Typically, an ANN is made up of an input layer, one or more hidden layers, and an output layer. There are multiple layers of neurons, each connected to the other via a weighted connection to form a network of processing units (Kaveh et al., 2008). The input neurons receive information from the external environment and transmit it to the hidden neurons, which then process the information and reconstruct the input–output mapping based on the key features they extract (Kaveh & Servati, 2001; Kaveh et al., 2001). Lastly, the neurons of the output layer will provide the network predictions to the outside world (Kaveh et al., 2014).

In Fig. 4, inputs, weights, summation functions, activation functions, and outputs are shown. It is possible for neurons to receive input from external data or to receive output from neurons in previous layers. By calculating the weighted sum of all inputs, adding a bias, and passing this value through a nonlinear activation function, the neuron produces its output. A neuron's output feeds an input for the next neuron of the layer below to it (Nakkeeran & Krishnaraj, 2023).

The mathematical expression is

$$o_j = f\left(\sum_{i=1}^{n} w_{ij}x_i + b\right)$$

where o_j is the output of the jth neuron, w_{ij} the weight, x_i the input, b the bias, and f an activation function. Over-fitting may be avoided by normalizing the variables, which can be done using the equation below (Nakkeeran et al., 2023):

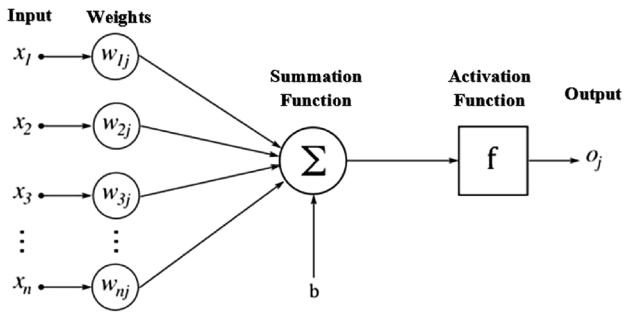

Fig. 4 ANN General Architecture

$$X_{norm} = \frac{(X_{max} - X_{min})(Y_i - Y_{min})}{(Y_{max} - Y_{min})} + Y_{min}$$

X_{norm} is the normalized parameter, X_{max} is the maximum and X_{min} is the minimum value of the scaling range, Y_i is the actual data to be scaled, Y_{max} and Y_{min} are the minimum and maximum values of the actual data, respectively.

Cross-validation

K fold cross-validation is applied to the training set to access the model performance. K fold cross-validation algorithm divides the training set into equal K parts. Out of the K parts, K-1 parts are used to train the model and left out 1 part is used for validating the model in one iteration. Similar iterations are performed by considering another 1 parts of data as test data and the remaining parts as training data. In all iterations, the accuracies are evaluated. The test reports the average of all the accuracies alongside standard deviation. In the current study, the K value is set as 10. The K fold cross-validation data for all the eight datasets are shown in the tables, and the corresponding statistical analysis of the data is shown in the

Evaluating classification models

In order to evaluate the classification model, two approaches are adopted in the current study. The first approach is evaluating the accuracy, precision, recall, and f1 score deduced from the confusion matrix for binary and multiclass classifications. The second approach is to draw the Receiver Operating Characteristic (ROC) curve and measure the Area

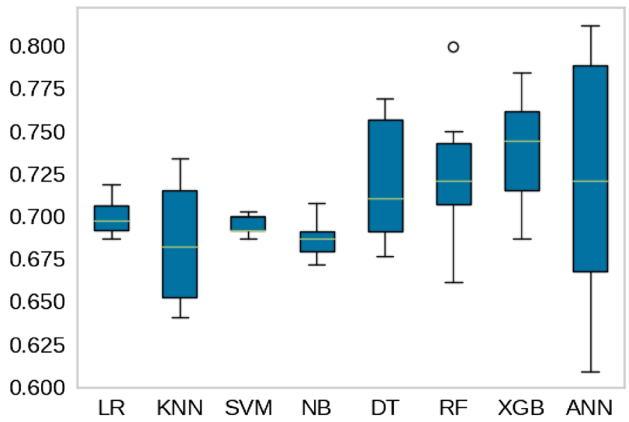

Fig. 12 Boxplot of K fold cross-validation accuracies obtained on training set of 04B

Under the Curve (AUC). Both the approaches and corresponding measured metrics are detailed in the following sections.

Confusion matrix

A confusion matrix is a square matrix formed between predicted values and actual values of the classes of a classification model. The structure and the various metrics calculated from the confusion matrix is explained with the help of a binary classification whose classes are 'Yes' & 'No' as shown in Fig. 13.

Here TP = Count of both predicted and actual positive; FP = Count of actual negative but predicted positive; TN = Count of both predicted and actual negative; FN = Count of actual positive but predicted negative.

The metrices calculated from confusion matrix for a binary classifier are as follows:

		Predicted	
		Yes	No
Actual	Yes	TP	FP
	No	FN	TN

Fig. 13 Confusion matrix for binary classification

$$Accuracy = \frac{TP+TN}{TP+FP+TN+FN}$$

$$Precision = \frac{TP}{TP+FP}$$

$$Recall\ or\ True\ Positive\ Rate\ (TPR) = \frac{TP}{TP+FN}$$

$$FalsevPositive\ Rate\ (FPR) = \frac{FP}{TN+FP}$$

$$f1\ Score = \frac{2xRecallxPrecision}{Recall+Precision}$$

Metrices calculated from confusion matrix Precision, Recall, Accuracy and f1 Score are calculated for the six binary datasets and two multiclass datasets on which eight classification algorithms viz (1) Logistic Regression, (2) K Nearest Neighbourhood, (3) Support Vector Machine, (4) Naive Bayes, (5) Decision Tree, (6) Random Forest (7) XG Boost and (8) Artificial Neural Networks is applied. The weighted averages of each metric obtained from the eight classification models are shown in column charts in Figs. 14, 15, 16, 17, 18, 19, 20, and 21 for better visualization.

ROC curve and AUC calculation

Receiver Operating Characteristic curve is a plot drawn between *True Positive Rate* on the vertical axis in function with *False Positive Rate* on the horizontal axis for different cut-off points. Each point on the ROC curve represents FPR, TPR pair corresponding to a particular decision threshold.

The area under the ROC curve is a valuable metric to evaluate the model's performance in the case of a binary classifier. For a truly accurate model, the AUC value is 1. When the AUC value is 0.5, the model cannot distinguish the positive and negative classes. Therefore, the higher the AUC value, the better the ability of the model to distinguish between positive and negative. The Sckit-Learn roc plot can be drawn for the binary classifier alone. With the help of roc_auc_score, AUC values can be calculated for multiclass classifiers. However, the plotting of multiclass ROC curves is not supported by all classification models directly in Sckit-Learn.

Yellowbrick's *ROCAUC* visualizer helps to plot multiclass classification curves containing ROC curves for each class with one-vs-rest (micro score) and one-vs-all (macro score) strategies on the same plot.

In the current study, Sckit-Learn *RocCurveDisplay* is used to draw ROC curves of different models of a binary classifier on the same plot. For drawing multiclass ROC curves, Yellowbrick's *ROCAUC* visualizer is used.

ROC curves for binary classification datasets On the binary datasets, the eight classification models are applied, and the corresponding ROC curves are plotted on a single graph along with their AUC values for better comparison, as shown in Fig. 22.

ROC curves for multiclass datasets With the help of Yellowbrick's library, ROC curves are drawn for the multiclass datasets. Yellowbrick's ROCAUC visualizer allows drawing ROC curves for one classification model, consisting of ROC curves for each class and their micro-average and macro-average ROC along with their AUC values. Figure 23 shows ROC plots for multiclass datasets namely 04A and 04B for different classification models in the sequence (a) 04A – LR (b) 04A – KNN (c) 04A – SVM (d) 04A – NB (e) 04A – DT (f) 04A – RF (g) 04A – XGB (h) 04B – LR (i) 04B – KNN (j) 04B – SVM (k) 04B – NB (l) 04B – DT (m) 04B – RF (n) 04B – XGB.

Conclusions and future scope

Following conclusions can be drawn from the extensive study on classification models:

- Artificial Neural Networks have better performed and evaluated out of 6 binary classification datasets and two

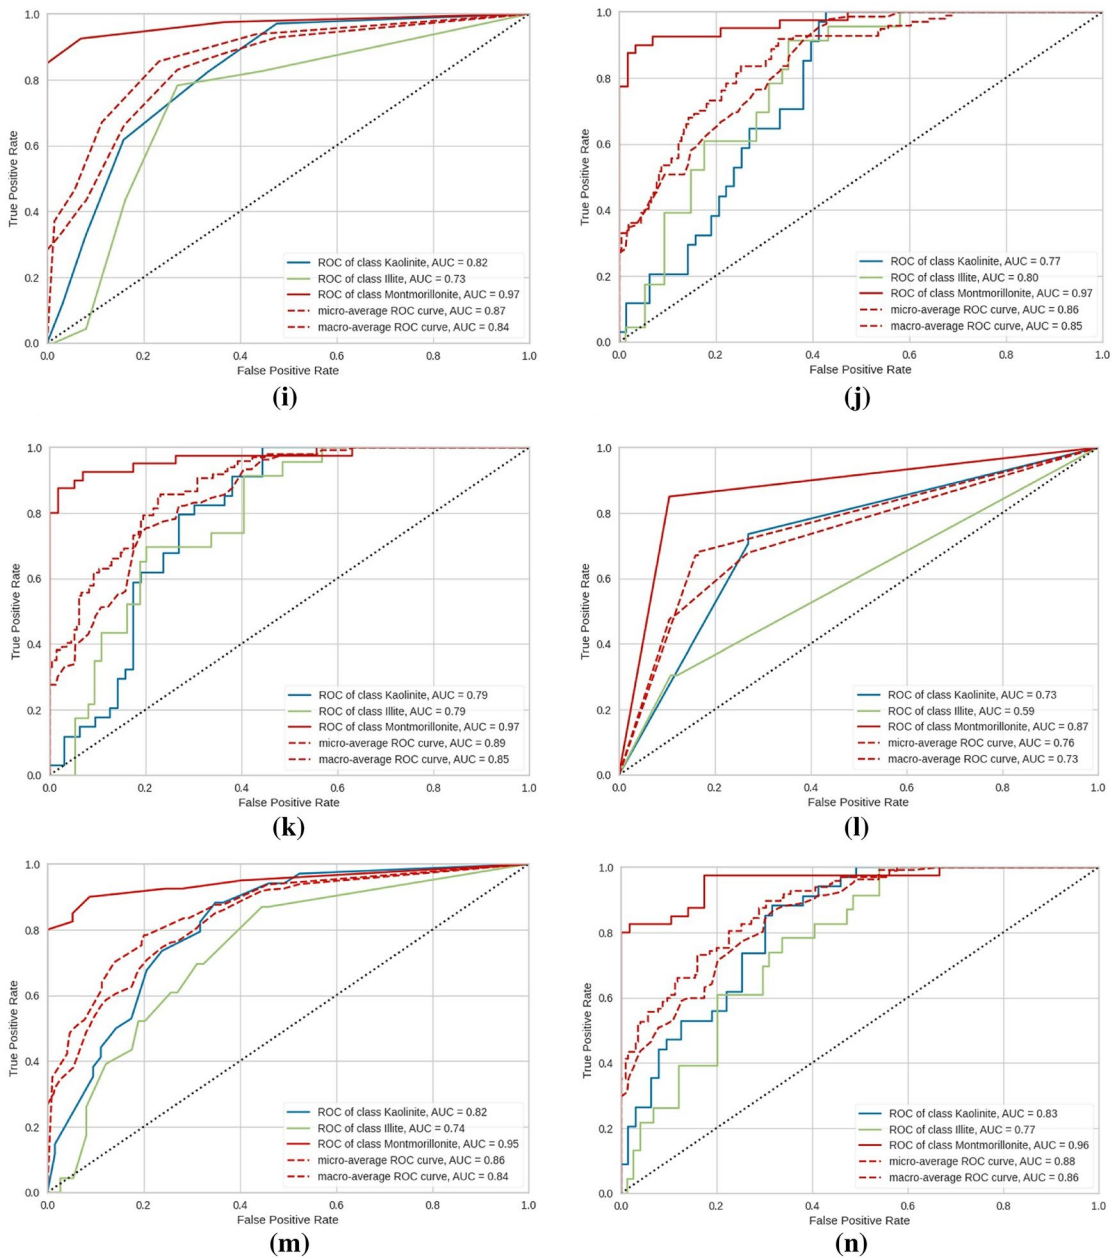

Fig. 23 (continued)

multiclass data sets. ANN proves to be a very effective classification model for multiclass datasets.

- In the 01A binary dataset, both ANN and Decision Tree have better accuracy; however, Decision Tree has consistent accuracy while cross-validating with the least standard deviation.
- For 01B, ANN was proved to be the only model which gave high and consistent accuracies, while K cross-validation was applied with a lower standard deviation.
- For the datasets 03A & 03B, though the Random Forest model gave slightly high accuracy, ANN produced better cross-validation accuracy with significantly less standard deviation proving to be better suitable for these datasets.
- The binary datasets having montmorillonite gave very high accuracy predictions, followed by Kaolinite.
- The plasticity index in place of plastic limit has not significantly contributed to the performance of predictions as an independent variable.

The current study establishes that Atterberg limits, namely liquid limit and plastic limit/plasticity index, are reliable input features for classifying clays based on the mineralogical

Content courtesy of Springer Nature, terms of use apply. Rights reserved.

composition. Montmorillonite can be predicted with the highest accuracy with these input features out of the three clay minerals. Next to Montmorillonite, Kaolinite can be predicted with reasonable accuracy; however, classifying Illites is quite challenging with these input features. Other features, namely shrinkage limit, percentage clay fraction, cation exchange capacity, and total surface area, can be examined to improve clays' predictions, especially Illite clays.

Study of AI-Driven MPPT in AC/DC Microgrid with Type-III Fuzzy Controller Enhanced by Bacterial Foraging Algorithm

Journal of Electrical Systems

Abstract: - The ongoing shift towards sustainable energy solutions has driven the development of microgrids, which offer a promising approach to ensure reliable and environmentally friendly energy production. This research presents a novel microgrid design that incorporates a variety of solar energy harvesting methods, including rooftop solar panels, photovoltaic cells, floating photovoltaic arrays and grid-connected PV systems with Batteries. DC-DC converters are used as power converters between load and source in order to amplify or increase the PV power depending on the output voltage. This study helps to provide a robust energy solution that not only meets fluctuating load requirements, but also strengthens the energy system against the disturbances associated with solar energy. This design incorporates an intelligent control system controlled by an Interval Type-3 fuzzy logic controller. The controller is meticulously designed to deal with the uncertainties and non-linear characteristics of renewable energy systems and to ensure optimal performance under varying weather and load profiles. The analysis in this microgrid uses an artificial intelligence-driven Maximum Power Point Tracking system that dynamically adjusts the operating parameters to utilize the maximum energy yield from the solar systems. A further improvement in the control strategy is achieved through the use of a bacterial foraging optimization algorithm. This advanced algorithm fine-tunes the fuzzy controller parameters, significantly increasing the efficiency and stability of the microgrid's power generation. The synergy between the Interval Type-3 fuzzy logic controller and the BFOA results in a resilient and adaptive control system that can efficiently deliver high quality energy. Extensive simulations were conducted using MATLAB Simulink 2023b to validate the performance of the proposed microgrid design and control architecture. The empirical results show that the integrated system effectively optimizes the energy flow of different solar systems, maintains power stability and achieves superior efficiency. The study pushes the boundaries of microgrid design and provides a scalable and smart energy solution that paves the way for the widespread adoption of renewable microgrids in different geographical areas.

Keywords: Artificial Intelligence(AI), Bacterial Foraging Optimization Algorithm (BFOA) Interlinking Converter, Interval Type-3 Fuzzy Controller, Microgrid, Maximum Power Point Tracking system(MPPT), Boost Converter and STATCOM.

1. Introduction

In the face of global warming, it is imperative to prioritize the reduction of carbon emissions and the transition to renewable energy sources in the energy sector. This is crucial for the sustainability of our planet and the well-being of future generations. a group of interconnected loads and decentralized energy resources that acts as a single controllable entity in relation to the grid. i.e. microgrids (MG). It plays a critical role in integrating distributed renewable energy generation such as photovoltaic (PV), wind power with energy storage systems, combined heat and power (CHP) systems, fuel cells and electric vehicles (EVs) into the grid. By operating as self-sufficient systems, MGs can continue to provide power to critical loads during grid outages or emergencies, reducing the impact of power outages on communities, businesses and essential services. The challenges posed by the unpredictable nature of renewable energy sources, which are dependent on fluctuating weather conditions and whose energy production is not entirely predictable, are usually overcome by using multiple energy sources. To overcome the above challenges and improve energy efficiency, controllers are equipped as an integral part of any microgrid operation and serve as the brain for managing various energy sources, storage systems and loads. These devices continuously monitor grid conditions and adjust parameters such as current flow, voltage and frequency to ensure grid stability and reliability [1,2,3,4].

At the beginning of this section, a detailed introduction to the MPPT algorithms for solar systems with artificial intelligence is required. The active power (P) of a solar power system with PV panels is affected by solar irradiance (E) and operating temperature (T), especially under rapidly changing partial shading conditions due to the nonlinear nature of photovoltaic cells. The complicated correlation between power output and PV input parameters leads to suboptimal power extraction, prompting researchers to focus on AI-based MPPT methods as an alternative to traditional perturbation and observation techniques to maximize the performance of wind turbines and PV systems. Several applications have been used in grids as a result of the introduction of new technologies in the development of controllers and converters [5]. These include solar arrays, fuel cells, wind turbines, small diesel generators, small hydroelectric plants, backup energy systems, and DC/AC load systems for energy demand. It is difficult to develop a hybrid system with all renewable and non-renewable energy sources, storage devices, converters and loads. In most hybrid systems, the DC components are the wind turbine, the solar panels and the battery bank, while the AC components are the diesel generator and the load. The conversion from AC to DC and vice versa is performed by an IGBT-based high-power converter [6]. Constant power loads (CPLs) in DC-MGs reduce the effective damping of the DC-DC converter and can have destabilizing effects since CPLs have nonlinear dynamics and negative incremental impedance [7-8]. An MG can be either a DC network or a mixture of DC and AC. Therefore, a DC microgrid is the best option for operating renewables, power converters and modern loads, all of which require DC power. Several non-linear control methods are used for a regulated DC bus voltage and stable operation.

In the past, linear PI/PID control, SMC and AI-based control have been used in some cases to control MG. However, in the last decade, much attention has been paid to the intelligent control of nonlinear systems [9]. As a result, common controls such as neural networks, fuzzy and neuro-fuzzy controls have been explored. in 1965, Zadeh introduced fuzzy logic for use in cellular robotics. Since then, numerous studies have applied this fuzzy logic to various modelling in control systems. It provides a framework for understanding the uncertainties and opacity of the entire model through human reasoning based on membership functions and linguistic variables. The application of fuzzy logic controllers (FLC) to the operation and control of power grids has become increasingly important in recent years [10]. Fuzzy controllers are excellent at dealing with non- linearities and uncertainties associated with renewable energy sources and loads, and provide superior performance in scenarios where conventional controllers struggle to maintain stability. The Integral Fuzzy Type-3 controller used in this research offers several advantages for microgrid control. By integrating fuzzy logic with proportional-integral-derivative control, this controller combines the adaptability and robustness of fuzzy logic with the ability of integral behavior to eliminate steady-state errors.

Bacterial foraging optimization, also known as BFOA, is a bio-inspired metaheuristic algorithm based on the foraging behaviour of Escherichia coli bacteria. It is used to solve optimization problems by gradually refining a population of potential solutions towards an optimal solution. The main goal of this process is to improve the controller's performance in terms of precision, resilience and effectiveness by iteratively adjusting the fuzzy logic membership functions and other parameters using the BFOA. This allows the controller to adapt and improve its performance even in difficult and unpredictable environments [11,12,13].

Another crucial component in most MG’s are power converters, which help to connect the AC and DC grids in addition to maintain the stability of the entire microgrid. A bi-directional droop control approach has been utilised along with Bi-directional DC/AC converters to measure the power demand of the AC and DC miFcrogrids depending on the frequency of the AC terminal bus and the voltage of the DC terminal bus, respectively. Moreover, the amplitude and direction of the power transfer through the power converters are deter- mined [14]. To maintain a constant DC link voltage, primary or local control with PV cells and batteries is used. To provide a stable voltage, ensure smooth grid synchronization and ensure proper sharing of active power between the DC and AC buses, the secondary or system level is achieved by controlling the intercom nested converter located between the AC and DC buses.

In a hybrid microgrid, the interconnected converter (ILC) plays a crucial role in connecting the AC and DC grids. Its control strategy has an impact on energy flow management, power quality, system efficiency and stability. The ILC is normally controlled as a current source, resulting in poor dynamic stability when a remote, weak AC sub-grid with a high connection impedance is connected. In times of surplus energy generation, e.g. during strong weather, the storage devices are used in microgrids to temporarily store this surplus energy for later use. Likewise the energy generation is not sufficient to cover the increasing load demand then the stored energy is utilized [15,16].

To link the sections presented above and ensure proper energy transaction, Artificial Intelligence (AI) is revolutionizing the operation and control of microgrids by providing advanced algorithms to optimize energy generation, storage and consumption. Through machine learning and predictive analytics, AI can forecast renewable energy generation, predict fluctuations in demand and dynamically adjust microgrid parameters in real time. This enables microgrids to achieve higher efficiency, reliability and resilience while seamlessly integrating different energy sources. The study on AI-driven Maximum Power Point Tracking (MPPT) in AC/DC microgrids with an interval type III fuzzy controller enhanced by the Bacterial Foraging Algorithm (BFA) presents a sophisticated approach to optimize the performance of renewable energy systems. In the following sections, Work Motivation, detailed view of MG Components, mathematical modelling of the relevant components in MG and the simulated experimental results of this research work and other requirements are described in detail.

2. Literature review

Prepare Hybrid power supply systems based on renewable energies are increasingly being used worldwide to reduce carbon emissions. However, renewables are sporadic and incredibly unpredictable, which can lead to significant frequency fluctuations. By using optimally designed control systems, these fluctuations can be kept within the appropriate limits. Maximum Power Point Tracking (MPPT) becomes the focus of study to increase the efficiency of the solar system and ensure that the operating point is always at the Maximum Power Point (MPP) to overcome the aforementioned limitations [5]. It is possible to achieve uniform peaks without abrupt irradiation or under PSC by using traditional hill-climbing (HC) MPPT approaches such as Incremental Conductance (IC) and Perturb and Observe (P&O) [6]. Despite some advantages of existing MPPT methods, AI-based MPPT methods for DC-DC converters are implemented in solar energy systems to increase the efficiency of solar energy. Electronically implemented MPPTs also include adjusting the tilt angle of solar panels to track the direction of the sun and integrating soft computing weather forecasts [7].In this research work, this AI driven MPPT trend has been successfully implemented.

Kinetic Gas Molecule Optimization (KGMO) is a state-of-the-art algorithm that uses the principles of kinetic gas molecules to optimize photovoltaic systems and increase their performance. The KGMO algorithm uses the principles of kinetic gas molecules to optimize the performance and maximize the power output of photo- voltaic systems together with ANN, which provides better results than the results of conventional MPPT schemes[29,30]. An LFC structure based on a Tilt-Fraction-Order-Integral (TI) controller and an FO-PID controller with a filter was proposed by Ahmed et al [16]. The Artificial Gorilla Troops Optimizer is used to optimally design this proposed controller. The effects of high renewable energy share on the considered power system is also investigated with the proposed controller. In [17], the performance of the system is improved with the recently developed ISSA (Improved Squirrel Search Algorithm) algorithm, which is used to adjust the parameters of several controllers, including PID, two- and three-degree PIDs, and cascaded 2DOF fractional-order PIDs (FOI). The performance of the optimal controller was modified using the integrated Particle Swarm Optimization (PSO) and Squirrel Search Algorithm (SSA). Numerous case studies have been con- ducted to evaluate the reliability, adaptability and flexibility of the system.

In [18], a hybrid energy system including a thermal system, wind and solar energy, diesel generators, electric vehicles, and energy storage systems such as batteries and superconducting magnetic energy storage is used. The frequency was controlled by a reliable FOPI frequency controller. In addition, the Water Cycle Optimization Algorithm (WOA) optimizes the FOPI parameters. The selected objective function is the Integral Time Absolute Error (ITAE). The results of the proposed algorithm are compared with those of PSO, another well-known optimization technique, to demonstrate its effectiveness. By maintaining a faster settling time, the pro- posed optimization method performs better than PSO. To address the frequency anomaly caused by the presence of renewable generation units in [19]. Microgrids are becoming increasingly popular to manage energy demand in localized areas [26]. The integration of the bacterial foraging algorithm with a fuzzy controller in microgrids offers a promising solution to optimize energy management and improve grid stability [27]. By using the bacterial foraging algorithm in conjunction with a fuzzy controller, microgrids can effectively balance energy supply and demand, thus improving the overall efficiency and stability of the grid [28].

An FLC-based EMS with AC/DC microgrid is implemented. The power quality of the MG is increased in addition to the EMS design. It proposes to analyse and manage storage devices. The FLC extends battery life and creates an ideal SoC. To reduce power quality issues caused by non-linear, unbalanced load conditions, a grid-integrated MG based on FLC is implemented. For automatic load frequency management (ALFC) of a hybrid power system, a hybrid sperm swarm optimized-gravitational search algorithm based on chaotic search is presented in [21]. The integral-time absolute error of the hybrid system is minimized to determine the control parameters of the PID controller for the ALFC, which controls the frequency of the system. The effectiveness of the proposed technique is tested with different combinations of power sources connected to the system. In addition, a sensitivity analysis is performed to investigate the flexibility of the proposed technique considering the real-time weather-related interruptions and load changes of the renewable energy sources. In [22], the innovative fuzzy PID+PID hybrid controller used for frequency regulation in a hybrid power system is optimized using the whale optimization algorithm (WOA). The proposed application of WOA approach for frequency regulation in HPS can be considered unique at this stage. Compared to other controllers, the proposed WOA-optimized fuzzy PID + PID hybrid controller performs the best, which proves the effectiveness of WOA in load frequency control experiments. Due to the spatial and temporal variability associated with renewable energy sources and the large operational uncertainties caused by the changing natural environment, the long- term optimal operation of RES is a difficult challenge. Stochastic model predictive control (MPC) based on probabilistic forecasting and rolling stochastic optimization is designed and implemented for the long-term operation of renewable energy [24].

PV energy generation systems are ranked as a top energy system by utilities around the world because they generate electricity from renewable sources. These energy options have the disadvantage of being unpredictable and dependent on climate and weather conditions. To achieve noise-free voltage reduction for DFIG and PV systems, an effective strategy using a Landsman converter has been developed [25]. The tracking point of maximum power is controlled with a PWM-based PI controller using the firefly method. A grid-synchronized 3-phase VSI with an LC filter converts the DC voltage into AC voltage, ensuring smooth operation and elimination of harmonics. The outputs have a minimum THD value.

3. Research Motivation

In today's world, there is a growing emphasis on generating electricity from sustainable sources to mitigate the impact on the environment. Researchers and energy stakeholders are exploring advanced technologies like AI, machine learning, deep learning, and fuzzy logic for developing microgrids. However, renewable energy sources such as solar radiation and wind speed are constrained by fluctuations that affect efficiency. In order to accommodate that Artificial intelligence techniques and fuzzy logic concepts are being explored to improve Power Quality in a cost-effective manner without significantly increasing costs through additional components such as converters and filters.

In this work, a study on the design of a proposed two-level control framework for stable and voltage-tracking operation of the HMG under variable generation and load changes is presented. In this paper the following considerations are necessary for design and reliable HMG operation. Firstly: Maintaining a stable DC link voltage in the variation of temperature and irradiation fluctuations through AI based MPPT. at next, this model ensure that the inverter can be precisely controlled in conjunction with the load grid and to minimize the voltage deviation from the reference voltage specified by the load. In addition, a robust control method must be implemented in the inverter in conjunction with the load grid to achieve high performance due to changes in load dynamics. Finally, it is mandate that will ensure synchronized operation between the AC and DC sides of the HMGs to enable appropriate power sharing between the primary grid and the DC side. In particular, the controller's design process has been split into two stages: one addressing stability issues through partial feed- back linearization method while another deals with robust control methods alongside operational synchronization between AC and DC sides of HMGs accomplished using VSC controlled by PI controller. This section provides an overview of the motivations behind the study, which will be further explained in succeeding sections.

4. Proposed Research Methodology

The block diagram represents an advanced hybrid AC/DC microgrid system integrating solar PV energy sources. A key feature of this system is the AI-driven Maximum Power Point Tracking (MPPT) scheme used for the

solar PV systems. In order to explore advanced control strategies, an interval type 3 fuzzy-based controller enhanced by the Bacterial Foraging Optimization Algorithm (BFOA) and interlinking drop control, ensure power quality. Here's a detailed breakdown of the elements and processes involved.

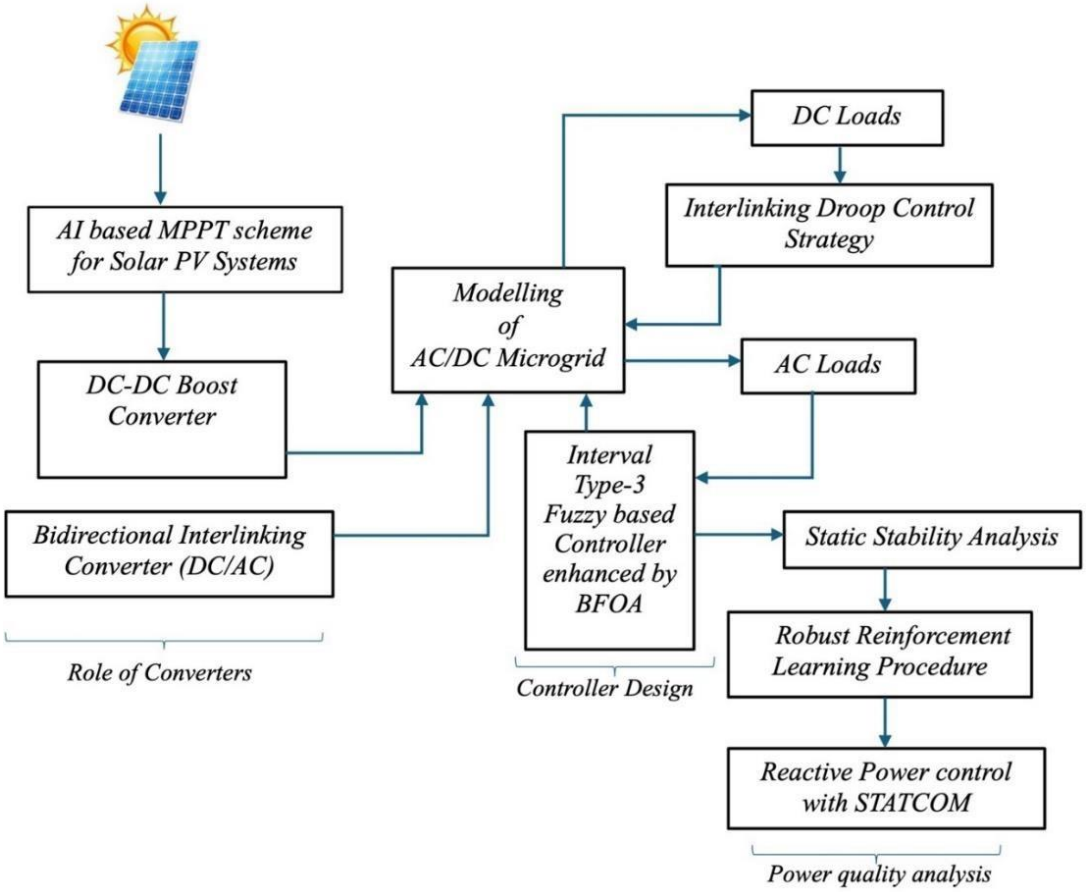

Fig.1. Block diagram for AI driven Hybrid AC/DC Microgrid

4.1 Modeling of AC/DC Microgrid

Comprehensive and accurate modelling enable researchers and industry professionals to gain valuable insights into the behaviour, performance, and control of AC/DC microgrids. The microgrid integrates both AC and DC loads, requiring thorough modelling for efficient operation and control. The dynamics of the power grid are significantly influenced by the growing adoption of renewable energy sources such as rooftop solar cells, photovoltaic, floating PV, solar PV, battery storage along with the grid (refer to Fig. 1). This system features AI-based Maximum Power Point Tracking which optimizes the power output of solar modules. A boost DC-DC converter with multiple inputs manages this optimized DC current in addition to a bi-directional link converter that facilitates current flow between AC and DC loads. Advanced control strategies including an Interval Type 3 fuzzy-based controller also improved by Bacterial Foraging Optimization Algorithm together with interlinking drop control ensure stability and quality in powering on demand needs. This proposed system delivers electricity to consumers via power converters, ensuring stable high-quality power supply even under extreme conditions. The paper discusses the use of reinforcement learning algorithms and static synchronous compensators for improving the performance and control of hybrid microgrids (Cheng et al., 2021). The paper highlights the importance of comprehensive modelling techniques and proposes an enhanced fuzzy-based en- ergy management strategy for a hybrid power system. This strategy aims to optimize power output, ensure stable high-quality power supply, and effectively manage the dynamics of the power grid.

4.2 AI-Driven MPPT Scheme for Solar PV Systems

In general, AI-based MPPT algorithms often use machine learning models such as neural networks, support vector machines, or fuzzy logic systems. These models are trained using historical data on solar irradiance and temperature, allowing them to accurately predict the maximum power point in real-time for photovoltaic systems. The use of ANN for MPPT allows for the identification and utilization of nonlinear correlations between variables in PV systems, resulting in a reliable, quick, and efficient maximum power point tracking process (Chen & Wang, 2019). Additionally, the ANN-based MPPT method eliminates the need for additional hardware and reduces dependence on system parameter variations.

This approach proves to be robust and versatile, making it a preferred choice for achieving optimal power generation in PV systems, particularly under partially shaded conditions. Furthermore, the combination of an artificial neural network controller with a scanning algorithm in this novel method enhances the tracking of the global maximum power point under partially shaded conditions, leading to improved performance and efficiency in PV systems. The proposed method, known as the ANN-KGMO MPPT controller, utilizes the Kinetic Gas Molecular Optimization Algorithm to train the developed Artificial Neural Network. This process enables the evolution of connection weights and biases to achieve optimal values for adjusting the duty cycle of the converter in accordance with PV array's Maximum Power Point, as depicted in a block diagram (refer to Fig. 2).

Real-world optimization problems are increasingly being solved by swarm-based algorithms. The optimization algorithm Kinetic Gas Molecule Optimization (KGMO), which is based on the kinetic energy of gas molecules, is presented in this study. The kinetic theory of gases, which establishes the guidelines for gas molecule inter- actions in the model, applies to the agents, which are gas molecules that are moving in the search space.

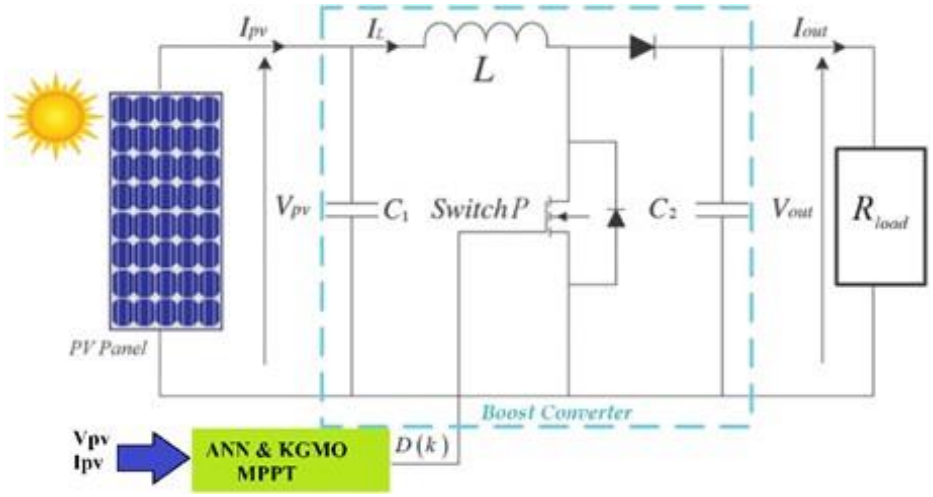

Fig. 2. Block diagram of the proposed ANN-KGMO MPPT model

The proposed MPPT algorithm involves three steps at most important i.e. data preparation and ANN training, Kinetic Gas Molecular Optimization, and applying KGMO optimized parameters to the ANN model. This approach combines data preparation and training of an Artificial Neural Network with the use of Kinetic Gas Molecular Optimization to optimize the model's parameters.

By utilizing this three-step approach, the proposed MPPT algorithm aims to effectively and accurately track the maximum power point of the photovoltaic system as depicted in Fig. 3. In this manuscript, we propose a metaheuristic optimized multilayer feed-forward artificial neural net- work controller to extract the maximum power from available solar energy. To improve the maximum power point delivered by PV arrays and overcome drawbacks in conventional MPPT methods under irradiation variation, a hybrid MPPT controller is designed. It takes PV array voltage and current as input parameters, and outputs the duty cycle of the DC/DC boost converter con- trolling power transfer between the PV array and the load. Discussion in this section will provide a summary of the Artificial Neural

Network based KGMO MPPT technique, highlighting its features and updates in managing DC power conversion for grid integration that will explained in subsequent sections.

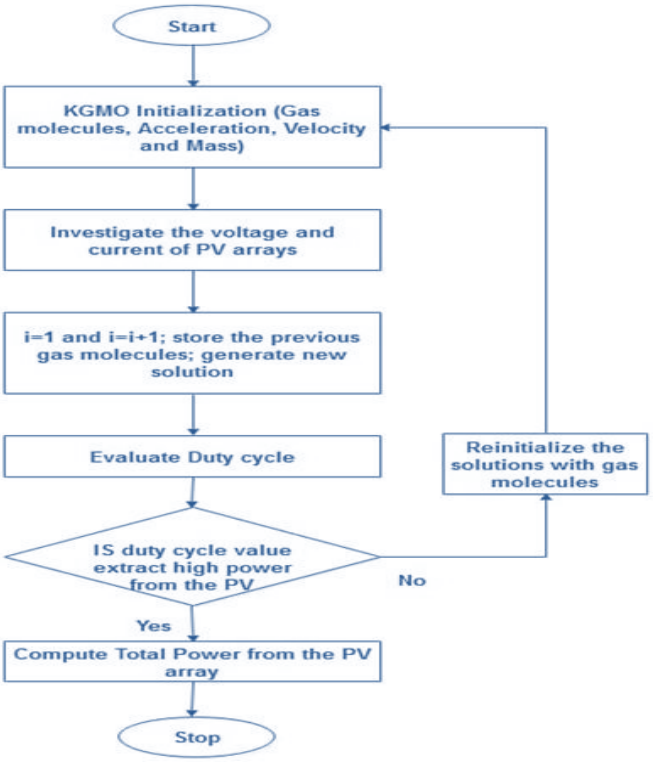

Fig. 3. Flow chart of the proposed ANN-KGMO MPPT model

4.3 Implementation of Converters in Hybrid Microgrid

In a hybrid microgrid, comprises a DC grid and an AC grid interlinked by a multi-objective control scheme of a bidirectional DC/AC converter. Bidirectional converters are crucial in hybrid microgrids because they enable two-way energy flow between various energy sources, storage systems, and the grid. They allow for efficient charging and discharging of batteries, facilitate seamless integration of renewable energy sources, and support grid stability by regulating voltage and frequency. By managing energy storage and distribution flexibly, bidirectional converters enhance the reliability, efficiency, and resilience of hybrid microgrids. Interlinking Converter (ILC) is a key component to connect the AC sub grid and DC sub grid. Its control strategy significantly affects power flow management, power quality, system efficiency and stability.

In microgrids, the primary or local level control is implemented for solar and battery for maintaining stable DC bus voltage. DC-DC Boost converters are being used as power converters in between load and source to enforce and increase the PV depending on the voltage output signal. The secondary or system level control is implemented by controlling the interlinking converter placed between ac and dc buses to supply stable voltage along with the smooth grid synchronization and ensuring the proper real power sharing between DC/AC buses. Furthermore, the ILC control prevents any negative sequence currents from flowing into the AC source.

4.3.1 Role of DC-DC Boost converter with MPPT in HMG

A boost converter is a DC/DC power converter which steps up voltage from its input (source) to its output (load). In continuous conduction mode (current through the inductor never falls to zero), it play a crucial role in increasing the voltage output from the maximum power point tracking system (Chen & Wang, 2019). These boost converters are responsible for efficiently converting the harvested solar energy into a higher voltage output, which is necessary for charging batteries or powering devices that require a higher voltage (Nguyen et al., 2020). Furthermore, the boost converters also help in maintaining a stable and regulated output voltage, thereby improving the overall efficiency and performance of the system as illustrated in Fig. 4.

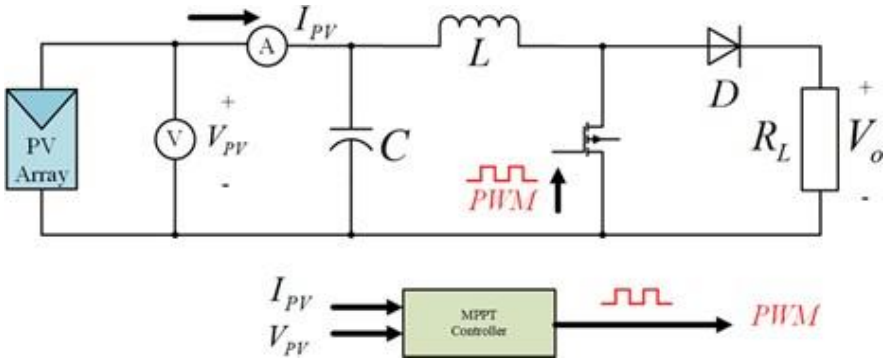

Fig.4. Circuit diagram of DC-DC Boost Converter

The boost converter output-input voltage relationship is proportional to the duty cycle in the sense that higher D will yield higher output voltages for a given input voltage. If the input voltage is Vin and the output voltage is Vout, Vout/Vin= 1/(1-D), where 0≤ D≤ 100% and D is the Duty cycle. In this case study, the power output of PV panel is 2000W, so the maximum operating power of the converter is 2000 W. Output voltage of the panel is 200 V at its MPP. The design parameters are the inductance, capacitance (supply) and capacitance (Load) are chosen as L=0.15H, C=100 and 470 uF and Vin=200V, Vout=400V, the voltage conversion ratio is set at K=400/200=2, frequency is 2.5 kHz, Load resistance is 80Ω. The algorithm proposed for MPPT in this manuscript, and detailed in the previous section, mainly focuses on the operating voltage and its corresponding power deviation. If the difference in power is positive, the future perturbation should follow suit to obtain MPP. Conversely, if the deviation in power is negative, the perturbation should be reversed and move in a reverse direction to obtain MPP. This procedure continues until it achieves maximum power.

4.4 Role of Bi-Directional DC/AC Converters in Hybrid Microgrid

Bidirectional converters are versatile power electronic devices that facilitate the flow of electrical energy in both directions between different parts of a power system. Unlike traditional unidirectional converters, which allow energy to flow in a single direction, bidirectional converters can switch between converting AC to DC and DC to AC, or between different DC voltage levels. This dual functionality is crucial in modern electrical systems, particularly in applications involving renewable energy sources and energy storage systems.

In renewable energy systems, bidirectional converters enable the integration of sources like solar panels and wind turbines with battery storage, allowing energy to be stored when production exceeds demand and later retrieved when needed. They also support grid stability by managing energy exchanges between microgrids and the main grid, helping balance supply and demand.

To validate the fuzzy logic-based control technique implemented in this proposed HMG, we had to design a bidirectional DC–AC converter that was capable of functioning as both an inverter and a PFC rectifier. The transition between these two modes of operation needed to be fully automated and without human intervention for our HMG to autonomously store, produce and supply energy for domestic use. Before validating its operation by appropriate experimental measurements, it is essential to detail the operating modes of the converter, as well as its control strategies. The energy transfer between a DC voltage source and an AC voltage source, and vice versa, was the basis of this structure. The association in series of a DC–DC stage and a DC–AC stage ensured this principle of operation with these two stages being necessarily bidirectional. The DC–DC stage needed to generate a rectified sine wave from the PWM command of the power switches. Since the power devices in this stage switched at a frequency of a few hundred kilohertz to optimize the compactness of the whole converter, the inductance, noted L1 was sized so that the ripple of the current was negligible com- pared to the sinusoidal component at low frequency (in this case, 50 Hz). Therefore, the DC–DC converter acted as a controllable output voltage source. By changing the voltage of a modulation stage, the output current could be regulated. This is very interesting, especially when the output current is strongly reduced or in the of variable DC voltage. This strategy allowed the output voltage of the DC–DC stage to be modulated. Specifically, when this modulated voltage was higher than the mains voltage, the

output current had a positive value. In the opposite case, the output current was negative. The design approach that was chosen allowed the converter to be used in both grid-connected and off-grid modes. Since the microcontroller was synchronized with the AC grid to sensibly drive the DC–DC and DC–AC stages, only the grid-connected mode will be discussed in the remainder of this paper. In this section of the paper, we will describe the control strategies of the pro- posed bidirectional DC–AC converter. We will only give the principles and thus, we will not detail the control circuit or the AC network connection strategy because several patents are pending. The DC–AC stage was controlled by the very same signal as the inverter mode, so it was synchronized with the AC grid at a frequency of 50 Hz.

Overall, bidirectional converters are essential for enhancing the flexibility, efficiency, and reliability of modern power systems, playing a key role in the transition to more sustainable and resilient energy infrastructures.

4.4.1 ILC Droop Control Coefficient

This paper proposes a novel, generalized droop scheme of ILC for autonomous power-sharing and control of a hybrid microgrid. A standalone hybrid microgrid is considered where the control of active power is more complex as compared to the grid-connected mode. The AC microgrid operates on frequency droop while voltage droop is used in the DC microgrid. A 3-dimensional plane is proposed for ILC control where the axis corresponds to DC voltage, AC frequency and converter power. The converter utilizes frequency droop at the AC terminal and voltage droop at the DC terminal so any change in DC voltage or AC frequency results in active power flow from an underloaded to the overloaded grid. The three quantities, namely active power, AC frequency and DC voltage, are introduced in the outer control loop of the converter along with three scaling factors which define the converter frequency and voltage droop.

To enable autonomous power-sharing between AC and DC grids, DC voltage droop and AC frequency droop are implemented in the outer control loop of the converter. Any load change in the ac grid will result in frequency variation and the power flow through the converter will change according to the frequency droop. Similarly, any dc load change will result in voltage variation which will change the converter power according to the dc voltage droop. Taking into account the fact that the converter does not generate any power and neglects converter losses, the following relation can be established.

$$k_1\Delta V_{dc} + k_2\Delta P_c - k_3\Delta f = 0 \tag{01}$$

Further expansion of this expression yields:

$$k_1\Delta V_{dc} + k_2 P_c - k_3 f - \left(k_1 V_{dc,ref} + k_2 P_{c,ref} - k_3 f_{ref}\right) \tag{02}$$

This is the generalized droop control which combines dc voltage and ac frequency. The maximum power flow through the tie line between ac and dc grids is represented as $P_{c,ref}$. The droop coefficients define the power flow through the converter. Equation (02) is a plane $ax + by + cz + d = 0$ drawn on the axis. If k_1 is set to zero, the converter operates in frequency droop and the droop coefficient is set by the ratio of k_2 and k_3 as shown in (03). This droop line is drawn on the plane on $f - P_c$ axis. In this case, no change in active power is observed due to load change in the dc grid and converter power is only dependent on ac grid frequency.

$$\frac{\Delta f}{\Delta P_c} = \frac{k_2}{k_3} \tag{03}$$

A voltage-frequency droop can be established by setting k_2 zero. In this case, the droop coefficient is given by

$$\frac{\Delta V_{dc}}{\Delta f} = \frac{k_3}{k_1} \tag{04}$$

This droop coefficient is the slope of the line drawn on $V_{dc} - f$ axis on the plane. Any change in DC voltage is translated into a change in frequency of ac grid but there is no control on the active power flowing through the converter. Any change in AC grid load will vary the power generated by the AC grid and the power flow through the converter according to the following relation:

$$\Delta P_L = \Delta P_{g,ac} - \Delta P_c \tag{05}$$

The load change in the ac sub-grid will cause frequency change. According to frequency droop, the change in ac power generation due to a change in frequency is given by:

$$\Delta P_{g,ac} = \frac{2\pi}{m}\Delta f \tag{06}$$

From the control scheme of the converter, the total change in active power ΔP_c from AC grid to DC grid is given by:

$$\Delta P_c = \frac{k_3\Delta f - k_1\Delta V_{dc}}{k_2} \tag{07}$$

Substituting Eqns.(06) and (07) in Eqn (05) gives us:

$$\Delta P_L = \frac{2\pi}{m}\Delta f - \frac{k_3\Delta f - k_1\Delta V_{dc}}{k_2} \quad (08)$$

This equation describes the impact of the ac load change on AC frequency and DC voltage in a hybrid microgrid. The change in power consumed by DC load can then be expressed as:

$$\Delta P_L = \frac{\Delta V_{dc}}{n} + \frac{k_3\Delta f - k_1\Delta V_{dc}}{k_2} \quad (09)$$

This relation can be used to determine its effect on frequency and DC voltage. Different voltage and frequency control strategies have been successfully implemented within AC and DC grids, but the control of hybrid microgrids requires further attention with a focus on ILC. In summary, interlinking converters are essential in microgrids as they allow for the integration of different energy sources, optimize power flow, enable power transfer between voltage systems, and ensure grid stability.

4.5 Controller Design

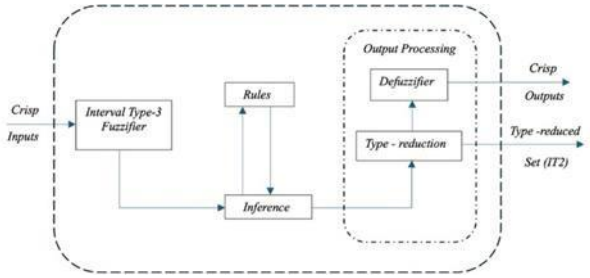

Fig. 5. Block Diagram of Interval Type-3 Fuzzy Controller

The voltage and frequency of MGs are strongly impressionable from the active and reactive load fluctuations. A change in load leads to an imbalance between generation and consumption. The output voltage and frequency of the DGs are primarily controlled by the droop characteristics. But, in case of severe changes in load, the DGs may be failed and the Microgrid is collapsed. Subsequently, the research proposed the interval type 3 fuzzy controller is used for controlling the load frequency of the multi-area system. A 1% step load perturbation is applied to the load demand of the power plant and analysis of the system responses in terms of settling time, peak overshoot and peak undershoot. Henceforth, it is necessary to maintain the system frequency to be constant. The structure of an interval type-3 system is almost the same as for type-2 and type-1, and it is composed of a fuzzifier, rules, inference, type reduction and defuzzifier [36]. In Fig. 5 we show the structure of an interval IT3 system [33,34,35].

Implementing an Interval Type-3 Fuzzy Controller in MATLAB involves defining fuzzy sets, membership functions, a rule base, and processes for fuzzification, inference, and defuzzification. Below is a basic outline ,

Step 1: Define Membership Functions

First, define the primary and secondary membership functions.

```
" function mu = primary_membership_function(x, a, b, c)
% Triangular membership function
mu = max(min((x - a) / (b - a), (c - x) / (c - b)), 0);
end

function mu = secondary_membership_function(primary_mu, l, u)
% Secondary membership function as a simple linear combination
mu = (primary_mu * (u - l)) + l;
end "
```

Step 2: Fuzzification

Convert crisp inputs into fuzzy values using the membership functions.

```
" function fuzzy_values = fuzzify(input_value, membership_functions)
  fuzzy_values = zeros(1, length(membership_functions));
```

```
    for i = 1:length(membership_functions)
        fuzzy_values(i) = membership_functions{i}(input_value);
    end
end"
```

Step 3: Rule Base

Define a set of fuzzy rules and apply them.

```
" function output_fuzzy_values = rule_base(input_fuzzy_values)
    % Example: simple rule base with two rules
    rule1 = min(input_fuzzy_values(1), input_fuzzy_values(2));
    rule2 = min(input_fuzzy_values(3), input_fuzzy_values(4));
    output_fuzzy_values = [rule1, rule2];
end"
```

Step 4: Inference

Apply the fuzzy rules to determine the output fuzzy sets.

```
" function inference_result = inference(fuzzy_values, rule_base)
inference_result = zeros(1, length(rule_base));
for i = 1:length(rule_base)
inference_result(i) = rule_base(i);
end
end"
```

Step 5: Defuzzification

Convert the fuzzy output sets back into crisp values.

```
"function crisp_output = defuzzify(fuzzy_output_values)
% Example: centroid method
numerator = sum(fuzzy_output_values);
denominator = length(fuzzy_output_values);
crisp_output = numerator / denominator;
end"
```

This is a simplified implementation to demonstrate the basic structure of an Interval Type-3 Fuzzy Controllerin MATLAB. A real-world implementation would require more detailed handling of the secondary member- ship functions, more complex rule definitions, and more sophisticated methods for fuzzification, inference, and defuzzification.

4.5.1 Interval Type 3 Fuzzy Controller

The interval type-3 FLSs (IT3-FLSs) are developed to handle more levels of uncertainty. In this study, IT3-FLSs are used for online dynamic identification. as Illustrated in Fig. 5,The structure of IT3-FLS is explained step-by-step below:

The inputs of IT3-FLSs are $y_1 = I_p(t)$, $y_2 = V_c(t-\tau)$, $y_3 = I_b(t)$, where, I_p and I_b are the currents of PV and battery, respectively and V_c is the load voltage. τ represents the sample time.

For each input, two Gaussian membership functions (MFs) are considered. The centres of MFs are set to the upper and lower bounds of each input. For input I_p, $\tilde{A}^2_{I_p}$, respectively. Similarly, for input I_b, one has: the upper and lower memberships are obtained as:

$$\bar{\mu}_{\tilde{A}^1_{I_p}|\alpha}(I_p) = exp\left(-\frac{\left(I_p - \underline{c}_{\tilde{A}^1_{I_p}}\right)^2}{\bar{\sigma}^2_{\tilde{A}^1_{I_p}|\alpha}}\right) \tag{10}$$

$$\bar{\mu}_{\tilde{A}_{I_p}^2|\alpha}(I_p) = exp\left(-\frac{\left(I_p-\bar{c}_{\tilde{A}_{I_p}^2}\right)^2}{\bar{\sigma}^2_{\tilde{A}_{I_p}^2|\alpha}}\right) \tag{11}$$

$$\underline{\mu}_{\tilde{A}_{I_p}^1|\alpha}(I_p) = exp\left(-\frac{\left(I_p-\underline{c}_{\tilde{A}_{I_p}^1}\right)^2}{\underline{\sigma}^2_{\tilde{A}_{I_p}^1|\alpha}}\right) \tag{12}$$

$$\underline{\mu}_{\tilde{A}_{I_p}^2|\alpha}(I_p) = exp\left(-\frac{\left(I_p-\bar{c}_{\tilde{A}_{I_p}^2}\right)^2}{\underline{\sigma}^2_{\tilde{A}_{I_p}^2|\alpha}}\right) \tag{13}$$

Where, α is the level of the horizontal slice. $\tilde{A}_{I_p}^1$ and $\tilde{A}_{I_p}^2$ are the first and second MFs for input I_p. $\underline{c}_{\tilde{A}_{I_p}^1}$ and $\bar{c}_{\tilde{A}_{I_p}^2}$ are the centres of $\tilde{A}_{I_p}^1$ and $\tilde{A}_{I_p}^2$, respectively. $\bar{\sigma}_{\tilde{A}_{I_p}^1|\alpha}/\underline{\sigma}_{\tilde{A}_{I_p}^1|\alpha}$ and $\bar{\sigma}_{\tilde{A}_{I_p}^2|\alpha}/\underline{\sigma}_{\tilde{A}_{I_p}^2|\alpha}$ are the standard division for the upper/lower bounds of $\tilde{A}_{I_p}^1$ and $\tilde{A}_{I_p}^2$, respectively. Similarly, for input I_b, one has:

$$\bar{\mu}_{\tilde{A}_{I_b}^1|\alpha}(I_b) = exp\left(-\frac{\left(I_b-\underline{c}_{\tilde{A}_{I_b}^1}\right)^2}{\bar{\sigma}^2_{\tilde{A}_{I_b}^1|\alpha}}\right) \tag{14}$$

$$\bar{\mu}_{\tilde{A}_{I_b}^2|\alpha}(I_b) = exp\left(-\frac{\left(I_b-\bar{c}_{\tilde{A}_{I_b}^2}\right)^2}{\bar{\sigma}^2_{\tilde{A}_{I_b}^2|\alpha}}\right) \tag{15}$$

$$\underline{\mu}_{\tilde{A}_{I_b}^1|\alpha}(I_b) = exp\left(-\frac{\left(I_b-\underline{c}_{\tilde{A}_{I_b}^1}\right)^2}{\underline{\sigma}^2_{\tilde{A}_{I_b}^1|\alpha}}\right) \tag{16}$$

$$\underline{\mu}_{\tilde{A}_{I_b}^2|\alpha}(I_b) = exp\left(-\frac{\left(I_b-\bar{c}_{\tilde{A}_{I_b}^2}\right)^2}{\underline{\sigma}^2_{\tilde{A}_{I_b}^2|\alpha}}\right) \tag{17}$$

Where, $\tilde{A}_{I_b}^1$ and $\tilde{A}_{I_b}^2$ are the first and second MFs for input Ib. $\underline{c}_{\tilde{A}_{I_b}^1}$ and $\bar{c}_{\tilde{A}_{I_b}^2}$ are the centres of $\tilde{A}_{I_b}^1$ and $\tilde{A}_{I_b}^2$, respectively. $\bar{\sigma}_{\tilde{A}_{I_b}^1|\alpha}/\underline{\sigma}_{\tilde{A}_{I_p}^1|\alpha}$ and $\bar{\sigma}_{\tilde{A}_{I_b}^2|\alpha}/\underline{\sigma}_{\tilde{A}_{I_b}^2|\alpha}$ are the standard division for the upper/lower bounds of $\tilde{A}_{I_b}^1$ and $\tilde{A}_{I_b}^2$, respectively. Finally, for input V_c, one has:

$$\bar{\mu}_{\tilde{A}_{V_c}^1|\alpha}(V_c) = exp\left(-\frac{\left(V_c-\underline{c}_{\tilde{A}_{V_c}^1}\right)^2}{\bar{\sigma}^2_{\tilde{A}_{V_c}^1|\alpha}}\right) \tag{18}$$

$$\bar{\mu}_{\tilde{A}_{V_c}^2|\alpha}(V_c) = exp\left(-\frac{\left(V_c-\bar{c}_{\tilde{A}_{V_c}^2}\right)^2}{\bar{\sigma}^2_{\tilde{A}_{V_c}^2|\alpha}}\right) \tag{19}$$

$$\underline{\mu}_{\tilde{A}_{V_c}^1|\alpha}(V_c) = exp\left(-\frac{\left(V_C-\underline{c}_{\tilde{A}_{V_c}^1}\right)^2}{\underline{\sigma}^2_{\tilde{A}_{V_c}^1|\alpha}}\right) \tag{20}$$

$$\underline{\mu}_{\tilde{A}_{V_c}^2|\alpha}(V_c) = exp\left(-\frac{\left(V_c-\bar{c}_{\tilde{A}_{V_c}^2}\right)^2}{\underline{\sigma}^2_{\tilde{A}_{V_c}^2|\alpha}}\right) \tag{21}$$

Where, $\tilde{A}_{V_c}^1$ and $\tilde{A}_{V_c}^2$ are the first and second MFs for input V_c. $\underline{c}_{\tilde{A}_{V_c}^1}$ and $\bar{c}_{\tilde{A}_{V_c}^2}$ are the centres of $\tilde{A}_{V_c}^1$ and $\tilde{A}_{V_c}^2$, respectively. $\bar{\sigma}_{\tilde{A}_{V_c}^1|\alpha}/\underline{\sigma}_{\tilde{A}_{V_c}^1|\alpha}$ and $\bar{\sigma}_{\tilde{A}_{V_c}^2|\alpha}/\underline{\sigma}_{\tilde{A}_{V_c}^2|\alpha}$ are the standard division for the upper/lower bounds of $\tilde{A}_{V_c}^1$ and $\tilde{A}_{V_c}^2$, respectively. 3) The output of $\hat{f}_1$ and $\hat{f}_2$ are:

$$\hat{f}_1 = \theta_1^T\zeta_1 \tag{22}$$

$$\hat{f}_2 = \theta_2^T\zeta_2 \tag{23}$$

Where, θ_i and ζ_i are:

$$\theta_i = \left[\underline{w}_{i1}, \dots, \underline{w}_{iR}, \overline{w}_{i1}, \dots, \overline{w}_{iR}\right]^T \tag{24}$$

$$\zeta_i = \left[\underline{\zeta}_{i1}, \dots, \underline{\zeta}_{iR}, \bar{\zeta}_{i1}, \dots, \bar{\zeta}_{iR}\right]^T \tag{25}$$

Where, $\overline{w}_{i1}$ and $\underline{w}_{i1}$ are the parameters of $l-$th rule for $i-$th IT3-FLS and R represents the number of rules. $\underline{\zeta}_{i1}$ and $\bar{\zeta}_{i1}$ are:

$$\bar{\zeta}_l = \frac{\sum_{j=1}^{n_\alpha} \bar{\alpha}_j \frac{\bar{z}^l_{\mu s=\bar{\alpha}_j}}{\sum_{l=1}^{R}\left(\bar{z}^l_{\mu s=\bar{\alpha}_j} + \underline{z}^l_{\mu s=\bar{\alpha}_j}\right)}}{\sum_{j=1}^{n_\alpha}(\bar{\alpha}_j + \underline{\alpha}_j)} + \frac{\sum_{j=1}^{n_\alpha} \underline{\alpha}_j \frac{\bar{z}^l_{\mu s=\underline{\alpha}_j}}{\sum_{l=1}^{R}\left(\bar{z}^l_{\mu s=\underline{\alpha}_j} + \underline{z}^l_{\mu s=\underline{\alpha}_j}\right)}}{\sum_{j=1}^{n_\alpha}(\bar{\alpha}_j + \underline{\alpha}_j)}, \; l = 1, \dots 8 \tag{26}$$

$$\underline{\zeta}_l = \frac{\sum_{j=1}^{n_\alpha} \bar{\alpha}_j \frac{\underline{z}^l_{\mu s=\bar{\alpha}_j}}{\sum_{l=1}^{R}\left(\bar{z}^l_{\mu s=\bar{\alpha}_j} + \underline{z}^l_{\mu s=\bar{\alpha}_j}\right)}}{\sum_{j=1}^{n_\alpha}(\bar{\alpha}_j + \underline{\alpha}_j)} + \frac{\sum_{j=1}^{n_\alpha} \underline{\alpha}_j \frac{\underline{z}^l_{\mu s=\underline{\alpha}_j}}{\sum_{l=1}^{R}\left(\bar{z}^l_{\mu s=\underline{\alpha}_j} + \underline{z}^l_{\mu s=\underline{\alpha}_j}\right)}}{\sum_{j=1}^{n_\alpha}(\bar{\alpha}_j + \underline{\alpha}_j)}, \; l = 1, \dots 8 \tag{27}$$

Where, n_α is the number of horizontal slices and:

$$\underline{\zeta}_l = \frac{\sum_{j=1}^{n_\alpha} \bar{\alpha}_j \frac{\underline{z}^l_{\mu s=\bar{\alpha}_j}}{\sum_{l=1}^{R}\left(\bar{z}^l_{\mu s=\bar{\alpha}_j} + \underline{z}^l_{\mu s=\bar{\alpha}_j}\right)}}{\sum_{j=1}^{n_\alpha}(\bar{\alpha}_j + \underline{\alpha}_j)} + \frac{\sum_{j=1}^{n_\alpha} \underline{\alpha}_j \frac{\underline{z}^l_{\mu s=\underline{\alpha}_j}}{\sum_{l=1}^{R}\left(\bar{z}^l_{\mu s=\underline{\alpha}_j} + \underline{z}^l_{\mu s=\underline{\alpha}_j}\right)}}{\sum_{j=1}^{n_\alpha}(\bar{\alpha}_j + \underline{\alpha}_j)}, \; l = 1, \dots R \tag{28}$$

The rules are written as:

Rule #1: If I_p is $\tilde{A}^1_{I_p}|\alpha$ and I_b is $\tilde{A}^1_{I_b}|\alpha$ and V_c is $\tilde{A}^1_{V_c}|\alpha$
Then $\hat{f}_i \in [\underline{w}_{i1}, \overline{w}_{i1}]$
Rule #2: If I_p is $\tilde{A}^1_{I_p}|\alpha$ and I_b is $\tilde{A}^1_{I_b}|\alpha$ and V_c is $\tilde{A}^2_{V_c}|\alpha$
Then $\hat{f}_i \in [\underline{w}_{i2}, \overline{w}_{i2}]$
Rule #3: If I_p is $\tilde{A}^1_{I_p}|\alpha$ and I_b is $\tilde{A}^2_{I_b}|\alpha$ and V_c is $\tilde{A}^1_{V_c}|\alpha$
Then $\hat{f}_i \in [\underline{w}_{i3}, \overline{w}_{i3}]$
Rule #4: If I_p is $\tilde{A}^1_{I_p}|\alpha$ and I_b is $\tilde{A}^2_{I_b}|\alpha$ and V_c is $\tilde{A}^2_{V_c}|\alpha$
Then $\hat{f}_i \in [\underline{w}_{i4}, \overline{w}_{i4}]$
Rule #5: If I_p is $\tilde{A}^2_{I_p}|\alpha$ and I_b is $\tilde{A}^1_{I_b}|\alpha$ and V_c is $\tilde{A}^1_{V_c}|\alpha$
Then $\hat{f}_i \in [\underline{w}_{i5}, \overline{w}_{i5}]$
Rule #6: If I_p is $\tilde{A}^2_{I_p}|\alpha$ and I_b is $\tilde{A}^1_{I_b}|\alpha$ and V_c is $\tilde{A}^2_{V_c}|\alpha$
Then $\hat{f}_i \in [\underline{w}_{i6}, \overline{w}_{i6}]$
Rule #7: If I_p is $\tilde{A}^2_{I_p}|\alpha$ and I_b is $\tilde{A}^2_{I_b}|\alpha$ and V_c is $\tilde{A}^1_{V_c}|\alpha$
Then $\hat{f}_i \in [\underline{w}_{i7}, \overline{w}_{i7}]$
Rule #8: If I_p is $\tilde{A}^2_{I_p}|\alpha$ and I_b is $\tilde{A}^2_{I_b}|\alpha$ and V_c is $\tilde{A}^2_{V_c}|\alpha$
Then $\hat{f}_i \in [\underline{w}_{i8}, \overline{w}_{i8}]$

In the type-3 MFs, the secondary membership is not a crisp value but it is a fuzzy set. Also a horizontal slice of a level $\mu_s = \alpha_k$ is equal with two slices at levels $\mu_s = \underline{\alpha}_k$ and $\mu_s = \overline{\alpha}_k$ in type-2 counterpart. Consequently, the research proposed a swarm-based hybrid metaheuristic optimizer of the Bacterial Foraging Optimization Algorithm (BFOA) which optimally tunes and controls the fuzzy controller parameters.

4.3.2 Enhanced Controller efficiency by BFOA

Initiating the deployment of the Bacterial Foraging Optimization Algorithm to refine the operations of a fuzzy type-3 controller within a microgrid framework involves a sequence of strategic steps. Commence with the construction of a detailed microgrid model encapsulating its integral components—distributed generation units,

storage mechanisms, consumer loads, and command modules. Forge a sophisticated fuzzy type-3 controller, crafted to govern the intricacies of power distribution, voltage modulation, and frequency stabilization, pinpointing the specific variables that warrant enhancement. Subsequently, establish a robust objective function adept at evaluating the microgrid's operational efficacy, engaging metrics that aim to curtail energy dissipation, equilibrate supply-demand dynamics, fortify voltage constancy, and augment frequency adherence. Proceed to meticulously calibrate the BFOA configurations, setting parameters such as bacterial population foundation, chemotaxis stages, navigational duration, procreation sequencing, and the probability metrics for elimination and dispersal phases. Culminate by methodically applying the BFOA, refining the controller parameters through iterative optimization, assiduously informed by the designated objective function's feedback, to realize an apex in microgrid performance (Das et al., 2009) (Hu et al., 2020)

4.3.2.1 Pseudo-code for BFOA-based Optimization

Initialize microgrid model and fuzzy type-3 controller parameters
Define objective function F(x) to evaluate microgrid performance

Initialize BFOA parameters:
S (number of bacteria)
Nc (number of chemotactic steps)
Ns (swim length)
Nre (number of reproduction steps)
Ned (number of elimination-dispersal events)
Ped (elimination-dispersal probability)

Initialize bacteria positions randomly in the search space

FOR each elimination-dispersal event
FOR each reproduction step
FOR each chemotactic step
FOR each bacterium i

Compute the objective function F(x) for current position

Tumble: generate a random direction Δ(i)
Move: compute new position using Δ(i)

Compute F(x) at new position

WHILE (not better or swim length not exceeded)
Move in the same direction and compute F(x)
END WHILE
END FOR

Implement swarming behavior

END FOR
Sort bacteria based on objective function value
Reproduce: eliminate least healthy half and split the healthier half
END FOR
Eliminate and disperse bacteria with probability Ped
END FOR
Output the optimized fuzzy type-3 controller parameters
Apply optimized controller to the microgrid and validate performance

By integrating the optimized parameters into the fuzzy type-3 controller and simulating the microgrid operation, you can validate the performance by comparing it against predefined benchmarks or previous configurations. If necessary, iterate the optimization process, adjusting the BFOA parameters for improved results and leading to enhanced system performance and stability.

However, most fuzzy controllers are static in that they respond only to current input, so they may not offer any improvement over the dynamic nature of designs. By replacing nonlinear and time-varying aspects of a neural network with uncertainties, a robust reinforcement learning procedure results that are guaranteed to remain stable even as the neural network is being trained.

4.6 Power Quality Analysis

In this study, a new reactive power control strategy is employed for optimization of the reactive power along with the stability improvement of the system under different small perturbed conditions. Therefore, this study focuses on controlling the reactive power of the hybrid power system model with the aid of a Static Synchronous Compensator (STATCOM). Further, evaluate the renewable energy resources' penetration limit of the AC-DC hybrid grid, which considers both economy and safety. The static stability indicators are considered for an evaluation of the penetration limit of RES.

4.6.1 Implementation of STATCOM as a Reactive Compensator

STATCOM is developed on the solid-state-based synchronous source of voltage which replicates a synchronous machine of ideal nature. It generates a set of 3-phase balanced sinusoidal voltages at the fundamental frequency by continuous controlling of phase angle and amplitude. The schematic of the STATCOM and its equivalent structure has been given in Fig. 6. A illustrated in Fig. 6, the voltage source converter, DC capacitor, and coupling transformer. The real part of the STATCOM controller current is insignificant and considered zero. The reactive current can be controlled by the variation of α and δ.

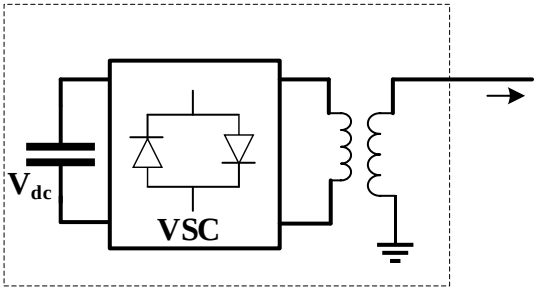

Fig. 6: Schematic Diagram for STATCOM Configuration

In this paper, α is the STATCOM's fundamental output voltage (kV_{dc}) phase angle and δ is the phase angle of the system bus voltage, U where the STATCOM is connected. The amplitude of the converter's fundamental output voltage is $kU_{dc}$where U_{dc}represents DC voltage developed in between the DC capacitor. The STATCOM controller injecting the reactive power to the connected bus has been given as in equation (30).

$$Q_{STATCOM} = kU_{dc}^2 B - kU_{dc} UB\ cos\ (\alpha - \delta) + kU_{dc} UG\ sin(\alpha - \delta) \quad (29)$$

In the considered HPS, bus voltage is taken as a reference voltage; so, the bus angle (δ) is zero. In the above equation, the G term is also insignificant, because $(G + jB)$ characterizes the admittance of the step-down transformer. Thus, equation (30) now becomes equation (31), considering G and δ as zero.

$$Q_{STATCOM} = kU_{dc}^2 B - kU_{dc} UB\ cos\alpha \quad (30)$$

Here, in equation (31), U and α, are the variable terms on which the reactive power depends; under the small perturbations, the change in reactive power of STATCOM can be written as equation (32).

$$\Delta Q_{STATCOM}(s) = G_1 \Delta\alpha(s) + G_2 \Delta U(s) \quad (31)$$

Where, $G_1 = kU_{dc}UB\ sin\alpha$ and $G_2 = kU_{dc}UB\ cos\alpha$.

It evaluates the renewable energy resources' penetration limit of the AC-DC hybrid grid, which considers both economy and safety. The static stability indicators are considered for an evaluation of the penetration limit of RES.

4.7 Loads, Energy storage Devices and utility Grid

DC Load: Devices that consume direct currents, such as DC machines, electric vehicles, and many electronic devices, are defined as DC loads. Similarly to the DC source, the DC load is represented as a controlled direct current source, but functions by absorbing power from the microgrid.

AC Load: The AC loads are represented by sets of impedance, composed of balanced three-phase resistors and inductances in series. Thus, these AC loads consume the active and reactive power of the AC microgrids (ACMG). The input and output of such loads occur according to the desired power profiles.

Nonlinear Load: The nonlinear load represents devices that distort the electrical current waveform, contaminating the grid with harmonic content. Such loads are modelled as a diode rectifier bridge with a resistive load and inductive filter at the input. The distortion in the waveform occurs due to the harmonic components added to the fundamental sinusoidal current. These harmonic distortions cause issues in the utility grid, thereby affecting the power quality of the energy supplied by the system.

Energy Storage Device: Among different existing energy storage technologies, Li-ion batteries are chosen as ESD in this work. The dynamic behaviour of such ESD is based on the Shepherd model, which represents the battery as a controlled DC source in series with internal resistance.

It is possible to describe, in a simplified way, the output voltage of the battery bank, according to equation (1).

$$V_{bat} = E_{bat} - R_{bat} I_{bat} \quad (32)$$

Where, V_{bat} and E_{bat} are the output and internal battery voltage, respectively; R_{bat} is the internal resistance, and I_{bat} is the battery's electrical current.

Utility Grid: Despite the main aspect of a microgrid being the possibility of operating in the standalone or grid-connected mode, this paper focuses exclusively on studying the grid-connected operation. In this study, the utility grid is implemented by a balanced, 60 Hz, three-phase, 220 V RMS, phase-to-phase AC source. Each voltage source represents a phase, with 120o of phase-shift between each phase, in the positive sequence. RL impedances are employed to characterize the conductors' dynamic effect, emulating the transmission line impedances. The value of these impedances is determined according to conventional short-circuit power for electrical distribution systems.

5. Simulation results

The simulation of the proposed hybrid microgrid involves modelling various components, integrating them into a unified system, and analysing performance under different operating conditions using MATLAB 2023a environment. The simulation is conducted on a Personal Computer System running Windows 11 Operating System with 6GB DDR3 of RAM and Intel Core i7 processor @ 3.5GHz. The total simulation time amounts to 10.190 seconds including power flow analysis and power quality evaluation at the DC-link of the DC Microgrid and the utility grid. The system includes loads and sources rated up to 4.5 kW, along with interlinkingconverters designed for a nominal power of 3 kW to ensure efficient hybrid power system operation based on selected inductors and capacitors which meet voltage ripple requirements as well as nominal power needs of the power converters. This accurate simulation models effectively analysing its performance under variousconditions using high-performance computer configurations advantageous in demonstrating successful integration of various components within this complex energy network while providing valuable insights into its feasibility showcasing effective component integration enabling smooth operations across diverse scenarios.

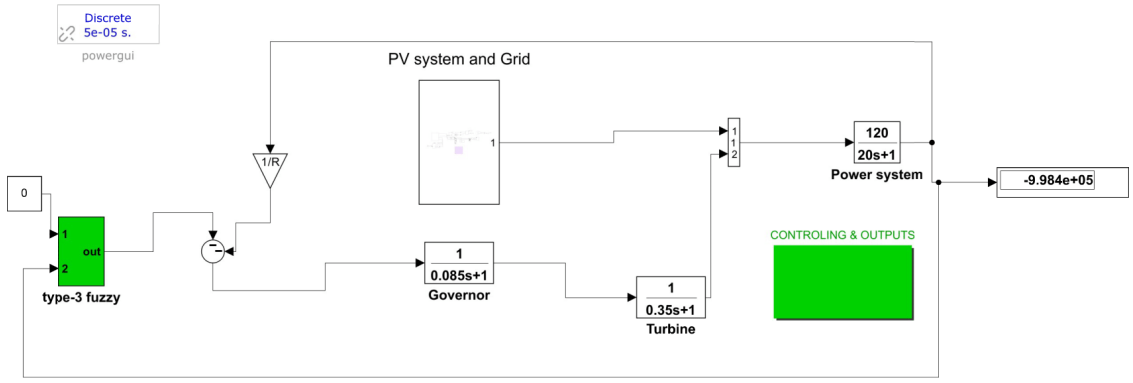

Fig.7. Simulation Model for Hybrid Renewable Energy Resources

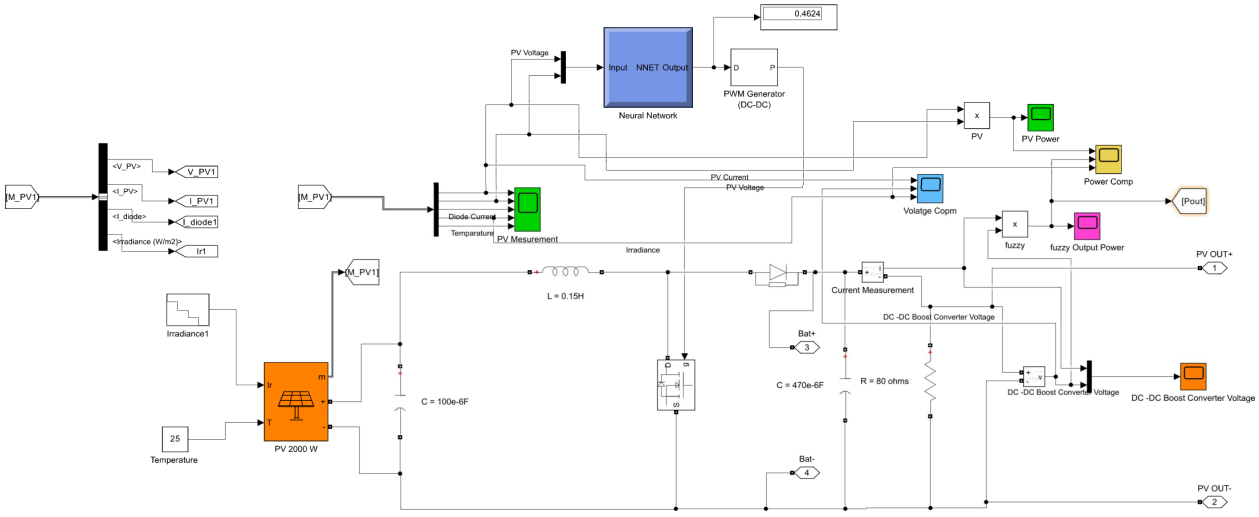

Fig. 8. Simulation Model of AI Based MPPT Scheme

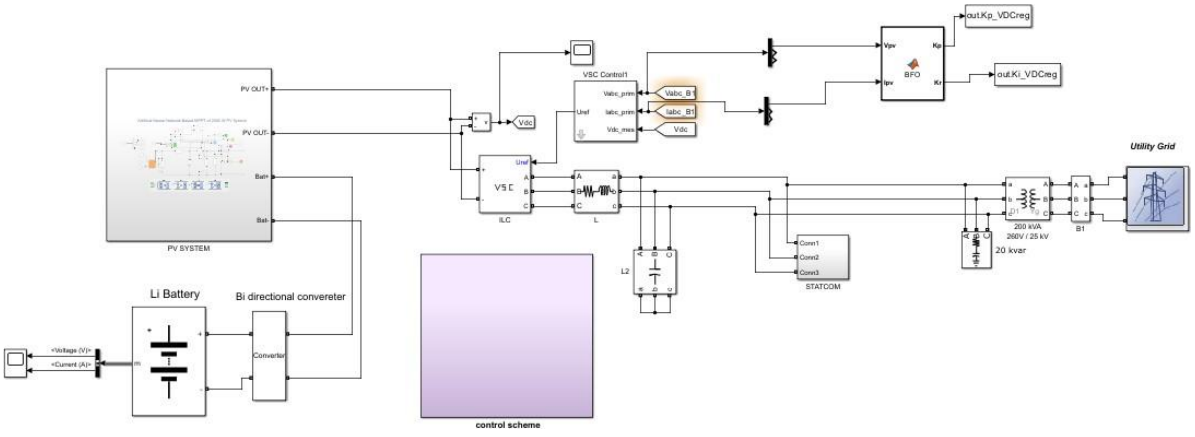

Fig.9. Proposed Simulation Model of PV system and Grid

The simulation model for hybrid renewable energy resources, illustrated in Fig. 7,8,9 was developed using MATLAB/Simulink. In this hybrid PV system, the PV array serves as the primary power source. Renewable energy sources are connected in parallel, with a battery connected across this parallel combination. The battery discharges when the voltage exceeds 30V and charges when the voltage drops below 30V. In this Battery circuit, if the semi-oxide concentration decreases linearly then the battery voltage drops rapidly.

The Key components in this model include the PV Panel with AI based MPPT, Type 3 fuzzy Controller, Bidi-rectional converter ,DC/DC converter, battery model, and power system. The optimum power control and pitch angle control mechanisms drive the induction generator. The turbine's external inputs are wind speed and rotor speed. The main

objective of the grid-side converter is to regulate the DC link capacitor voltage and control power flow between the DC bus and the AC side.

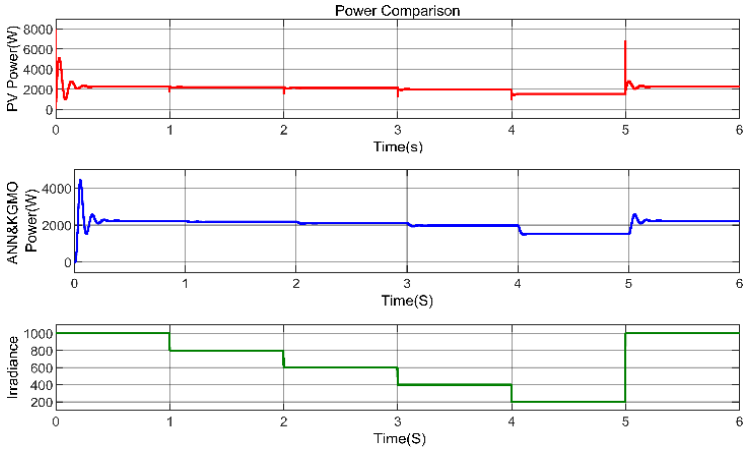

Fig. 10(a). Power Comparison from ANN-KGMO *method*

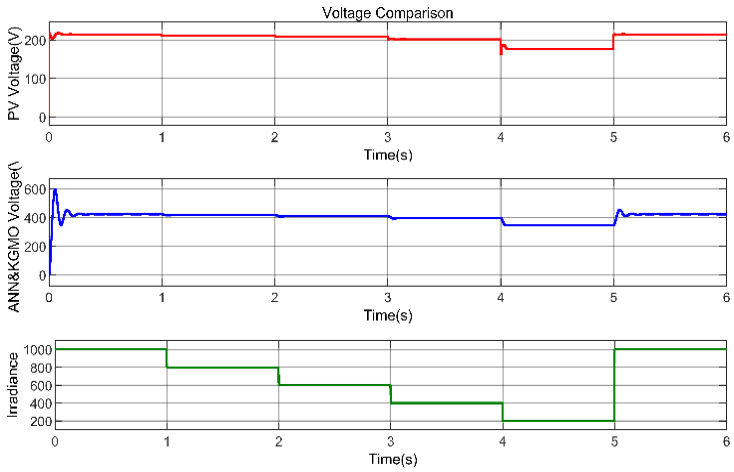

Fig. 10(b). Voltage Comparison from ANN-KGMO *method*

Fig. 10 shows the simulation outcome with ANN-KGMO based MPPT tracking algorithm is more reliable than the conventional control methods. It has less settling time with no steady state oscillations and more power output.

It is observed that ANN-KGMO based MPPT algorithm regulates the output voltage at 400V and hence the power at 2000 W with rapid step changes in the solar irradiance.

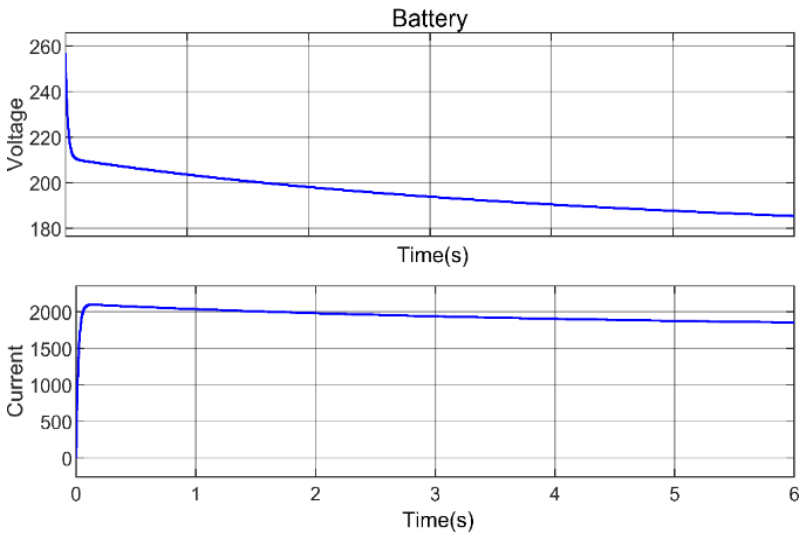

Fig.11. Current and Voltage Graph for Battery

The current and voltage graph for the battery is presented in Fig. 11. It produces a battery current of approximately 1900 A for 6 second. However, the voltage produced due to the battery is approximately 190 V for time 6 second. The input charging current to the battery stack in a photovoltaic hybrid solution will not be constant due to the atmospheric conditions and the time of day.

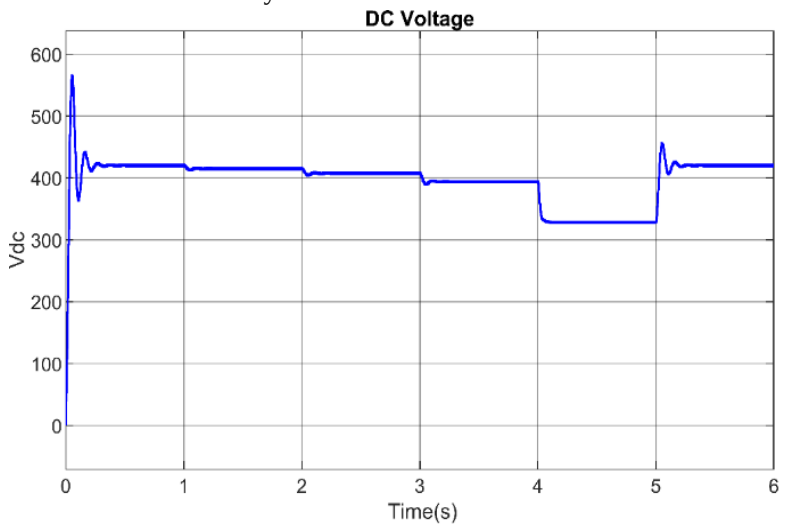

Fig.12. Response of Hybrid V_{dc} value

Fig. 12 the simulation results of ANN-KGMO methods and Battery DC Voltage at 25°C temperature and light intensity is varied from 1000 to 200 W/m^2 in steps at rate of 200 W/m^2 per second. After reaching 200 W/m^2 the intensity is varied to 1000W/m^2 in single step. Upto 4 sec (400 W/m^2) seconds the output voltage is maintained approximately 410V but after reaching 200 W/m^2 at 4 second the DC Voltage value reduced to 340V and gain the intensity is varied to 1000W/m^2 in single step the DC Voltage is reached to approximately 410V.

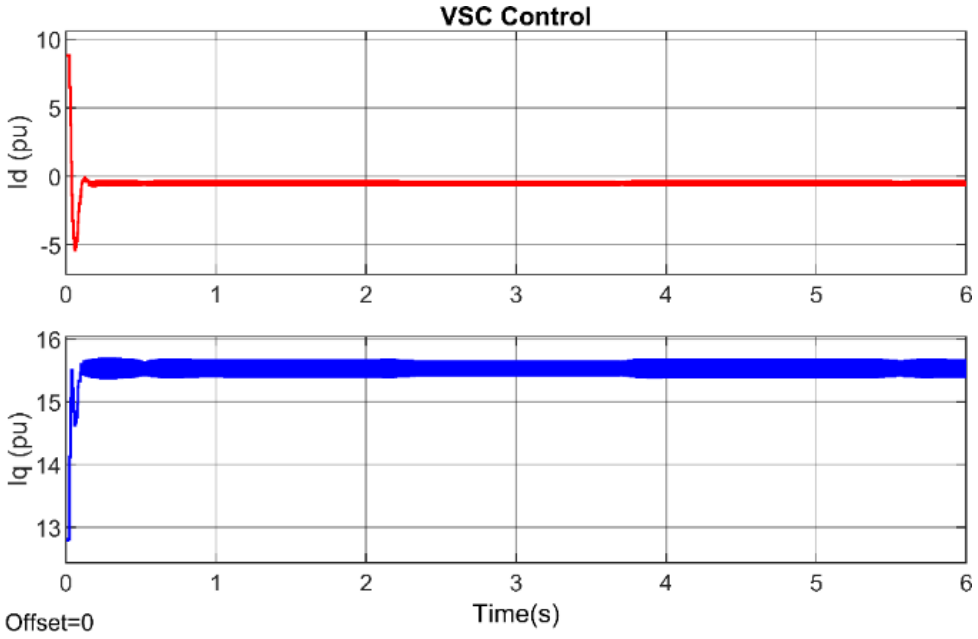

Fig.13. Response of I_d, I_q in VSC Conrol

Fig. 13. shows the high quality of the current injected into the grid with the proposed current control scheme. This result meets the requirements of the grid-connection standard. The grid voltage produces 1.9 X 10^4 V. The grid voltage harmonic disturbances are rejected by the robust ADRC controller, leading to much better performance.

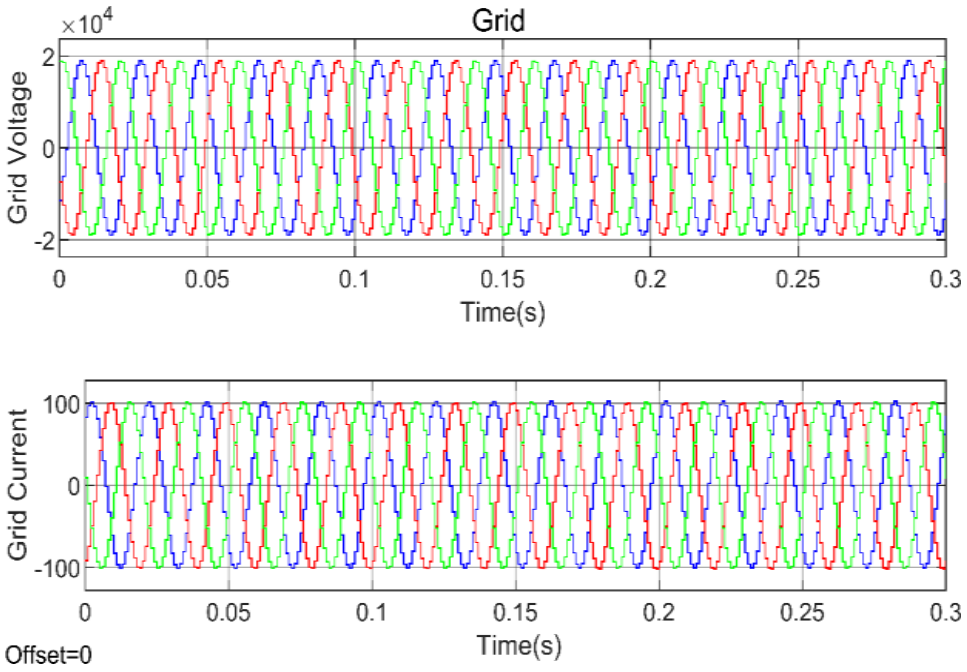

Fig.14. Grid Current and Grid Voltage

Fig. 14 reveals the grid current and grid voltage. The grid current is regulated to its nominal value and is in phase with the grid voltage as can be seen in Fig. 9. The grid voltage produces 1.9 X 10^4 V.

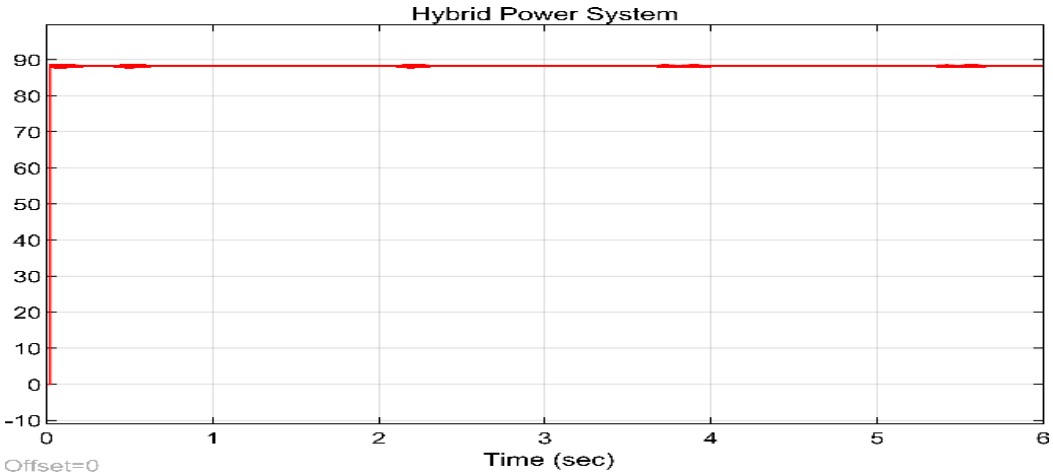

Fig.15. Response of Power for proposed hybrid power system

The power graph for the proposed hybrid power system is presented in Fig. 15. It produces approximately 90 kW of power generated from hybrid power systems. This power value is measured based on the time seconds. This reading of power was measured when the time was 0 to 6 second, respectively. The temperature is set at 25 degrees Celsius, and the light intensity is gradually reduced from 1000 to 200 W/m^2 at a rate of 200 W/m^2/s. After attaining 200 W/m2, the intensity is increased in one step to 1000 W/m2. The light intensity varied with respect to time but power generated by proposed hybrid power system was maintained constant that is approximately 90 kW.

Fig. 16 appearances PLL frequency and ω under different conditions. The frequency was maintained constant and Output 1: Measured frequency (Hz)=w/(2pi), Output 2: Ramp w.t varying between 0 and 2*pi, synchronized on zero crossings of the fundamental (positive-sequence) of phase A. parameters are Minimum frequency (Hz):45, Initial inputs [Phase (degrees), Frequency (Hz)]:[0,60] and For optimal performance, set regulator gains [K_p K_i K_d] = [180 3200 1] and check the Enable Automatic Gain Control parameter. Com- pared to API, it has been found that the proposed controller results in more improvement of the DC-side volt-age within the operating frequency range of the ac-side of the ILC.

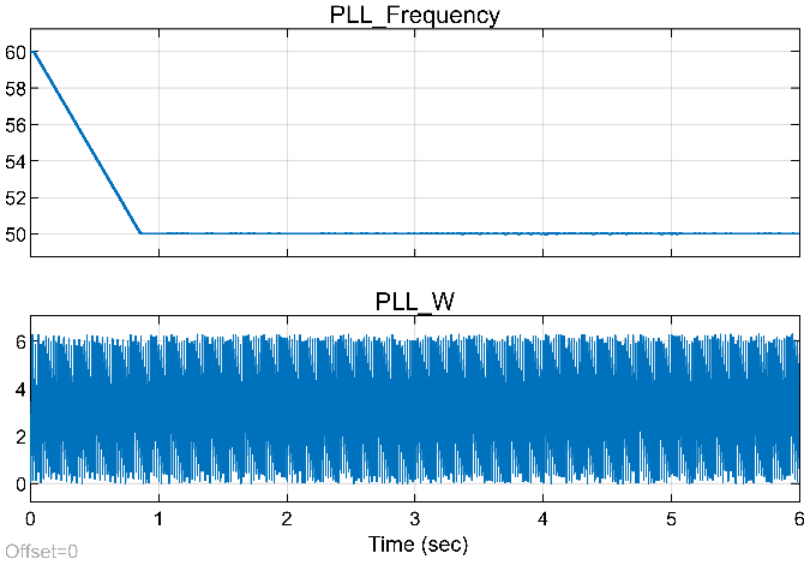

Fig.16. Response of PLL frequency and ω

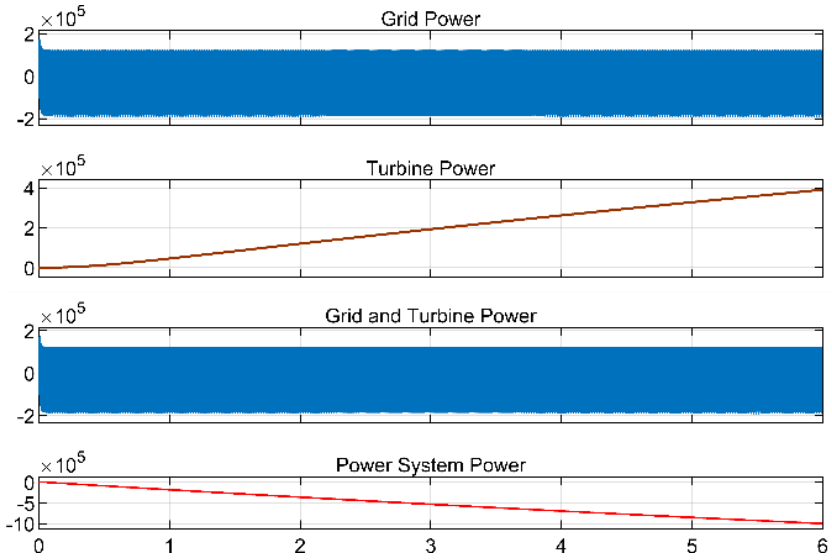

Fig.17.Response of Power for proposed powersystem powers

Fig. 17 appearances of grid, turbine, grid_turbine and finally power system outputs as present. Which has running 6 sec with different conditions however grid maintained constant output levels so turbine gives the residual power to the hybrid renewable energy sources. These results demonstrated the ability of the proposed redesigned interlinking converters to regulate power flow under all hybrid microgrid operating situations whilealso delivering the needed ancillary services. In the future, investigations on deep uncertainty analysis and stability analysis will be given, as well as the crea-tion of an intelligent control algorithm for the HMG.

Fig. 18 depicts the comparison graph for the overshoot voltage of converters. It shows the output voltage response with an overshoot of different converters' performance like P&O, FLC, and proposed converter. Based on the discussion the existing P&O method is unstable, and the FLC is stable but the proposed methodis more stable than these existing techniques. These perturbations are limited by the joint action of the output capacitor and the feedback control: the former limits the initial overshoot caused by a sudden change in load current, whereas the controller behaviour depends on the control circuit being used. From this Fig.18,

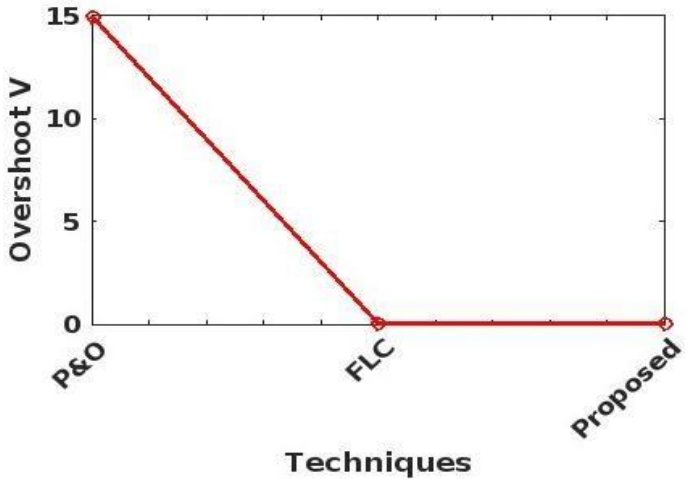

Fig.18. Comparison Graph for Overshoot Voltage

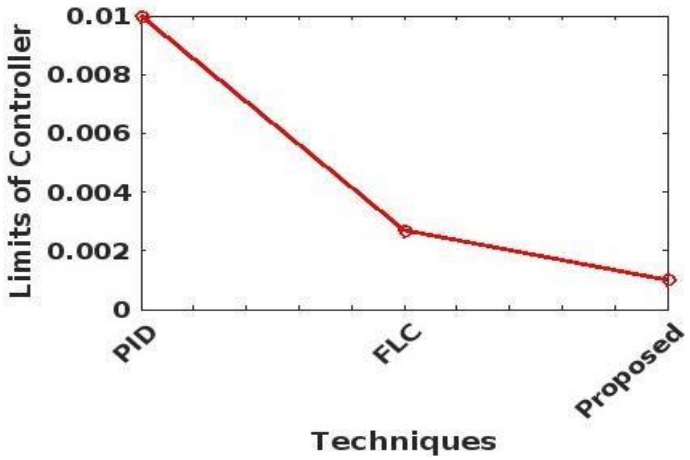

Fig.19. Comparison Graph for Limits of Controller

Fig. 19 depicts the comparison graph for Limits of Controller. In that The limits of the controller compared to the existing PID and FLC controllers are presented in this Fig. 19. The Fig. depicts that the limits of the PID controller are 0.01, and the limits of FLC controllers are 0.0027, however, the proposed method produces lower controller limits of 0.0013, respectively.

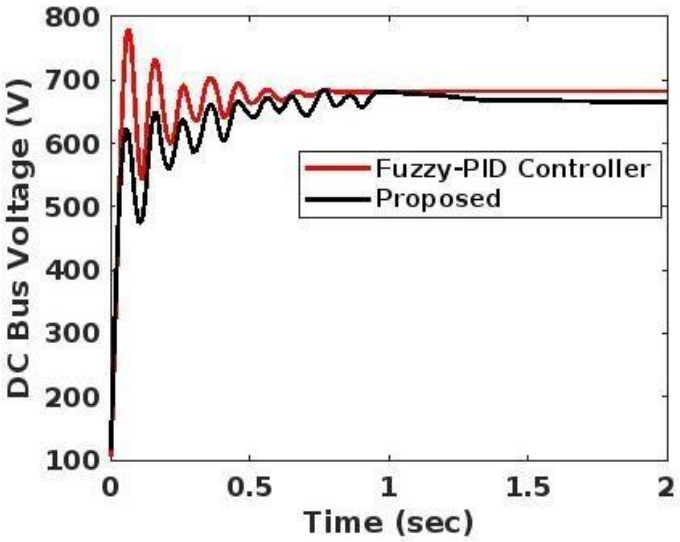

Fig.20 Comparison of DC Bus Voltage

Fig. 20 reveals the comparison graph for DC bus voltages, the proposed IT3-FLS controller is compared with the existing Fuzzy-PID controller. It can be observed that the error signal contains only the DC component due to the cancellation of the ripple component in the measured DC bus voltage. Consequently, the line currentwaveform is nearly sinusoidal.

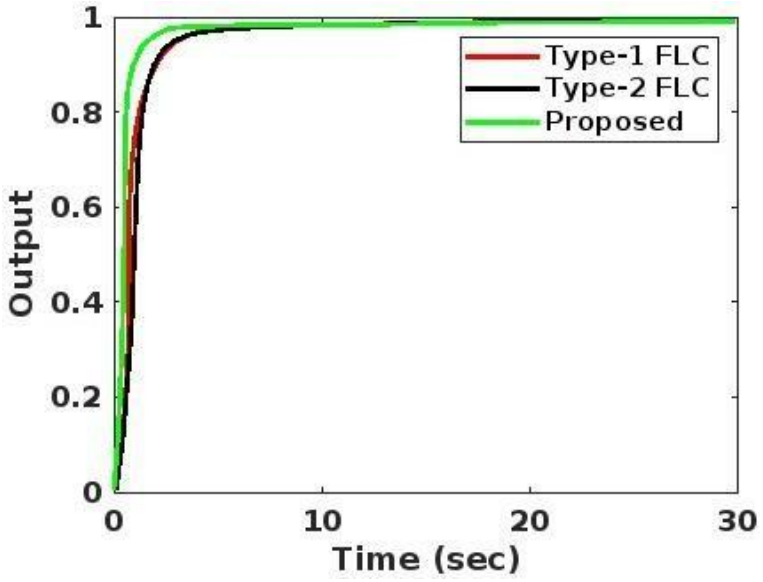

Fig.21. Comparison Graph for Dynamic Response of Controllers

Fig. 21 reveals the comparison graph of the dynamic response of different controllers. The proposed Interval Type-3 FLC is compared with the existing methods like Type-1 FLC, and Type-2 FLC. It evaluates the pro- posed method and knows the dynamic performance of the control system. From this Fig., the proposed method produces higher output dynamic response.

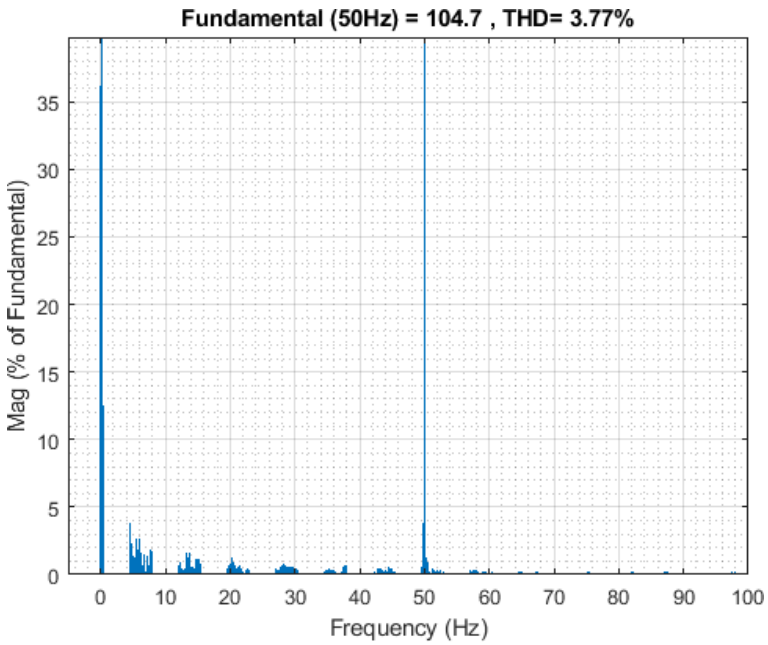

Fig.21. Grid Current % THD

From the IEEE – 519 Standard for Harmonic Control in Electric Power Systems suggests that total harmonicdistortion (THD) of the grid current has been maintained under 5% under all conditions. It is to be noted the grid current THD has been maintained under 3.77% as exposed in Fig. 21 and grid voltage THD has been maintained under 0.32% as presented in Fig. 22.

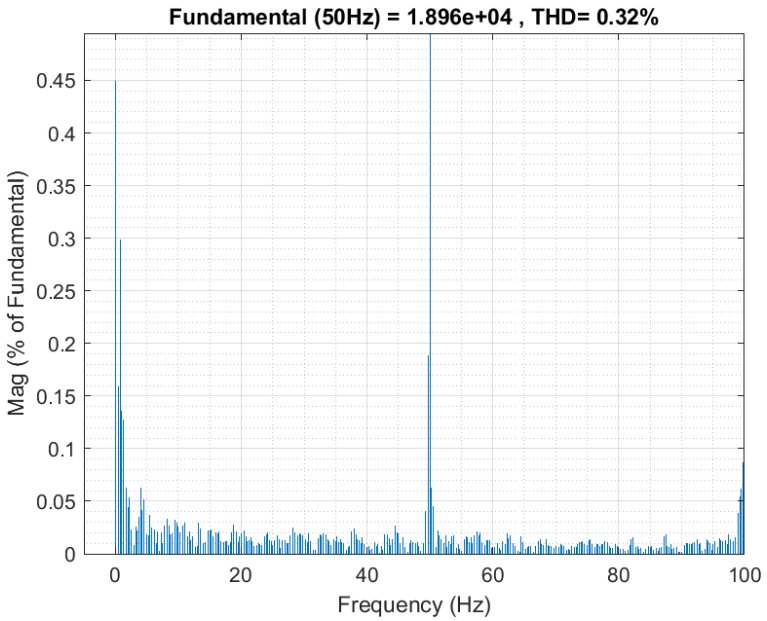

Fig.22. Grid Volatge % THD

Advanced hybrid AC/DC microgrid system integrating solar PV energy sources. A key feature of this systemis the AI-driven Maximum Power Point Tracking (MPPT) scheme used for the solar PV systems. In order to explore advanced control strategies, an interval type 3 fuzzy-based controller enhanced by the Bacterial For- aging Optimization Algorithm (BFOA) and interlinking drop control, ensure smooth operation and eliminationof harmonics. The grid voltage and current THD has been maintained under 5% with all conditions as per theIEEE-519 Standard.

5. Conclusion

A microgrid is a small-scale electrical system made up of distributed generation (DG) and energy storage devices (ESD) technologies designed to suit the needs of local loads. This paper proposes a Boost converter and a type-3 fuzzy controller, as well as a Swarm-based hybrid metaheuristic optimizer based on the Bacterial Foraging Optimization Algorithm (BFOA) for optimally tuning and managing the PI controller settings. Con- trolling the reactive power of the hybrid power system model using a Static Synchronous Compensator (STATCOM). In the MATLAB Simulink environment, a hybrid microgrid consisting of solar, battery, utilitygrid, and AC and DC loads is created using the AC and DC bus. The findings show that the suggested approach based on the algorithm outperforms the adaptive PI (API) controller in terms of rapid reaction time and tight regulation of power flow, voltage, and frequency under various situations. In comparison to API, the suggested controller improves the dc-side voltage within the working frequency range of the ac-side of the ILC. As a result, the penetration level characteristics are compared with the converter, and the suggested control approach is used to determine the efficiency of the hybrid power system. The grid voltage is 1.9 X 10^4 V, the battery current is around 1900 A for 6 seconds, and the voltage produced by the battery is around 190 V for 6 seconds. However, the acquired power-sharing diminishes the energy supplied by the power grid, avoiding focusing the required effort in the battery system. The power quality study demonstrated the efficiency of theinterlinking converters in reducing harmonic distortions and reactive power under all operating situations. Furthermore, the excellent performance of the voltage regulation, accomplished by a hierarchical control, was recorded and employed to rectify the voltage deviation induced by the droop technique. These results demonstrated the ability of the proposed redesigned interlinking converters to regulate power flow under all hybrid microgrid operating situations while also delivering the needed ancillary services. In the future, investigationson deep uncertainty analysis and stability analysis will be given, as well as the creation of an intelligent controlalgorithm for the HMG.

An Experimental Investigation on Steel Fiber Reinforced Self-Compacting Concrete Using Alccofine and Granite Powder

K. Vinodachari[1], Dr. D. V. Prasada Rao[2]

PG Student, Department of Civil Engineering, Sri Venkateswara University College of Engineering, Tirupati, India[1]

Professor, Department of Civil Engineering, Sri Venkateswara University College of Engineering, Tirupati, India[1]

ABSTARCT: *"The requirement for self-compacting concrete(SCC) in the construction area is increasing due to its benefits, such as easy finishing, excellent flow even in dense reinforcement, and enhanced structural integrity. In this experimental study, the binding materials are Ordinary Portland Cement (OPC), Alccofine-1203, and Granite Powder (GP). The mineral admixture of Alccofine-1203 helps to avoid segregation and bleeding while increasing workability. Granite powder (GP) is chosen as a suitable cement replacement due to its high silica content. To study the fresh and hardened properties of M30 Grade self-compacting concrete, the binder content is fixed at 500 kg/m³, with 70% OPC, 12% Alccofine-1203, and 18% GP. Furthermore, crimped steel fibers (CSF) are added at 1%, 2%, 3%, 4%, and 5% by the weight of binder content to improve the flexural strength of hardened concrete. The water-to-binder ratio is 0.4 for all the SCC mixes. The workability tests on SCC are performed according to the EFNARC 2005 Guidelines by Slump flow test (Diameter and T50), V-funnel, and L-Box. The mechanical properties of SCC studied include compressive, split tensile, flexural strength, and modulus of elasticity. Based on the test results, it can be observed the improved strength properties."*

Key words: Self-compacting concrete (SCC), Alccofine-1203, Granite powder, Crimped steel fibers, Mechanical properties

1. Introduction

Self-compacting concrete (SCC) is a special type of concrete that can settle into heavily reinforced, deep, and narrow sections by its own weight. It can consolidate itself without necessitating internal or external vibration while maintaining stability without leading to segregation and bleeding. SCC demands a large amount of powder content compared to conventional vibrated concrete to produce a homogeneous and cohesive mix. One of the disadvantages of SCC is its cost, which is associated with the use of chemical admixtures. One alternative to reduce the cost of SCC is the use of mineral additives such as limestone powder, Alccofine-1203, natural pozzolans, fly ash, slag, and granite powder, which are finely divided materials. Granite stone is one of the most commonly used building materials, leading to a high amount of waste, amounting to almost 50% of the volume of the final granite products, throughout its processing and extraction. Granite waste has accumulated over the years, with only negligible amounts being used, while the rest is dumped, resulting in environmental problems. As these mineral additives replace part of the Portland cement, the cost of SCC will be reduced, especially if the mineral additive is an industrial by-product or waste. Therefore, the use of these types of mineral additives in SCC will not only decrease the cost but also increase its long-term performance.

In this present experimental investigation, the self-compacting concrete achieved using Ordinary Portland cement, Alccofine-1203, Granite Powder, and a dosage of Chemical Admixture. In this study, the PCE-based superplasticizer BUILDPLAST-SP200(M) is used to achieve self-compacting concrete, with the dosage of chemical admixture set at 1.3% by weight of binder content, using a trial method in which the water-to-binder ratio is maintained constant at 0.4. Alccofine-1203 enhances the workability of concrete by acting as a micro-filler, reducing the water demand without

AN EXPERIMENTAL INVESTIGATION ON POLYPROPYLENE FIBER REINFORCED CONCRETE BY PARTIAL REPLACEMENT OF CEMENT WITH ALCCOFINE

Vadde Venkata Harish[1], Dr. D. V. Prasada Rao[2]

PG Student, Department of Civil Engineering, Sri Venkateswara University College of Engineering, Tirupati, India[1]

Professor, Department of Civil Engineering, Sri Venkateswara University College of Engineering, Tirupati, India[2]

ABSTRACT: *In this experimental investigation an attempt was made to study the feasibility and effectiveness of integrating Alccofine as a supplementary material in Polypropylene Fiber Reinforced Concrete of grade M25. Various concrete mixes with Alccofine substitution (5%, 10%, and 15%) were examined to determine the optimal percentage. The addition of Polypropylene fibers to concrete at 0.1%, 0.2%, 0.3%, and 0.4% by weight of concrete were prepared to determine the optimum dosage of Polypropylene fibres in concrete which is replaced with optimum Alccofine percentage. These fibers help control cracking from plastic and drying shrinkage, reduce concrete permeability, and enhance impact strength. Addition of Polypropylene fibres transforms the material from brittle to ductile. The study includes determination of compressive strength, split tensile strength, flexural strength and impact characteristics. The findings reveal that a combination of 10% Alccofine substitution along with 0.3% Polypropylene fibers leads to notable enhancement 45.3%, 35.6%, 16.67%, and 191% in compressive, split tensile, flexural, and impact strength, respectively, compared to control concrete. Based on the results it can be concluded that the combination of 10% Alccofine and 0.3% Polypropylene fibers in concrete significantly improves both the strength properties and impact strength of the concrete in comparison to control concrete.*

Keywords: *Polypropylene Fiber Reinforced concrete, Alccofine, impact characteristics, impact strength*

1. Introduction

The modern construction constantly evolves to meet the demands of sustainable development and enhanced performance. Conventional concrete compositions often rely heavily on Portland cement, a material associated with significant carbon emissions during its production. To address environmental concerns and improve concrete properties, innovative solutions such as Alccofine as partial replacement for cement offers multifaceted benefits. By reducing the cement content, these materials help lower carbon emission associated with concrete production, aligning with sustainability objectives. Moreover, to enhance the mechanical properties and Impact characteristics of concrete, resulting in structures that exhibit superior performance and longevity. Polypropylene fibers, derived from a thermoplastic polymer, is increasingly recognized for its ability to enhance the impact strength of concrete. When dispersed within the concrete matrix, these fibers act as reinforcement, improving tensile strength, crack resistance, and Impact characteristics. Additionally, Polypropylene fibers mitigate plastic shrinkage cracking and improve Impact strength, making them invaluable in various construction applications. Alccofine, a supplementary cementitious material, offers a sustainable alternative to conventional cement. Produced from finely ground aluminosilicate materials, Alccofine possesses pozzolanic properties that react with calcium hydroxide forming additional calcium silicate hydrate (C-S-H) gel. This reaction not only contributes to the densification of the concrete matrix but also enhances long-term strength of the concrete. Furthermore, Alccofine reduces the heat of hydration and mitigates alkali-silica reaction, thus improving the overall sustainability and performance of concrete structures. In this investigation the effects of incorporating Polypropylene fibers and Alccofine

BUILDING INFORMATION MODELLING OF AN EARTHQUAKE RESISTANT STRUCTURE

ABSTRACT

Constructing a structure that minimizes earthquake damage can be challenging due to the unpredictable nature of seismic events, making it seem impractical. However, this study focuses on developing earthquake-resistant structure by incorporating Building Information Modelling (BIM) in the design and detailing process. The primary focus is on a G+5 apartment building designed to withstand seismic forces and prioritize occupant safety during earthquakes. BIM technology, using software such as Revit, ETABS, SAFE, SketchUp, AutoCAD, etc., is employed to enhance the structural design. Starting with creating a detailed architectural plan for the G+5 structure and rendered different architectural 3d views by creating models in Blender software. Then the detailed seismic analysis and design is done in ETABS & SAFE as per seismic design code (IS:1893-2016). BIM tools generate a dynamic 3D model, facilitating the visualization and simulation of seismic responses. The project encompasses comprehensive Structural, Architectural, and MEP (Mechanical-Electrical-Plumbing) BIM. The BIM model serves as a central information repository, allowing for precise quantity take-offs and cost assessments. The study's outcomes contribute significantly to the advancement of earthquake-resistant building design, highlighting the efficiency of BIM in optimizing structural performance and cost-effectiveness. These findings hold relevance for professionals in structural engineering, architecture, and construction management, underscoring the pivotal role of integrating BIM in earthquake-resistant designs. Furthermore, the detailed cost estimation for the entire G+5 building is also included.

Keywords: Building Information Modelling (BIM), seismic resilience, G+5 apartment building, earthquake-resistant structure, cost estimation, architectural, MEP BIM.

I. INTRODUCTION

1.1 General

Designing earthquake-resistant structures is crucial in civil engineering, particularly in earthquake-prone areas. Building design must consider hindrances to earthquake forces and ensure adequate support to prevent collapse. In this G+5 project, advanced BIM tools like AutoCAD, ETABS, Revit, and SAFE are employed. These tools help as digital assistants, enhance the design process, provide detailed information, and optimize the building's resilience to both routine and seismic challenges.

In India the earthquake prone area is divided into 4 zones based upon their vulnerability to earthquakes. So, for designing any type of structure in these zones, there are some design codes (see in 1.2). Following these codes will ensure that our constructions are not only safe but also capable of withstanding earthquakes.

Design Guidelines: Structural designers must adhere to key standards for earthquake-resistant design:

- IS 1893: 2016: Criteria for Earthquake Resistant Design.
- IS 13920: 1993: Ductile Detailing of Reinforced Concrete Structures subjected to seismic forces.
- IS: 456–2000: Indian Standard Plain Reinforced Concrete Code of Practice (Fourth Revision).
- IS 875 (Part 1-5): 1987: Code of Practice for Design Loads (excluding earthquake) for Buildings and Structures (Second Revision), encompassing dead loads, live loads, wind loads, snow loads, and special loads.

These streamlined guidelines ensure structures are resilient to seismic challenges in their respective zones, promoting safety and structural integrity.

An Experimental Investigation on Glass Fiber Concrete by Partial Replacement of Cement with Alccofine

B.Girinath Naik[1], Dr. D. V. Prasada Rao[2]

PG Student, Department of Civil Engineering, Sri Venkateswara University College of Engineering, Tirupati, India[1]

Professor, Department of Civil Engineering, Sri Venkateswara University College of Engineering, Tirupati, India[2]

Abstract: Concrete is the most widely used construction material due to its strength, durability, and versatility. However, the production of cement, which is a key component of concrete, is a major contributor to greenhouse gas emission. The use of supplementary Cementitious materials (SCMs) can improve the properties of concrete, reduce use on natural resources and CO_2 emissions. The present study is directed to investigate the effect of Alccofine-1203 (AL) as partial replacement of cement on Glass Fibers (GF) reinforced M30 grade concrete. Different types of concrete mixes were prepared by replacing cement with Alccofine-1203 of 5%, 10% and 15%, respectively, then it is found to be the optimum percentage of replacement of cement with Alccofine-1203 is 10%. Further, the effect of Alccofine and Glass Fiber with different combinations, such as, 10%AL+0.1%GF, 10%AL+0.2%GF, and 10%AL+0.3%GF was also carried out. Based on the test results of Mechanical properties of concrete the optimum dosage is found to be 10% AL and 0.2% GF.

Keywords: Alccofine-1203, Glass fibre, Compressive strength, Split tensile strength, Flexural strength, Modulus of Elasticity.

1. INTRODUCTION

Cement is the most prevalent kind of concrete binder. At present sustainable development of the cement and concrete industry requires the utilization of industrial and agricultural by-products. At present, for a variety of reasons, the concrete construction industry is not sustainable. It consumes huge quantities of virgin materials and the principal binder in concrete is Portland cement, the production of which is a major contributor to greenhouse gas emissions that are implicated in global warming and climate change. So, finding a solution to substitute for part of the cement seems to be desirable for sustainable development. In the present investigation applications ofAlccofine-1203 as partial replacement of Cement for the Glass fibers reinforced concrete is adopted.

OBJECTIVES

The main objective of the present experimental investigation is to obtain the influence of Alccofine-1203 and Glass fibre on various Mechanical properties of M30 grade concrete.

It consists of following:

- To find out optimum replacement percentage of Alccofine-1203 .
- To determine the mechanical properties such as Compressive Strength, Split Tensile Strength, Flexural Strength and Modulus of elasticity of concrete prepared using alccofine-1203 and Glass fibers and to compare with conventional concrete.

ABSTRACT

This summary discusses a study focused on making regular concrete stronger by adding fibers like steel, asbestos, and banana fibers. The goal was to see how these fibers affect M35 grade concrete. Tests were done to check things like how much weight it can hold and its resistance to breaking, compressive strength, flexural strength, split-tensile strength, ultrasonic pulse velocity. The study found that using 1.5% steel fibers makes the concrete much stronger, improving its ability to withstand pressure and bending. Additionally, combining steel, asbestos, and banana fibers in specific amounts created an even stronger mix. Comparisons showed that this new mix performed significantly better than regular concrete and the one with only steel fibers. Notably, it was lighter and more cost effective. This research provides practical ideas for making stronger concrete without increasing weight and costs too much. It's a useful guide for building stronger structures economically.

Keywords: Steel Fibers, Asbestos Fibers, Banana Fibers, Compressive Strength, Flexural Strength, Split Tensile Strength.

I. INTRODUCTION

Concrete is a vital material, in a worldwide consumption. It is the second most utilized substance on Earth after water. Comprising a mixture of sand, gravel, bound together by a water-based binder called cement, concrete often incorporates modifiers and additives like fine mineral powders to enhance its characteristics during the mixing process or in its final hardened state. Having been a favoured construction material for an extensive period, concrete remains popular for its cost-effectiveness and ease of fabrication in the building industry. Despite its commendable strength and durability, concrete does possess weaknesses, with low tensile strength being one of them. To address this, reinforcement with alternative materials becomes essential. While traditional steel reinforcement bars serve this purpose, this research takes a different approach by utilizing fibers. Fiber Reinforced Concrete involves reinforcing concrete with fibers, whether they be continuous filaments or threads. Various fiber types, including steel, glass, natural, and synthetic, have been integrated into concrete. Initially, fibers were employed to counteract plastic and drying shrinkage in concrete. Over time, research and advancements have revealed that adding fibers to concrete can enhance properties such as flexural strength, compressive strength, tensile strength and post-crack strength. Some studies have even explored the incorporation of multiple fiber types, leading to the development of Hybrid Fiber Reinforced Concrete. The problem addressed in this study revolves around the need to increase the compressive strength, flexural strength, and split-tensile strength of concrete by reinforcing it with materials possessing these mechanical properties. While steel fibers are suitable for this purpose, their high cost, attributed to manufacturing and transportation expenses, necessitates a reduction in percentage and substitution with other materials. In this investigation, asbestos, and banana fibers are chosen to replace a portion of the steel fibers. Mineral fiber, like asbestos are very good fibers give well mechanical properties and Natural organic fibers, such as banana fibers obtained from the banana tree, are abundant in our surroundings. In India, where tons of banana trees go unused and are discarded, especially in rural areas, this study explores the potential of repurposing this local waste as concrete composites. These fibers are not only cost effective but also have low manufacturing costs and are easy to process.

II. OBJECTIVES

1. To cast the M35 grade concrete mix as control mix and to cast the mixes with different ratios of fibres.
2. To study the strength of fibre reinforced concrete using Steel fibers, asbestos fibers, and banana fibres in various percentages from the optimum percentage of Steel fibers and to observe the changes in properties of fiber reinforced concrete (FRC).
3. To test the strength of fibre reinforced concrete using steel fibres, asbestos fibres in various percentages from the optimum percentage of steel fibres and to observe the changes in properties of fibre reinforced concrete.
4. To study the strength of fibre reinforced concrete using steel fibres, banana fibres in various percentages from the optimum percentage of steel fibres and to observe the changes in properties of FRC.
5. To perform the different tests like compressive strength test, flexural, split tensile, and non-destructive tests (ultrasonic pulse velocity test) on fibre reinforced concrete.
6. To compare the properties of steel fibre reinforced concrete with conventional concrete.
7. To compare the properties of fibre reinforced concrete with steel fibres and with composite fibres.

III. METHODOLOGY

MATERIALS

In this experimental investigation the following materials are used.

3.1 Cement

Ordinary Portland cement (OPC) of 53 grade confirming to IS 12269:2013 was used. The specific gravity is 3.15.

3.2 Coarse Aggregate

Well graded coarse aggregate conforming to the provision of IS: 383-2016 is going to use throughout the investigation. Aggregate of nominal size 20mm, were blended to a desired proportion and mixed intimately to obtain well graded aggregate. The specific gravity, water absorption and fineness modulus for 20mm is shown below.

Property	Value
Specific gravity	2.67
Water absorption	0.45%
Fineness modulus	7.2

3.3 Fine Aggregate

Locally available river sand conforming to IS 383:2016 specifications passing through 4.75 mm sieve and retained on 75µm was used as the fine aggregate in the concrete mix. The fineness modulus, specific gravity were determined and Sieve analysis of the fine aggregate is shown below.

Property	Value
specific gravity	2.55
fineness modulus	3.15
grading	Zone-II

3.4 Steel fibers

Irregular steel fibers, distributed randomly, are employed in this investigation. The chosen fibers are crimped and made of low carbon, cold-drawn steel, intended to offer concrete temperature and shrinkage crack control while enhancing its resistance to cracking. They are formulated for effortless mixing, placement, and finishing in concrete applications.

Property	Crimped steel fibre
Length	30 mm
Diameter	0.5 mm
Aspect ratio	60
Density	7800 kg/m^3
Young's modulus	200 Gpa
Tensile strength	750-1100 N/mm^2

3.5 Asbestos fibers

Mineral fiber stands out as the most effective due to its compatibility with Portland cement. The tensile strength of asbestos ranges from 560 to 980 N/mm^2. Asbestos cement paste exhibits significantly greater flexural strength compared to Portland cement paste.

Property	Asbestos fibre
Colour	White
Physical state	Solid
Melting point	800-850 ℃
Specific gravity	2.55
solubility	Insoluble in water and organic solvents
Density	2426 (kg/m^3)

e-ISSN: 2582-5208
International Research Journal of Modernization in Engineering Technology and Science
(Peer-Reviewed, Open Access, Fully Refereed International Journal)
Volume:06/Issue:03/March-2024 Impact Factor- 7.868 www.irjmets.com

3.6 Banana fibers

In an era where global awareness of environmental issues is increasing, there is a rising demand for sustainable materials. One such material that has garnered attention in recent times is banana fiber, known for its diverse and noteworthy characteristics. From its capacity to absorb moisture to its impressive tensile strength, banana fiber presents itself as a material worthy of exploration due to its multitude of advantages.

Property	Banana Fibre
Colour	Gold brown
Tensile Strength	650-780 (N/mm^2)
Young's Modulus	27-32 (Gpa)
Density	1300 (kg/m^3)
Length	40 mm
Diameter	2 mm
Aspect ratio	20

3.7 Super plasticizer:

AURAMIX 450 is utilised as superplasticizer in this project. It is a polycarboxylate Ether (PCE) based high performance super plasticizer. It is used for concrete requiring long workability retention.

Type	Property
Appearance	Light yellow coloured liquid
pH	Minimum 6.0
Chloride content	Nil to IS 456

Here we used three fibres namely steel, asbestos and banana fibers at a time and M35 grade concrete is prepared using them. As steel is extensively used fiber we have given higher proportion for it.

Volume:06/Issue:03/March-2024 Impact Factor- 7.868 www.irjmets.com

V. CONCLUSION

The following are the conclusions of this project:

- The compressive strength obtained for conventional concrete (M35 grade) is 44.06 N/mm². the flexural strength obtained is 7.38 N/mm² and the split tensile strength obtained is 3.42 N/mm².
- The optimum percentage of steel fibres is obtained at 1.5% at which the compressive strength obtained is 55.44 N/mm², flexural strength is 8.40 N/mm² and split-tensile strength is 7.55 N/mm².
- The percentage difference obtained for conventional concrete and optimum steel fibre reinforced concrete is 25.8%, for split-tensile strength is 120%, for flexural strength is 13.82%.

- From the mixes of composite fibres i.e., it is shown that 0.75% steel, 0.375% asbestos, and 0.375% banana fibres mix gives more strength (57.83 N/mm^2) with the percentage difference of 4.31% of optimum percentage of steel mix.
- The percentage difference of the mix (0.75% steel, 0.375% asbestos, and 0.375% banana fibres) and the mix (1.5% steel)) for split tensile strength is 9.13% and for flexural strength is 20.83%.
- From all the results obtained for all the mixes it is concluded that M35 grade concrete with fibres gives more strength i.e., steel fibres.
- From the composite fibres mixes it is concluded that fibre reinforced concrete with the combination of steel, asbestos, and banana fibres gives better results than optimum steel fibres mix as it has high percentage difference with optimum dosage of steel fibres.
- Even though steel fibres gives high strength, it has more weight compared to asbestos and banana fibres and also they are costlier than asbestos and banana fibres. So, replacing 0.375% asbestos and 0.375% banana fibres with steel fibres will give us a lighter weight, lower cost concrete and strength is higher than optimum.

The poor intelligibility and out-of-the-ordinary nature of the traditional concatenation speech synthesis technologies are two major problems. CNN's context deep learning approaches aren't robust enough for sensitive speech synthesis. Our suggested approach may satisfy such needs and modify the complexities of voice synthesis. The suggested model's minimal aperiodic distortion makes it an excellent candidate for a communication recognition model. Our suggested method is as close to human speech as possible, despite the fact that speech synthesis has a number of audible flaws. Additionally, there is excellent hard work to be done in incorporating sentiment analysis into text categorization using natural language processing. The intensity of feeling varies greatly from nation to country. To improve their voice synthesis outputs, models need to include more and more concealed layers & nodes into the updated mixture density network. For our suggested algorithm to perform at its best, we need a more robust network foundation and optimization methods. We hope that after reading this article and trying out the example data provided, both experienced researchers and those just starting out would have a better grasp of the steps involved in creating a deep learning approach. Overcoming fitting issues with less data in training, the model is making progress. More space is needed to hold the input parameters in the DL-based method.

Keywords: Natural Language Processing, Deep Learning, Machine Learning, Speech to Text.

1 INTRODUCTION

For voice synthesis to sound genuine and understandable, fundamental frequency (F0) modelling is essential. Mandarin speech synthesis is unaffected by the use of a mixed Tibetan train corpus [1]. When compared to the Tibetan monolingual framework, the mixed BBERT-based cross-lingual synthesis of speech framework only requires 60% of the learning corpus to synthesis a comparable voice. Thus, the suggested approach may be used to low-resource languages for voice synthesis by using the corpus of a high-resource language [2]. The process of synthesizing the sounds of numerous voices from a single model is known as "multi-speaker speech synthesis." There have been various proposals for employing deep neural networks (DNNs), however DNNs are vulnerable to overfitting when there is insufficient training data [3]. Utilising deep Gaussian processes (DGPs), which are a complex structure of Bayesian kernel correlations that are resistant to overfitting, we provide a framework for multi-speaker voice synthesis. Voice synthesis studies that convey a speaker's personality and feelings is thriving because to recent advancements in the field made possible by deep learning-based voice synthesis. For speakers with extremely low or very high vocal ranges as well as speakers with dialects,

the present day does not adequately portray a variety of moods and features [5]. Modern neural text-to-speech (TTS) systems are able to create speech that is indistinguishable from normal speech [6] thanks to the remarkable progress in deep learning. However, rather than having extensive prosodic variance, the produced utterances often retain the average prosodic character of the database. To effectively transmit meaning in pitch-stressed languages like English, proper intonation and emphasis are essential [7]. Recognizing feelings in a speaker's voice automatically is a difficult and time-consuming task. Humans' complex range of emotions makes categorization challenging. Extracting relevant speech elements is a significant challenge because of the need for human intervention [8]. Deep learning methods that make use of high-level aspects of voice signals improve the accuracy of emotion identification. One of the primary challenges of employing target-driven models for articulatory-based speech synthesis is representation learning [9]. Computer-aided diagnostic systems that help in clinical decision-making rely heavily on deep learning methodologies. Because of the scarcity of annotated medical data, however, the development of such automated systems is difficult [10, 11]. The purpose of the user interface is to accurately read the user's mood. The most pressing concern in speech emotion identification research is how to efficiently extract relevant speech characteristics in tandem with an adequate classification engine. [12][13]. Emotion recognition and analysis from speech signals need well-fined speech databases as well. Numerous real-world applications, such as those dealing with human-computer interaction, gaming on a computer mobile services, as well as emotion assessment, have made use of data science in recent years. Speech emotion recognition (SER) is a very new and difficult area of study with a broad variety of potential applications. When it comes to SER, current research has relied on handmade characteristics that provide the greatest results but fall short when applied to complicated settings. Later, SER made advantage of automated feature detection from voice data using deep learning methods. Despite the fact that deep learning-based SER approaches have solved the accuracy problems, they still have a long way to go before they can be considered fully comprehensive. [14] [15].

The following is a problem statement we developed to address the aforementioned challenges and provide a solution to the issue of multilingual voice recognition.

- The ability to identify and convert a multilingual sentence into a sentence in a single language.
- Creating a model that can interpret voice navigation questions spoken in many languages and provide a unified response in one of those languages.

Although there are 22 official languages in India, most are only spoken within a single state. As a result, resources for these languages are limited, and high-quality voice data is hard to come by. Furthermore, no publicly accessible multilingual dataset includes these languages and English.

2 RELATED WORK

In this study, we work to refine Isarn's speech-synthesis modelling of F0. For this problem, we recommend an RNN-based model called F0. Supra-segmental aspects of the F0 contour are represented by using sampled values of F0 at the syllable degree of continuous Isarn sound in conjunction with their dynamic features. We investigate several deep RNN architectures and feature combinations to find those that provide the highest performance. We evaluated the suggested technique against different RNN-based baselines to determine its efficacy. Objective and subjective evaluations show that the proposed model outperforms the baseline RNN strategy that predicts F0 values at the frame level as well as the baseline RNN model that depicts the F0 contours of words using a discrete cosine transform [16].

This study introduces a deep Gaussian process (DGP) as well as sequence-to-sequence (Seq2Seq) learning-based approach to voice synthesis, with the goal of producing high-quality end-to-end speech. Since DGP makes use of Bayesian training and kernel regression, it is able to create more lifelike artificial words than deep neural networks (DNNs). Such DGP models, however, need extensive knowledge of text processing since they are pipeline architectures of separate models, including acoustic and duration models. The suggested model makes use of Sequence-to-Sequence (Seq2Seq) learning, which allows for joint training of spectral and temporal models. Parameters are learned using a Bayesian model, and Gaussian process regressions (GPRs) are used to represent the encoder and decoder layers. To adequately simulate character-level inputs in the encoder, we additionally propose a self-attention method based on Gaussian processes. In a subjective assessment, the suggested Seq2Seq-SA-DGP was shown to produce more natural-sounding speech synthesis than DNNs with self-awareness & recurrent structures. In addition, Seq2Seq-SA-DGP is useful when a straightforward input is provided for a complete system, and it helps alleviate the smoothing issues of recurrent structures. Sequence-to-Sequence Deep Neural Network Model. The field evaluations also demonstrate the efficacy of the DGP framework's self-attention structure, with Seq2Seq-SA-DGP being able to synthesise more natural discourse than Seq2Seq-SRU-DGP & SRU-DGP [17].

In this study, we offer a deep learning-based system for cross-lingual speech synthesis that can simultaneously synthesise Mandarin and Tibetan voices. In order to train the acoustic models, we employ a large size Mandarin multi-speaker corpus as well as a limited basis Tibetan one-speaker corpus due to the difficulty of recording a Tibetan training corpus. Models for analysing sound are taught using a combination of deep neural networks (DNN), hybrids long short-term memories (BERT), and hybrid simultaneous recurrent neural networks (BBERT). To generate context-dependent labels from incoming Chinese or Tibetan phrases, we additionally enhance our Chinese text analyzer with a Tibetan text analyzer. The Tibetan text analyzer has features including text normalisation, a prosodic boundary predictor, a grapheme-to-phoneme converter, and a new Tibetan word segmentation which combines a BBERT with a conditional random field. In order to educate a speaker-independent multilingual average voice model (AVM) using DNN, hybrid BERT, & hybrid BBERT from a mixed corpus of Mandarin and Tibetan, we choose initials and finals from both languages to use as speech synthesis units. Next, a small target speech corpus from an AVM is used in conjunction with the speaker adaption to train a speaker-dependent DNN, hybrids BERT, or hybrids BBERT system for Mandarin or Tibetan. In the end, we use speaker-dependent models of Mandarin or Tibetan to synthesise their respective languages' spoken sounds. Compared to the other two cross-language frameworks as well as the Tibetan multilingual framework [18], the hybrid BBERT-based cross-language speech synthesis framework performs the best in the testing.

This work introduces a technique for improving the effectiveness of meta-learning-based multilingual voice synthesis via the separation of pronunciation and prosody modelling. To forecast mel-spectrograms across languages, the default meta-learning synthesis technique uses a single text decoder with a parameter generation conditional on language embedded and a single decoder. Our suggested approach, on the other hand, models pronunciation and prosody separately using separate encoders and decoders since these two types of information should be exchanged across languages in distinct ways. Our experimental results show that, compared to the baseline meta-education synthesis technique [19], our suggested method significantly enhances the intelligibility & authenticity of multilingual speech synthesis.

In this setup, speaker codes are used to transmit speaker data to duration/acoustic models. To effectively account for speaker similarities and differences, our method concurrently learns the portrayal of each speaker with other model parameters. To test the efficacy of the suggested methodologies, we conducted experimental evaluations of two scenarios. One scenario has an equal quantity of information from all of the speakers (speaker-balanced), whereas the other has less information from some of the speakers (speaker-imbalanced). Evaluation findings demonstrated that the DGP & DGPLVM synthesise multi-speaker speech better than a DNN in a speaker-balanced setting, both subjectively and objectively. We also observed that in the case of speaker imbalance, the DGPLVM performs far better than the DGP. [20].

We present MIST-Tacotron, a Tacotron 2-based speech synthesiser model that incorporates an image style transfer module into the reference encoder. The suggested approach is a method that uses a deep learning model that has been trained to extract the speaker's feature using the reference mel-spectrogram in conjunction with picture style transfer. The speaker's style, including pitch, tone, and length, may be taught using the extracted feature to better convey the speaker's style and emotion. With only the ID value for the individual who speaks and the ID number for the state of mind as inputs, the speaker's style may be extracted completely independently of the speaker's timbre and mood. The mel-cepstral distortion (MCD), the band aperiodicity distortion (BAPD), the voiced/unvoiced error (VUVE), the false positive rate (FPR), and the false negative rate (FNR) are used to assess performance. In comparison to the current designs, GST (Global Style Token) Tacotron & VAE (Variational Autoencoder) Tacotron, the suggested model was shown to have better performance and lower error values. The suggested model's audio quality scored best on MOS measures of both emotional expressiveness and reflection of speaker style. [21].

We provide a Tacotron-based approach for multilingual text-to-speech (TTS) synthesising that can generate high-quality voice in a number of different languages using a single set of speakers. Further, the model can synthesise natural-sounding Spanish speech using the voice of an English speaker, without being trained on bilingual or parallel samples. Even across very distantly related languages like English and Mandarin, such transmission is possible. Use of a phonemic input representation to facilitate cross-language model capacity sharing and the addition of an adversarial loss term to train the model to separate its representation of speaker identity from the speech content are two key ingredients in this recipe for success. integrating an autoencoding opinions to help stabilise attention during training and expanding the model to train on several speakers of each language yields a model that can reliably synthesise intelligible expression for training individuals in all languages seen throughout training, in either their native language's or a language for which they were not originally fluent [22].

In this study, we present a deep architectural model for voice synthesis using deep Gaussian processes (DGPs), which are layered Bayesian kernel regressions. In this approach, we mimic deep neural network (DNN)-based voice synthesis by training a statistical model of transition from contextual data to speech parameters. Our approach employs the approximation technique doubly stochastic

Just Accepted

variational deduction to implement DGPs inside a statistical parametric voice synthesis framework; this method works well with large datasets. When compared to DNNs, DGPs are more robust to overfitting since their training depends on the marginal likelihood, which considers not just data fitting but also model complexity. We conducted experiments to compare the effectiveness of the suggested DGP-based architecture to that of a feedforward DNN-based alternative. Our DGP architecture outperformed the status quo in both subjective and objective evaluations [23], with a higher mean opinion score and reduced distortions to acoustic features.

In this paper, we propose a neural speech synthesis approach that incorporates ToBI (Tones and Break Indices) encoding for fine-grained prosody modelling. Both a text interface for ToBI prediction as well as a Tacotron-based TTS component with prosody modelling make up the proposed solution. The ToBI representation allows us to exert fine-grained control over the system, allowing us to synthesise speech with natural intonation and syllable-level stress. Experiments demonstrate that, in comparison to the Tacotron and the unsupervised technique, our model is able to create more realistic speech with more precise prosody and to exert more precise control over the speech's stress, intonation, as well as pause [24].

In this research, we introduced a system that uses deep learning to identify the emotional state of a speaker based on their speech. Using a time-distributed flatten (TDF) layer, the system integrates a deep convolutional neural network (DCNN) with a bidirectional long-short term memory (BBERT) network. The suggested model has been used using the newly created SUBESCO emotional speech corpus in Bangla, which is audio only. All the models in this study were put through a battery of tests, comparing them in single-language, cross-language, and multilingual training-testing configurations. Compared to previous state-of-the-art CNN-based SER systems that are able to operate on both temporal & sequential representations of emotions, the model with a TDF layer obtains greater performance, as shown by testing data. The Bangla as well as English languages' SUBESCO as well as RAVDESS datasets were used for cross-corpus instruction, multi-corpus training, as well as transfer learning during the cross-lingual studies. Weighted accuracies (WAs) of 86.9% and 82.7% were achieved on the SUBESCO & RAVDESS datasets, respectively [25], demonstrating that the proposed model has achieved state-of-the-art perceptual efficiency.

In this paper, we present a deep learning-based approach for extracting basic characteristics from initial information with good accuracy across languages and speaker demographics (male/female) in voice corpora. To fine-tune the.wav files for Deep Convolutional Neural Network (DCNN), we first transform them into the RGB spectrograms (pictures) and normalise their size to (224x224x3). There are two phases of training for a DCNN model. Stage 2 involves re-training the model using the optimum learning rate determined in stage 1 through the Learning Rate (LR) ranging test. In order to down-sample the characteristics with a smaller model size, a unique stride is employed. Positive, negative, neutral, and a few more emotions are taken into account. The proposed approach is evaluated using the publicly-available German-language EMODB, Italian-language EMOVO, and British-English SAVEE speech corpora. The stated emotion identification accuracy is higher than that seen in previous research across languages and speakers. [26].

In this study, we offer a computational technique for learning underlying articulatory goals from a 3D articulatory speech synthesis model, utilising a simultaneous long short-term memory recurrent neural networks trained with a limited collection of representative seed samples. A bigger training set was produced from the seed data, allowing the model to be exposed to more diverse contexts. The process of articulation was reverse-engineered into a model by training a model that uses deep learning for acoustic-to-target mapping. This technique employs a trained model to map the provided audio data into the articulatory target parameters, allowing for the identification of distributions according to language situations. The perceived accuracy of speech recreated from the predicted articulation was used to assess the model's performance, along with its ability to map acoustics to articulation. The findings suggest that the simulator can successfully mimic speech without a high level of phonemic accuracy [27].

To develop generalizable and domain-invariant representations across a variety of medical imaging applications, including malaria, retinopathy from diabetes, and TB, we offer a unique & a computationally effective deep learning technique. We call the process by which we construct our CNNs Incremental Modular Network Synthesis (IMNS), as well as the resultant CNNs themselves IMNets. Our IMNS method makes use of specialised network components called SubNets, each of which may provide problem-specifically relevant characteristics. Next, we use these smaller networks, called SubNets, to construct bigger and more robust networks using a variety of alternative configurations. Each new SubNet module is only updated once each stage. This lessens the burden on the computer during training and assists in optimising the network. In this research, we evaluate IMNets with established and cutting-edge deep learning architectures including AlexNet, ResNet-50, Inception v3, DenseNet-201, & NasNet. Classifier accuracies of 97.0%, 97.9%, & 88.6%, on average, are achieved with our suggested IMNS architecture for malaria, diabetic eye disease, and TB, respectively. In all benchmarked use cases, our modular deep learning architecture outperforms the competition. Unlike most conventional deep learning architectures, the IMNets built here need less processing power to run. In this experiment, the biggest IMNet had 0.95 million trainable parameters and 0.08 billion MAdd operations (floating point multiplication and addition). The

Just Accepted

simplest IMNets examined [28] outperformed the benchmark techniques in terms of training speed, memory needs, and image processing speed.

In this study, we built a Korean sentimental speech dataset for emotion analysis in spoken language and presented a feature combination to boost recurrent neural network-based emotion detection accuracy. We retrieved F0, Mel-frequency cepstrum parameters, spectral characteristics, harmonic features, among other data to further explore the acoustic features that might indicate discrete instantaneous shifts in emotional expression. Statistical analysis was used to zero down on the best possible set of speech acoustic variables for conveying feeling. An emotional classification model based on a network of recurrent neurons was deployed. According to the findings, the suggested system outperforms its predecessors [29] in terms of accuracy.

To get over such problems, the authors of this research presented a new SER model. Due to a lack of previous study, we zeroed in on Arabic vocal expressions in particular. The suggested model enhances data before extracting features. Emotion identification was accomplished by using the 273 extracted characteristics as input into a transformer model. We test this model on four different datasets (BAVED, EMO-DB, SAVEE, and EMOVO). The experimental results showed that the suggested model outperformed state-of-the-art methods with ease. The best results were achieved using the BAVED dataset, demonstrating the proposed model's suitability for identifying emotions in Arabic speech [30].

The Griffin-Lim vocoding method is a technique used for audio signal processing, specifically for the synthesis of audio signals, including speech and music. It's commonly applied in the field of speech and audio processing, particularly in the context of spectrogram inversion or phase reconstruction.

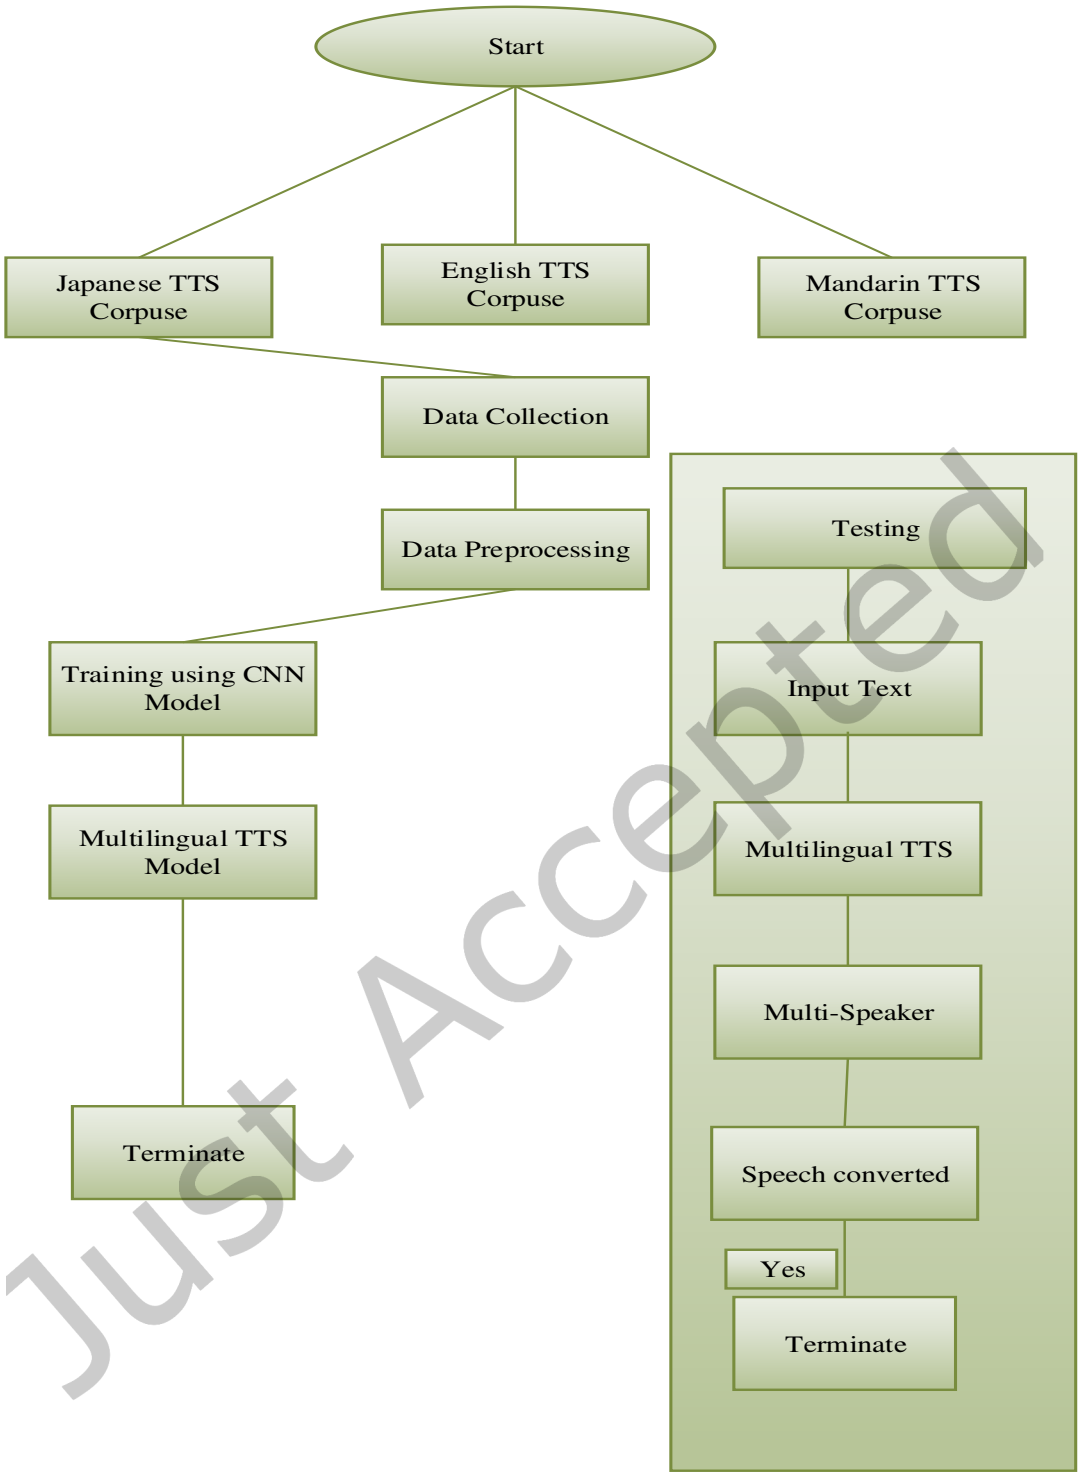
The Griffin-Lim algorithm is named after its creators Mike Griffin and John Lim, who introduced it in their 1984 paper titled "Signal Estimation from Modified Short-Time Fourier Transform". The primary goal of this algorithm is to reconstruct a time-domain audio signal from its magnitude spectrogram, which contains information about the magnitude of the frequencies present in the signal

3 PROPOSED WORK

3.1 Research Gaps

There is a rich history of research into voice synthesis that led to the proposal of several models. When attempting to forecast parameters, a great deal of contextual data is considered. The acoustic feature incorporates a hierarchical framework to map context data to the waveform of human voice. Convolutional Neural Network (CNN) based approaches are using this idea as a foundation for predicting voice synthesis acoustic feature parameters. In most cases, the linguistic traits will be converted into speech synthesis probability densities for different decision trees. The model for complete voice synthesis from beginning to finish can be trained rather quickly using deep learning. Template-based speech synthesis algorithms struggle with high natural voices because of voice glitches. Features extraction for voice synthesis continues in the presence of obstacles.

In the first stage of VecMap, monolingual word embedded are normalized and orthogonalized. Then, a compact bilingual dictionary is used to provide an approximation of the linear mapping. This eliminates the need for a massive seed dictionary. After that, new terms in the original language are transformed using what was learnt, thereby expanding the vocabulary. Until the convergence condition is achieved, the procedure is iterated [14].



Many studies use the regularisation term Mean Squared Error (MSE) for VecMap:

$$\Omega_{\mathrm{MSE}} = \|\mathrm{W}\mathrm{X}^{s} - \mathrm{X}^{t}\|_{\mathrm{F}}^{2}$$

The given formula computes the Frobenius norm square of the residual matrix.

In this work, we use VecMap under supervision. A 5,000-word English-Persian lexicon is used for teaching and testing purposes under close supervision.

3.2 CNN

In the figure 2 shows the Words in the system correspond to a real number vector. The words represent the integers 0 through N-1. These word indices are represented as vectors of length N that may be plugged right into a model of the corresponding network. The textual sequences were in time, much as a skip gramme model would predict. The conditional probability of each word is denoted as a vector. Using the softmax function on the vector, as shown in Equation 1, it identifies the most pivotal target word,

$$C_p(w_o \mid w_t) = \frac{\exp(u_0^{\mathrm{T}} v_c)}{\sum_{i \in v} \exp(u_i^{\mathrm{T}} v_c)} \qquad (1)$$

Where v is index set. $\mathrm{v} = \{0,1,\ldots..|v|-1\}\mathrm{T}$ is shorthand for the sequence's duration. The term in context will be found in the lexicon (index). During the approximative training phase, the loss function is built using the path from one node to another in a binary tree structure. Gradient computational, a part of the training process, has complexity that grows as the lexicon does. The serial data is pre-processed using negative sampling. We've developed a model for word embedded that can compare words like "Hi" and "Hai" to determine their level of similarity. Instead of using the morphology function, a separate vector is utilised for word to vector conversion. In other words, the skip gramme model is now live. The minimum and maximum length of retrieved subwords were both set by us. The size of dictionaries, however, is not a fixed parameter. For this purpose, we have used a byte-pair encoding strategy [1]. The Convolution Neural Network (CNN) may be rapidly trained based on the quality of the input voice. Input vectors that are able to conform to the probability distributions are welcomed by the input layers. The parameters of the underlying hidden layers will also be determined. Convergence data is not entered into the hidden layer until it is reached. Based on the length of the recovered subwords, the results layer will interpolate Acoustic characteristics. These variables are trained inside the same network, thus there will be no

Just Accepted

future fragmentation issues. Additionally, the excessively smooth issue is mitigated by correlating the acoustic properties with varying frame size.

Model average is an ensemble method in which all of the individual models' predictions are weighted equally. Overfitting is a major problem in ML jobs, and this might cause it. One variant of this strategy, known as the weighted mean ensemble, gives more credence to members with higher anticipated model performance on an outlier dataset. As a result, models with better performance may contribute more and those with less performance can contribute less. In this study, the model average ensemble has been employed, although it may be better if a weighted average ensemble was used instead. When doing a classification job, we may determine the certainty of each class by using the Softmax activating function, which yields the anticipated probability for each class. The softmax function's output is the class label with the greatest average trust, which is determined by the model averaging method's calculation of the average classification likelihood of base pupils for each class.

$$\text{Softmax}(\mathbf{z})_i = \frac{e^{\mathbf{z}_i}}{\sum_{j=1}^{C} e^{\mathbf{z}_j}} \qquad (2)$$

where Z is the vector of input values and C is the total number of categories in the dataset, e^{z_i} and e^{z_j} are the common exponential equations for the vectors of input and output. Equation 4 describes the model confidence-averaged prediction of a class label. The agrgmax for the anticipated labels in the target class is used to determine this.

$$\hat{y} = \underset{i\in\{1,\cdots,c\}}{\text{argmax}} \frac{\sum_{j=1}^{k} p_j(y=i|B_j,x)}{k} \qquad (3)$$

where B_j is the j_{th} base learner, k is the number of selected base CNN learners, and k = 3 in the proposed TTD; $p_j(y = i \mid Bj, x)$ represents the likelihood that the category value i will be present in a given data sample x B_j.

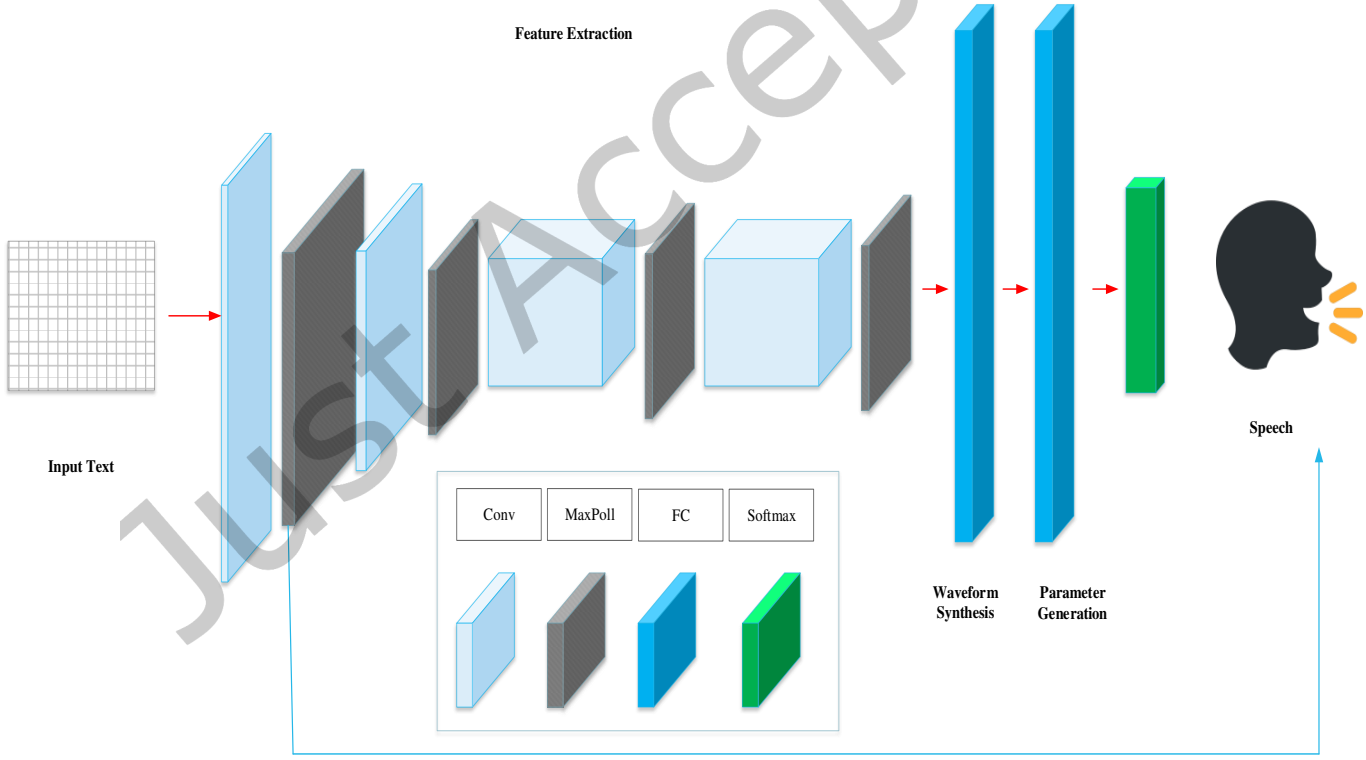

Fig.3. Proposed CNN Architecture for TTS

4 RESULTS & DISCUSSION

We utilised a number of Python packages, including Keras, Pandas, Gensim, and Matplotlib, to put our study into practise. Table 1 provides a brief overview of the model parameters we employed. For BERT and other vector models, we use embeddeds of 300 dimensions.

Just Accepted

In this work, we experimented with voice synthesis to confirm a viable strategy for realising a multilingual synthesis systems. We built each system based on the voice quality of the a Japanese speaker (nicknamed NKY) and tested it using English-only synthesised speech since judging the tone quality of several languages is challenging. (Our English language natural speaker, or ELN, speaks English.) These are the experimental parameters:

- A quiet room with headphones was used to listen to all of the speeches.
- There was no order to the speeches that were offered.
- One native English speaker from the United States was responsible for rating the level of naturalness.

Four native Japanese speakers weighed in on the similarity.

As input text, we employed a training corpus and 30 sentences from English news articles. Auditory assessment samples: The hearing test included both synthetic speech samples from seven different TTS systems (Tables 1, 2) and actual human speech. Information about each speech sample is provided in Table 1.

Each voice sample's CNN architecture is broken out in Table 1.

Table 1. Parameter settings used in the CNN model.

Model	Parameters	Values
CNN	Strides	10
	Activation	ReLU
	Filter region size	(2,3,4,5)
	Feature maps	100
	Dropout rate	0.3
	Pooling layer	$I-$ max pooling
	Optimizer	Adam
	Sequence length	128
	Learning rate	0.0001

The specifics of the ASR systems tested here are listed in Table 3.

The matrix of uncertainty [19] uses the following fundamental terminology.

- Observation is positive and consistent with the expected outcome; this is a true positive (TP).
- The opposite of a true positive is a false negative.
- A true negative (TN) is an observation that matches expectations of negativity.
- A false positive (FP) occurs when an unfavourable observation contradicts a favourable prediction.

To analyse test results, we calculated an Accuracy, Extractness, Recollotion, & F1Score. The performance evaluation techniques are shown by the equations. (4), (5), (6), & (7).

$$\text{Accuracy} = \frac{TP + TN}{TP + TN + FP + FN} \quad (4)$$

$$\text{Precision} = \frac{TP}{TP + FP} \quad (5)$$

$$\text{Recall} = \frac{TP}{TP + FN} \quad (6)$$

The accuracy of a model is the easiest to understand when compared to other assessment indices. However, a supplemental index is necessary when the data categories are not evenly distributed. The F1-Score is a useful measure since it takes into account both accuracy and recollotion.

We use the Common voice Semantics (CSS10) voice corpus, which has a single speaker for each of 10 languages. We choose German, Dutch, Chinese, and Japanese to build a work sequence. We use the publicised train/validation splits from, which provide 15.1 hours, 11.5 hours, 5.4 hours, and 14.0 hours of training audio, in that order. For each language, we used the latest 20 examples from the validation set as test samples. We rank the various methods of lifelong learning as follows: German (DE), Dutch (NL), Swiss German (CHZ), and Japanese (JA). Our buffer size for replay-based algorithms is 300 utterances, or around 0.6h of audio. After instruction on each language, random samples are added to the buffer. To maintain linguistic parity in the buffer during the course of the training sequence, old samples are removed at random as new ones are added.

Just Accepted

Framework and tuning settings. Each language undergoes 100 iterations of training. We use the Adam optimizer, which has a learning rate of 0.001 at the outset and decays to 0.049 after 60 iterations. The default batch size is 84. All sequential techniques of language acquisition begin current language instruction using the best possible model parameters gained from the previously learned language.

Table 2. When compared to the results of the baseline monolingual models using CNN as the classifier, the suggested cross-lingual sentiment analysis approach shows significant improvement.

Train data	Static/dynamic	BERT			VectorMap

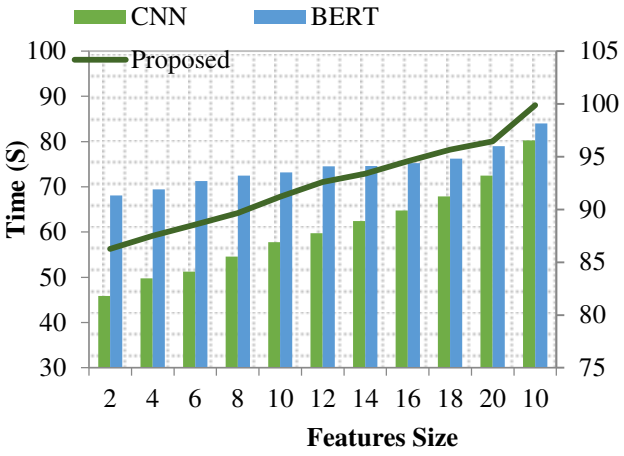

Fig.8.Comparison of Runtime

Two distinct cross-lingual embeddeds (BERT and Vector Map) and classifiers (CNN and CNN-BERT) are employed in our research. Furthermore, we conducted our tests in two modes because to the fact that the cross-lingual embeddeds have been trained with no information from the data used for training of the sentiment evaluation job: There are two types of embedded models: static, which employs the pre-trained vectors directly, and dynamic, which fine-tunes the embeddings using the training data. All experiments are provided with regards to their levels of accuracy, extractness, recollection, and F-measure.

The following are noteworthy insights gleaned from a comparison of the outputs of several training models and cross-lingual embeddeds:

Our suggested model, trained on English data rather than Persian data, consistently outperforms state-of-the-art baseline algorithms in experimental settings.

Although the suggested cross-lingual sentiment analysis performs much better than monolingual models, we may further enhance the model by taking use of English as well as Persian information in a Bilingual training phase, as shown by a comparison of the results from English training as well as Bilingual training. Bilingual training allows for the use of the extensive English data set as well as the study of the language-dependent characteristics present in the Persian dataset.

VectorMap consistently beats BERT, while the performance gaps are small. Because BilBOWA needs parallel data, the corpora available for training the algorithm are restricted, while with VectorMap, this is not the case.

We may further enhance the model by collecting semantic properties that are present in the subject matter of training data, as shown by a comparison of static and dynamic embeddeds.

Figure 8 shows that when all classifiers are compared, hybrid models perform the best. Taking use of the strengths of both models, BERT-CNN and CNN-BERT architectures are able to collect sequential and atypical information from the text, leading to more precise predictions. Furthermore, the fact that BERT- CNN outperforms CNN-BERT demonstrates the importance of gathering sequential data early on in the design. However, with the CNN-BERT model, some sequential information may be lost since a CNN model is performed first. When combined, BERT-CNN and VectorMap provide an F-measure of 95.04, making them the most effective methods.

In contrast to the technique of concatenative speech synthesis, the method that was provided is capable of creating synthetic speech that is not only extremely easily comprehended but also sounds very much like real speech. One of the disadvantages of the existing TTS-based speech synthesis model is that it makes use of context decision trees to trade speech parameters. This is one of the limitations. As a direct consequence of this, the artificially produced speech lacks the necessary degree of realism to fulfill the requirements of expressive speech synthesis. In the suggested method, the clustering phase of the context CNN is replaced by the deep learning-based speech synthesis models. These models employ entire context information and distributed illustration in lieu of the clustering process. They map the context characteristics to high-dimensional acoustic data by using several hidden layers, which leads in the quality of the synthesized speech being better to that of the approaches that were utilized in the past. The enormous representation possibilities of DL-based models, on the other hand, have led to the appearance of a number of brand new difficulties. The models need an increase in the number of hidden layers and nodes so that they can provide more accurate predictions of the world's behavior. This, in turn, will undoubtedly result in a rise in the total number of network parameters, in addition to the amount of

Just Accepted

time and space that is necessary for the training of the network. Over-fitting is a common problem that arises in cases when there is insufficient data for the models to be trained on. As a result, the training of the model necessitates the use of a huge quantity of computing resources in addition to a large number of corpora.

5 CONCLUSION

The poor intelligibility and out-of-the-ordinary nature of the traditional concatenation speech synthesis technologies are two major problems. CNN's context deep learning approaches aren't robust enough for sensitive speech synthesis. Our suggested model may satisfy those voice synthesis needs and alter the associated difficulties. The suggested model's minimal aperiodic distortion makes it an excellent candidate for a communication recognition model. Our suggested method is as close to human speech as possible, despite the fact that speech synthesis has a number of audible flaws. Additionally, there is excellent hard work to be done in incorporating sentiment analysis into text categorization using natural language processing. The intensity of feeling varies greatly from nation to country. To improve their voice synthesis outputs, models need to include increasingly hidden layers and nodes into the updated mixture density network. If we want to assess the model in the best way possible, our suggested method will require a more robust network structure and optimization approaches. We hope that after reading this article and trying out the example data provided, both experienced researchers and those just starting out would have a better grasp of the steps involved in creating a deep learning approach. Overcoming fitting issues with less data in training, the model is making progress. More space is needed to hold the input parameters in the DL-based method.

Text to **S**peech (TTS) algorithms have made tremendous strides in recent years in terms of their ability to generate speech in a single language that sounds as natural as possible. However, because to a lack of available training data, the synthesis of speech from the same person in various languages continues to be difficult. It might be challenging to locate people who are proficient in numerous languages at a level equivalent to native speakers. Voice conversion is one method that may be used to create a polyglot corpus, which can then be used to solve this problem. This entails making use of a voice representation model that has been trained on 53 different languages through the application of hybrid deep learning in order to capture speaker-invariant qualities. In this study, we present a novel approach for the conversion of voices across different languages by employing Generated Adversarial Networks (GANs) to train a multilingual TTS system. The concept of individual likeness loss in order to address the special difficulty of maintaining one's individual speaking identity during the training process can be offered. This work is focused to provide the impression that voice data coming from a variety of languages and speakers was produced by the same individual, and one way to do so is by using this word. In order to determine the extent to which our model is useful, two experiments that compared it against benchmarks that made use of varying degrees of parameter sharing between languages are carried out. The purpose of these experiments was to evaluate the accuracy of pronunciation as well as the caliber of the synthetic voice during transitions between different languages.

Keywords: Cross Lingual Multi-Speaker Analysis, Text to Speech Analysis, Sentiment Analysis

1 INTRODUCTION

The application of approaches that make use of neural networks has allowed for great progress to be made in the area of Text to Speech (TTS) synthesis. When a Tibetan training corpus is utilized alongside other languages, Mandarin speech synthesis is unaffected. This is in contrast to previous cross-language frameworks including the Tibetan multilingual framework [1]. In addition, the hybrid BLSTM-based cross-lingual speech synthesis architecture [2] does not need the Tibetan monolingual architecture because it only needs sixty percent of the training corpus to synthesize a voice that is comparable to the Tibetan one. This suggests that a big resource language corpus may be used for voice synthesis of a low-resource language.

Enhancing speech across multiple languages is of paramount importance as it plays a vital role in facilitating effective communication, bolstering accessibility, and enabling diverse applications in our progressively multilingual and interconnected global

landscape. This enhancement empowers individuals, enterprises, and institutions to transcend language barriers, broaden their audience reach, and ensure the utmost quality and usability of audio data across a spectrum of linguistic environments. Recent research has investigated many approaches to multilingual and multispeaker TTS synthesis. These approaches rely on unique databases of performing artists and require tweaking to accommodate additional voices. However, the expenses associated with these strategies are frequently rather significant. We present a novel solution to this problem in the form of a system that makes use of speakers who are proficient in more than one language to deliver high-quality speeches in a number of different languages.

Deep neural network (DNN)-based systems often require a large amount of data in order to be trained, which presents issues in environments with limited linguistic resources. Despite the fact that zero-shot multi-speaker DNN-based TTS systems have been created based on high-resource languages, their performance on unseen speakers continues to be below average. In this paper, we provide an end-to-end method that increases speaker similarity for both known and unknown speakers, with a special focus on accurate speech encoder modeling. This technique enhances speaker similarity for both known and unknown speakers.

Even when trained exclusively on monolingual datasets, recent developments in multilingual TTS systems have exhibited encouraging outcomes, which is cause for optimism. Cross-language voice synthesis, on the other hand, frequently results in the introduction of audible accents and is unable to match the quality of the speaker's original language. Due to the efficient exploitation of parallel processing throughout the training and/or inference processes, Transformer-based TTS models have demonstrated greater performance when compared to RNN-based models (for example, Tacotron citeshen2018natural). However, in a multi-speaker context with noisy data and diverse speakers, it is more difficult to learn the alignment between the text and the speech, which limits the application of Transformers in multi-speaker TTS.

The capacity to infer speech features from facial expressions has opened up new prospects for multi-speaker TTS technology, particularly in situations where a considerable volume of high-quality voice data as well as related transcriptions are available. However, the collecting of paired data using methods that require a significant amount of time continues to be a significant challenge for many research institutes. The phrase "multi-speaker speech synthesis" refers to the technique of synthesizing the voices of numerous persons from a single model. Deep neural networks (DNNs), despite the fact that various methods based on them have been devised, are prone to overfitting when the amount of training data available is restricted.

- WaveNet, an alternative to vocoders, has demonstrated extraordinary performance in the generation of very realistic synthetic speech in multi-speaker speech-to-text synthesis systems, notably in terms of naturalness and speaker similarity. This is due to WaveNet's ability to generate speech that is highly comparable to the natural speech of several speakers. However, in order for the WaveNet vocoder to work well, it is necessary to make accurate predictions of acoustic qualities, which are then employed as local condition parameters. The process of efficiently training this model is currently underway. The quality of synthetic speech suffers a major hit whenever the predicted acoustic qualities diverge from the actual ones. This causes a substantial decline in the quality of the produced speech.
- In the TSS model, text analysis is a very important component. The majority of traditional methods for analyzing text are predicated on rule-based approaches, which require a large time commitment for the purpose of collecting and learning these rules. Bigram analysis, trigram analysis, HMM-based analysis, and DNN-based analysis are just a few examples of the data-driven methodologies that have arisen as a result of the rapid developments in data mining technologies.
- When doing text analysis using the latter two approaches, the Festival system is typically utilized to carry out phoneme segmentation and annotation on the corpus. This is done so that the results may be better interpreted. This method requires many layers of analysis and considers a variety of factors, including the ones listed below:
- Phoneme level: This level takes into account the phonetic symbols that come before, after, or are located in close proximity to the present phoneme. It also takes into account how far along the syllable the current phoneme is located.
- Syllable level: At this level, the emphasis is placed on aspects such as syllable stress (previous, current, or next), the number of phonemes in the previous, current, or next syllable, the position of the current syllable within the word or phrase (forward or backward), the number of stressed syllables immediately preceding or following the current syllable within the phrase, the distance to the nearest stressed syllable (forward or
- Analysis at the word level takes into consideration the part of speech (POS) of the previous, current, or next word; the number of syllables in the previous, current, or next word; the position of the current word within the phrase (forward or backward); the content word (forward or backward) that is closest to the current word within the phrase; the distance to the nearest content word (forward or backward); and the POS of the previous, current, or next word.
- Phrase level: This level focuses on characteristics such as the number of syllables and words in the previous, current, or next phrase, as well as the location of the current phrase inside the sentence (forward or backward), and the prosodic annotation of the current phrase.
- At the highest level, the analysis takes into account the amount of syllables, words, or phrases that are contained in the sentence at hand.
- Because these several levels of analysis are taken into consideration, the TSS model is able to properly evaluate and comprehend the textual material, which in turn enables correct voice synthesis.

Just Accepted

1.1 Preliminary Knowledge

TTS systems typically consist of three primary components: a text analysis front-end, an acoustic model, and a voice synthesizer. These components are educated independently from one another and need substantial topic expertise. Nevertheless, independent training may be a time-consuming process, and mistakes can compound as they are introduced into each component. The first step in the TTS synthesis process is an analysis of the text, and the second step is the generation of the speech waveform as mentioned in Figure.1. An approximation formula is used in order to convert the phonetic and prosodic information that was gleaned from the analysis into a waveform. In order to generate the correct speech output, the amplitude of each signal contained inside the speech waveform must first be measured. Depending on the circumstances, these speech waves might either take the shape of language or non-linguistic communication. The purpose of this investigation is to create a voice synthesizer that not only converts TTS but also stores the resulting file in the mp3 file format.

End-to-end speech synthesis technologies have become more popular in the industry as a solution to the problems that are related with the training of separate component parts and the potential accumulation of errors. These solutions include all of the components into a cohesive framework, which provides a number of benefits for TTS systems, including the following: (1) They are able to be trained using a large-scale dataset with minimum human annotation; (2) They do not require phoneme-level alignment; and (3) Errors do not compound since they rely on a singular model.

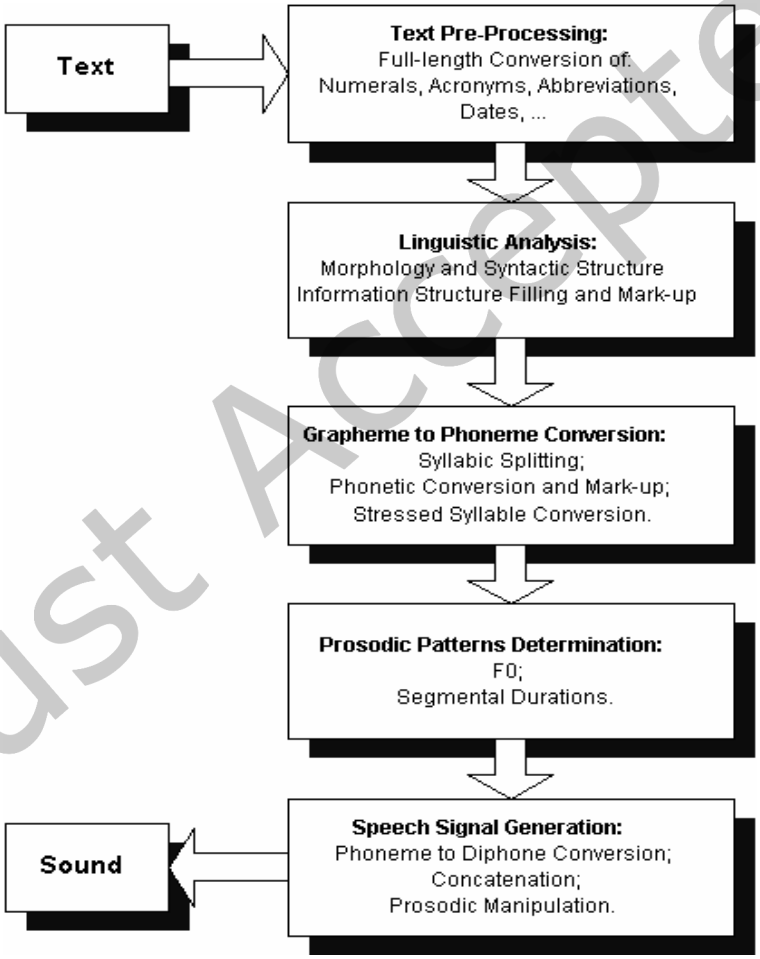

Fig.1. System Model

- The following are the stages that are often included in a TTS procedure:
- Text Input: To create speech in a particular language (for example, Punjabi), you must first provide the system with text written in that language. The text that is inputted might be as simple as a single word or as complex as an entire paragraph or collection of words. This input is subjected to further processing, which includes tokenization and the extraction of phonemes.

Just Accepted

- Tokenization is the process of generating tokens by processing the text. This entails transforming the text into more manageable pieces known as tokens and deleting items such as numerals or special characters that are not desired. This preliminary phase of processing guarantees that the data are free of errors and prepared for the subsequent processing steps. Following this stage, the tokens that were produced are sent on to the subsequent procedure.
- Phonetic Synthesizer: The phonetic synthesizer is in charge of producing the tokens that are used in the game. The phonemes are extracted from each token, and then those phonemes are represented as location numbers within a data format. This operation is performed on each token. Each token is then transformed into a list of numbers, where each number represents the position of a phoneme in the list of phonemes included within the phoneme database. The token list is set to a predetermined size in order to preserve the consistent data form that is necessary for machine learning models. Empty items in the token list are replaced with the integer value '-1'. The model is then trained using this data, and its accuracy may be evaluated using any text that is entered.
- Formant Synthesis: This approach of generating voice from processed text is known as formant synthesis. This requires the utilization of formant frequencies as well as a particular strategy for converting these formant frequencies into the sound that is sought in Punjabi. The finished recording of the speech is saved in a separate file.
- Speech Output: This stage involves processing the speech that was created earlier in the procedure. The formant synthesizer model is used to evaluate the output of the speech generator from the stage before this one. In order to determine whether or not the speech output is accurate, the formant frequencies and any other attributes that have been extracted are compared to the database.

1.2 The Contributions Made to Research

Text is analyzed through the lens of sentiment in order to identify whether it has a good, negative, or neutral tone. This study is absolutely necessary for applications that are dependent on the views of the general population. In this study, the categorization of text based on emotion is investigated. A variety of label categorizations are shown for the text that is supplied as part of this investigation.

In the course of the study, we utilized a number of different cross-lingual transfer learning strategies in order to educate our low-resource TTS models. In the beginning, we just used a tiny amount of data that was already available in the targeted language and paired it with data that was already available in the target language. After that, both datasets to do additional adjustments to the model are used. Following the training of the algorithm with high-resource speech data, which is followed by training with target language data and enhanced target speech data, our studies show that this technique enables the system to generate extremely accurate speech synthesis in the target language. This strategy entails training the algorithm with target language data and augmented target speech data. It received an opinion score of 3.50 on average from native speakers.

It is essential to keep in mind that sentiment analysis models developed for a single language could not work very well when applied to data written in many languages and scripts. On the other hand, by making use of cross-lingual models that were educated on the training dataset, an average F1 score of 95.4% on the test dataset has been attained.

2 RELATED WORK

To analyze speaker attributes and generate synthesized speech in a variety of languages, we propose a neural end-to-end TTS system as part of this study. In our approach, we build a neural speaker modeling network that is uncoupled from linguistic and acoustic input during training. This illustrates that a voice synthesis network trained in English can be used to synthesize speech for Chinese speakers, and that a speech synthesis network trained in Chinese can be used to synthesize speech for English speakers. With just a few minutes of audio from a fresh speaker, our experimental findings suggest that the proposed model may reach acceptable levels of naturalness and similarity in speech synthesis for two languages [16]. Exploration of many options for generalizing the model to new speakers with less extensive speech data is possible.

As a solution to the challenge of adapting TTS systems to a wide variety of languages, it is suggested a speaker adaptation approach that combines domain adaptation approaches with a speaker consistency loss. In contrast to traditional methods, which rely on direct fine-tuning for adapting speakers within a single language, we use speaker verification in conjunction with domain adaptation to train a language-independent speaker encoder using multilingual data that includes both the source language and the language that

Just Accepted

will be used as the target. Then, we use the speaker embeddings generated by the speaker encoder to train a multilingual multi-speaker TTS model on the source language data. In order to fine-tune the source language TTS system utilizing target language data, we provide a speaker consistency loss. This loss seeks to increase the degree to which synthesized speech and the resulting speaker embeddings are highly correlated with one another. The speaker consistency loss is used to optimize this correlation. It can be shown that our proposed technique outperforms the gold standard process in terms of the spoken naturalness of the final translation by doing extensive tests on datasets that include both English and Japanese native speakers [17].

Detailed explanation on a whole learning-based architecture developed for cross-lingual Chinese and Tibetan voice synthesis is done. This approach allows for the simultaneous synthesis of Mandarin voices and Tibetan speech inside a single system. We do this by providing our acoustic models with both a large Mandarin multi-speaker dataset and a smaller Tibetan single-speaker corpus to train on. The system that provides context-based labels for phrases in both Chinese and Tibetan has been enhanced with the addition of a Tibetan text analyst to the textual analyzer. Our approach employs deep neural networks (DNNs), hybrid bidirectional LSTM (BLSTM), and hybrid long short-term memory (LSTM) to train acoustic models. Finally, we use a bilingual corpus of Mandarin Chinese and Tibetan to train long short-term memory (LSTMs), deep neural networks (DNNs), and back-propagation neural networks (BLNs) to construct synthetic voices. Using speaker adaptation approaches and data on Mandarin or Tibetan speech from a limited listener corpus, the models are fine-tuned. Finally, we use speaker-dependent modeling of Mandarin and Tibetan [18] to reproduce the sounds produced by native speakers.

By fixing the issue of lacking data in DNN-based TTS systems for low-resource languages, our study contributes to the advancement of cross-lingual TTS synthesis with multiple speakers. Problems with low-resource languages, such as the transmission of accents and the improper pronunciation of words, may be circumvented by the use of tone preservation methods and data augmentation, respectively. Applying these methods across a range of languages improves intelligibility, target accent ratings, and perceived similarities between speakers of various tongues.

It is proposed in this work that the Normalizing Flows (NF) method, which is used in neural vocoding, be significantly improved upon. To be more specific, we look at the possibility of enhancing expressive voice vocoding by using a modified version of the Parallel WaveNet (PW). Instead of the PW's affine transformation, we propose using invertible non-affine functions for the transformation due to their greater expressiveness. The enhanced PW allows for more expressive waveform reconstruction and TTS results. We test our model on a broad range of speech patterns utilizing data from a number of speakers who each speak a different language in order to determine how well it performs. The results of the waveform reconstruction tests suggest that the model we have presented reduces the discrepancy between the original PW and the recorded waveforms by 10% in terms of the naturalness and signal quality. Furthermore, our model achieves a reduction of over 60% when compared to existing neural vocoding systems presently regarded to be state-of-the-art. When measured on a set created for the express aim of giving feedback, objective measures like as L2 Spectral Distance and Cross-Entropy show gains of 3% and 6%, respectively, over the affine PW. In addition, we extend the approach introduced in the PW study to any non-affine invertible and differentiable function through the distillation of probability densities. [19].

Given the resource constraints of cross-lingual TTS synthesis, we describe a technique that can synthesize speech in various languages using distinct voices. We zero down on synthesizing English and Mandarin voices using limited training data, including only 15 minutes of a female speaker's Mandarin speech. Common problems in low-resource languages, such as mispronunciation and accent transfer, are addressed by our method. We suggest solutions, including tone preservation and data augmentation, to cope with these difficulties. All of these methods enhance intelligibility, target accent ratings, and cross-lingual speaker similarity ratings when applied to a strong multilingual baseline [20].

Authors describe a method that uses tone/stress embeddings as an extension of language embeddings to add tone and stress into the synthesis process. The proposed system can produce synthetic speech with a variety of accents by changing the tone/stress embedding input. To make it simpler to incorporate new speakers into an online application scenario, authors condition a Tacotron-based synthesizer on speaker embeddings generated from a pre-trained x-vector voice encoder using transfer learning. Authors present a common phoneme set to promote further phoneme sharing beyond the International Phonetic Alphabet (IPA). Our Mean Opinion Score (MOS) ratings confirm the intelligibility and fluency of native speakers of every language. Authors also find that L2-norm normalizing and ZCA-whitening on x-vectors significantly improve the system's dependability and audio quality. WaveNet models may be trained on any of the three languages supported by our system, and authors discover that they can produce high-quality speech in the other two languages[21].

In order to increase the similarity of speech for unidentified speakers, this work presents SC-GlowTTS, a zero-shot multi-speaker speech synthesis system. In this paper, authors introduce the idea of zero-shot flow-based decoding and offer an outline of the system's

Just Accepted

architecture. The gated convolution encoder, the transformer-based encoder, and the dilated residue convolution encoder are only few of the text encoding algorithms authors investigate. Furthermore, authors show how the TTS algorithms' suggested GAN-based vocoder, which is specifically designed for spectrograms, may greatly improve the similarity and quality of voice for new speakers. State-of-the-art outcomes in terms of sound quality and speaker similarity [22] are achieved by our system with just 11 speakers.

This research aims to improve the efficiency of zero-shot speaker adaption for unseen speakers as a means of overcoming the data shortage barrier in DNN-based TTS for low-resource languages. To combat this problem, authors provide a unique multi-stage transfer learning strategy that employs a single-speaker TTS system equipped with a d-vector speaking encoder trained on a high-resource language as the starting domain. In addition, authors offer a TTS model that makes use of explicit style direction from target speech to improve zero-shot sentence adaption, as well as speaker representations loss at the phrase level during TTS training. Our study use open-source speech datasets to show how our training strategy efficiently prepares TTS models for languages with few accessible training materials. Our models, as compared to those trained using more traditional approaches, generate more understandable and lifelike speech. Our proposed style encoder networks, in conjunction with the speaker reconstruction loss, also show substantial improvements in speaker similarity over the baseline model in the zero-shot speech adaption test. When applied to the unknown speakers test set, our proposed TTS model and training approach increase the cosine resemblance between native and non-native speakers by 0.468 and 0.279, respectively [23].

A speech encoder utilizing the best-of-breed ECAPA-TDNN models from the speaker verification challenge, a synthesizer based on the FastSpeech2 model, and a vocoder using HiFi-GAN are the three parts of the proposed architecture that have been trained separately. In comparison to existing voice encoder models, our method achieves higher levels of speaker similarity. Authors adopt and evaluate multiple automated Mean Opinion Score (MOS) assessment methodologies based on deep learning, a first in this area [24], to reliably measure the quality of the synthesized speech.

Using a fine-grained style encoder to improve voice quality and allow cross-speaker style transfer to correct inauthentic accents, authors offer M3, a multi-speaker, multi-style, multi-language speech synthesis system. Using a speaker-conditioned variational encoder and adversarial speaker training with a gradient reversal layer, authors are able to block timbre information from entering the style encoder. To further link the textual output of each speaker with their unique extracted style vectors, authors create a Mixture Density Network (MDN). The inference process allows for the transfer of any speaker's style type into the target language, allowing for the production of speech that is both idiomatic and free of non-native pronunciations. Our suggested method routinely achieves a 4.0 [25] on the MOS-speech-naturalness measure, which is much higher than the performance of the baseline system.

In this paper, authors introduce MultiSpeech, a multi-speaker Transformer-based TTS system with a focus on synchronizing text and sound. To avoid training and inferencing twice, authors use two layers of normalization on the phonetic encoding in the encoding phase and a pre-net obstacle in the decoding phase. Authors show the efficacy of MultiSpeech via tests using the VCTK and LibriTTS multi-speaker datasets. Compared to naive Transformer-based TTS, our system's ability to synthesis multi-speaker audio is greatly improved by training a FastSpeech model on top of the MultiSpeech model [26].

This research presents Face2Speech, a new kind of speech synthesis system that makes use of facial image predictions to create realistic speech. The system includes a voice encoder, a text-to-speech (TTS) module with several voices, and a face encoder. While the voice encoder creates an individual embedding vector for each speaker, the face encoder's captured facial picture is used in the multi-speaker TTS module's encoding process. Synthetic speech created from a face-derived encoding vector is equivalent to that generated from a speech-derived embedding vector, as shown by our matching and naturalness assessments [27].

Authors present a semi-supervised learning strategy for multi-speaker TTS. The proposed encoder-decoder system with discrete speech representation allows us to train a multi-speaker TTS model using raw audio alone, eliminating the requirement for transcriptions. A single hour of matched speech data from numerous speakers or a single person is sufficient for the suggested model to create understandable speech in a variety of voices, as shown by experimental findings. Even with noisy paired voice data, authors find that the suggested semi-supervised learning strategy still benefits the model. In addition, authors show how speaker characteristics affect semi-supervised TTS using paired data, which is a major focus of our study. [28].

As a solution, authors offer a framework for multi-speaker sound synthesis that makes use of deep Gaussian processes (DGPs), a complex structure of Bayesian kernel regressions that is resistant to overfitting. In our method, authors use speaker codes to provide information about the speakers to time and sound models. The potential of deep Gaussian process latent variable models (DGPLVMs) is also investigated. Our approach concurrently learns the representation of each speaker along with other model parameters to accurately capture speaker similarities and differences. Experiments were run with both balanced data from all speakers (speaker-balanced) and unbalanced data from select speakers (speaker-imbalanced) to see which strategy performed better. Both DGP and DGPLVM are shown to perform better than a standard DNN in synthesizing multi-speaker speech in a speaker-balanced situation,

Just Accepted

according to the assessment results. Authors also find that DGPLVM performs better than DGP [29] in the speaker-imbalanced situation.

Authors propose novel WaveNet-based multi-speaker sound synthesis frameworks that use a single conditional generative adversarial network (GAN) or its version, the Wasserstein One GAN with gradient penalty (WGAN-GP), to overcome this difficulty. WaveNet's acoustic model takes inputs from the GAN generator and uses them to calibrate local condition parameters. Authors add the discretized mixture of logistics (DML) cost from a well-trained WaveNet to the standard mean-squared-error (MSE) and adversarial-loss (ADL) components of GAN frameworks. Models trained with WGAN-GP with back-propagated DML losses show better accuracy and speaker similarity in subjective testing [30].

The results of pertaining to augmenting data for automatic speech recognition (ASR) systems, particularly in scenarios where resources are limited or moderate experiments reveal that our approach effectively narrows the gap between ASR models trained with synthesized speech and those trained with human speech. This achievement is noteworthy when compared to other methodologies that involve the use of multiple speakers for similar purposes. Moreover, our findings indicate the feasibility of achieving promising ASR training outcomes through our data augmentation method, even when employing only a single real speaker from the target language [31].

3 PROPOSED WORK

3.1 System Model

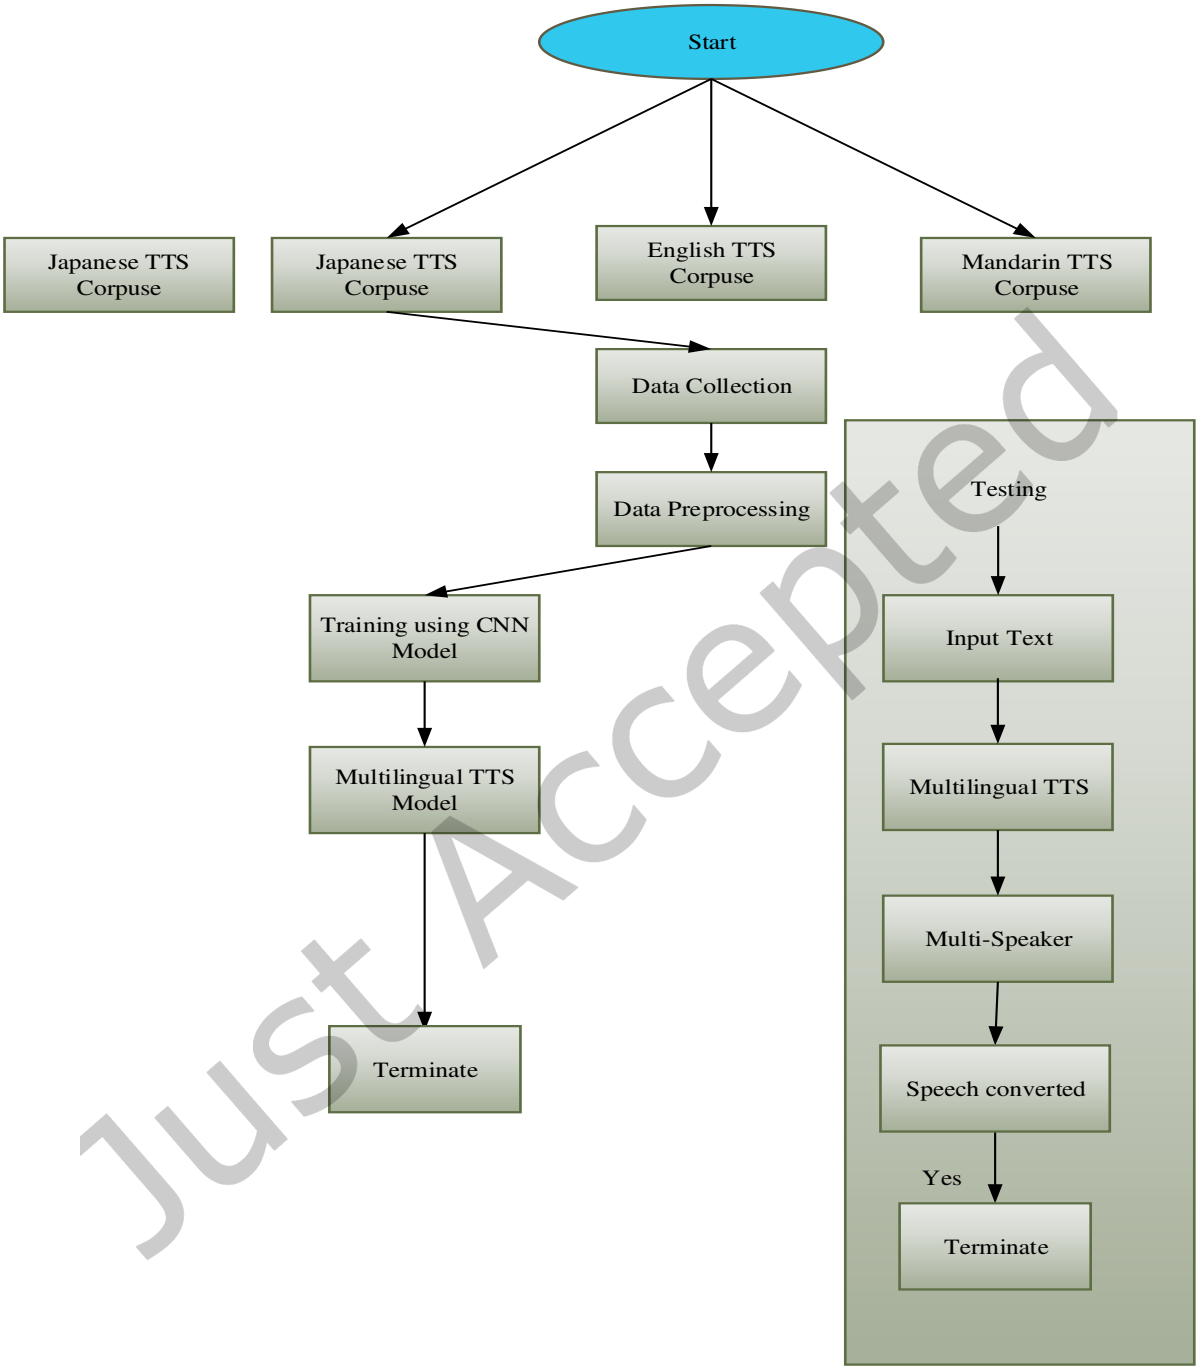
Deep learning has gained popularity in various natural language processing (NLP) applications, including sentiment analysis. However, these methods typically rely on large annotated corpora, which can be challenging to obtain, especially for languages with limited resources. In order to bridge this knowledge gap and address the scarcity of resources in sentiment analysis, we propose a novel deep multi-task multi-lingual approach. Our system leverages cross-lingual word embeddings to effectively align different languages in a shared semantic space. This enables the seamless exchange of information across languages, facilitating more accurate sentiment analysis even in resource-constrained environments..

3.2 Cross Lingual Word Embedding TTS

Most cross-lingual embedding models either utilize monolingual training models directly or extend existing multilingual word embedding methods to handle cross-lingual contexts. As a result, the foundational techniques used for monolingual word embeddings can be adapted to their respective cross-lingual counterparts. Recent research on cross-lingual anchoring models has revealed that the effectiveness of these models depends more on the choice of multilingual signals rather than the architecture itself.

Cross-lingual procedures can be categorized along two dimensions: comparability and alignment. Comparability refers to the availability of parallel data sources, such as literal translations or equivalent data across languages. Alignment level, on the other hand, is related to the level of supervision provided for bilingual data. Various types of alignment can be performed on bilingual data, including word and phrase alignment similar to machine translation, as well as document alignment.

In our study, we adopt a word-level mapping approach using parallel data to establish a bilingual setting. Furthermore, we aim to maximize the similarity between the source and target word embeddings while imposing the constraint of orthogonality. This constraint ensures that the target-to-source translations remain orthogonal. By employing this method, the computation process is facilitated and streamlined.



3.3 GAN Model for Data Augmentation

To address the issue of an unbalanced dataset, down sampling is performed to ensure a well-balanced training dataset. This step was taken to improve the model's performance, as the initial dataset distribution was unfavorable. It is expected that the Cross Lingual model will outperform other models, particularly in both low-resource and high-resource languages. By training the GAN Model with a Translation Language Modelling approach, the model can learn common representations across languages, enhancing its ability to perform well.

Data Augmentation (DA) Technique is a valuable approach that allows us to artificially increase the size of the training data by generating various versions of the existing datasets without the need for additional data collection. However, when applying data augmentation in Natural Language Processing (NLP), particularly for language-related tasks, it poses unique challenges compared to computer vision. Unlike images, where it is relatively easy to create augmented versions, language data augmentation is more complex due to the intricacies and context sensitivity of natural language.

Just Accepted

In NLP, we need to be cautious when replacing words with synonyms, as doing so may alter the context and meaning of the text. Therefore, direct word replacement is not always a suitable strategy. Nonetheless, data augmentation techniques are still valuable in NLP, as they help address issues of data scarcity and lack of diversity, ultimately improving the performance of classification tasks.

Just Accepted

Fig.2. Flowchart for Proposed Method

Data augmentation is a technique that increases the size of the training data, leading to improved model performance. Having more data generally results in better model performance. However, it is important to strike a balance with the augmented data's distribution. The augmented data should neither be too similar nor too different from the original data, as this can cause overfitting or poor model performance. Effective data augmentation approaches aim for a balanced distribution. There are several benefits of data augmentation

- **Cost reduction:** Data augmentation helps reduce the costs associated with collecting and labeling large amounts of data.

- **Improved prediction accuracy:** By increasing the size of the training data, data augmentation improves the model's ability to learn and make accurate predictions.
- **Prevention of data scarcity:** Data augmentation addresses the issue of insufficient data, ensuring that the model has enough varied examples to learn from.
- **Reduction of data overfitting:** By creating variability in the data, data augmentation helps prevent the model from overfitting to the training set, leading to better generalization to unseen data.
- **Enhanced generalization ability:** Data augmentation increases the model's ability to generalize its learned patterns to new and unseen data.
- **Addressing data imbalance:** Data augmentation techniques can be used to alleviate the problem of imbalanced classes in classification tasks, ensuring that the model is trained on diverse examples from each class.

The model in question utilizes a 2048 encoder, pooling layers, 12 hidden layers, and a dropout rate of 0.1. Its maximum supported vocabulary size is 30145. Since the dataset consists of code-mixed Tamil and English text, the model incorporates language embedding to handle both languages. Both the training and validation datasets were used to develop the model

To condition a mel-spectrogram generating network, the model utilizes the speech signal of the target speaker. This is achieved by extracting acoustic properties using the speaker encoder. The structure of the speaker encoder is inspired by GAN-TTS, which captures universal speech features irrespective of speaker or language. The convolution layers in this model use filters with sizes of 64, 128, 256, and 512. The Generation Block processes the preprocessed raw audio as input. Figure 2 illustrates the structure and flow of the speaker encoder within the model.

. To achieve temporal smoothing of activations over an extended duration, a temporal average layer is employed. The pooling layer extracts significant features, followed by an affine transformation. Through the affine transformation layer, the utterance-level representation is projected into a 256-dimensional embedding. To create a speaker embedding that encompasses both the speaker's characteristics and language nuances from the latent space, the output undergoes regularization using length normalization. This process ensures that the speaker embedding captures the desired traits while accounting for variations in utterance length.

Let’s first make a brief introduction to their structure that consists of two parts.

A data generator that is capable of learning to provide credible data. The generator component of the GAN architecture receives as input a random vector of a predetermined length, and its goal is to learn how to create samples that have distributions that are similar to those of the original dataset. After that, the samples that were created are sent through the discriminator's training process and utilized as examples of what not to do. The generator's goal is to trick the discriminator into thinking that the simulated instances are real ones by producing realistic samples that are accurate representations of the primary dataset.

A discriminator that is capable of learning to tell the difference between the generator's synthetic data and actual data. The discriminator part of the GAN system accepts a sample as its input and determines whether or not it is "real" (meaning that it was taken from the primary dataset) or "fake" (meaning that it was created by the generator). The discriminator is responsible for determining which samples are authentic and which ones are fraudulent, and providing input to the generator. If the generator produces samples that are impossible or unrealistic, it will be penalized by this feature, and those examples will be labeled as "fake." This adversarial process drives the generator to increase its ability to create samples that closely match the genuine data. The goal of this process is to fool the discriminator and limit the discriminator's capacity to differentiate between real and false samples.

- The generator wants to minimize $\log(1 - \mathrm{D}(\mathrm{G}(\mathrm{z})))$ where z is the element of randomness that is fed into the generator. The discriminator is fooled into thinking that the bogus samples are legitimate since the generator plays down the significance of this phrase.
- The discriminator wants to maximize $\log(\mathbf{D}(\mathbf{x_d})) + \log(\mathbf{1} - \mathbf{D}(\mathbf{G}(\mathbf{z})))$ where $\mathbf{x_d}$ These are representative examples taken from the initial dataset. This phrase refers to the chance of correctly labeling both the genuine examples and the samples that were generated by the algorithm.

The use of Generative Adversarial Networks (GANs) offers several advantages, including the ability to generate high-quality data and their versatility in addressing various problems. However, GANs also come with certain disadvantages and challenges. For instance, generating discrete data such as text can be challenging for GANs. GANs require extensive training and often demand significant computational resources. Similar to other Artificial Neural Networks (ANNs), GAN models can suffer from instability or overfitting issues.

In our GAN model, we employ the following parameters:

The activation function is Leaky ReLU, with a negative slope of 0.2.

- There will be five of each item in each batch.

Just Accepted

- The learning rate is now set at 0.0002 percent per second.
- A dropout algorithm is used in the generator, and its probability is set at 0.3.
- The loss function is represented here by the binary cross-entropy.
- The Adam algorithm is being used as the optimizer at this time.
- Our design does not include any layers that are used for convolution.

In the event that the generator has many layers, those layers are arranged with the larger ones coming first, but in the discriminator, the layers are arranged with the smaller ones coming first. Dropout is a widely employed regularization technique within neural networks, particularly in the realm of deep learning, aimed at mitigating overfitting. Its core concept revolves around the random deactivation, or "dropout," of a specific proportion of neurons during each training iteration. This strategic process bolsters model robustness by reducing its dependence on specific neurons, ultimately enhancing its ability to generalize to previously unseen data.

The Adam algorithm, an abbreviation for Adaptive Moment Estimation, stands as a widely employed optimization technique frequently employed in the training of both machine learning and deep learning models. Distinguished for its efficiency, speed, and commendable performance across a diverse spectrum of tasks, Adam amalgamates the strengths of two other optimization algorithms, namely AdaGrad and RMSprop.

Before fine-tuning the entire model using triplet loss, which maps sound into a feature space where distances reflect speaker similarity, we initially train the speaker anchoring network independently on a speaker authentication task using softmax loss. The triplet loss requires three examples: an anchor, a positive example, and a negative example. During training, the model utilizes pairs of speaker embeddings to increase the cosine similarities between embeddings from the same speaker and decrease the cosine similarities between embeddings from different speakers. In essence, this process helps the model learn to distinguish between speakers based on their embeddings.

$$Loss = \sum_{i=1}^{N} \left[\| f_i^a - f_i^P \|_2^2 - \| f_i^a - f_i^n \|_2^2 + \alpha \right]_+ \quad (1)$$

where f_i^a, f_i^p and f_i^p are the embedded anchor, positive, and negative speakers, $\alpha \geq 0$ is a constant.

Through training the model on data from multiple languages, we enable a two-step cross-lingual reasoning process. Initially, the model generates the voice of a native speaker in the target language, followed by converting that voice to match the target speaker. The evaluation results indicate that, on average, our technique enhances the intelligibility of the generated output compared to the baseline. Furthermore, it suggests that our approach might also improve the pronunciation of cross-lingual output. Notably, the same model demonstrates its efficacy even in low-resource scenarios, requiring only a single training procedure. This is achieved despite the inclusion of speakers in the training set with an average speech duration of 7.5 minutes.

3.4 CNN-Bi_LSTM Model for TTS

The key component of our model that is responsible for categorization is known as an attention-based bidirectional long short-term memory (Bi-LSTM). Though the Convolutional Neural Network (CNN) may minimize the number of characteristics that are input in order to make more accurate predictions, it does not address the connection that each word has with the final classification in the same way. In order to make the most of the capabilities offered by both the models, the authors of this work make use of Bi-LSTM to encode long-distance word relationships in a more efficient manner.

Just Accepted

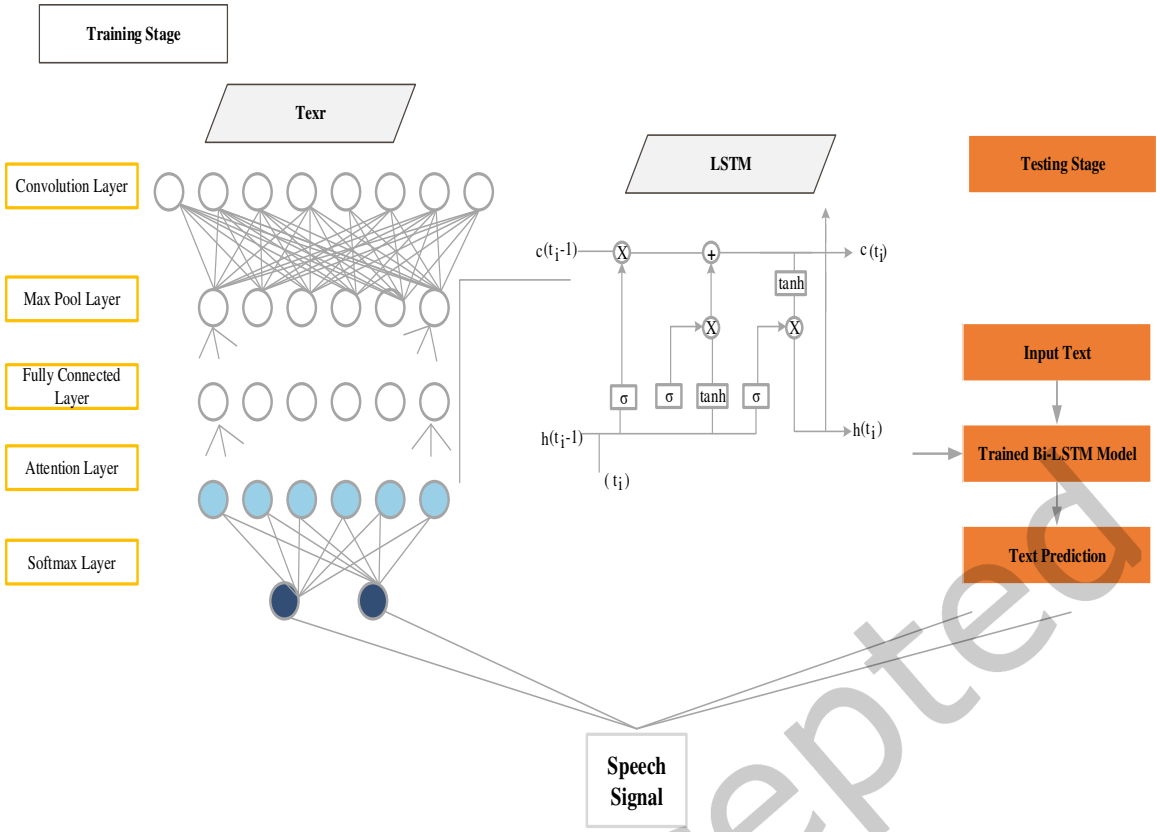


Fig.3. TTS using CNN with Bi-LSTM

Figure 4 is an illustration of the Bi-LSTM method, which depicts how it takes the features created by the CNN stage as input and uses those features to extract features from the final hidden layer. The Bi-LSTM is able to generate two separate textual representations due to the fact that it takes into account both the prior and following contextual information. After having been acquired through CNN_ij, the aforementioned characteristics are subsequently introduced into a Bi-LSTM model in order to provide a sequence representation. The resulting feature representation is then put through an attention layer, which identifies the strongly associated characteristics that will be used for the classification in its entirety.

Take, for instance, the line "Though he is sick, he is happy," which has to be categorized as having a positive mood. "Though he is sick, he is happy" According to the attention technique, the word "happy" is given more weight than the word "sick," showing that the feeling of "happy" is unaffected by the incidence of sickness. The accuracy of predictions may be greatly improved with this attention strategy, and the amount of learnable weights that are necessary for prediction can be reduced. In the context of the model that we have developed, we make use of the Bahdanau attention approach, with attention scores being calculated as follows:

$$\text{score}(querry, key) = V^{\text{T}} \tanh\left(W_{1key} + W_{2query}\right) \quad (2)$$

4 RESULTS & DISCUSSION

In this part of the article, we will discuss the experiments that were carried out in order to evaluate how well the suggested model works. The outcomes of the experiments are analyzed and compared to the most advanced deep learning models that are currently available. Both the number of epochs and the size of the data set were used as independent variables in two separate trials. The following text describes the experimental conditions, data utilized in the experiment, and assessment techniques.

The following is a concise summary of the datasets that were employed in the experiment that we carried out. Following this, the proposed model is disassembled into its component elements, and a variety of different training strategies are presented. At long last, the outcome of the subjective evaluation has been disclosed.

Just Accepted

In order to produce our dataset, we collect four speech corpora in their respective languages from both internal and external sources. The information shown in Table 1 reveals that the dataset contains multi-speaker transcripts in the languages of Mandarin Chinese (ZH), English (EN), Korean (KO), Japanese (JA)and . The frequency of audio files is resampled to 22.05 kHz after the process. Because we have a grapheme-to-phoneme converter in-house, we are able to translate speech transcripts into a string of phonemes. A validation set that excludes 5% of the total phrases is considered complete.

Table 1: Language-specific information about our dataset

Language	EN	KO	JA	ZH	Total
Quantity of speakers	1622	28	111	175	473
Length	72.4hr	43.5hr	27.5hr	60.0hr	203.4hr

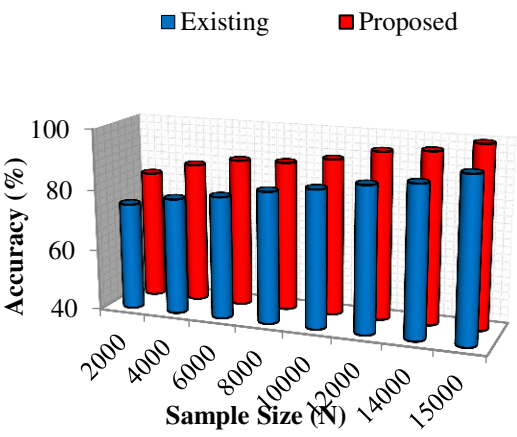
Additionally, we performed data augmentation on the selected 30 minutes of multi-speaker speech data, generating approximately 15 hours of augmented target language data. This augmentation involved altering the pitch and speed of the original speech. The pitch shift was conducted in increments of 0.5 semitones, ranging from -2.5 to 2.5 semitones. The speed ratio of the augmented speech compared to the original speech ranged from 0.7 to 1.55 times the original speed, in steps of 0.05. This resulted in 27 variations of each target language utterance.

During the training process, we utilized two NVIDIA A100 GPUs and trained our framework for 200 iterations. The batch size for mixed-precision training was set to 64. The speaker classifying loss in DAT [20] was weighted according to a sequence of scale factors, following the prescribed method.

$$\lambda = \frac{2}{1+\exp(-10 \cdot p)} - 1 \qquad (3)$$

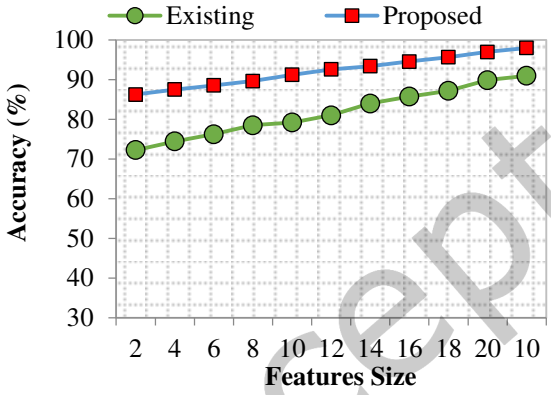
W

The factor p, which ranges from 0 to 1 in a linear manner, is used to determine the loss scale factor during training. Initially set to 0, it gradually increases as the number of training iterations progresses. This schedule helps to mitigate DAT (Discrete Anomaly Training) in the early stages of training and improves the quality of the generated outputs.



To demonstrate the high-quality statements generated by GAN-TTS during cross-lingual inference, we compare it to an official open-sourced version of a separate multilingual TTS model. The meta-education model is trained with a batch size of 64 for up to 100 iterations, using the Griffin-Lim vocoding method included in the official implementation.

We evaluate GAN-TTS by comparing it to models where a single tweak has been removed. Specifically, we remove the use of DAT, include speaker regularization loss, and switch from SDP (Soft Dynamic Programming) to DDP (Dynamic Duration Prediction). During cross-lingual inference, we input the speaker embedding into the duration predictor after removing the speaker regularization loss. For the international TTS model to function, we do not make any adjustments to the language embedding.



To assess the resemblance of the speaker and the naturalness of the utterances, we use mean opinion scores (MOS) with 95% confidence intervals. The MOS assessment employs an absolute subcategory rating system, where performances are rated on a scale from 1 to 5 with 1-point increments. We collect opinion ratings on English speech from native English speakers, as it is challenging to find native experts for evaluating non-English target languages. Each individual utterance and speech pair is evaluated by a total of five raters. Speaker similarity is determined by comparing synthetic speech to actual speech by the same speaker from the validation set. To establish ground truth, two speeches by the same speaker from the validation set are compared by human raters to assess their similarity. Thirty phrases from the English validation set are randomly chosen as evaluation speech samples. Additionally, we test the intra-lingual and cross-lingual synthesis ability by selecting five male and five female speakers from each of the four languages, resulting in over 1200 different combinations of voices and phrases being synthesized.

Based on the performance metrics of the model, sentiment analysis of code-mixed Tamil-English text still has room for improvement. If the output is affected by an imbalanced dataset, up-sampling procedures can be employed to rectify it instead of down-sampling. The misclassification of text using the test dataset may be attributed to the loss of certain critical characteristics due to down-sampling. Considering that the retrieved YouTube postings may contain symbols and abbreviations, preprocessing the data is as crucial as up-sampling the system.

The observations from the experiments can be summarized as follows:

Data Augmentation Benefit: The model showed significantly lower loss when data augmentation techniques were applied. This suggests that data augmentation was effective in improving the accuracy of estimating acoustic features. By generating additional augmented data, the model had access to a larger and more diverse training set, allowing it to capture a wider range of acoustic variations.

Improved Generalization: In the case of data augmentation, there was a notable reduction in the gap between the training and validation losses compared to the case without augmentation. This indicates that the model's generalization performance was enhanced. The model consistently provided accurate estimation results not only for the training data it had seen but also for unseen data in the validation set. The narrower gap suggests that the model learned more robust and generalizable representations, resulting in better performance on unseen data.

These observations highlight the benefits of data augmentation in improving the accuracy of acoustic feature estimation and enhancing the model's ability to generalize to unseen data. By leveraging augmented data, the model gained a broader understanding of the acoustic variations, leading to more reliable and consistent estimation results.

5 CONCLUSION

In this study, we introduce GAN-TTS, an end-to-end multilingual TTS model that produces natural and human-like speech. Due to the limited availability of multilingual speech data for training, we employ a data augmentation approach to enhance the training corpus. One of the challenges in developing multilingual TTS models is accurately predicting speech in languages other than the target speaker's native language. To address this challenge, we incorporate a speaker regularization loss, allowing the model to learn speaker representations in a language-agnostic manner. This approach enables the model to handle multilingual synthesis effectively.

Furthermore, it is ensured that the model generates consistent phoneme durations regardless of speaker identity by substituting a zero vector for the speaker embedding during cross-lingual duration prediction. Additionally, leveraging DAT (Disentangled Acoustic Representations) and language embeddings, which are commonly used techniques in TTS models. GAN-TTS successfully produced high-quality audio samples in bilingual setups involving languages such as English, Korean, Japanese, and Mandarin Chinese. It achieves high speaker similarity in both cross-lingual and intra-lingual synthesis.

By demonstrating the effectiveness of GAN-TTS in languages beyond English, our research paves the way for future advancements in utilizing GAN-TTS for a wide range of languages, expanding its application and impact in the field of multilingual TTS synthesis.

Abstract: Electrified transportation systems are emerging quickly worldwide, helping to diminish carbon gas emissions and paving the way for the reduction of global warming possessions. Battery remaining useful life (RUL) prediction is gaining attention in real world applications to tone down maintenance expenses and improve system reliability and efficiency. RUL forms the prominent component of fault analysis forecast and health management when the equipment operation life cycle is considered. The uprightness of RUL prediction is vital in providing the effectiveness of electric batteries and reducing the chance of battery illness. In assessing battery performance, the existing prediction approaches are unsatisfactory even though the battery operational parameters are well tabulated. In addition, battery management has an important contribution to several sustainable development goals, such as Clean and Affordable Energy (SDG 7), and Climate Action (SDG 13). The current work attempts to increase the prediction accuracy and robustness with selected machine learning algorithms. A Real battery life cycle data set from the Hawaii National Energy Institute (HNEI) is used to evaluate accuracy estimation using selected machine learning algorithms and is validated in Google Co-laboratory using Python. Evaluated error metrics such as Mean Square Error (MSE), Root Mean Square Error (RMSE), Mean Absolute Error (MAE), R-Squared, and execution time are computed for different L methods and relevant inferences are presented which highlight the potential of battery RUL prediction close to the most accurate values.

1. Introduction

One of the major challenges facing society today is reducing greenhouse gas emissions Which has prompted the industry's top producers to promote the progress of electric vehicles (EVs). Since the majority of end user electronics are motorized by battery-like technology, and the use of renewable energy sources to generate electricity is expanding quickly, energy storage has emerged as one of the key sectors. Due to their high energy density and lengthy cyclical and calendrical lifetime, lithium-ion batteries (LIBs), which are efficient energy storage systems, have assumed a leading position in powering EVs. RUL is the required amount of time, which is commonly calculated using the numerical subsequent charge–discharge cycles, from the active profile point to the end of a battery's life. A battery's lifespan ends when its remaining capacity reaches 70–80% of its initial value, according to a widely accepted generalization. RUL is a well-liked research area in the realm of electric battery research because it has an obvious significance for the assessment of the safety of batteries. The length of time a machine or asset is liable to function before needing repair or substituent is known as the remaining useful life (RUL). In addition, it is important to highlight that good management and prediction

of battery use can significantly contribute to improving the efficiency and sustainability of energy storage systems, promoting the adoption of clean energy, reducing emissions, and encouraging innovation and collaboration [1]. In this way, its contribution to several sustainable development goals is interesting, including, for example, Clean and Affordable Energy (SDG 7), and Climate Action (SDG 13) [2]. The Battery RUL problem is directly related to SDG 7 by supporting the development and deployment of affordable, reliable, and clean energy solutions. In systems relying on batteries, knowing the remaining useful life allows for efficient planning and operation. By optimizing the use of batteries and extending their useful life, we can enhance the sustainability of energy systems, promote renewable energy adoption, and work toward the achievement of SDG 7's targets for universal access to clean and affordable energy [3]. In the same vein, solving the Battery RUL problem contributes to SDG 13 by supporting efforts to combat climate change, promote renewable energy, reduce greenhouse gas emissions, and enhance resilience in the face of climate-related challenges. By extending the useful life of batteries and optimizing their use, we can minimize the environmental and economic impact of battery-related activities and contribute to a more sustainable and climate-resilient future [4].

The time period may be expressed in terms of days, miles, cycles, or any other number, depending on the system you are using. RUL prediction offers early failure alerts and has evolved into a crucial part of system prognostics and health management. Figure 1 shows deterioration of a machine over time.

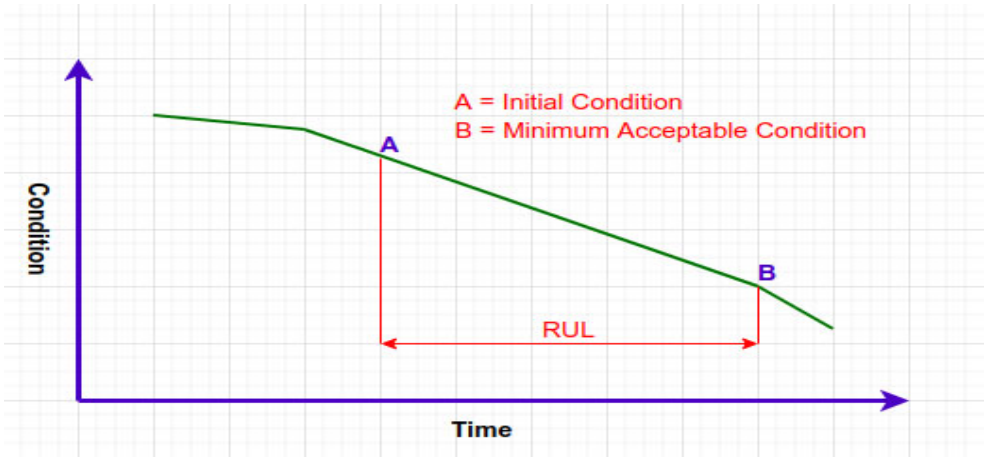

Figure 1. Prediction of RUL.

This picture illustrates how a machine degrades over time. Remaining useful life is calculated as the interval between these two points if A is the current condition and B is the minimal condition beyond which the machine will fail. RUL can be replaced or maintained to prevent unforeseen downtime and financial losses if it is forecast in advance. It is crucial to estimate RUL precisely because it is essential for operations and decision-making. The study of the most precise RUL calculation has recently gained popularity due to the swift advancement of situation and health tracking technology. In the most recent modelling trends for figuring out the RUL the examination places a strong emphasis on statistical methods that are fact-driven and use the finest readily available historical determined records and statistical models.

The different procedures that have been suggested and put into exercise to simulate the degradation of these complex systems have led to the evolution of two techniques: entirely model-based techniques and information-driven techniques. Due to the model's complexity, its universality is also limited and usually impossible to attain. As a result, the generalization impact cannot be determined. The kinetics of SEI generation and solvent transportation are considered in a one-dimensional model to examine possible decline in lithium-ion batteries. This work advises analyzing potential fade at various cyclic

charge–discharge settings within a lithium-ion electrochemical pseudo-dimensional (P2D) battery version.

The model exhibits a stronger relationship between battery performance and electrolyte chemical characteristics by combining porosity exchange with electrolyte partial molar concentration [3]. The changing modern pricing and cut-off voltages are expected to cause fluctuations in the stable electrolyte interface (SEI) layer. The results show that the porosity version and convective heat switch coefficient have a substantial impact on the SEI layer development and battery life.

The semi-empirical cycle aging model for an LFP-based fully cylindrical cell presented here has been improved as a result of better knowledge of aging phenomena under the effect of DOD and Ah-throughput variables [4]. It is based on ability loss and is the primary LLI degradation technique since it takes into account both internal resistance aging and capacity loss. A Thevenin version has been described with a single RC branch and constant values for all model parameters. In this work, parameters of similar circuit models that account for battery aging and qualities for resistance aging, as well as several internal battery capabilities are included [5].

A substitute is used for random initialization, a prediction model with LSTM is initialized, and the system parameters are optimized based on test temperature and test dates, which presents an 89.18% average accuracy [6]. A comparison has been drawn between Naïve Bayes (NB) and Support Vector Machine (SVM): where NB is employed, the RUL of Li-ion batteries exhibit stable and better competitive prediction performance than SVM under constant discharge conditions [7].

A probabilistic-based adaptive estimator is used with caution for both SOE and SOC estimation using neural networks and information-pushed methodology, and accurate battery models are examined [8]. The voltage prediction effects that may be more accurate for the SOC calculation are provided by an electrochemical model and an n ordered RC equal circuit model. For SOE estimation, the relationship between the terminal voltage and the model input is often examined using a sliding window neural network model. The results demonstrate that the proposed voltage mistakes and records pushed neural network models can produce accurate version predictions.

A weighted least squares assist vector device is used for online estimation of the SOH of 2D-use lithium-ion batteries. The suggested method has been tested on a variety of 2D-use lithium-ion battery data units under various environmental conditions and battery types [9]. The results of the application show that, in comparison to the totally BPNN-based technique and the totally GPR-based approaches, the SOH accuracy anticipated via the totally WLSSVM-based approach is the best because the suggested approach has a higher ideal for nonlinear conditions with much less educational information. Battery terminal voltage characteristics during the charge process for RUL prediction has been considered Importance Sampling which has been employed in combination with a Feed Forward Neural Network [10].

In ref. [11] the author worked on a fusion of 3-D CNN and 2-D CNN which yielded a 1.1% test error for battery cycle life and a 36% test error for RUL prediction. The design and development of a lithium-ion cell version battery management system may also be used to execute state machines for charge and discharge current limit calculations, fault management, contactor management, and other duties [12]. The simulation model for designing and testing these methodologies includes Li-ion battery cell parameter estimation, battery packs with 6 and 96 cells, test documents with check cases to confirm state machine logic and linking requirements to models. Bayesian methodology is a probabilistic method for forecasting the RUL of a battery. When we initially offer a framework for feature extraction, we use the RUL estimation model to apply Bayesian inference of linear regression [13].

The lithium battery deterioration model and its RUL can both be accommodated by an integrated mastering approach that is entirely based on tracking records [14]. The relevance vector device (RVM), the random woodland (RF), the elastic net (EN), the autoregressive model (AR), and the lengthy quick-time period memory (LSTM) community are the five

fundamental rookies used by the ensemble learning approach, which aims to improve prediction performance [15]. Remaining useful life (RUL) estimation of drilling pumps and critical components in fossil energy production is carried out with deep feature learning technique that uses a Convolutional Neural Network (CNN), Convolutional Block Attention Module (CBAM) [16].

Rechargeable battery systems with attractive potential for commercial applications are emerging as alternatives to traditional lithium-ion batteries (LIBs). They offer the promise of higher theoretical energy density and lower production costs compared to LIBs. However, despite their potential, these emerging lithium-sulfur Batteries (LSBs) continue to face persistent challenges that hinder their widespread industrial adoption. These issues include the inevitable dissolution of lithium polysulfide intermediates during electrochemical reactions and significant volume expansion, sometimes reaching up to 80%, upon the formation of Li_2S. These challenges result in severe limitations on battery lifespan and safety [17].

In this comprehensive review [18], an overview of the theoretical and experimental advancements in Ge-based monoelemental and binary two-dimensional (2D) materials is presented and encompasses various aspects, including crystal structures, as well as electronic, mechanical, thermal, optical, and photoelectric properties. Furthermore, we delve into the potential applications of these materials across a wide spectrum, including field-effect transistors, photodetectors, optical devices, catalysts, energy storage devices, solar cells, thermoelectric devices, sensors, biomedical materials, and spintronic devices.

Effective monomer design can lead to the creation of a sulfur-containing polymer with advantageous characteristics. These properties encompass ion and electron conductivity, high sulfur content, suitable viscosity, processability, and controllable morphology. These attributes hold significant promise for application in the cathodes of Li-S batteries, facilitating high capacity and consistent discharge even at elevated rates. This review provides a concise overview of the latest advancements in cathode materials based on sulfur-containing polymers [19].

The introduction of lithium iodide (LiI) as a Lewis basic salt serves to prevent the interaction between LiTFSI and the MoS_2 electrocatalyst, thereby inhibiting the formation of a surface gel layer. This electron-deficient center, induced by the trifluoromethanesulfonyl group in LiTFSI interacting with the Lewis acidic sites on MoS_2, triggers the cationic polymerization of the 1,3-dioxolane solvent and leads to a reduction in electrocatalytic activity. As a result of this modification, Li-S batteries incorporating the MoS_2 electrocatalyst and the LiI additive achieve an exceptionally high actual energy density of 416 W h kg^{-1} demonstrated at the pouch cell level [20].

Despite the notable theoretical energy density associated with lithium-sulfur (Li-S) batteries, they grapple with practical challenges, notably sluggish conversion kinetics and the notorious shuttle effect of polysulfides. In response to these challenges, a novel approach has been introduced involving a nitrogen-doped continuous porous carbon (CPC) host that firmly anchors monodispersed sub-10 nm FeS_2 nanoclusters, referred to as CPC@FeS_2. This innovative host exhibits a robust capability for adsorbing polysulfides, holding the promise of mitigating the polysulfide shuttle effect and enhancing the initial stages of the catalytic conversion process [21].

The other sections of this paper are prepared as follows: Section 2 explains the recent relevant works based on model-dependent and data-driven methods. Section 3 presents the pre-requisites of the data set, ML Algorithms, and Problem formulation. Section 4 presents Proposed Methodology of ML Methods for RUL Prediction and estimation of Performance error indices. Section 5 shows the results of our proposed method and discussion. Finally, Section 6 offers a conclusion and directions for future work.

2. Literature Review

To predict the RUL of lithium-ion batteries, completely version-based and statistics-driven techniques are frequently used. Primarily version-based procedures frequently make use of an extension of algebraic, differential, and empirical equations. Records-driven algorithms estimate battery RUL in the realm of mathematical fashions by utilizing latent mappings between inputs and outputs, hidden correlations between developments or features, hidden correlations between qualities and skills, and so on [22]. Several approaches for estimating lithium-ion battery RUL are currently linked. RUL prediction algorithms are classified into three categories: entirely version-based, facts-driven, and hybrid. Figure 2 depicts a thorough evaluation of the RUL prediction methods. The completely version-based approach makes use of modelling that is generally based on physics to enlarge the degradation and an empirical version to disclose how a linked item declines with time. Statistic-driven styles, on the other hand, embellish the degrading version to expand packages using ML approaches and historical statistics. In order to incorporate the respective advantages of the two models, hybrid-based solutions are finally developed.

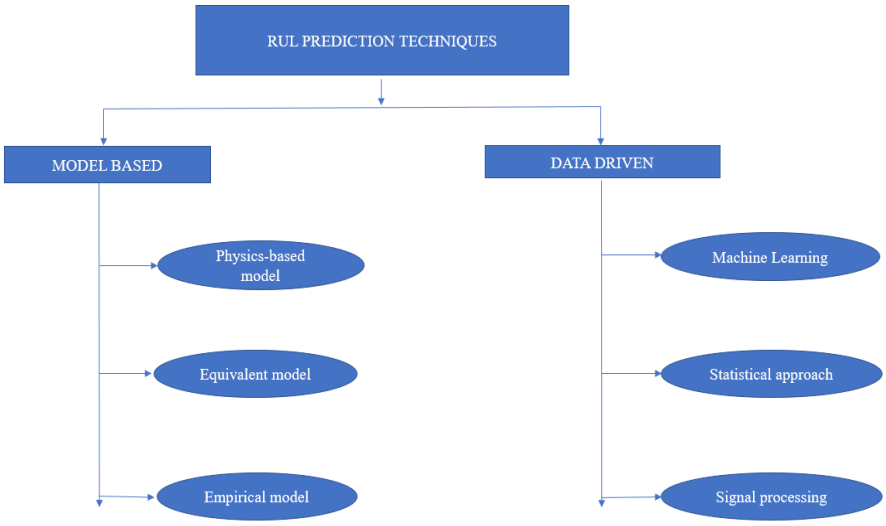

Figure 2. Classification of various RUL prediction methods for lithium-ion battery.

(A) Model Dependent Methods

Algebraic and empirical equations, linked elements, and mathematical models make up the model-based techniques. They also include a significant amount of empirical data gathering via experimentation. A physics or regression model can be used to create the battery's deterioration behavior, and the results can then be extrapolated to estimate battery performance.

(A.1) Physics-based model

The physical and electrochemical phenomena that take place inside the battery serve as the foundation of the physics model. The electrode porosity and reaction kinetics theories are used to create the physics model for RUL prediction. The physical and chemical processes, as well as calculating battery states like SOC and SOH, may also be better understood by using the physics model. The pros and cons of using dynamic models for the operation and diagnosis of Li-ion batteries are discussed in [23]. The summary of models and dynamics is succinct but clear, and it also looks at the necessary advancements for the field's future. The fundamental processes, including their dynamics, parameters, and time, must be understood in order to determine battery diagnostics and operation constants. Compared to other model-based methodologies, the accuracy of physics models is relatively poor [24]. The demand for batteries is rising as new energy electric vehicles

and smart grids emerge quickly. An essential component of a system using batteries for energy storage is the battery management system (BMS). The state estimation approaches are evaluated in terms of ultimate potential and power estimation, strength functioning prediction, lifespan and health forecasting, and other important indicators in BMS.

(A.2) Equivalent circuit model

The equivalent circuit model (ECM), which stands based on knowledge of the physical and chemical processes involved in popular battery production, has been developed. It is entirely predicated on the idea that different electrical element combinations can result in outcomes that are electrically comparable to those of a battery. Consequently, a mathematical model can be developed using circuit assessment techniques. Additionally, the employment of ECM results in the simulation of several significant characteristics, such as the production of power, electricity, and heat under challenging operating conditions [25]. As the SEI movie layer matures, it has been seen that the battery's internal resistance continuously rises. Additionally, the electrochemical impedance spectroscopy (ECM) characteristics may be seen using EIS datasets, and RUL can be predicted using a regression model. One of the most important metrics for assessing the health of lithium-ion batteries is the electrochemical impedance spectrum (EIS). Ref. [26] outlines a method for online implementation that determines the EIS of lithium-ion batteries using a fractional-order equal circuit model (FOECM). The parameters of the fractional-order model are first generated based on measurements of current and voltage using a fractional-order kingdom variable clean out and the recursive least-squares approach. The parameters that were gathered are then used to construct the battery's expected EIS under various ageing scenarios. The regression version of the estimated EIS spectrum is then utilized to show how the battery is deteriorating in terms of the rise in internal resistance. Finally, compared to tests applicable to current FOECM-based regression models, the enhanced regression model is successfully applied in the context of particle filtering to predict the battery's final usable lifetime (RUL).

(A.3) Empirical model

The foundation of the empirical model is built by looking at the association between a wide range of factual aspects. Several battery degradation traits are included in the empirical model for RUL prediction. Empirical models can predict degradation trends using empirical formulas or exceptional regression models to represent degradation behavior. In [27], a framework for RUL prediction based on a logarithmic variant was established, proving its superiority over conventional empirical models. It is important to carefully choose version settings related to scalar quantities to prevent the introduction of complex values for expected ability. A two-term logarithmic variant was built to reflect the 2-segment nonlinear concave degradation of cylindrical-type Li-ion batteries. The proposed design accurately captured the inflection factor of the two-section concave deterioration. Reference [28] recommended a dual EKF (DEKF) based entirely on the Thevenin model for estimating battery kingdom. When a primary-order Taylor expression was employed for country estimate, the DEFK was used to convert a non-linear state and statement expression hooked on a linear feature. The empirical model remains a non-linear system, therefore conventional KF remains appropriate. The equivalent circuit version is constructed from basic circuit components, and the modelling process is challenging. The form acts as a real replacement for the outside function switch of battery charge and discharge. The comparable circuit version's parameter identification is rather straightforward; as a result, it is frequently used. As a result, we created the second-order Thevenin equal circuit version as well as the RC version.

(B) Data-driven-based Techniques for RUL Prediction

Utilizing past data, data-driven context predicts the rate of battery degeneration. At this time, it is still unclear how data-driven models function and propagate. Without using physics-based methods, the weight limitations in the data-driven mathematical context are determined using the training data. Recently, the flexibility and applicability of data

driven models have attracted attention on a worldwide scale. Three categories can be made to classify the RUL estimation techniques created with data-driven methods: machine learning (ML), statistical methods, and signal processing.

(B.1) Machine learning (ML)

RUL can be predicted using model-based, statistics-driven, or hybrid strategies using historical data or direct statistics extraction. Developing version-based strategies in complex devices is particularly challenging, expensive, and time-consuming because it calls for a great deal of skill outside of the realm of machine learning, because data-driven tactics mainly rely on machine learning (ML) techniques.

The component's maximum useful life (MUL) is one of the most significant indicators of expected failure. The studies on RUL prediction using ML approaches are described in [29]. It is difficult, expensive, and time-consuming to develop totally version-based procedures in complex equipment since it requires extensive outside device expertise. Statistics-driven techniques had been heavily reliant on machine learning (ML) procedures.

Machine learning is employed in [30] to predict battery cycle life and early pleasant class throughout manufacture. Information-driven machine learning algorithms have been used to forecast and classify the early success of battery manufacture. The predictive power of linear regression models and artificial neural networks (ANNs) were investigated using a variety of datasets. However, the linear regression shows an equivalent look at errors of about 13% when only a few enter features are used. The focus of the RUL prediction investigation was on three top-ranked regions [31]. The first entails compiling battery data using publicly and commercially available Li-ion battery data sets. The second part of the section involves estimating battery statuses using a battery management system [32]. The symbolic regression machine learning algorithm was used to anticipate the final useful existence of these batteries. A single methodology for batch categorization, unit utilization, and battery recycling is provided by the information-pushed device mastery method used to anticipate strong state battery life. Offline training and online correction of data driven models for RUL prediction has been worked and the author inferred that a reduction of 40% in Root Mean Square Error and 34% in mean uncertainty calibration error is achieved with the augmented model [33].

(B.2) Statistical approach

The method of building a model for RUL prediction is statistical. A capacity deterioration model was created using data from earlier measurements. The application of statistical modelling is straightforward and precise. In the subsections below, a few of the statistical techniques utilized for RUL prediction are displayed.

(a) Autoregressive integrated moving average (ARIMA) technique

For battery RUL estimation, the ARIMA typical mostly substitutes the Autoregressive version due to the predominance of underfitting at some point in version schooling. To alleviate the problems associated with underfitting, ARIMA combines a shifting common approach with an autoregressive model. A novel hybrid Elman-LSTM approach for estimating the amount of usable existence that a battery has left was developed using Elman neural networks, long and short-term memory, and empirical model decomposition. This method is made available by way of [34]. The recorded battery potential versus cycle number data is broken down into several sub-layers using the empirical version decomposition set of rules. Then, utilizing Elman neural networks and recurrent long and short-term memory, high- and occasional-frequency sub-layer forecasting is performed. Large battery test datasets were used to parameterize the models and assess their performance. The appropriate HI for RUL prediction was determined using the capacity regeneration profile data from the state of health (SOH) estimation. When compared to the RVM, echo state network (ESN), and traditional ARIMA models, the determined RUL errors become insignificant. The performance of the model can be enhanced through PDF computation, as shown in [35]. A fractional-order equal circuit device is created using a combined Ge-

netic Algorithm/Particle Swarm Optimization technique. The model is able to predict the voltage response using cycle-based comprehensive testing with a root-mean-squared error below many others. A dual fractional-order prolonged Kalman filter is suggested in order to obtain concurrent SOC and SOH estimates. Combining GM (1, 1), the ARIMA model, and the Variational mode decomposition (VMD) denoising scheme allowed us to forecast RUL, as is shown in Figure 3.

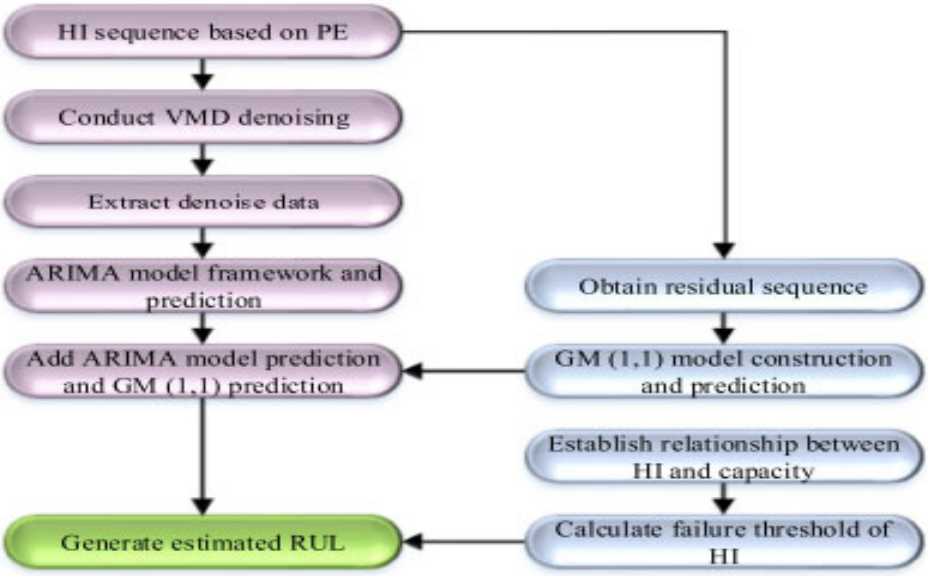

Figure 3. ARIMA based RUL prediction.

(b) Grey model technique

Enhancing the grey prediction classical means that we can use it to predict the number of users in a public road transportation system [36]. For evaluating the behavior of an unknown system, only small amounts of data are necessary. The forecasts are based on a small number of data points. Three different strategies are used in three different grey prediction models that have been presented to boost accuracy. To achieve the prediction of time series, these models convert discrete sequences into a continuous and dynamic differential equation. Each grey model is denoted by the notation GM (H, N), where H is the number of variables and N is the order of the differential equation. Small amounts of data are needed by the grey models to estimate the behavior of an unidentified system. The grey prediction model is described in greater detail in the ensuing subsections.

With the appropriate optimization of the extracted HI, the accuracy of the grey model's performance was increased [37]. The suggested model showed great accuracy, robustness, and dynamic flexibility. However, taking into account dynamic circumstances such as EV application, the provided results may vary. The RUL is predicted using an improved grey model, GM (1, 1), based on the HI that has been given. The experimental findings demonstrate the effectiveness and precision of the suggested strategy for battery degradation modelling and RUL prediction.

(B.3) Signal processing approach

With the help of the signal processing technique, significant data can be extracted. Data augmentation is one of the traits of signal processing methods. To estimate battery RUL, one can utilize a signal processing method. The DWT method is used to split a signal into its component parts. Although the DWT technique is rarely used for battery RUL prediction, it is commonly recognized for removing noise during the pre-processing of battery data. In ref. [38], lithium-ion battery remaining useful life prediction is performed using discrete wavelet transform. The remaining usable life and health are important factors in determining how safely and reliably an electric vehicle operates. Several methods

have been used to estimate the RUL and SOH, with a focus on capacity loss, internal resistance growth, voltage drop, self-discharge, and cycle count. Most works only take batteries into account in specific circumstances. The model and identification techniques are the most crucial elements in figuring out how accurate the prediction results would be.

3. Problem Formulation

(A) Data set

The overall performance of a battery diminishes for a variety of reasons, and the reduction is not necessarily linear. Battery becoming older facts are required to develop an RUL prediction set of rules and compare its balance and correctness. In the early days of lithium-ion technology, battery life was limited. As a result, many ageing checks are required to swiftly acquire battery growing older facts. Numerous charge–discharge charges and ambient temperature are the most commonly utilized pressure parameters. However, apparent battery aging checks take time, and complex and expensive sign collection equipment is required to extract battery attributes from multiple aging cycles. Several researchers have used publicly available battery information to validate their RUL prediction algorithms. The Hawaii Natural Energy Institute evaluated 14 NMC-LCO 18,650 batteries with a nominal capacity of 2.8 Ah after being cycled over a thousand times at a temperature of 25 °C with a CC–CV rate of C/2 and a discharge price of 1.5C. The unique dataset is used to create features that emphasize the behavior of the voltage and current over the course of each cycle. These characteristics can be used to calculate the batteries' ultimate beneficial life (RUL). The dataset contains summaries for the 14 batteries. Finally, voltage, current, and time are used to extract seven functions from the original datasets. The goal is to forecast the battery's RUL using these features. The characteristics are listed in Figures 4–6:

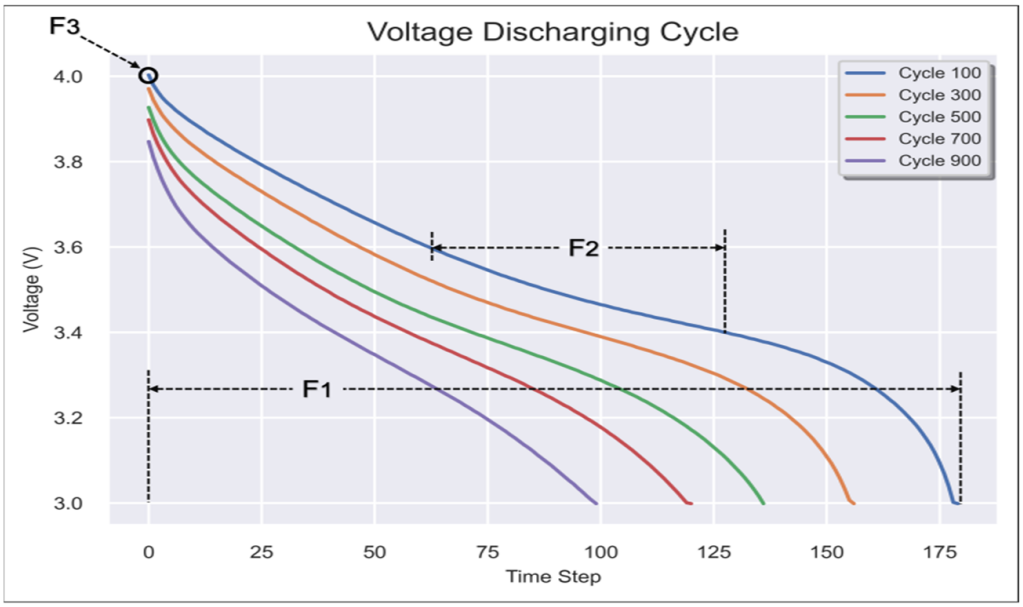

Figure 4. Profile of features F1, F2 and F3 in Voltage Discharge Cycle.

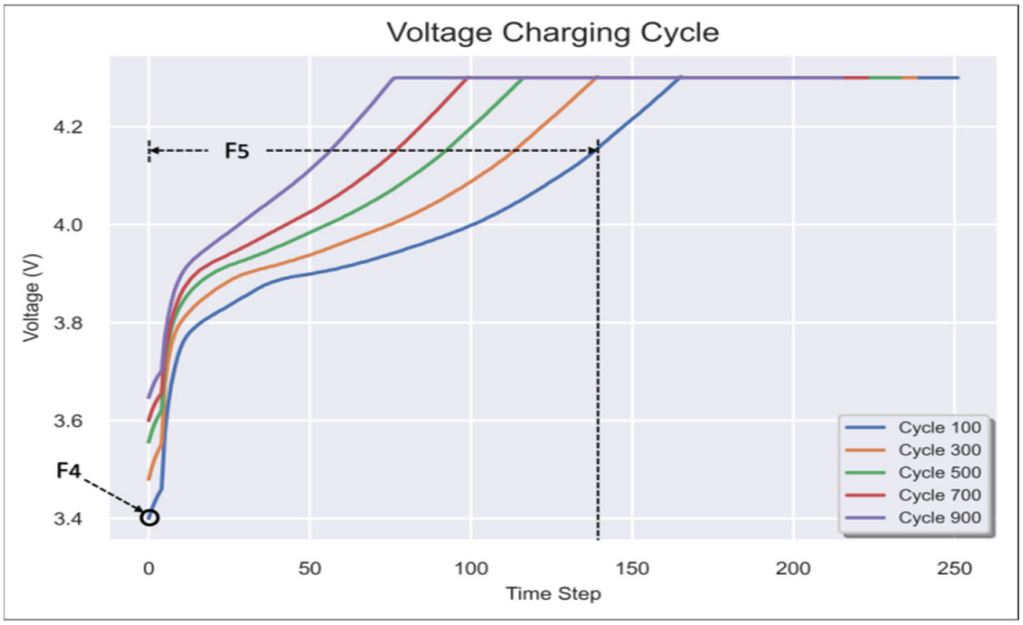

Figure 5. Profile of features F4 and F5 in Voltage charge Cycle.

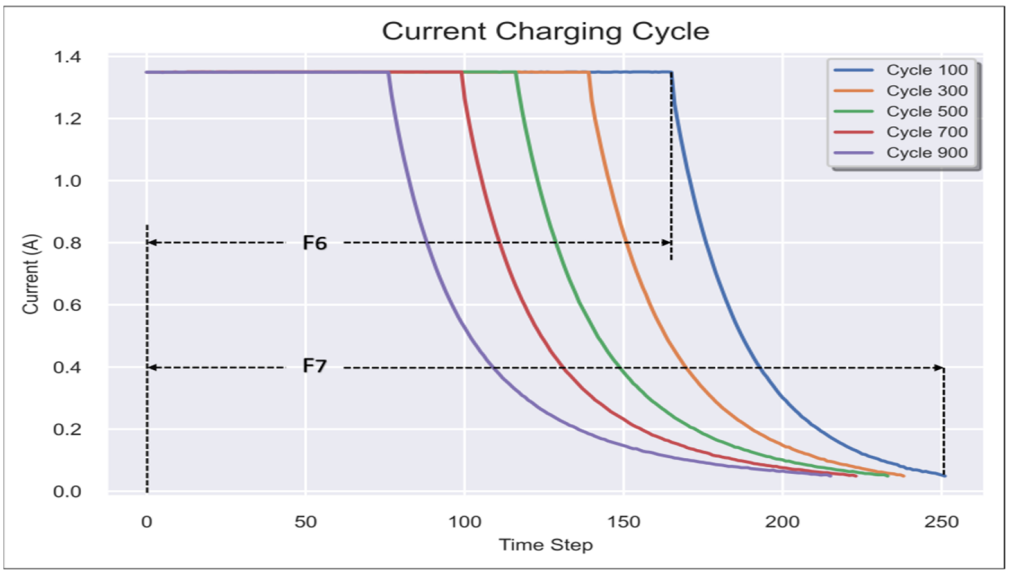

Figure 6. Profile of features F6 and F7 in Current charge Cycle.

Characteristic features:

- Cycle Index: number of cycle;
- F1: Discharge Time (s);
- F2: Time at 4.15 V (s);
- F3: Time Constant Current (s);
- F4: Decrement 3.6–3.4 V (s);
- F5: Max. Voltage Discharge (V);
- F6: Min. Voltage Charge (V);
- F7: Charging Time (s);
- Total time (s);
- RUL: target.

The battery life cycle databases that are available to the general public do not provide ready-to-use data for the assignment in [39]. Despite the fact that they incorporate various

factors such as voltage (V), current (A), time (S), discharge and fee capability (Ah), and charge and discharge energy (Wh), not all of these factors can be employed for this enterprise. Voltage, cutting-edge, and time are the best inputs allowed. However, using such variables as inputs right away is impractical because they provide worthless information and are insufficient to construct a version. As a result, they must be used as a starting point and adjusted to produce new qualities, which the neural community can use to educate.

(B) Elucidation of ML Algorithms

Machine learning (ML), a completely AI-based technique, teaches a machine to mimic human behavior in order to carry out previously impossible tasks. It also encourages communication between individuals and ML systems in order to make ML outcomes intelligible to humans. Figure 7 depicts the extensive classification of gadget learning methods. The ML era has the potential to improve both prognostic accuracy and computing efficiency for predicting the RUL of Li-ion-based batteries. Machine learning aims to discover styles and laws mechanically, using data experiments or in-person interactions [40].

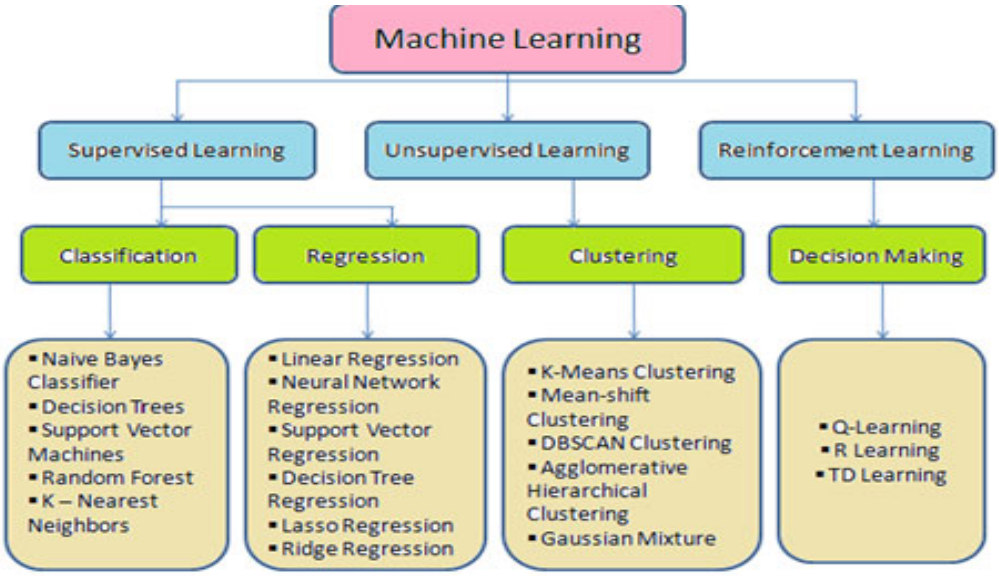

Figure 7. Classification of Machine learning algorithms.

This type of guide vector tool technique has grown in popularity during the last ten years. While using the technique as a regression strategy, its critical functions can be maintained. When records are regressed using the SVM, it is known as support vector regression (SVR). The RUL for Li-ion batteries can be predicted using the SVR technique. We decided to use a hybrid version of the SVR particle elimination technique [41]. For the terminal life cycle, an RUL prediction version that would offer the charge of RUL while updating the possibility distribution was provided. The results confirmed the efficacy of the cautioned RUL function prediction algorithms.

A simple and effective technique called KNN has been widely used in sample recognition for categorization. Using KNN and a specific number (k) of its closest neighbors in the feature area, a testing factor is categorized. These neighbors are chosen from a selection of educational websites with the right established categories. KNN regionally approximates the feature and waits to compute it because it is a lazy studying collection of rules [42].

Supervised Learning:

The supervised learning approach uses an enter-and-output pair-based learning dataset with the goal of implicitly establishing the mapping and intentional links between the inputs and outputs. The enter-and-output pairs' class output for the education dataset addresses a constrained set of discrete classes that need labelling. Information input and output are mapped as the basic goal of supervised learning. As it depends on

supervision, supervised learning is analogous to when a student studies under a teacher's direction. Two further sorts of supervised learning issues can be identified:

(i) Classification;
(ii) Regression.

Unsupervised Learning:

Unsupervised learning is a sort of machine learning in which the computer is free to make decisions based solely on the information provided. The algorithm wishes to act on those records without supervision, thus the unsupervised models may be trained using the unlabeled dataset, which is neither categorized nor labelled. The version in unsupervised learning digs through the enormous number of facts in search of insightful data rather than providing a deliberate outcome. They are used to overcome the Association and Clustering difficulties As a result, they can be split into two groups:

(i) Clustering;
(ii) Association.

Reinforcement Learning:

When an agent uses reinforcement learning, it engages with its surroundings and learns from the feedback it receives. The agent receives feedback in the form of prizes; for instance, he gets a high compliment for every admirable activity and a bad reward for every distasteful conduct. The agent is not subject to any supervision. The decision-making process, which includes reinforcement algorithms, can be further divided into:

(i) Q-learning;
(ii) R-learning;
(iii) TD-learning.

Some of the popular machine learning algorithms which are used for prediction purpose are:

1. Linear Regression Algorithm;
2. Random Forest;
3. Decision Tree;
4. Support Vector Machine;
5. Naïve Bayes;
6. K-Nearest neighbor;
7. Gradient Boosting Regressor;
8. Deep Neural Network;
9. K-means Clustering;
10. Q learning.

(C) Work Objective and Problem Formulation

A twofold objective is proposed for the present work. The first step is to extract and build new features based on voltage, current, and time from the given source datasets. And the second is to predict a battery's RUL by working with machine learning methods using Python 3.6.8 in Google Co laboratory. The methods employed produce the outcome in terms of performance evaluation metrics like MSE, MAE, RMSE, and R2.

4. Proposed Methodology

(A) Framework for RUL Prediction

Although data-driven models can train quickly since they are based on historical data, choosing the right hyperparameters for effective model training requires human judgement. In this research, we suggest a novel RUL prediction framework. RUL prediction implementation is broken down into three stages, which are covered below.

Stage 1: Extraction of characteristics from considered dataset and subsequent pre-processing of data is performed.

Figure 8 shows the stage 1 flow chart. Here the battery dataset is obtained from Hawaii Natural Energy Institute (HNEI). By evaluating the charging profile data and capacity the

input parameters voltage, current, and time are chosen, methodical sampling is employed. The capacity degradation data are attained from discharging cycles, and normalizations of data are done in this process.

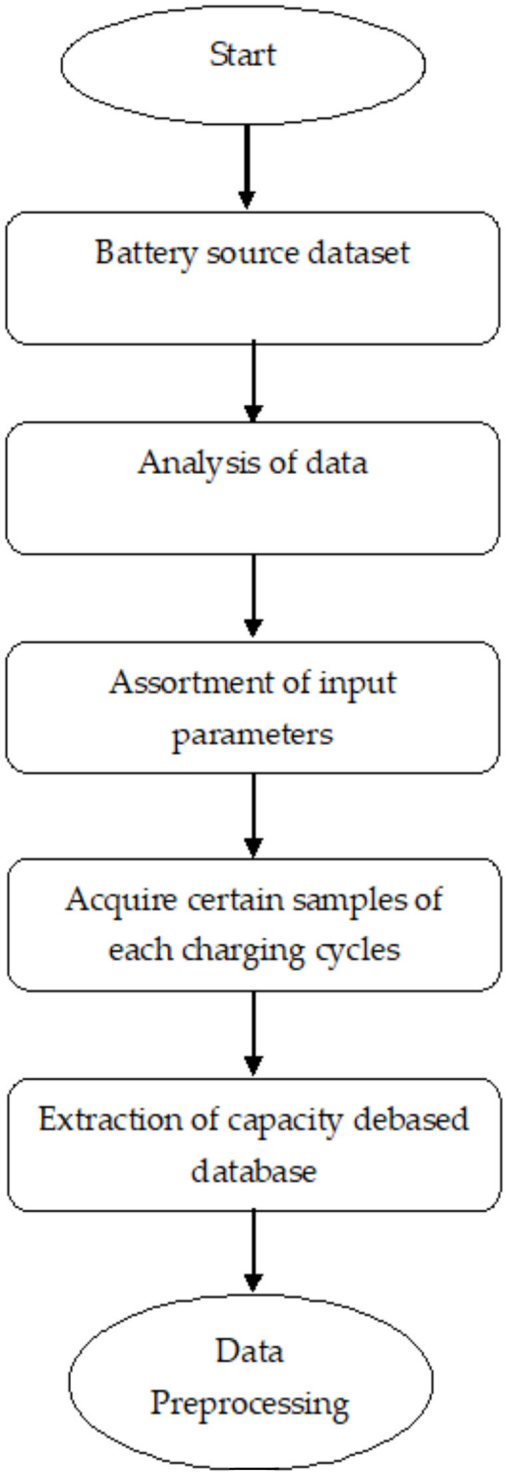

Figure 8. Extraction and Processing of data.

Stage 2: Data Division and Model Training

Figure 9 shows the flow chart of the stage 2 process. In the second stage, the data are divided into two components to facilitate model training, i.e., train and test the data. By

using the hit and trail method for solution of focused parameters input features are selected and suitable algorithms are applied.

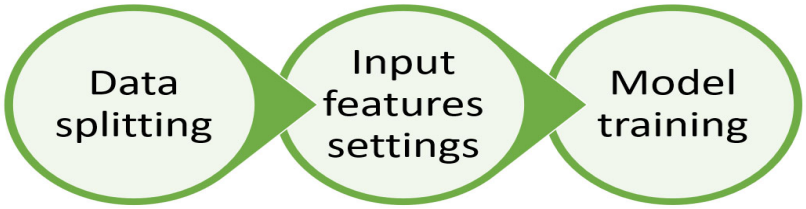

Figure 9. Data division and model training.

Stage 3: Prediction and Investigation

In the last stage, as displayed in Figure 10, RUL prediction and performance indices are calculated by Root Mean Square Error (RMSE), Mean Absolute Error (MAE), Mean Square Error (MSE), and Root Square (R^2), and various training dataset combinations are employed.

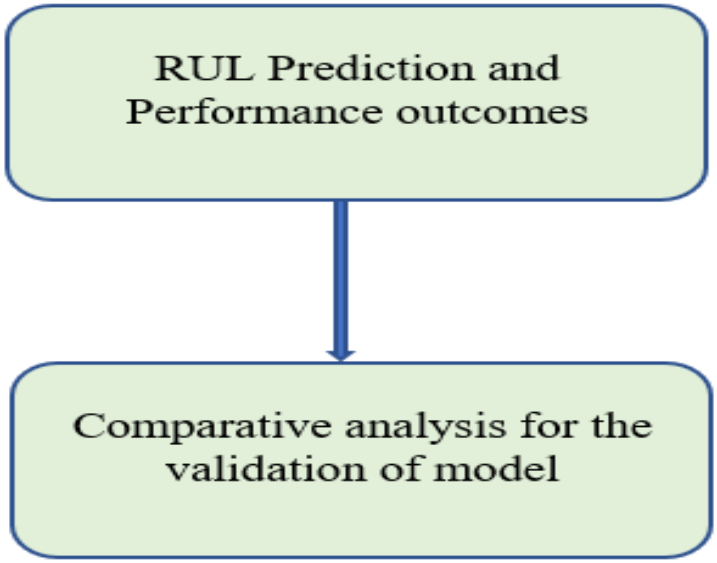

Figure 10. Prediction and Investigation of data.

(B) Selected ML Algorithms

The efficacy of a battery is determined by determining its remaining usable life. Through the identification of elements that will raise and improve their efficiency, it supports the development and testing of numerous EV variations. The method involves a number of parameters. Engineering difficulties with non-linearity and complexity can be modelled using machine learning approaches. ML approaches offer a non-invasive alternative with good accuracy and little processing, in contrast to the temporal constraints of battery degradation. The report provides a thorough and impartial assessment of the difficulties. Individual studies of numerous RUL evaluation methods are conducted. Finally, an overview that focuses on applications is provided, emphasizing the benefits in relations of accuracy and efficiency. The planned technique has six different algorithms that are used for obtaining the values of MSE, MAE, RMSE, and R Squared error. Figure 11 shows the flow chart for the proposed method.

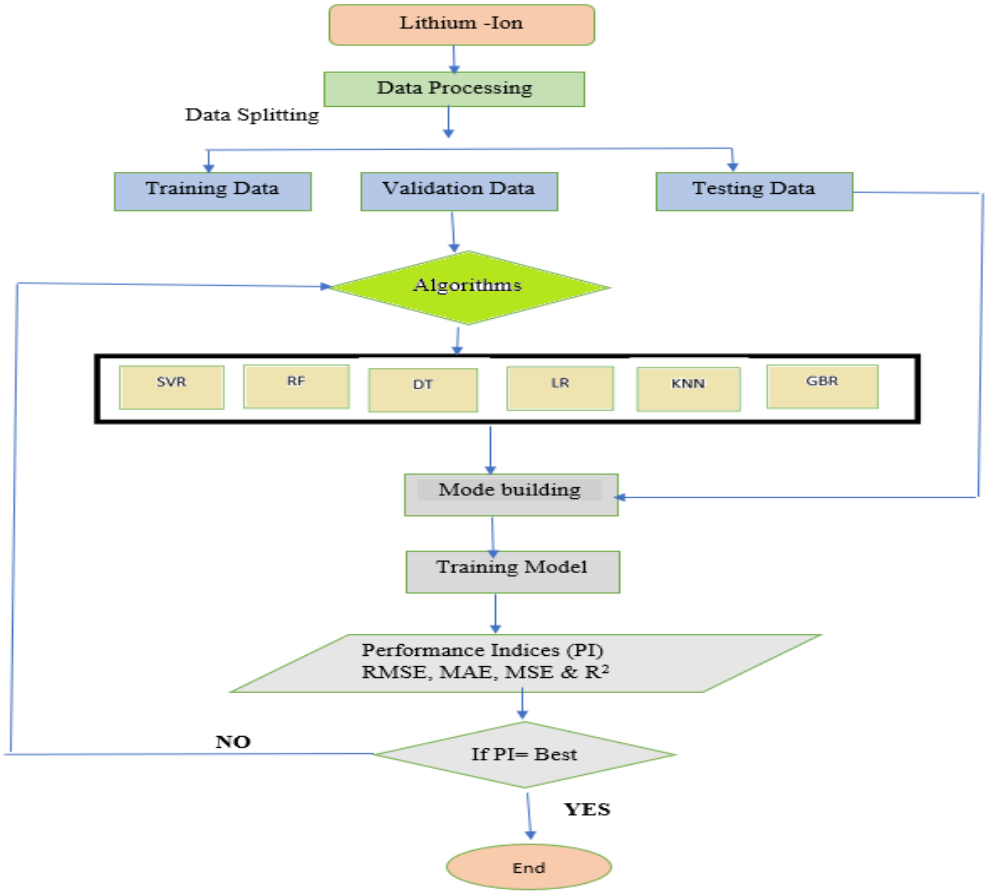

Figure 11. Flow chart for proposed method.

Random Forest Regression:

Random Forest, RF, may be applied for each type and regression, and it can manage a tremendous quantity of information. Many parallels exist between decision tree and random forest. The most basic distinction is that after the set of rules is run at some time in education, RF generates a larger number of DTs. The three primary benefits of using RF are that it eliminates the overfitting problem, has extremely high predictive accuracy, and is simple to use. The Gini index, which is frequently used, must be understood when using random forests that are entirely dependent on categorization data. The formula used to decide how nodes on a decision tree branch is given below.

$$\text{Gini} = 1 - \sum_{i=1}^{c} (p_i)^2 \quad (1)$$

The capacity to anticipate batteries for the purpose of maintaining a consistent supply of energy and the best possible use of that energy, remaining usable life (RUL), must be calculated beforehand. When it comes to accurately anticipating the battery management systems' state of charge, we decided to forecast RUL using a random forest model. With the help of this model, data may be gathered, pre-processed, and classified in order to forecast RUL. In terms of R2 and Root Mean Square Error (RMSE), the simulation is run. According to the findings, the ensemble random forest model has a greater level of prediction accuracy shows in Table 1. The random forest approaches utilized for RUL prediction are depicted in Figure 12.

Table 1. Features of random forest method.

Parameter	Value/Description
n_estimators	42
Max_features	09
Min_sample_leaf	10
Criterion	Gini Impurity
Max_leaf_nodes	10

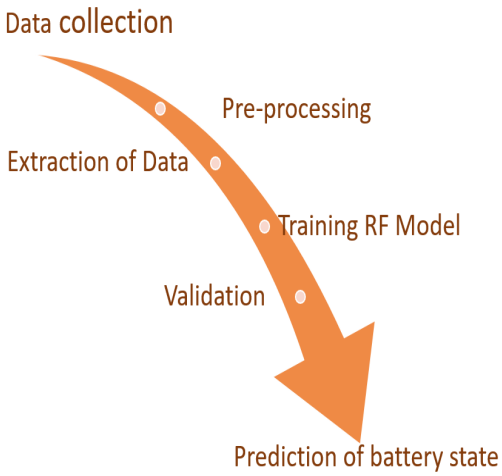

Figure 12. Flow chart for RF method.

Decision Tree Regression:

Although it can also be used to address regression problems, the decision tree approach to supervised learning is commonly used to solve classification problems. It is properly suited to each unique and continuous variable. Figure 13 depicts a tree-like structure with nodes and branches, beginning from the root node and progressing along extra branches to the leaf nodes. The central node represents the dataset's features, whereas branches indicate decision-making techniques, and leaf nodes represent results.

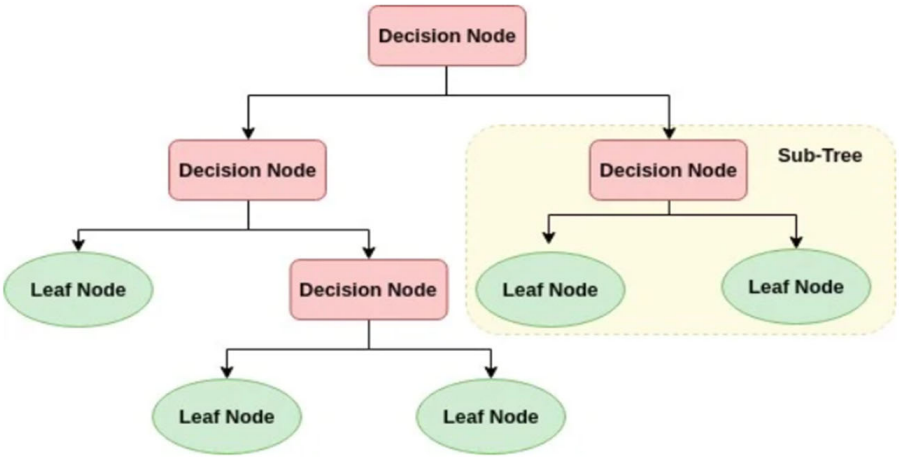

Figure 13. Decision tree Regression.

To determine which direction the node should head in, entropy analyzes the likelihood of a chosen outcome. It is more theoretically difficult to calculate than the Gini index since

it uses a logarithmic feature. Entropy can also be used to analyze the branching patterns of nodes in a selection tree.

$$\text{Entropy} = \sum_{i=1}^{c} -P_i * \log_2 P_i \quad (2)$$

The DT classifier generates a final tree with leaves that reflect the final prediction and branches that represent the observations [43]. The dataset is split up into a number of subsets while the process is running, and these subsets are subsequently utilized to create the DT. The well-known classifier DT is applicable to both classification and regression. DT can therefore be applied to both numerical and categorical data. DTs are useful in a range of applications because they work well when the dataset contains missing values. Figure 14 shows the steps for predicting decision tree regression for RUL calculations shows in Table 2.

Figure 14. Decision tree regression for RUL.

Table 2. Features of decision tree method.

Parameter	Value/Description
Splitter	Random subset of features
Max_depth	-
Min_sample_split	Two
Criterion	Gini
Max_leaf_nodes	-
Min_sample_leaf	One
Max_features	Nine
Class_weight	-
Min_weight_fraction_leaf	-

Linear Regression (LR):

Linear regression is one of the most well-liked and straightforward device mastery procedures for predictive evaluation. Predictive analysis is used to explain what is predicted, and linear regression anticipates continuous values such as age, profitability, and other factors. In response to the unbiased variable (x), the dependent variable (y) adjusts, and the linear dating between the structured and independent variables is confirmed. The regression line is the path that aims to maximize the statistics among the dependent and independent variables. The equation for the regression line is:

$$y = a_0 + a^* x + b \quad (3)$$

where y = dependent variable; x = independent variable; and a_0 = Intercept of line.

Procedures for linear regression are applied if the output is a continuous variable. Instead, grading algorithms are utilized when output is classified into categories like pass/fail, good/average/bad, etc. [44] shows in Table 3. The LR method is the basic regression algorithm, but we also have other regression algorithms or classifying behaviors. Figure 15 displays the flow chart for the linear regression model.

Table 3. Features of linear regression.

Parameter	Value/Description
Linearity	Relationship between x and mean of y
Homoscedasticity	For any value of x, variance of residual is same
Observations	Independent
Normality	For any fixed x, y is normlly distributed

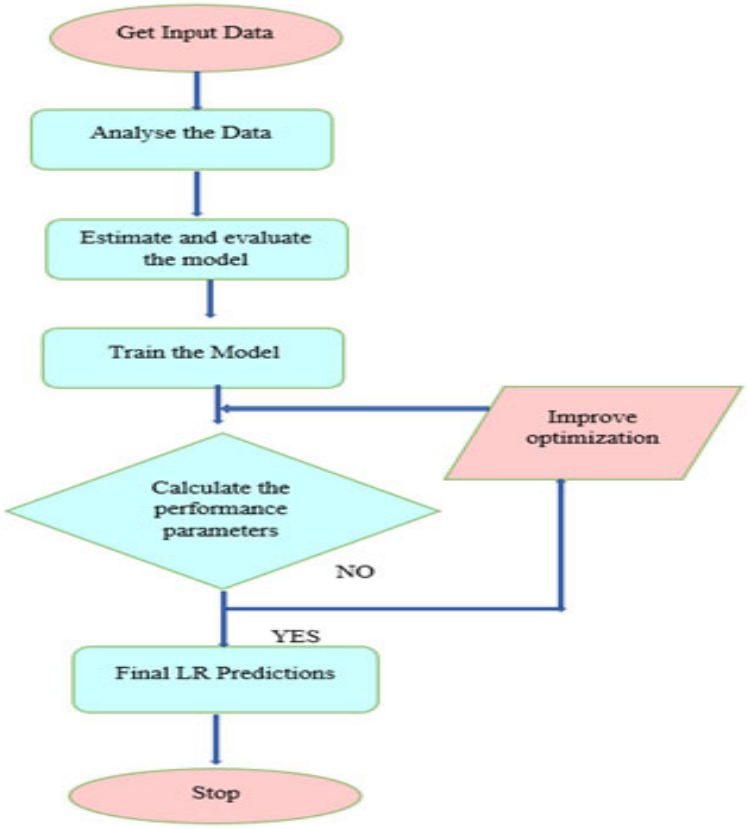

Figure 15. Flow chart for linear regression.

Gradient Boosting Regression:

An electric vehicle's battery management system must be reliable and durable in order to anticipate the state of charge. Lithium-ion batteries are heavily dependent on ageing information, which is occasionally pricey, or no longer accessible online. For the purpose of electrical car programs, it is strongly advised in [45] that the state of rate estimate of lithium-ion battery systems be carried out using a gradient boosting approach, which may also accumulate the nonlinear relationship model through offline training. The intensive gradient boosting methodology, which successfully works and accelerates, is used in the tree-based learning method.

To correct the flaws in the prior model, gradient boosting tree ensembles upload more timber at each stage. Those models are typically applied when the heterogeneity of the features is excessive. Unlike other boosting techniques like AdaBoost, this uses gradients to identify flaws. Additionally, the Gradient Boosting model is more resilient against outliers than the AdaBoost approach [46]. Evidently, gradient boosting is an expanded form of AdaBoost that is capable of handling unique loss features showed in Table 4. Typical loss features used in regression models include "huber" and "absolute" loss capabilities. More protection against outliers is provided by these loss features than by squared loss capabilities. We employed the Huber loss function as the loss function parameter in our gradient boosting regressor model. x Consider a training set (x_i, y_i) with $i = 1, 2, 3, \ldots,$

N and a differential loss function ($L(y_i, z)$, here referred to as "deviance"), where z is the predicted value. Set the model's parameters to:

$$f_0(x) = argmin_z \sum_{i=1}^{i=n} L(y_i, z). \quad (4)$$

Table 4. Features of gradient boosting regression method.

Parameter	Value/Description
n_estimators	500
Max_features	Nine
Learning rate	0.1
Random_state	100

For each observation in each tree calculate the gradient which is given by:

$$\theta_{jm} = argmin_z \sum L(y, z + f(x_i)). \quad (5)$$

Now, update the model of the succeeding tree with the gradient of the previous tree. This is given by:

$$f_m(x) = f_{m-1}(x) + \sum_{j=1}^{j=Jm} l_{jm} * I. \quad (6)$$

For each x which belongs to the region of that tree (i.e., R_{jm}), the overall output is given by $f_m(x)$.

The steps evolved for prediction of RUL using GBR are given below:

Step 1: Load the data.
Step 2: Define the target variables.
Step 3: Split the data into training and test sets.
Step 4: Initialize the GBR.
Step 5: Model the training data.
Step 6: Predict the target.
Step 7: Evaluate the performance.

Known as a Bayesian network, certain types of probabilistic graphics use Bayesian reasoning to calculate probabilities. Bayesian networks represent conditional dependency as edges in a directed graph with the objective of explaining conditional dependence and, by extension, causality. Using factors, these correlations can readily be exploited to extract data about the random variables in the graph [47].

To fully comprehend a Bayesian network, it is necessary to first grasp probability theory. It is vital to remember that the joint probability distribution of the random variables A_0, A_1, . . ., A_n, abbreviated as P(A_0, A_1, . . ., A_n), equals P(A_1 | A_2, . . ., A_n) * P(A_2 | A_3, . . ., A_n) *... * P(A_n). As it comprises N components, each with a localized probability, we can think of it as a factorized representation of the distribution.

$$P(\bigcap_{k=1}^{n} A_k) = \prod_{k=1}^{n} P(A_k | \bigcap_{j=1}^{k-1} A_J) \quad (7)$$

A and B are independent as long as C has a known and stable value. Remember that the conditional independence between the random variables A and B equals C * P B, assuming that C is the only other random variable. This can also be expressed in the way we will utilize it, which is C = A community software.

A Bayesian network's nodes and edges are directed acyclic graphs that represent conditional relationships and discrete random variables, respectively. Because the region (A, B) within the graph that implies A connects the random variables A and B, the joint opportunity distribution explicitly considers this. In order for it to execute inference, we

must be aware of the P(B) possible values of A and B. Bayesian networks satisfy the nearby Markov asset, which asserts that a node is conditionally independent of its non-descendants given its parents. After simplification, In the Table 5 joint distribution of a Bayesian network is equal (mother and father(node)), as shown below:

$$P(X1....Xn) = \prod_{i=1}^{n} P(Xi|X1, ...Xi-1) = \prod_{i=1}^{n} P(Xi|parents(Xi)) \quad (8)$$

Table 5. Features of Bayesian Network.

Parameter	Value/Description
Probability	Posterior—updated after evidence is considered
Conditional independence	Subset of variables
Directed acyclic graph	Continued valued variables

This feature allows us to drastically reduce the amount of processing required in larger networks because most nodes often have few parents relative to the size of the network as a whole.

(C) Performance Error Indices

To assess the model's accuracy and gauge how well it is functioning in its predictions, the process of developing system mastering models must include this step. The evaluation metrics vary depending on the problem type. The main issue with the regression problem—possibly the most famous example of this kind of issue—is that a dataset's objectives can only include real values [48]. The errors display how frequently the version makes erroneous predictions. The fundamental concept behind accuracy evaluation is to use a set of criteria to compare the original aim with the anticipated one. Following are the evaluation metrics:

C.1. MAE (Mean Absolute Error) is the difference between the original and predicted values calculated by averaging the absolute difference over the facts set. As the projected aim is the same, MAE is primarily a degree of accuracy for the labored model expressed on the same scale. If MAE is closer to zero, the more accurate the model is.

$$\text{Mean Absolute error} = \frac{1}{n}\sum_{i=1}^{n}(y_i - \hat{y}) \quad (9)$$

C.2. MSE (Mean Squared Error) depicts the variance between the original and predicted values as determined by square rooting the mean variance throughout the data set.

$$\text{Mean Square Error} = \frac{1}{n}\sum_{i=1}^{n}(y_i - \hat{y})^2 \quad (10)$$

C.3. The error rate by the square root of MSE is known as (Root Mean Squared Error) RMSE.

$$\text{Root Mean Square Error} = \sqrt{MSE} = \sqrt{\frac{1}{n}\sum_{i=1}^{n}(y_i - \hat{y})^2} \quad (11)$$

C.4. R-Squared (Coefficient of determination) represents the degree to which the values fit the initial values. the proportions of values in the range of 0 and 1. The model improves as the value increases.

$$\text{R Squared} = 1 - \frac{\sum(\boldsymbol{y_i} - \hat{\boldsymbol{y}})^2}{\sum(\boldsymbol{y_i} - \overline{\boldsymbol{y}})^2} \quad (12)$$

5. Results Analysis

Heat Map:

To show how closely related various factors are, these coefficients are presented as a warmth map. It aids in locating trends that are useful for constructing device learning models. The warmth map converts the correlation matrix into a color-coding system. The correlation matrix displays how the variables are connected to one another on a scale of −1 to 1, with 1 signifying an extremely bad connection and −1 a flawless exceptional correlation. The main function of the Heatmap in Seaborn is to show a color-coded correlation matrix enabling easy visualization of the relationships between the statistical data.

From the heatmap in Figure 16, it can be inferred that:

- Features Time Constant Current' and Charging Time have a strong positive correlation with a value of 0.95.
- Features 'RUL' and 'Maximum Voltage Discharge' also have a strong positive correlation with a value of 0.78.
- Another positive correlation is between features 'Time at 4.15 V' and 'Discharge Time' with a value of 0.78.
- Feature 'Minimum Voltage Discharge' has a strong negative correlation with features 'RUL' and 'Maximum Voltage Discharge' with values −0.76 and −0.72, respectively.

Figure 16. Heat map for the features of the source dataset.

Table 6 illustrates the numeric RUL prediction errors of the Hawaii Natural Energy Institute (HNEI) dataset's batteries. In addition, it compares ML strategies. We looked at five separate machine learning algorithms for predicting assessment metrics and the range of evaluation predictive accuracy. In this case, the records are educated, and the high-quality version forecasts are evaluated using the four outstanding overall performance error indices MSE, RMSE, MAE, and R-Squared. In this case, inputs are defined for a wide range of voltages, moderns, and temperatures for separate charging and discharging cycles. This provides a simple framework for including an expansion of input features for prediction, as well as general elapsed real time for training all algorithms. The battery RUL problem is crucial for the efficient and reliable operation of battery-dependent systems and is an active area of research and development, particularly in industries where batteries play a vital role in powering critical applications. Predicting RUL accurately can help extend the lifespan of batteries, reduce maintenance costs, and enhance overall system performance and safety [49].

Table 6. Comparison of ML methods with evaluation metrics.

ML ALGORITHMS	MSE	RMSE	MAE	R-Squared	TIME
Random Forest Regression	14.1186	3.7574	2.0930	0.9998	0.0651
Decision Tree Regression	26.8489	5.1816	2.2296	0.9997	0.1510
Linear Regression	54.5430	7.3853	4.6441	0.9994	0.0248
Bayesian network	54.5478	7.3856	4.6483	0.9993	1.2356
Gradient Boosting Regression	57.4476	7.5794	4.9842	0.9990	2.5640

In summary, the battery RUL problem is closely related to various Sustainable Development Goals, particularly those related to clean energy, sustainable infrastructure, climate action, responsible consumption, economic growth, and collaboration. Addressing the battery RUL problem through research and innovation can contribute significantly to achieving these global sustainability development goals:

Affordable and Clean Energy (SDG 7): one of the targets of SDG 7 aims to ensure access to affordable, reliable, sustainable, and modern energy for all. Batteries play a crucial role in energy storage and the transition to renewable energy sources such as solar and wind. Extending battery run-time can make these energy sources more reliable and accessible, helping to achieve the goal of clean and sustainable energy for everyone [50]. In systems relying on batteries, knowing the remaining useful life allows for efficient planning and operation. This information helps to ensure that energy storage systems and devices continue to function reliably until the end of their expected lifespan [51].

Climate Action (SDG 13): It's aims to combat climate change and its impacts. Batteries are essential for electric vehicles and renewable energy systems, both of which play a critical role in reducing greenhouse gas emissions. Improving battery run-time can accelerate the adoption of these technologies and contribute to mitigating climate change. Further regarding goal 13.1, one of the key targets is to strengthen resilience and adaptive capacity to climate-related hazards and natural disasters [52].

The comparison graph of RF, DT, LR, BN, and GBR are shown in Figure 17 and it is observed that the random forest regression (RF) method achieves the best value in MSE measurement with 14.1186 which is lower than all the other four methods. Therefore, this learning prediction method has higher robustness and better applicability. Accurate estimation of a battery's remaining useful life is crucial in various climate-related applications, such as renewable energy systems and electric vehicles. By optimizing battery usage and ensuring batteries operate at their full lifespan, we can reduce the need for premature replacements and the associated environmental impacts, such as the carbon footprint of manufacturing and disposing of batteries [53].

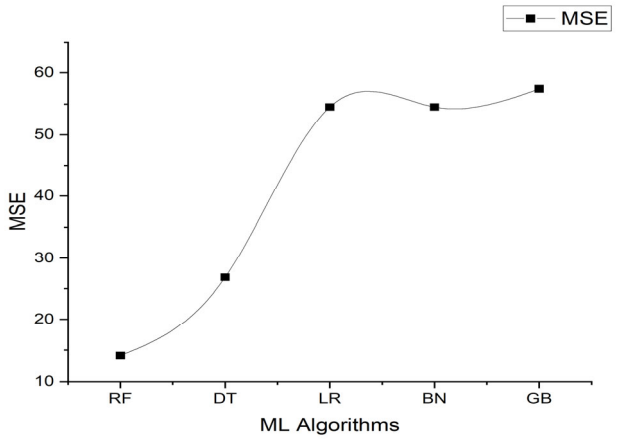

Figure 17. Mean Squared Error for different machine learning methods.

Figure 18 shows the training and prediction result for battery RUL prediction based on RMSE evaluation. It can also be seen that the random forest (RF) model stages the best performance for RUL prediction in terms of RMSE. This also verifies the advantage and superiority of all the five different machine learning algorithms.

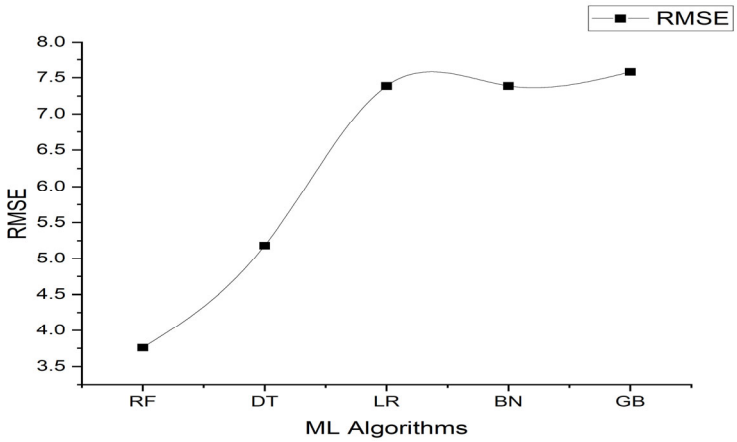

Figure 18. Root Mean Squared Error for different machine learning methods.

The MAE prediction of battery RUL is shown in Figure 19. This also verifies five different ML algorithms for prediction and determines that the random forest regression model has a good prediction capacity for determination of a battery's RUL. This also validates the effectiveness of the model for prediction.

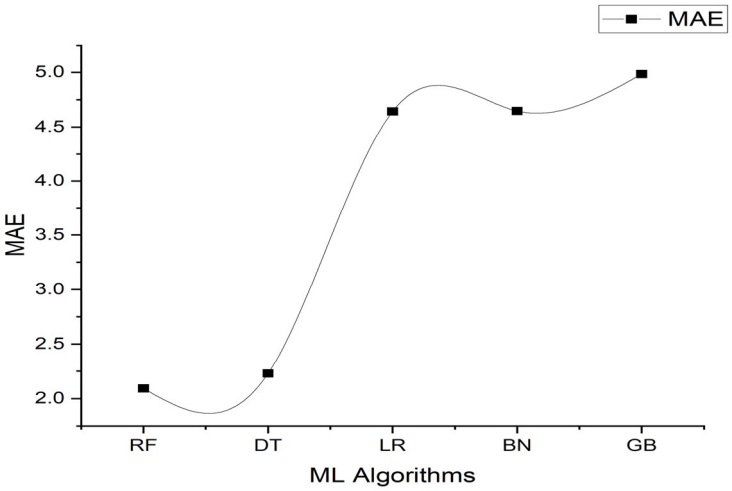

Figure 19. Mean Absolute Error for different machine learning methods.

The statistical indicator R-Squared is predicted for RF, DT, LR, BN, and GB as shown in Figure 20. This performance indicator describes the amount of uncertainty explained by an independent variable. From these performance error indices, it determines which approach achieves good efficiency with the other outperformed all the other methods.

The main contribution of this study is that it finds the optimized version and effectively captures characteristics of RUL model prediction with less execution time. Figure 21 shows the execution time obtained for all five of the ML algorithms to perform different performance error indices. This also shows the shorter training time and advantage features of all the models proposed for prediction of RUL.

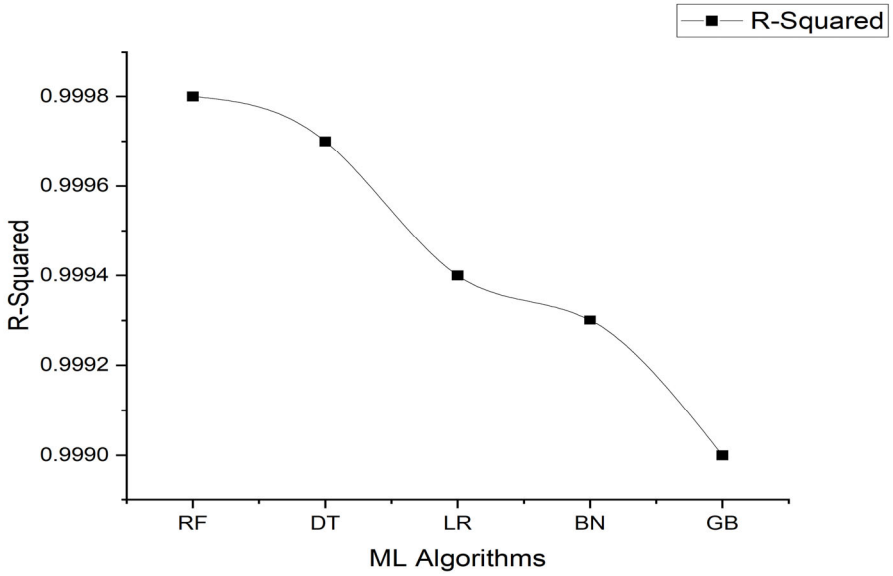

Figure 20. R-Squared Error for different machine learning methods.

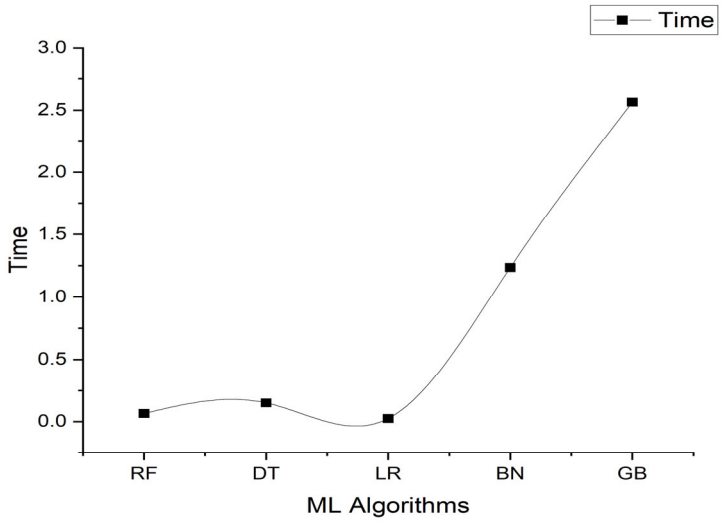

Figure 21. Time taken by different Machine Learning Methods.

In addition, the following two SDGs are also positively impacted by addressing battery run-time problem:

Responsible Consumption and Production (SDG 12): Sustainable batteries that last longer reduce the frequency at which batteries need to be replaced, resulting in less waste and fewer raw materials used in manufacturing. This aligns with SDG 12's target to ensure sustainable consumption and production patterns. Replacing batteries prematurely can be costly, especially in applications such as electric vehicles, where batteries are a significant part of the overall cost. Accurate RUL predictions help optimize the replacement schedule, reducing unnecessary expenses, waste, and raw materials used [54].

Industry, Innovation, and Infrastructure (SDG 9): SDG 9 emphasizes the development of resilient infrastructure and the promotion of sustainable industrialization. Longer battery run-time can contribute to the development of more efficient and sustainable transportation, communication, and industrial systems, reducing energy waste and promoting sustainable infrastructure [55].

The profile of the five performance error indices of the given data set using all five different machine learning algorithms is shown in Figure 22.

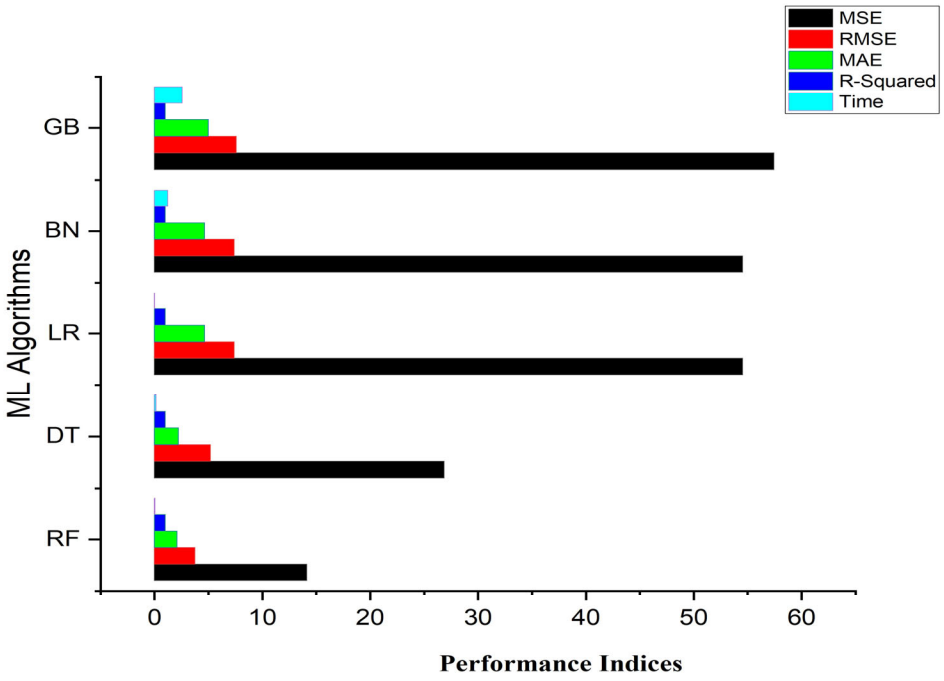

Figure 22. Error indices for different Machine Learning Methods.

6. Conclusions

This article studied the RUL prediction for the Hawaii Natural Energy Institute's (HNEI) real life battery dataset with various machine learning algorithms such as linear regression, gradient boosting, random forest, decision tree, and the Bayesian network. Subsequently the error metrics such as Mean Square Error (MSE), Root Mean Square Error (RMSE), Mean Absolute Error (MAE), R-Squared, and execution time were determined for the considered battery dataset. The proposed data driven model with all the ML algorithms was executed in python with Google Co-laboratory. Each algorithm exhibited a notable deviated relevancy with regard to the different system error indices. It is observed from the obtained results that the random forest method had better optimized evaluation metrics with less execution time and was also well suited for accurate RUL prediction. A heatmap in seaborn was also generated for the dataset where voltage, current, and time were considered to extract seven functions from the original datasets. A correlation matrix has also been computed to illustrate the association between the coefficients as presented in the warmth map.

In a global context, where energy sector emissions represent more than 75%, it is important to highlight that good management and prediction of battery use can significantly contribute to improving the efficiency and sustainability of energy storage systems. In addition to promoting the adoption of clean energy, good battery management can help reduce sector emissions and encourage innovation and collaboration between members of the supply chain. In this way, the proposed methodology is interesting for its contribution to several sustainable development goals, such as Clean and Affordable Energy (SDG 7), and Climate Action (SDG 13).

The research findings highlighted in this article may be useful for the researchers in predicting the battery RUL accuracy enhancing the overall battery efficiency. Future research can be focused on further improving the accuracy of prediction by employing Deep Learning, Hybrid Learning algorithms.

Author Contributions: Each author contributed equally in each part. All authors have read and agreed to the published version of the manuscript.

Funding: This research received no external funding.

Institutional Review Board Statement: This article does not contain any studies with human participants or animals performed by any of the authors.

Informed Consent Statement: Not applicable.

Data Availability Statement: The data used to support the findings of this study are available from the corresponding author upon request.

Acknowledgments: The authors thank to Sri Venkateswara University College of Engineering for providing characterization supports to complete this research work. The authors claim that none of the material in the paper has been published or is under consideration for publication elsewhere.

Conflicts of Interest: The authors declare that they have no conflict of interest.

Abbreviations

Abbreviation	Explanation
LIB	Lithium-ion battery
RUL	Remaining useful life
SOH	State of health
SOC	State of charge
ML	Machine learning
SVR	Support vector regression
KNN	K-Nearest neighbor
DT	Decision Tree
GBR	Gradient Boosting Regressor
DNN	Deep Neural Network
MAE	Mean Absolute error
MSE	Mean Square Error
RMSE	Root Mean Square Error
HNEI	Hawaii National Energy Institute

TITLE: HYDROLOGICAL INFERENCE ON THE NANDIVARGAM SUB - WATERSHED FOR WATER RESOURCE ANALYSIS AND MANAGEMENT THROUGH REMOTE SENSING AND GIS TECHNIQUES

Vidudala Ravi babu[1*], D V Satyanarayana Moorthy[2]

[1, 2] Department of Civil Engg., S.V.U college of Engg. S.V. University, Tirupati, Andhra Pradesh, India

Abstract:
The current study focuses on hydrological analysis for a sub-watershed in Nandivargam, within the Nandyal district, Andhra Pradesh. India. The drainage patterns and acquiring pertinent hydrological inferences related to the sub-watershed using digital elevation model STRM (DEM) imagery. Size, slope, soil type, land use, and vegetation, the drainage area, the length of water courses, hydrological model and morphometric analysis has been successfully accomplished through the integration of remote sensing and geographic information systems (GIS). The watershed's stream order, which travels from first order to fifth order and displays a dendritic type drainage network, it is an indication of the watershed's homogeneous texture. GIS-based watershed model has been developed for this study, Stream network, Stream order, Aspect, land use and land cover, Relief, Contours, Mean and Annual rainfall, the study area, and watershed borders were all generated as GIS layers. The watershed area's drainage density was found to be low to medium, which indicates the area has low relief and highly permeable soils. The bifurcation ratio varies from 1.30 to 2.53 and elongation ratio is 0.83 which reveals that the basin belongs to the oval shaped basin category the mean bifurcation ratio of the basin is 2.15 which indicates that the drainage pattern is not much influenced by geological structures. Mathematical or quantitative measurement helps us in analyzing the landforms accurately for any planning and development purposes. Morphometric Analysis is also very useful as it quantifies the landform features of evolutionary significance.

Key words: Watershed, Nandivargam, Remote sensing, Geographical Information system, Morphometric analysis,

1. Introduction.

The quantitative morphometric analysis of a watershed can yield valuable insights into the hydrological characteristics of the rocks present in the watershed. A drainage map of basin provides a reliable index of permeability of rocks and their relationship between rock type, structures and their hydrological status. Watershed characterization and management requires detail information for topography, drainage network, water divide, channel length, geomorphologic and geological setup of the area for proper watershed management and implementation plan for water conservation measures (Sreedevi et al., 2013). Remote sensing data, along with increased resolution from satellite platforms, makes these technologies appear poised to make a better impact on land resource management initiatives involved in monitoring LULC mapping and change detection at varying spatial ranges in semi-arid regions is undergoing severe stresses due to the combined effects of growing population and climate change. (Singh et al., 2012). Surface hydrological indications are one of the promising scientific tools for assessment and management of water resources. Drainage morphometric analyses are a prerequisite for selection of water recharge site, watershed modelling, runoff modelling, watershed delineation, groundwater prospect mapping and geotechnical investigation. (Magesh et al., 2011; Thomas et al., 2012). The drainage network analysis is generally performed to understand the prevailing geological variation, topographic information and structural set of a basin and their interrelationship. Remote sensing and GIS based drainage basin evaluation has been carried out by number of researchers for different terrains and it is proved to be a very scientific tool for generation of precise and updated information for characterization of drainage

basin parameters (Grohmann, 2004; Korkalainen et al., 2007; Hlaing et al., 2008; Javed et al., 2009; Pankaj and Kumar, 2009). Previously drainage morphometric parameters were extracted from topographical maps or field surveys. Drainage parameter extractions from last two decades are more popular from digital topographical information which is called as digital elevation models (DEM), which is more fast, precise, updated and inexpressive way of watershed analysis (Moore et al., 1991; Maathuis, 2006). One of the most recent near global elevation data sets recorded during the 11 day Shuttle Radar Topographic Mission is based on a C-band interferometric radar configuration. This information, representing the radar reflective surface (which may be vegetation, man-made features or bare earth), was collected in 2000 (Maathuis, 2006). Digital elevation models (DEMs), such as from the Shuttle Radar Topography Mission (SRTM), or the ASTER GDEM product (USGS, Denver, Colorado, USA), have been used to extract different geomorphological parameters of drainage basins, including drainage networks, catchment divides, slope gradient and aspect, and upstream flow contributing areas (e.g. Mark, 1984; Tarboton, 1997). GIS based watershed evaluation using Shuttle Radar Topographic Mission (SRTM) data have given a precise, fast, and an inexpensive way for analyzing hydrological systems (Farr and Kobrick, 2000; Grohmann et al., 2007; Panhalkar, 2014). Recently Bastawesy et al. (2013) utilized remote sensing data and digital elevation models to extract the catchment hydrological parameters to delineate storage areas for the Uganda Equatorial Lakes region. They concluded that digital elevation models (DEMs) are a very accurate tool for morphometrically parameter evaluation and watershed delineation for watershed management. In addition, low-intensity and erratic monsoons create further shortages of surface-water supply. As a result, the demand for groundwater resources has increased tremendously from year to year, causing a drastic decline of groundwater levels. Over-exploitation of groundwater has led to the drying up of the aquifer zones in several parts of the country. It is, therefore, essential to increase the recharge of the basin for the water management program at watershed level (Ellis and Revitt, 2010; subba Rao, 2008); Eyquem, 2007).

The current study focuses on a location where rainfall is the primary source of recharge. An integrated watershed-based morphometric study is essential to get insights into the region's physiographic features. The research analyzes sub-watersheds in Nandivargam, Nandyal, district, Andhra Pradesh, and analyzes their morphology. With the goal of helping in the management of water resources, this research makes use of STRM, satellite imagery, and GIS methods. With the objective to conserve and manage water resources sustainably, the primary objective is to explore and identify multiple drainage factors that might improve knowledge of the watershed's shape. The results of this research can help identify alternate approaches to water harvesting in the study region and can act as a scientific foundation for more in-depth hydrological investigations.

2. Geographical of the Study Area

The study area selected for evaluating morphometrical parameters and conducting watershed delineation for effective watershed management is the Nandivargam sub-watershed, as shown in (Fig-01). This sub-watershed is situated within the Nandyal district, Andhra Pradesh, of India and The watershed is located in between latitudes 15°22'30"N to 15°32'30"N and longitudes 78°7'30"E to 78°25'0"E, covering a total area of 240.80 km^2. The mean elevation of the study area is 425 meters above mean sea level. It experiences a dry climate with an annual average rainfall of 878mm. The mean minimum and maximum temperatures are 21.9 ºC and 38.5 ºC, respectively. Located in the Kundu river basin, also known as Kunderu, Kumurdruthi, it is a tributary of the Penna River in the Rayalaseema region of India. The Kundu valley, known as Renadu, is associated with the term "Renati Pourusham." The Kundu River's flood plains cover an area of around 6,000 acres (24km^2). The study area encompasses the Kunderu river valley, situated between the Erramala and Nallamala hills, forming the western and eastern boundaries, respectively. It includes the entire Koilakuntla and parts of Nandikotkur, Nandyal, Allagadda, and Banaganapalle. The Kunderu River, a tributary of the River Penner, flows southward through the central part of the region. The Madduleru and Jurreru rivers in the west, and the Galeru and Vakkileru Rivers in the east, are the main tributaries of the Kunderu River. The region has an average slope ranging between 200 and 300 meters

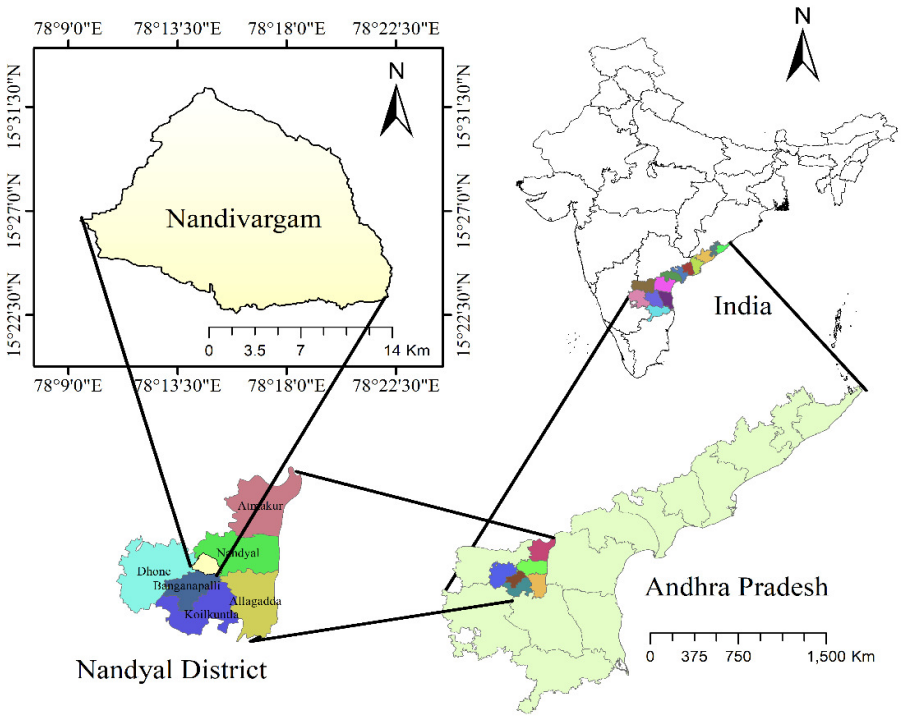

Fig-01: Location map of the study area

2.1 Objective

The primary aim of this study is to explore the morphometric analysis of the watershed in relation to its drainage pattern, utilizing multi-temporal satellite data to examine aspects such as drainage, surface water bodies, and the watershed.

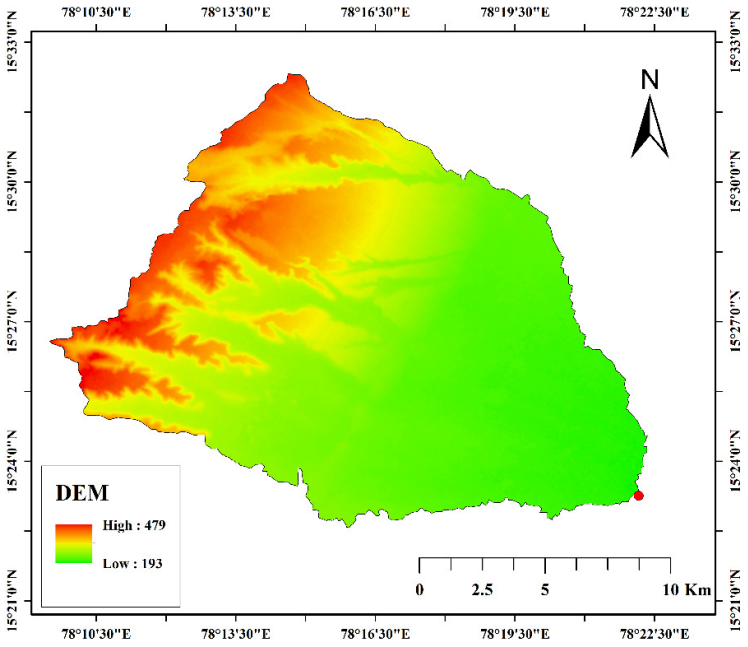

Fig-02: Digital Elevation map of the study area

3.0 Materials & Methodology

3.1 Materials

The source of organisation of data for study area shown in (Table -01) the generation of input parameters for explore the morphometric analysis has been successfully accomplished through the integration of remote sensing and geographic information systems (GIS).

3.2 Methods

The present study adopts the following methodology and procedure to achieve its objectives. Collection of satellite data and Topographical maps. Rainfall and other collateral data within the study area. Drainage pattern , stream order, surface water bodies' Contour, Slope, Aspect, and Relief maps based on the Digital Elevation Model (DEM) as shown in (fig-02).Conducting preliminary pre-field interpretation of Hydro geomorphology using Satellite data for delineated sub-watersheds was exported in Arc GIS 10.8 software for used to morphometric analysis. Recommending a land and water resources development plan.

3.2.1 Drainage Morphometric Analysis

In a GIS environment, we conducted an assessment of the basins linear, aerial, and relief characteristics. Subsequently, we generated graphs and performed linear regression analysis to investigate the inter relationships among certain variables. These variables included a range of morphometric parameters of the basin, such as perimeter, stream order, stream length, bifurcation ratio, stream length ratio, basin length, drainage density, texture ratio, stream frequency, form factor, circularity ratio, elongation ratio, and length of overland flow. We thoroughly examined and provided detailed discussions on these parameters. For a comprehensive understanding of the morphometric analysis, refer to the various notations and methodologies outlined in (Table 02)

Table -02 "Methods and sources utilized for the computation of geomorphic parameters."

Stream Numbers:

The total number of streams in each order is called as the Stream Number. After Stream Order, the 2nd step in Morphometric analysis is to count the Stream Number. The Stream Number decreases with the increasing order of stream (as shown in Table 02). Stream number is inversely proportional to stream order. Horton has developed 'Law of Stream Number'. According to this Law, when Stream Number (taken in arithmetic scale) is plotted against Stream Order (taken in logarithmic scale), it gives a negative linear pattern. It means number of streams from highest to lowest order in a particular basin tend to give a Geometric Series. In the 5th order river basin shown in (Fig 04), the series is 19, 48, 121, 157, and 352 which is plotted on the logarithmic scale to the Fig-03.

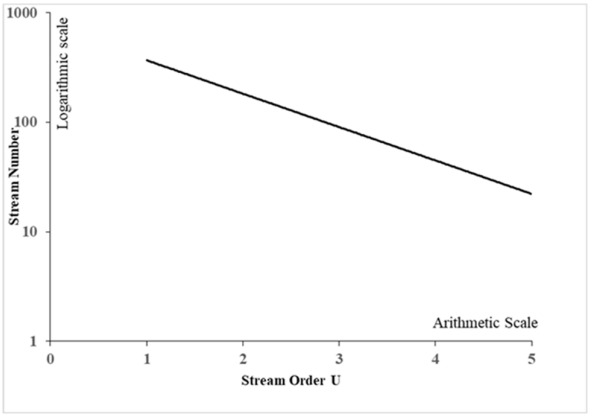

Fig-03: Stream order Vs Stream number (N_u)

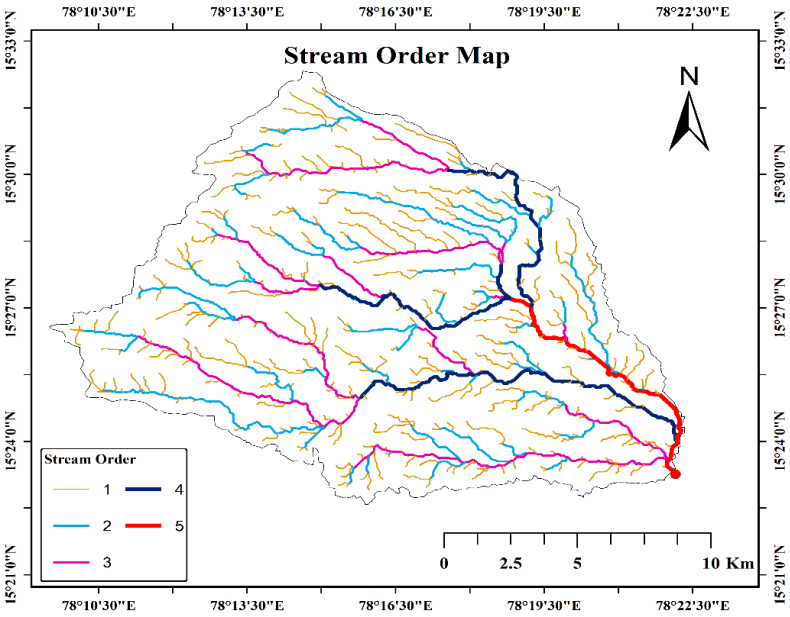

Fig-04: Drainage with stream network and order map of the study area

3.2.2 Stream Order (N_u):

Stream order, also referred to as water body order is a positive whole number utilized in the fields of geomorphology and hydrology to denote the extent of branching within a river system. Various techniques for stream ordering, such as those proposed by (Horton in 1945)[19] and (Strahler in 1952), exist. In this study, Strahler's method, which is a slightly modified version of Horton's approach, was employed to assess stream order. According to this system, the smallest streams, which have no branches, are classified as first order. When two first-order streams converge, they become second order, and two second-order streams joining together become third order, and so on. If streams of different orders merge, they retain the highest order. In the case of the Nandivargam basin, it is classified as a fifth-order stream. In total, 697 streams were identified in the study area, with 352 being first order, 157 second order, 121 third order, 48 fourth order, and 19 fifth order (as shown in Fig-05). The analysis of stream network characteristics is crucial for comprehending the hydrological processes within the basin. Stream magnitude is strongly linked to the portion of the entire basin area that contributes to runoff, making it a reliable indicator of relative stream discharge in smaller river systems. Strahler's stream order classification has been utilized in numerous river systems.

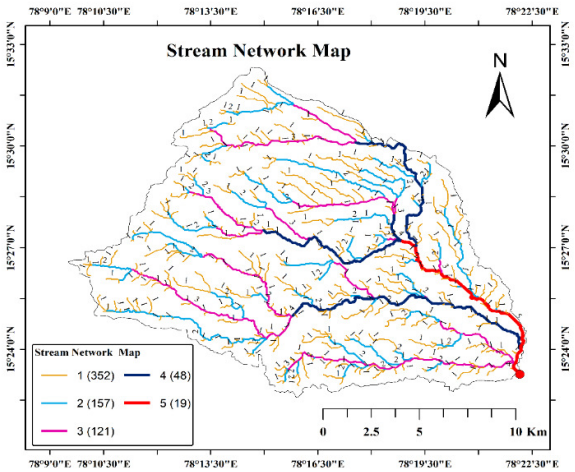

Fig-05: Drainage with stream network and order map of the study area

3.2.3 Stream length (L_u)

The research includes the assessment of the quantity of streams with varying orders inside a sub-watershed, along with the measurement of their lengths from their starting points to the point where they reach the drainage divided. The calculation of stream length (Lu) for 14.67km sub-watersheds has been computed on the proposed by (Horton's 1945) method, as indicated in (Table 2). and according to this law, the cumulative mean length of streams increase in geometrical progression with increase of stream order. If stream order is taken on X- axis on an arithmetic scale and cumulative mean length of stream on Y-axis a logarithmic scale, it gives a positive liner pattern. The relationship Stream length Vs Cumulative stream length which is follows. Stream Order and Total Stream Length exhibit an inverse correlation. Stream Order and Mean Stream Length display a direct correlation. Stream Order and Cumulative Mean Stream Length demonstrate a positive association. Furthermore, (Fig-06) besides, the latter increases geometrically with each successive higher order.

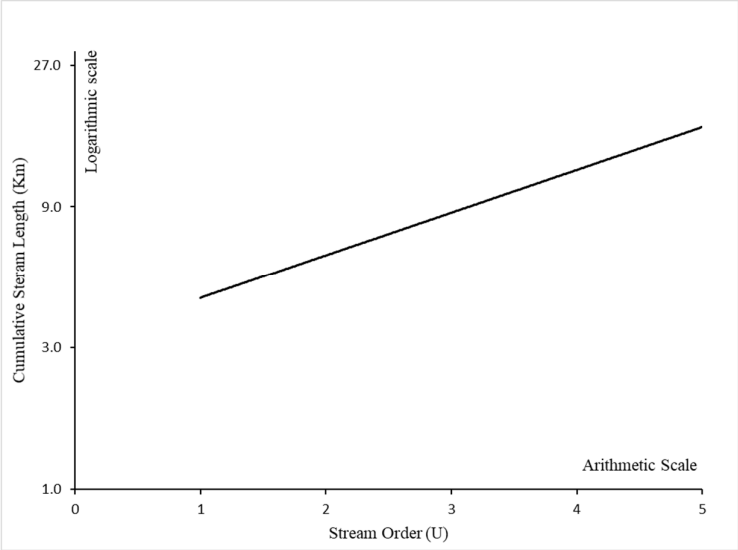

Fig-06: Stream order Vs Cumulative Stream length (L_u)

3.2.4 Mean stream length (L_{sm})

According to Strahler (1964), the mean stream length (Lsm) is an inherent property connected to the drainage network and its associated surfaces. To calculate the mean stream length (Lsm), the total stream length of order 'u' is divided by the number of streams of the same segment or order 'u' (Table 2).

3.2.5 Stream length ratio (RL)

The ratio of the mean length of one stream order to the next lower order of stream segment may be termed as the length ratio (RL). According to Horton's law (1945) of stream length, the mean stream length segments of successive orders in a basin tend to form a direct geometric series, with stream length increasing as the order of streams goes higher. The variation in stream orders within the research area demonstrates sub-basin, likely due to variations in topography, slope. And exhibit an increasing length ratio from lower to higher orders, suggesting a more advanced geomorphic stage. Conversely, the transition from one order to another in the remaining sub watershed indicates a youthful stage (Table-02).

3.2.6 Bifurcation ratio

The term bifurcation ratio (Rb) may be defined as the ratio of the number of the stream segments of given order to the number of segments of the next higher order (Schumn, 1956). Horton (1945) considered the

bifurcation ratio as an index of relief and dissections. Strahler (1957) demonstrated that bifurcation ratio shows a small range of variation for different regions or for different environment except where the powerful geological control dominates.

Table No.03 Liner aspect of the Nandivargam sub-watershed.

Sno.	Stream Order (W)	Number of Stream (Nu)	Bifuration ratio (Rb)	Mean Bifuration Ratio (Rbm)	Total Length of Stream (Km)	Mean length of streams (Km)	Length ratio (R_L)
1	I	352			3.73		
2	II	157	2.24		3.16		
3	III	121	1.30	2.15	3.22	2.93	1.02
4	IV	48	2.52		2.22		
5	V	19	2.53		2.33		
	Total	**697**		**Total**	**14.67**		

Based on the information presented in (Table 3), it can be observed that the bifurcation ratio (R_b) varies between different orders of the drainage system. These variations are influenced by the geological and lithological characteristics of the drainage basin, as explained by (Strahler, 1964). Lower R_b values are indicative of sub-watersheds that have experienced fewer structural disturbances, as noted by (Strahler, 1964) and where the drainage patterns have remained relatively undistorted due to such disturbances, as mentioned by (Nag. 1998). The mean bifurcation ratio (R_{bm}) can be defined as the average of the bifurcation ratios across all orders. In this particular case, R_{bm} ranges from 2.15 in the Nandivargam sub-watershed, classifying it within the normal basin category.

3.2.7 Drainage density

Horton (1932) has introduced drainage density (D_d) into American hydrologic literature as an expression to indicate the closeness of spacing of channels. It is defined as the total length of streams of all orders per drainage area. Langbein (1947) recognized the significance of D_d as a factor determining the time of travel by water and he also suggested a drainage density varying between 0.55 and 2.09 km/km^2 in humid region with an average density of 1.03 km / km^2. Density factor is related to climate, type of rocks, relief, infiltration capacity, vegetation cover, surface roughness and run-off intensity index. Of these only surface roughness has no significant correlation with drainage density. The amount and type of precipitation influences directly the quantity and character of surface run-off. An area with high precipitation such as thundershowers loses greater percentage of rainfall as run-off resulting in more surface drainage lines. Amount of vegetation and rainfall absorption capacity of soils, which influences the rate of surface run-off, affects the drainage texture of an area. The similar condition of lithology and geologic structures, semi-arid regions have finer drainage density texture than humid regions. According to Nag (1998), low drainage density generally results in the areas of highly resistant or permeable subsoil material, dense vegetation and low relief. High drainage density is the resultant of weak or impermeable subsurface material, sparse vegetation and mountainous relief. Low drainage density leads to coarse drainage texture while high drainage density leads to fine drainage texture. The average drainage density 1.82km/km^2 indicating low drainage density (Table 2). In the study area, the low drainage density indicates the region has highly permeable subsoil and thick vegetative cover. The drainage density map is shown in (Fig. 07)

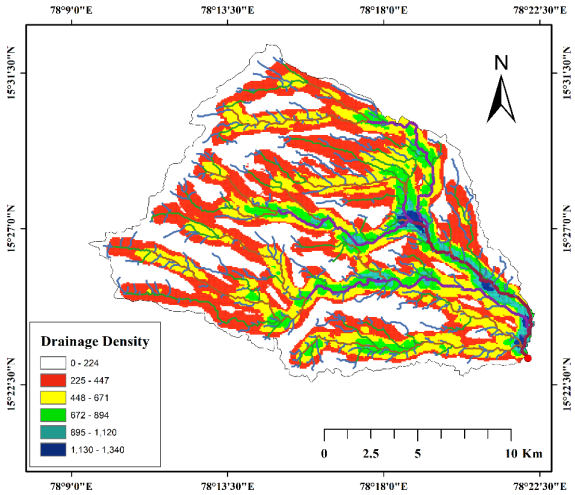

Fig-7: Drainage density map of the Nandivargam sub-watershed

3.2.8 Stream frequency

Horton (1932) introduced stream frequency (F_s) or channel frequency which is the total number of stream segments of all orders per unit area. Stream frequency, also known as channel frequency, refers to the overall count of stream segments of various orders within a given area 2.87(as shown in Table 02). In theory, it is conceivable for two basins with the same drainage density to have different stream frequencies, and conversely, two basins with the same stream frequency may exhibit varying drainage density. Table 2 provides data on stream frequency for the study area. It is noteworthy that there is a positive correlation between stream frequency (F_s) and the drainage density values of these sub-basins, signifying an increase in the number of streams relative to an increase in drainage density.

3.2.9 Drainage texture

Drainage texture (T) is a significant concept within geomorphology that pertains to the relative spacing of drainage lines. It's worth noting that drainage lines tend to be more abundant in impermeable areas compared to permeable ones. According to Horton (1945), "T" is defined as the total number of stream segments of all orders per unit perimeter of a particular area. Horton identified infiltration capacity as the primary factor influencing Rt and considered it as part of drainage texture, which encompasses both drainage density and stream frequency. Smith (1950) further categorized drainage density into five distinct textures. A drainage texture of less than 2 is classified as very coarse, between 2 and 4 as coarse, between 4 and 6 as moderate, between 6 and 8 as fine, and anything greater than 8 is considered very fine drainage texture. In Table 02, it is observed that the drainage texture from 5.22. For instance, sub-watershed exhibits a moderate course.

3.2.10 Form factor

According to Horton (1932), form factor (F_f) defined, as the ratio of basin area to square of the basin length (Table 2). The value of Form factor (F_f) is always less than 0.7854, which is for a perfectly circular basin (Strahler, 1964). The form factor values of the sub watershed in the study area of value 1.15. Basins of low form factor are elongated and have flatter peak flows for longer duration, while the basins with high form factors are circular and have high peak flows for shorter duration.

3.2.11 Circularity ratio

It represents the proportion of the basin's area to that of a circle with an equivalent perimeter as the basin (Miller 1953). Circular ratio (Rc) is affected by various factors such as the length and occurrence of

streams, geological formations, land usage, climate, terrain, and the slope within the basin. In this particular investigation, the Rc value is recorded as 0.49 (as shown in Table 2). The notable Rc value of 0.49 in the Nandivargam sub-watershed indicates that this particular sub-basin possesses a relatively circular shape. Moreover, it features a topography marked by substantial to moderate relief.

3.2.12 Elongation ratio

Elongation ratio (Re) is the ratio defined as the ratio of diameter of the circle of the same area as the drainage basin and the maximum length of the basin (Schumm, 1956). The values of "Re" generally numerical value varies from 0 to 1.0 over a wide variety of climatic and geo- logic conditions. Values close to 1.0 are typical of regions of very low relief, whereas values in the range 0.6–0.8 are usually associated with high relief and steep ground slope (Strahler, 1964). These values can be grouped as a three categories namely (a) Elongated (< 0.7), (b) Oval (0.9 -0.8) (c) Circular (> 0.9). The current research study area computed Re value of Re is 0.83, which is greater than 0.8, this sub watershed has a shape that is almost circular and typically belongs to regions of low relief areas (as shown in Table 2).

3.2.13 Length of overland flow

Surface water movement plays a significant role in triggering the formation of channels. "Overland flow" is the term employed to characterize the movement of water on the basin surface that occurs beyond the boundaries of a defined stream channel. Traditionally, the generation of overland flow is classified into two primary mechanisms: "infiltration excess," by Horton's work (1945). This factor basically relates inversely to the average slope of the channel. The length of overland flow (Lg) approximately equals, to half of the reciprocal of drainage density (Horton 1945). The current research study area calculated Lg value is 0.28.

3.2.14 Relief (R) and Relief Ratio of the Basin.

The term "total relief" refers to the difference in elevation between the highest and lowest points within a basin's valley floor. The "relief ratio," denoted as R_r and introduced by (Schumm 1956), quantifies the minimum relief relative to the horizontal distance along the longest axis of the basin, aligned with the primary drainage channel. This ratio serves as a metric for assessing the overall steepness of a drainage basin and provides insight into the level of erosion occurring on its slopes. the computed R value for the basin is 293, as presented in Table 2. This suggests that a substantial portion of the basin displays a pronounced slope.

3.2.15 Aspect Map

An aspect map typically refers to the orientation of a mountain slope, indicating the direction it faces. This aspect map holds significant importance in understanding the local climate's sensitivity to sunlight within the region. In general, slopes facing west tend to experience the hottest part of the day during the afternoon, and, in most cases, these west-facing slopes are warmer than their sheltered counterparts facing east. The aspect map plays a pivotal role in influencing the types of vegetation found in an area. When derived from SRTM DEM data, the aspect map indicates the compass direction of the slope's orientation, with 0 degrees denoting true north, and a 90-degree aspect pointing to the east (Fig. 8). In the case of the Nandivargam sub-watershed, it predominantly features east-facing slopes. Consequently, these east-facing slopes exhibit higher moisture levels and more abundant vegetation compared to their west-facing counterparts.

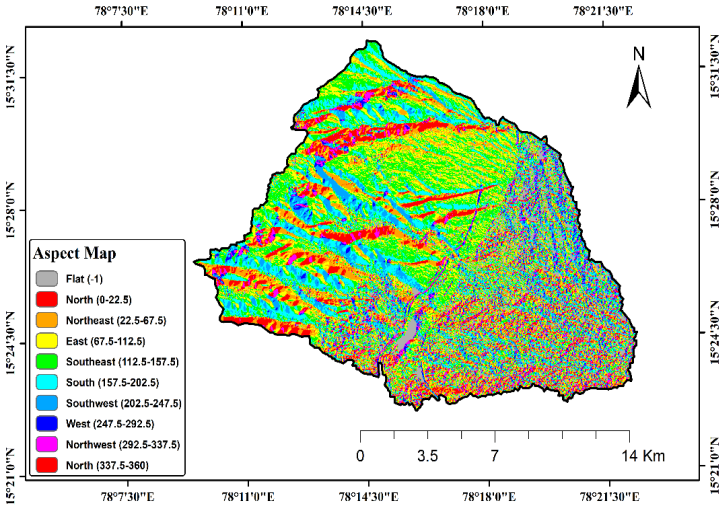

Fig-8: Aspect map of the Nandivargam sub-watershed

3.2.16 Slope Map

Slope is the measure of change in surface value over distance and can be expressed in degrees or as a percentage. In a raster format, the Digital Elevation Model (DEM) is a grid where each cell is a value referenced to a common datum. For extraction of elevation from remote sensing dedicated software packages are required but most GIS packages have routines for point or contour line interpolation. Any two points on the grid will be sufficient to ascertain a slope. Once the slopes have been calculated, then the maximum difference can be found and the gradient can be determined (Burrough and McDonnell, 1998; Maathuis, 2006; Jha et al. 2007). In the present paper topographical elevation map for the study area was developed by Digital Elevation Model (DEM) extracted from the Shuttle Radar Topography Mission (SRTM) data. For this, the DEM was subjected to two directional gradient filters (one in x-direction and another in y-direction).The resultant maps were used to generate a slope map of the study area using ARCGIS Spatial Analyst tools. The highest topographic elevations 395 m and lowest 102m exist in the western and northwestern portions of the area which induces highest runoff and hence less possibility rainfall infiltration. The slope map of the study area has grouped in five classes in degrees viz. 1°–3° (Gentle), 3°–5° (Moderate), 5°–10°(Steep) , 10°–35° (Very Steep) and >35° (Very Very Steep). The current study area observed that the gently slope 0-2.27%, moderate slope 2.28% to 6.28%, Steep 6.29% to12.2%, very steep 12.3% to 18.7%,very very steep 18.8% to34.1%. as shown Fig 09.

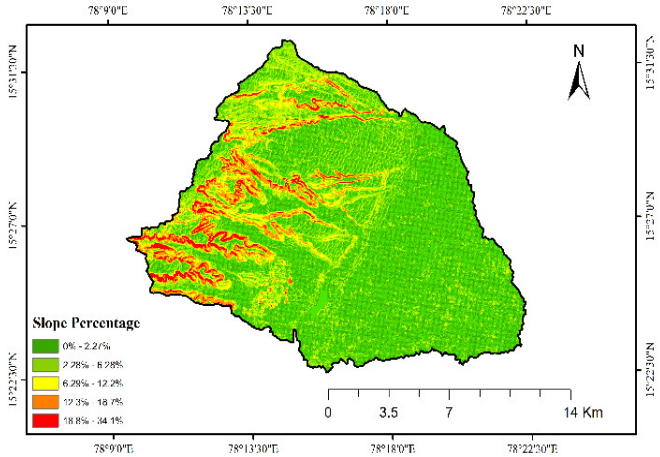

Fig-9: Slop map of the Nandivargam sub-watershed

4.0 Result and discussion

Assessment of watershed using quantitative morphometric analysis can provide information about the hydrological nature of the rocks exposed within the watershed. A drainage map of a basin provides a reliable index of permeability of the rocks and gives an indication of the yield of the basin. The DEM has been obtained with a pixel size of 90 m and furthermore, it has been used to calculate slope and aspect maps of the watershed. The development of drainage networks depends on geology, precipitation apart from exogamic and endogenic forces of the area. Shuttle Radar Topographic Mission (SRTM) Digital Elevation Model (DEM) data were used for preparing slope, aspect maps and morphometric analysis of the watershed. Linear, areal and relief aspects of the watershed were evaluated in GIS environment using Arc GIS software. Recent development in geospatial technology, the assessment of drainage basin has been more accurate and precise for morphometric parameter evaluation with better accuracy. Satellite data and GIS have been successfully utilized to generate data on the spatial deviations in drainage characteristics thus L providing an insight into hydrologic conditions necessary for developing watershed management strategies (Das and Mukherjee, 2005). Hydrogeological observations, integrated with drainage analysis, provide useful clues regarding broad relationships among the geological framework of the basin. Therefore, the results reveal different levels of agreement using morphometric analysis, which were supposed to be different from one region to another. Factors controlling groundwater storage are different in space and time, and the majority of these factors depend on the following parameters: (1) rainfall availability as the source of water; (2) drainage characteristics have a role in the distribution of runoff and indicate an infiltration scheme and it governs the behaviour of water flow on terrain surface vertically and horizontally; (3) rock type for which the lithologic character governs the flow and storage management; (4) slope is another influencing factor, and it controls water flow energy, which plays a role in facilitating water flow in the basin. The morphometric analysis can be achieved through measurements of linear, areal and relief aspects of basin.

5.0 Conclusion and Recommendation:

The hydrological analysis carried out for the Nandivargam sub- watershed confirms that the watershed is having low relief and circular shape. Drainage network of the basin exhibits as mainly dendritic type which indicates the homogeneity in texture and lack of structural control and helps understand various terrain parameters such as nature of the bedrock, infiltration capacity, runoff, etc. Lower drainage density and stream frequency indicate high permeability rate of the subsurface formation. The observed parameters reveal recharge-related measures and areas where surface-water augmentation measures can be undertaken for water resource management and soil conservation structures. Large scale watershed analysis using GIS, remote sensing data and Digital elevation Model (DEM) has efficient tools for understanding any terrain parameters such as nature of bedrock, infiltration capacity, surface run off etc., which helps in better understanding the status of land form and their processes, drainage management and evolution of groundwater potential for watershed planning and management. This work will be useful for natural resource management at the micro level of any terrain for sustainable development by planners and decision makers for sustainable watershed development programme. The results observed in the present work can be used for site suitability analysis of soil and water conservation structures in the area and subsequently, these parameters were integrated with other hydrological information viz., The study recommended that the watershed needs a hydrogeological and geophysical investigation in future for proper water management and selection

An Experimental Investigation on the Properties of Geopolymer Concrete with Partial Replacement of Marble Powder

Kowsalya Burra[1], Dr. B. Madhusudana Reddy[2]

[1]PG Student, Department of Civil Engineering, SVU College of Engineering, Tirupati, Andhra Pradesh, India
[2]Professor, Department of Civil Engineering, SVU College of Engineering, Tirupati, Andhra Pradesh, India

ABSTRACT

This research provides a geopolymer concrete investigation in which fly ash is partially replaced with marble powder. Geopolymer concrete uses waste materials such as fly ash (FA) and an alkaline solution (NaOH&Na2SiO3) to form a strong binder, replacing cement and including marble powder as a partial substitute. This experimental study looks at the tensile properties of geopolymer concrete with different quantities of fly ash replaced by marble powder. The major purpose is to use landfilling waste, such as marble powder, as a binding agent in geopolymer concrete at varying percentages (0, 5%, 10%, 15%, 20%, and 25%) instead of fly ash. The geopolymer mix is designed for a 12M, with an alkaline-to-binder ratio of 0.45. By adding fly ashwith marble powder, the concrete achieves 28-day cube strengths ranging from 40 to 60 MPa utilizing air curing procedures. This formulation allows for rapid strength development, making it appropriate for large structural elements (e.g., precast) without the requirement for extended conventional curing times. Superplasticizers, notably PCE (Poly Carboxylate Ether)-based ones, are used to improve workability. Mechanical property tests were performed, including compressive strength for 100*100*100 mm cubes, split tensile strength for 100*200 mm cylinders, and flexural strength for 500*100*100 mm prisms. When compared to conventional geopolymer concrete, which does not contain partial replacement marble powder, the concrete achieves 28-day cube strengths ranging from 40 to 60 MPa using air curing methods. This formulation allows quick strength growth, making it suited for heavy structural parts.

Keywords: Geopolymer concrete, Fly ash, Marble powder, Mechanical properties, Optimum percentage.

INTRODUCTION

Sustainable development is a crucial topic today due to the deterioration of the human environment and natural resources. Cement manufacture is a large contributor to air pollution, accounting for around 7% of global carbon dioxide emissions. Rapid urban development causes building construction and demolition, resulting in large volumes of waste that are frequently dumped in landfills. To address this issue, researchers are investigating the use of industrial waste materials such fly ash, powdered granulated blast furnace slag, and marble powder as alternatives to ordinary cement in construction. Geopolymer, a cement-free binder, is gaining popularity for its ability to include elements such as fly ash and marble powder. In a recent study, marble powder was studied as a partial replacement for fly ash in geopolymer to determine the impact on strength attributes. Various percentages (0%, 5%, 10%, 15%, 20%, and 25%) of marble powder were examined, and mechanical properties of the resulting geopolymer materials were evaluated. The data were compared to traditional concrete mixes to examine the feasibility and effectiveness of employing marble powder in geopolymer concrete manufacture.

This experimental investigation focuses on the strength behavior of geopolymer concrete when Fly Ash is partially replaced with Marble powder. The primary goal of the study is to determine the optimal proportion of Marble powder in enhancing the strength of Fly ash-based Geopolymer Concrete by partially substituting Fly ash with Marble powder at various percentages such as 0%, 5%, 10%, 15%, 20%, and 25%. The geopolymer is designed for 12M and has an alkaline-to-binder ratio of 0.45 and a sodium silicate-to-sodium hydroxide ratio of 2. The mechanical properties of geopolymer materials including fly ash, marble powder, fine aggregate, coarse aggregate, and alkaline solution were tested. For the compression test, 100mm x 100mm x 100mm cubes were constructed.For the purpose of testing split tensile strength, a 200mm diameter by 100mm length cylinder was used, and 500mm x 100mm x 100 mm prisms were constructed. The results of the flexural strength test were compared with the typical control mix, that is, without partial replacement.

Objectives:

- To find the optimum percentage of Marble Powder in developing the strength in Fly ash based Geopolymer concrete mix.
- To determine the mechanical properties of geopolymer concrete such as Compressive strength for cubes(100mm*100mm*100mm), Split tensile strength for cylinders(200mm*100mm), Flexural strength for prisms (500mm*100mm*100mm) at various replacement levels of Marble Powder dust as partial replacement of Fly ash in geopolymer concrete.
- To compare the mechanical properties of Fly ash based Geopolymer Concrete with partial replacement of Fly ash with Marble Powder to those of control concrete mix of Geopolymer Concrete.

MATERIALS USED

Fly ash

Fly ash, a residue derived from the combustion of pulverized coal in coal-fired thermal power plants, serves as a valuable component in hydraulic-cement concrete, significantly enhancing its properties. When mixed with hydraulic cement during hydration, fly ash contributes to the formation of a binding agent. This study employs class-F fly ash as a supplementary cementitious material, aiming to improve both the initial and long-term characteristics of concrete. Typically, fly ash utilized in concrete applications exhibits a color spectrum spanning from dark grey to yellowish tan.

Coarse aggregate

Well graded coarse aggregate conforming to the provision of IS: 383-2016 is going to use throughout the investigation. The aggregate of nominal size 12mm were blended to a desired proportion and mixed intimately to obtain well graded aggregate.

Table-1: Properties of Coarse aggregate

Specific gravity	2.65
Water absorption	0.73%
Fineness modulus	6.31

Fine aggregate

Locally available river sand conforming to is 383:2016 specifications passing through 4.75 mm sieve and retained on 75µm was used as the fine aggregate in the concrete mix. The fineness modulus, specific gravity were determined and sieve analysis of the fine aggregate and the corresponding grading curve is shown.

Table -2: Properties of Fine aggregate

Specific Gravity	2.58
Fineness modulus	3.15
Grading	Zone-II

Marble Powder

Marble powder entering open areas causes environmental, health and economic losses. Waste marble powders can be used in geopolymers to eliminate these disadvantages and provide sustainable environmental and eco-economic benefits. The Marble Powder is a calcium-rich waste material produced from processing plants sawing and polishing of marble blocks.

Table -3: Chemical composition of Marble Powder

Chemical composition	**Percentages**
Silica (SiO_2)	21.12
Iron Oxide (Fe_2O_3)	3.24
Alumina (Al_2O_3)	5.62
Calcium Oxide (Ca O)	62.94
Magnesium Oxide (MgO)	2.73
Potassium Oxide (K_2O)	0.25
Loss on ignition	38.65
Fineness	Completely passing through 90 Micron sieve

Sodium Hydroxide solution
Generally, the sodium hydroxides (NaOH) are available in solid-state in the forms of pellets or flakes. The price of sodium hydroxide varies a lot depending on how pure of product. The solution of NaOH was prepared by dissolving pellets in water for different molarity. It is recommended that NaOH solution should be made 24 hours before casting and should be used within 36 hours of preparing the solution otherwise it will be converted into a semi-solid state.

Sodium Silicate solution
Sodium metasilicate is also known as sodium silicate and is of industrial grade with SiO2 as 29.4% by mass and Na2O as 14.7%. As per the manufacturer, silicate is used as a bonding agent in detergent industries and textiles industries.

Super plasticizer
AURAMIX 450 is utilized as superplasticizer in this project. It is a polycarboxylate ether (PCE) based high performance super plasticizer. It is used for concrete requiring long workability retention. Appearance is light yellow colored and its pH is of minimum 6.

Water
The locally available potable water, which is free from the concentration of acids, organic substances, is used for mixing solution and concrete which promotes chemical reaction and also helps in the strength attaining of concrete. So bad quality of water affects the strength. It is necessary to follow quality analysis and water purity before being used in the project.

MIX DESIGN

Preparation of Alkaline solution
Alkaline solutions are created by mixing sodium hydroxide solution and sodium silicate at room temperature. When these solutions are combined, they initiate a reaction, known as polymerization, releasing a significant amount of heat. It is advisable to let the mixture sit for approximately 24 hours to allow the alkaline liquid to fully form as a binding agent. In this study, geopolymer concrete is prepared using 12 molarities of sodium hydroxide. The molecular weight of sodium hydroxide is 40. To prepare a 12M solution, 480g of sodium hydroxide flakes are measured and dissolved in distilled water to create a 1-liter solution. This process involves slowly adding sodium hydroxide flakes to distilled water in a 1-liter capacity pycnometer until fully dissolved. Water and Super plasticizer are used only for workability purpose. After many trial mixes by changing water and super plasticizer percentages at finally below mentioned percentages got high workability of 110 mm slump.

Table – 4: Ingredients of Geopolymer concrete

Material	Proportions (Kg/m^3)
Coarse aggregate	924
Fine aggregate	756
Binder	496.55
Sodium Hydroxide	74.48
Sodium Silicate	148.96
Super plasticizer	1% of Binder
Water	10% of Binder
Molarity	12M
Na_2SiO_3: NaOH	2

Mix design
In this design, a 12M solution of sodium hydroxide is utilized for alkaline preparation. The ratio between sodium hydroxide and sodium silicate is set at 2. The aggregate volume is determined as 70% of the total volume of the cube. The ratio of alkaline liquid to fly ash is maintained at 0.45. Fly ash is substituted with different percentages ranging from 0% to 25%, including 5%, 10%, 15%, 20%, and 25%.

Table -5: Various mix proportions of Geopolymer concrete

Mixes	Fly ash (%)	Marble Powder (%)
M0	100	0
M5	95	5
M10	90	10
M15	85	15
M20	80	20
M25	75	25

Mix Procedure

In the lab, the dry mixing of fly ash and aggregates took about three minutes in a pan mixer. Aggregates were prepped in a saturated-surface-dry (SSD) condition. Alkaline liquid was combined with superplasticizer and water. This liquid mix was then added to the dry materials, followed by mixing for an additional four minutes. Workability was assessed via the conventional slump test. Air curing is typically advised for low-calcium fly ash-based geopolymer concrete, with curing time and temperature significantly impacting strength. Specimens were cured at room temperature for 24 to 48 hours, with longer durations enhancing polymerization and strength

Figure 1: Casted Specimens

Figure 2: Failure Specimens

RESULTS AND DISCUSSION

Compressive strength Test

The primary test for strength evaluation is compressive strength, commonly conducted on cube specimens measuring 100mm x 100mm x 100mm. Compaction of each layer is achieved using a tamping rod, followed by leveling the top surface of the mould with a trowel. Specimens are tested after 7 days, 28 days, and 56 days to assess compressive strength across varying curing durations.

Table-6: Compressive strength

Mixes	Compressive Strength (MPa)		
	7 days	28 days	56 days
M0(Std mix)	34.88	39.15	40.80
M5	25.52	44.16	45.74
M10	27.67	52.85	54.43
M15	33.43	59.65	60.75
M20	**33.84**	**60.47**	**62.34**
M25	31.87	53.26	54.20

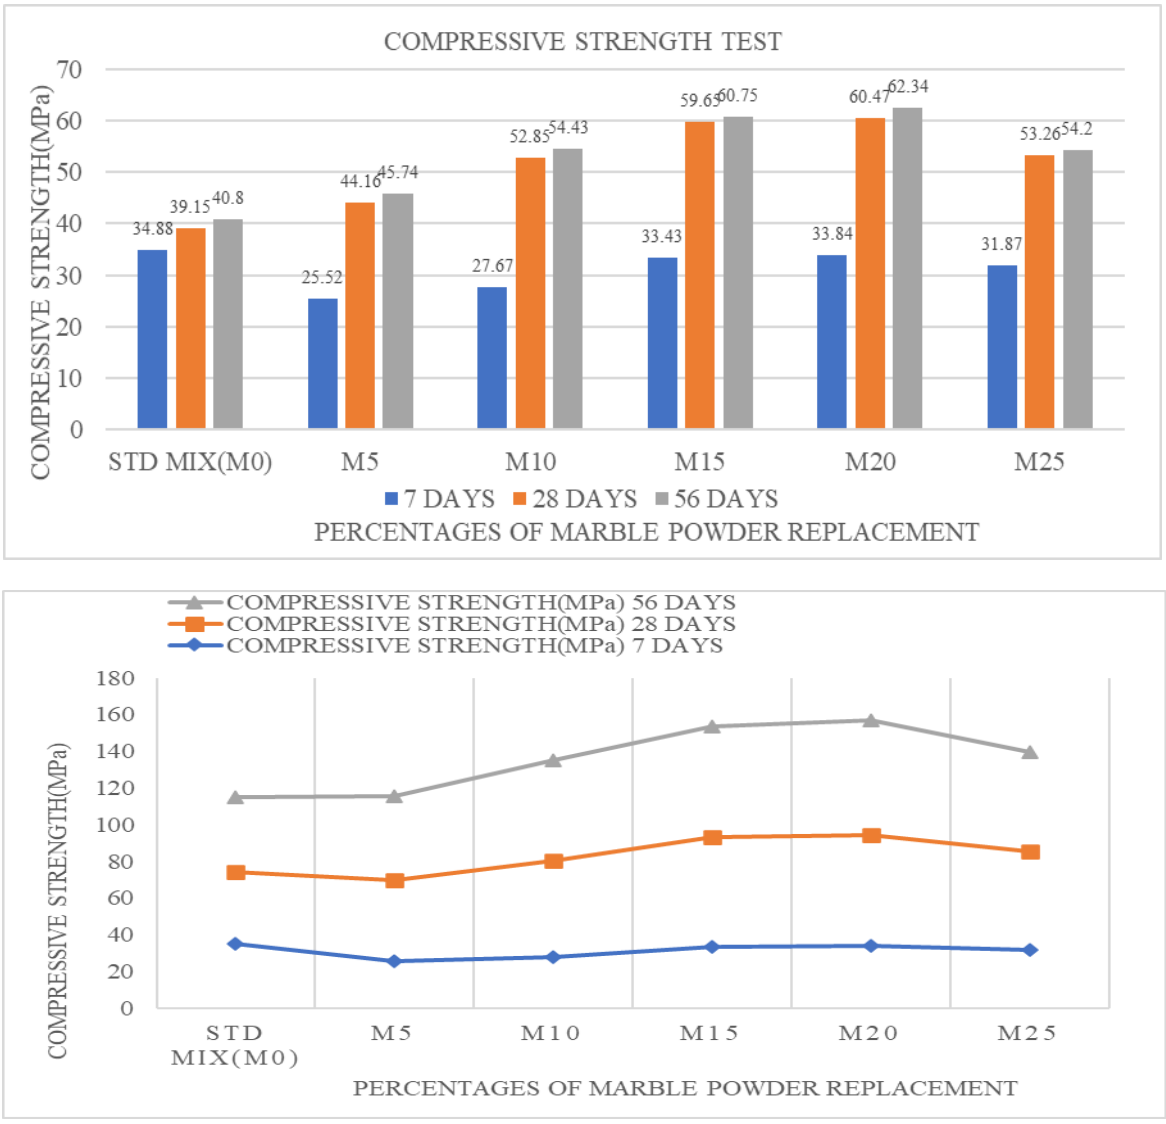

Figure 3: Comparison test of compressive strength on 7, 28 and 56 days with standard mix

Split tensile strength test

This test employs an indirect tension method, involving the placement of a cylindrical specimen horizontally between the compression testing machine's loading surfaces. Load is gradually applied until the cylinder fails along its vertical diameter. Notably, the same compressive testing machine and cylindrical specimen used for compression tests can be utilized. To mitigate high compressive stresses, narrow cracking strips of suitable material are incorporated. The split tensile test is known for its simplicity and ability to produce uniform results.

Table 7: Split Tensile strength

Mixes	Split tensile strength (MPa)
M0(Std mix)	1.71
M5	2.22
M10	2.51
M15	3.05
M20	**3.26**
M25	2.48

M25	5.94

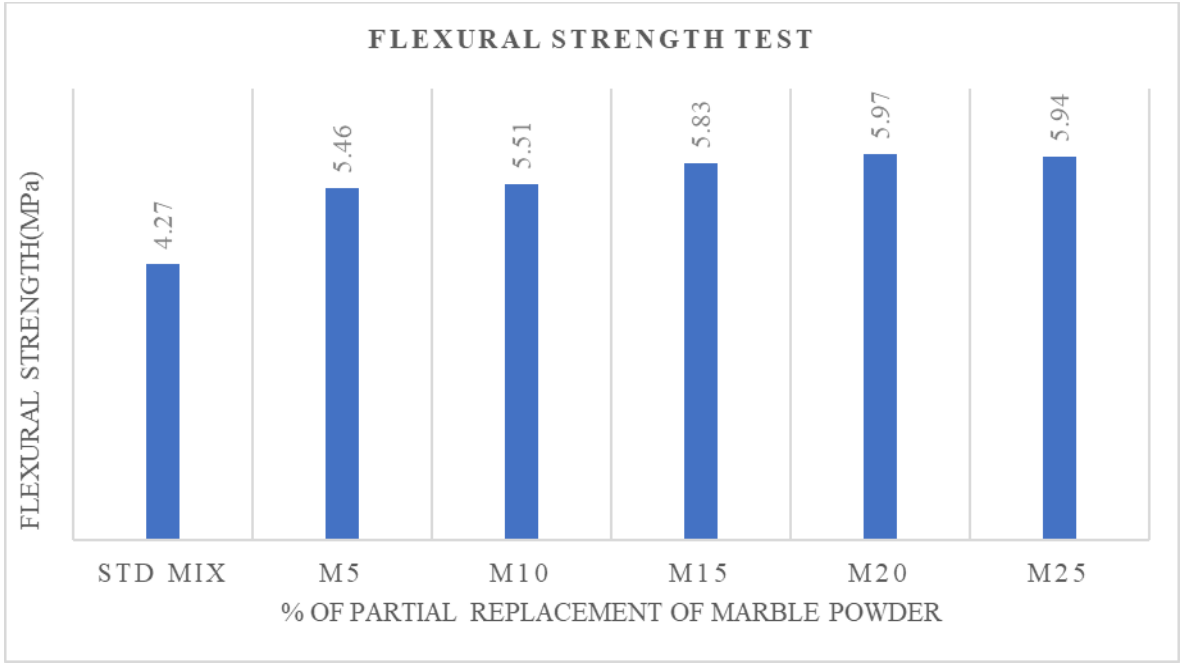

Figure 3: Variation of Flexural strength with partial replacement of Marble powder at 28 days

CONCLUSION

Durable, eco-friendly materials are sought for by the construction sector. GGBS and fly ash provide benefits over regular concrete. Optimizing the use of marble powder is the project's goal. The compressive strength of marble powder substitute peaks at 20% replacement by 28 days, and it is comparable to the regular mix after 7 days. Marble powder can boost the strength of geopolymer concrete by up to 20%. Structure is somewhat impacted by strength when it approaches 20% replacement. Marble powder has a compressive strength of 60.75 MPa at 20% replacement, which is 54% higher than that of normal mix. Marble powder outperforms normal mix, increasing strength by 76% (@M20) at 20% replacement in the split tensile test. At 20% replacement, flexural strength peaks at 5.97 MPa, representing a 40% increase (@M20) above normal mix. Slump value increases with the percentage of marble powder and exceeds that of traditional geopolymer concrete. The ease of geopolymer innovation is especially advantageous for precast applications. Particularly in harsh conditions, geopolymer concrete provides strength and a greater range of applications than regular concrete. Marble powder, an industrial waste that is only used for landfilling, is a very cost-effective addition to geopolymer concrete, and is the primary cause of the compressive strength increase of up to 60 MPa. It also contributes to the geo-polymerization process, which gives strength to the concrete. Instead of using cement, geopolymer concrete employs industrial waste as a binder, which reduces pollution and is also utilized in areas with limited fly ash production. There are therefore numerous benefits to employing these industrial wastes in the geopolymer concrete used for many heavy structural works.

***Abstract*—Power distribution infrastructure is being harmed by the advent of nonlinear devices, which cause harmonics to enter into the power system networks and distort the voltage and current signals. Shunt Active Power Filter (SAPF) is a new power electronics-based technology that can reduce harmonics and improve the power quality in distribution networks. This research provides an efficient and inexpensive strategy to minimizing harmonics and improving the power quality in power distribution networks by employing Shunt Active Power Filter's (SAPF), which uses the Particle Swarm Optimized Artificial Neural Network Controller (PSO-ANN). The goal of the PSO-ANN algorithms have been developed for SAPF is to improve system performance by lowering the amount of Total Harmonic Distortion (THD). In this work, the standard PI controller is initially tuned using the PSO algorithm to obtain the optimal gain values (K_i, K_p) for the PI controller. After that, these values of the PSO-PI controller's input and output will serve as a dataset for the ANN controller. Now, the PSO algorithm is being used to tune this ANN controller in order to acquire the optimal values for the weight and bias. Using the MATLAB/SIMULINK tool, the proposed algorithm's performance is evaluated and compared to that of a PSO-PI based SAPF and the conventional PI based SAPF. The results of the simulation demonstrate that a SAPF which is based on a PSO-ANN controller is capable of achieving superior THD in the drawing source current while maintaining minimum levels and which are acceptable in accordance with the IEEE-519 standard for harmonics.**

***Index Terms*—ANN-controller tuning, particle swarm optimization algorithm, PI-controller tuning, power quality, shunt active power filter, total harmonic distortion**

I. Introduction

Harmful harmonic currents are produced at the Point of Common Coupling (PCC) due to the usage power electronics devices and non-linear load in huge quantities [1]. Because of the many issues that can arise from distribution system current harmonics, loss, instability, noises, heating appliances, etc. It would be preferable to reduce their risk and bring them down to an acceptable level, as specified by the IEEE-519 standards for Total Harmonic Distortion (THD) [2].

To reduce current harmonics, compensate for reactive power, and improve power factor, a Shunt Active Power Filter (SAPF) could be the solution. Fig. 1 (next page) depicts the SAPF setup, this consists of the active filter controller as well as the Voltage Source Inverter (VSI). In order to achieve the desired result of injecting a controlled compensating current into the power system, the VSI requires instantaneous adequate firing signals from the control unit [3, 4]. The reactive power control to the grid is supplied by the DC-link capacitor employed on the front side of the VSI [5]. In order to connect the DC component to the three-phase power distribution system, a VSI is necessary. To reduce the amount of distortion in the source current, VSI injects a compensating current in response to the firing signals [6].

To analyze the VSI switching operation, either reference generating methods or control techniques are used. The SAPF control techniques are able to be implemented in two steps, which are as follows: first, by using reference current generation theories to extract compensating signals from distorted signals, and then, by using signal estimated reference methods to produce appropriate firing signals for the purpose of controlling the SAPF switching devices [7]. Several writers have compared SAPF control techniques ([8, 9]).

The PI-controller, which is an integral aspect of reference current theory, is responsible for minimizing the impact of harmonics. K_i and K_p gain settings of the PI-controller need to be properly tuned in order to obtain the best possible results. The traditional approach for tuning the gains of the PI-controller utilizes linear modeling, which ultimately results in a less-than-optimal setting for the gains [10, 11]. Consequently, PI-controller tuning makes use of a variety of different metaheuristic optimization strategies. There are a variety of control methods that can lower current harmonics and introduce the converter to brand new opportunities [12]. Consider, for example, the Particle Swarm Optimization (PSO) [13−17] method and Genetic algorithm (GA) [18].

Artificial Neural Network (ANN) is a network that is set up and works in a way that is similar to how the human brain works. To simply stated, the brain is a network of cells called neurons. The behavior of the

whole network depends on how strong the connections between interneuron's are and how they are set up. During the training of the network, the weights are changed and tweaked [19]. At the moment, Artificial Neural Network (ANN) techniques are only used on SAPF for producing reference compensation current, which is used to control the compensation that SAPF gives [20, 21]. Learning weights can be accomplished in a variety of techniques [22]. Some examples include the Widrow-Hoff (W-H) approach, the Steepest Descent method of variable learning, the Levenberg-Marquardt method, and others.

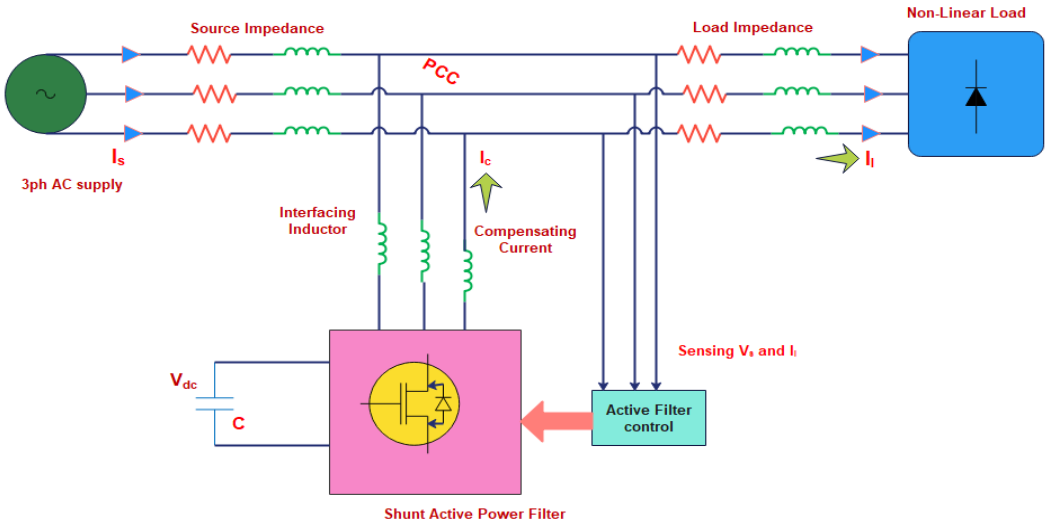

Fig. 1. Basic elements of the shunt active power filter.

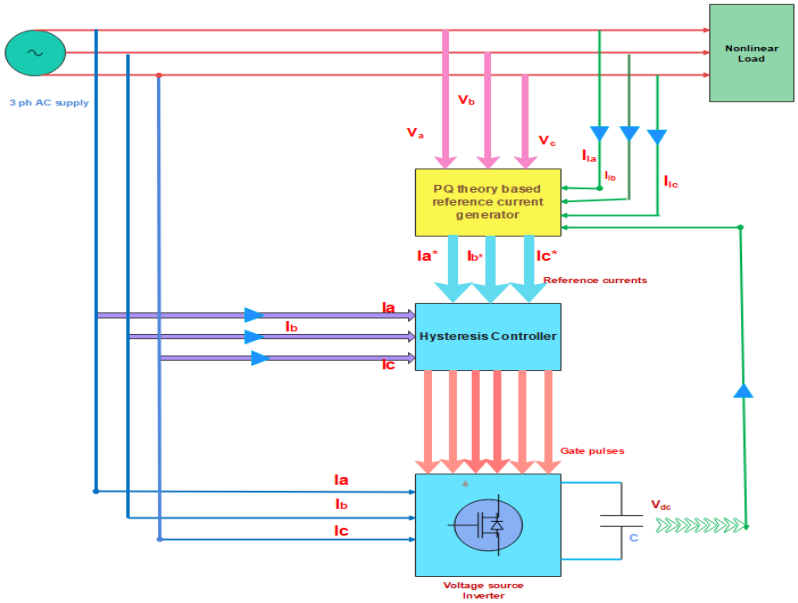

Fig. 2. SAPF controller configuration.

This work uses the concepts of instantaneous active and reactive power to derive the reference current (PQ-theory). Hysteresis current controller technique, as shown in Fig. 2 [23], estimates reference currents to provide necessary gating pulses. For optimum performance of a PQ-theory based ANN-controller for a dc-link voltage requires fine-tuning of weight and bias values. For the optimum ANN-controller weight and bias particle swarm optimization algorithm is implemented in order to identify its optimal state.

II. PQ Theory

In the case of three-phase, three-wire systems that have sinusoidal and balanced source voltages, a PQ-theory-based constant instantaneous power control approach has been developed. The instantaneous power is calculated by sensing the source voltage (V_a, V_b, V_c) and load current (I_{la}, I_{lb}, I_{lc}) and transforming them using Clarke transformation into (α, β) components. Error signal is derived from reference and measured dc-link voltages, then introduced to PI or ANN controller to obtain power losses component of dc-link voltage (P_{loss}). As illustrated in Fig. 3 (next page) [24], the reference current signals are obtained by inverting the components (α, β) with the real and reactive power by use of the inverse Clarke transformation (α, β to three phase values (V_a, V_b, V_c, I_{la}, I_{lb}, I_{lc}).

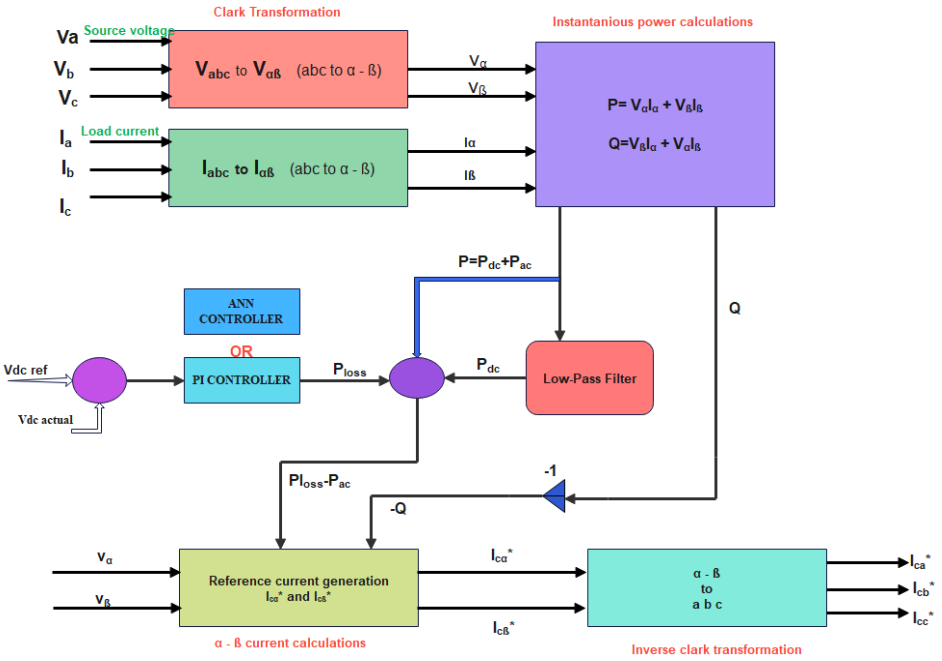

Fig. 3. Work flow of PQ theory based reference current generation.

III. Artificial Neural Network (ANN)

The human brain's structure is built on neural networks, hence the terminology "Artificial Neural Network" is adopted from the neuroscience area. Multiple layers of interactions are present between neurons in artificial neural networks, just like the neurons in the human brain are connected to each other. These nerve cells are called nodes as shown in Fig. 4. A nominal neuron is a processing element that, in general, possesses one or more outputs and n inputs (x_1, x_2,⋯, x_n) which are the independent inputs or outcomes of the different neurons. Fig. 5 provides a visual representation of these inputs and outputs. The neuron begins by computing the sum of its inputs, and then it transfers this value through its activation function in order to form its output, which is indicated by the value Y_i [25].

$$Y_i = f_i\left(\sum_{j=1}^{n} w_{i,j}x_j + b_i\right) \quad (1)$$

where $w_{i,j}$ are the weight of the connection between the input neuron and the output neuron, b_i is the bias of the neuron, x_j represents the neuronal input, and f is activation function that controls the characteristics of the neural network.

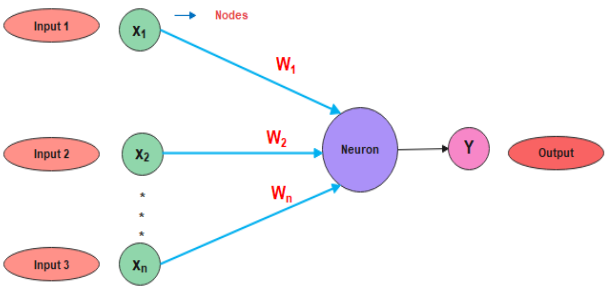

Fig. 4. Basic structure of artificial neural network.

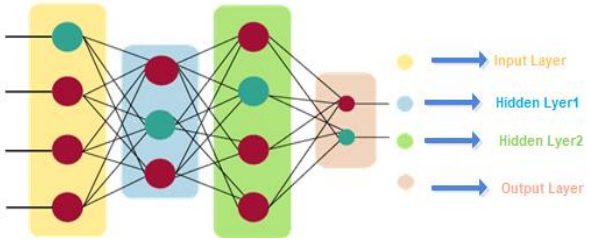

Fig. 5. Architecture of the artificial neural network.

Neural networks adjust to input data by changing connection weights (including biases) and sometimes layer number and neurons number.

IV. Introduction to PSO

The comprehensive implementation of PSO algorithm starts with the movement of a group of possible random solutions, which are represented in the form of moving particles in inside target region. This movement is done in order to find the optimal solution. Every one of the nearby particles that are being assumed has some a speed as well as a selective memory, which enables each other to recall the position and value that corresponds to their optimal level of performance. This is being done by taking into account all of the information that is currently being taken into account. A predetermined objective function that is tied to the problem that needs to be resolved [26] is used to evaluate the efficacy of each individual particle. The velocity of each particle at iteration is determined by linearly combining the velocity and position at iteration, as well as the intervals that separate the existing position of the particle from its preceding best position and finest position, respectively. This information is then used to calculate the velocity of each particle. This leads to the development of a formula for determining the velocity of the particle at the next iteration, which is denoted by t+1. The motion of the

particles is formalized for us by Eqs. (2) and (3), which provide us a representation of the movement of the particles.

$$v_i(t) = wv(t-1) + \left[P_{\text{best}}(t-1) - x_i(t-1)c_1r_1\right] + \left[G_{\text{best}} - x_i(t-1)\right]c_2r_2 \quad (2)$$

$$x_i(t) = x(t-1) + v_i(t) \quad (3)$$

where x_i is the ith particle position, v_i is the ith particle velocity, P_{best} is particle best position, G_{best} is target position, w is coefficient of inertia, c_1 and c_2 are coefficients of acceleration, and r_1 and r_2 are values at random between 0 and 1.

Iterate (2) and (3) until convergence is achieved [27].

V. Proposed Implementation

A. PSO Tuned PI Controller

The primary function of SAPF is dependent on DC link voltage regulation, which is controlled by standard PI controller. This controller requires a great deal of mathematical calculation, and it is possible that it will not produce optimal gain values for k_p and k_i. With the help of the PSO algorithm, we can determine the optimal values for k_p and k_i.

The actual dc voltage as compared to the reference dc voltage and the error that will be fed to the PSO-PI controller can be seen in the Fig. 6. The Integral Absolute Error (IAE) is the objective function that needs to be minimized with the help of the PSO algorithm in order to obtain the optimal gain values. The parameters for the PSO are specified in the Table I.

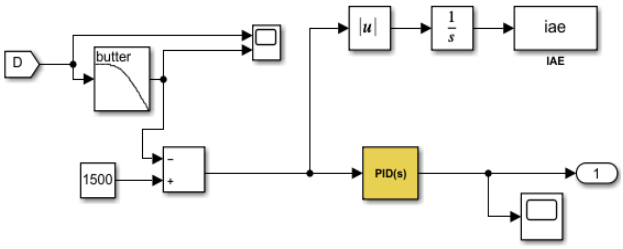

Fig. 6. DC voltage regulation of SAPF with PSO-PI controller.

TABLE I: PSO Parameters

Maximum iterations	1000
Total Population	50
Weight of Inertia	0.89
Constant of Acceleration (C_1)	2
Constant of Acceleration (C_2)	2
Total Variables	2
Higher Limit of K_i, K_p	200
Lower limit of K_i, K_p	0
Optimum value of K_p	5.65119
Optimum value of K_i	7.93019

B. PSO Tuned ANN Controller

The objective of ANN training is to arrive at the most accurate possible values for the network's weights and biases. The right values of the ANN's weights and biases are determined by the application of a variety of methodological approaches. The PSO method was utilized in this paper. According to the Fig. 7, the input (e) and output of the PSO-PI controller will serve as the dataset for the neural network feed forward controller.

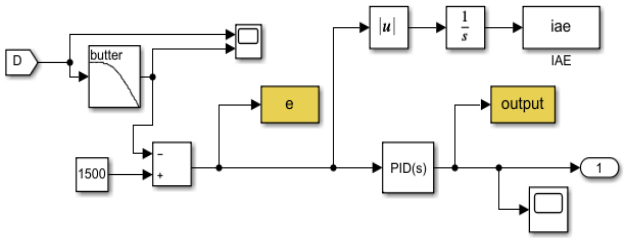

Fig. 7. The workspace representation of the PSO-PI controller's input (e) and output.

The Initialization of the neural network code shown in below says to get the input and target values from the PSO-PI controller, then initialize the hidden neurons are 10, configure the neural network based on the input and output, get the weights and bias of the configured neural network, create the objective function as root mean squire error, and use the PSO algorithm to fine-tune the weights and bias of the pre-trained neural network.

Initialize the neural network problem

- inputs = e';
- expects = output';
- hn = 10; (number of hidden neurons)
- Nn = feedforwardnet (hn);
- Nn = configure (Nn, inputs, expects);
- getwb(Nn) (Getting initial weight and biases)
- Based on weights and bias(y), Nn, inputs, and expects, calculate the objective function which is root mean square error denoted by (g).
- Train the neural network by applying the PSO algorithm .From that we can obtain the updated weights, bias (y), and error (e).
- Nn = setwb(Nn, y');
- getwb(Nn)
- e = expects - Nn (inputs);
- def = mean(e.^2)/mean(var(expects',1));
- gensim(Nn)

The algorithm's operation can be summed up using the steps as follows:

- Initialization at random of all of the local positions X_i (weights and biases).
- Evaluate the fitness function for each initialized particle, which is provided by (4), then establish the local locations $P_{i\text{-best}}$ and the global positions G_{best}.

$$f = \sum\sqrt{(\text{target} - \text{actual output})^2} \quad (4)$$

- Update all $P_{i\text{-best}}$ local positions
- Assess the current best in the area and the fitness function. If $(fP_{\text{best}}) < f(G_{\text{best}})$ then $G_{\text{best}} = P_{\text{best}}$.
- Using (2) and (3), modify the neural networks' weights and biases.
- The process should end if the stop condition holds true. If not, proceed to Step 2 to display the updated weights and biases.

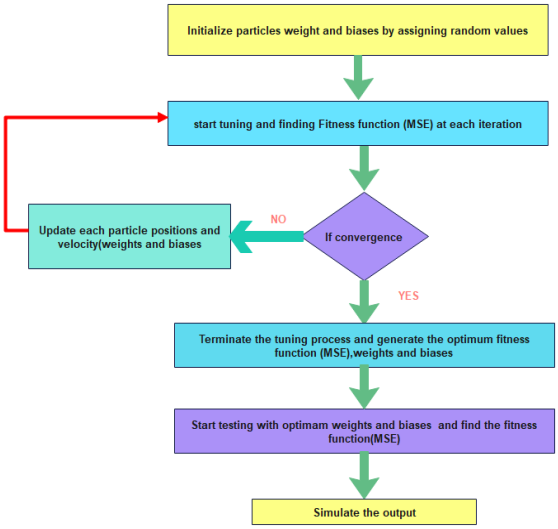

Fig. 8. Flow chart representation of PSO trained ANN controller.

Convergence is reached when the synaptic coefficients settle on a final value and the network's Mean square error (NMSE) drops below a specified threshold. Limiting the number of possible iterations is another way to interrupt the learning process. Fig. 8 depicts the training algorithm's flowchart.

Finally for a given input and an output, we will get the feed-forward neural network as shown in Fig. 9, which will be replaced by the PSO-PI controller.

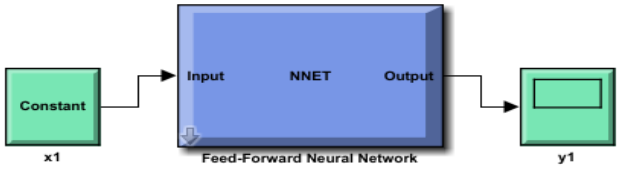

Fig. 9. Simulink block of PSO-ANN algorithm.

TABLE II: SIMULINK MODEL FRAMEWORK

Specification	Values
Source Voltage	415V
Source Frequency	50 Hz
Source Impedance	0.1 ohm, 15mH
Interfacing impedance	15mH
Load Real Power	4472 W
Load Reactive Power	1718 VAR
DC link Capacitance	100μF

VI. MODEL CONFIGURATION

The configuration of the suggested model is shown in Fig. 10, which consists of a three-phase power grid coupled to a three-phase un-controlled diode rectifier coupled to a non-linear load represented by an inductive load on the DC side. SAPF with a VSI design and a capacitor on the DC link are incorporated into the system at the PCC.

The simulation diagram of a PQ theory-based reference control method for SAPF is represented in the Fig. 11. Table II contains a listing of the suggested model's parameters.

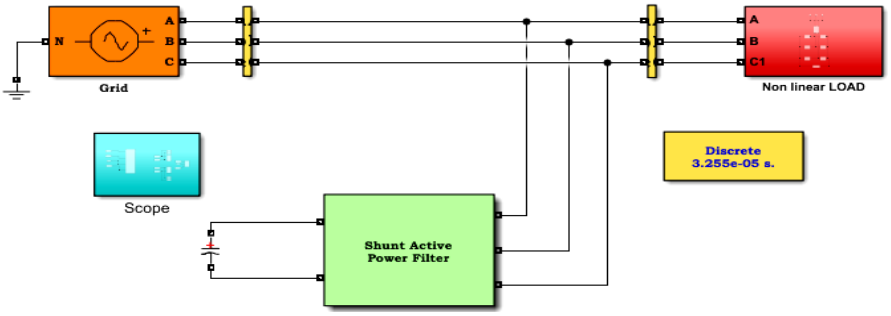

Fig. 10. Simulink model of Grid connected nonlinear load with SAPF.

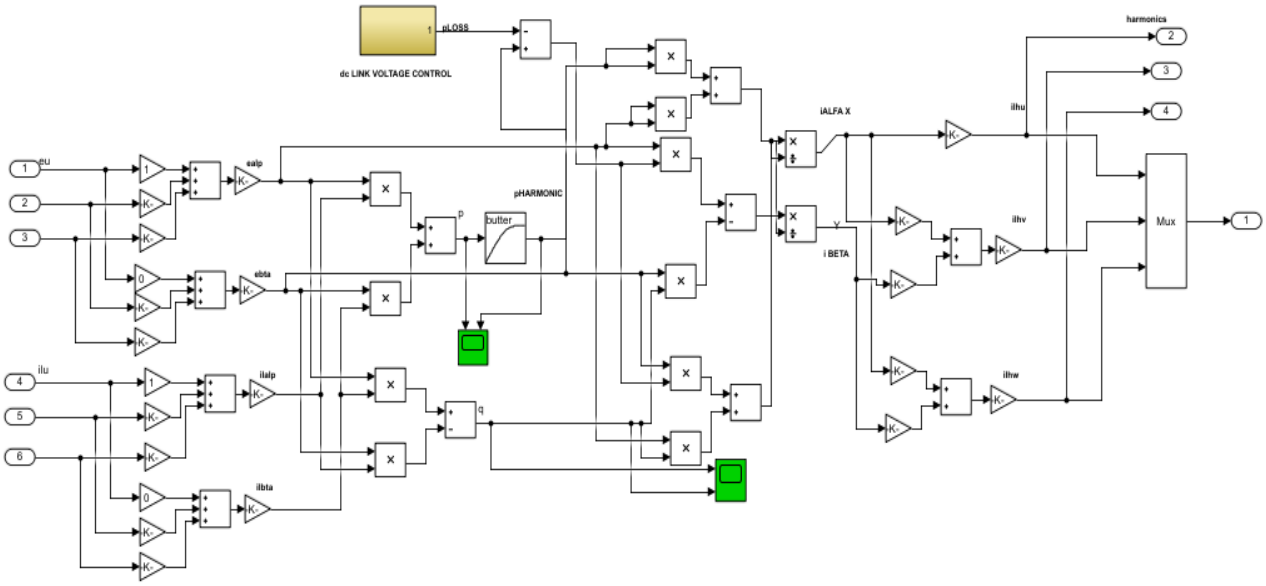

Fig. 11. Simulink model of PQ theory based SAPF.

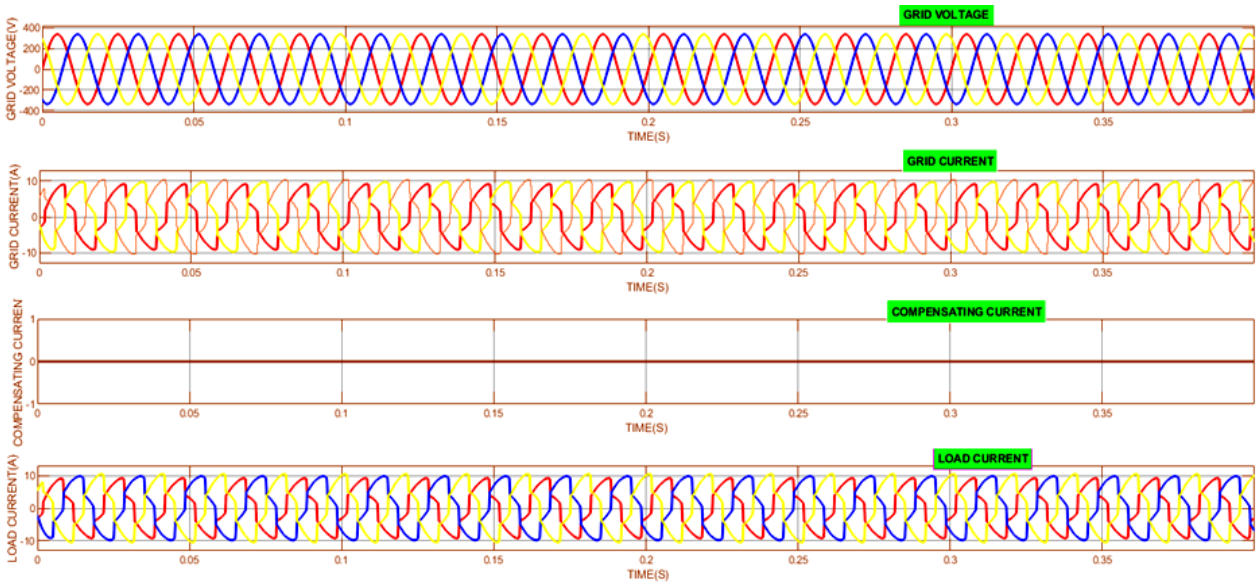

Fig. 12. The source voltage, source current, compensation current, and load current waveforms without SAPF.

VII. Simulation Results

The MATLAB simulative environment was used for the implementation of the proposed reference generation and current control techniques for a SAPF. This research was performed in accordance with the following scenarios.

- Without SAPF
- SAPF with conventional PI controller
- SAPF with PSO-PI controller
- SAPF with PSO-ANN controller

A. Without SAPF

In this scenario, SAPF is switched off, and a distortion in source current induced by a nonlinear load is evaluated using Fast Fourier Transform (FFT) analysis, which came out to be about 18.42%. Fig. 12 shows the source and load current waveforms from the three-phase simulation. Fig. 13 shows the source current FFT harmonic spectrum.

B. SAPF with Conventional PI Controller

In this scenario, SAPF is linked to the PCC, and the results of the simulation are obtained without any adjustment to the PI-controller gains. After SAPF connection, the supply current distortion is brought down to 3.76% of its original value as shown in Fig. 14.

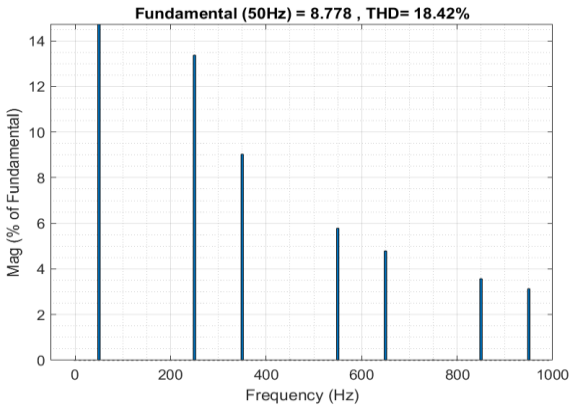

Fig. 13. Grid current THD value of distribution system without SAPF.

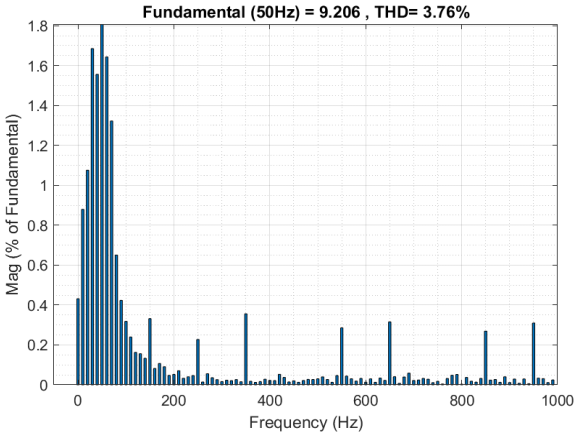

Fig. 14. Grid current THD value of distribution system with PI controller based SAPF.

C. SAPF with PSO-PI Controller

In this particular instance, the simulation was run using the SAPF compensation action, and the PSO Algorithm was utilized to modify the PI-controller gains. The findings that were collected suggest that the THD of the source current has been drastically reduced to 0.93%, as shown in Fig. 15.

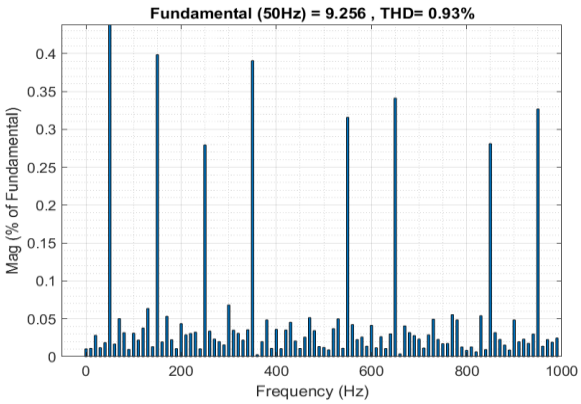

Fig. 15. Grid current THD value of distribution system with PSO-PI controller based SAPF.

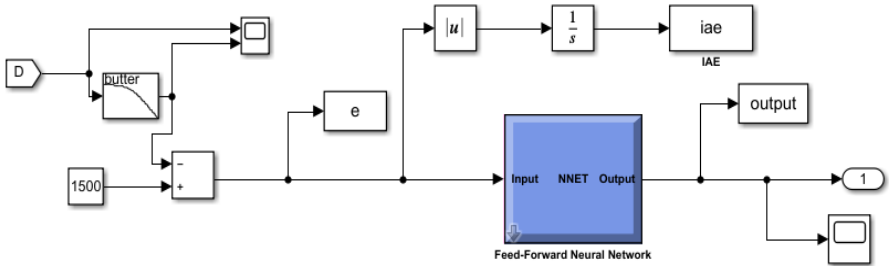

Fig. 16. DC voltage regulation of SAPF by using PSO-ANN controller.

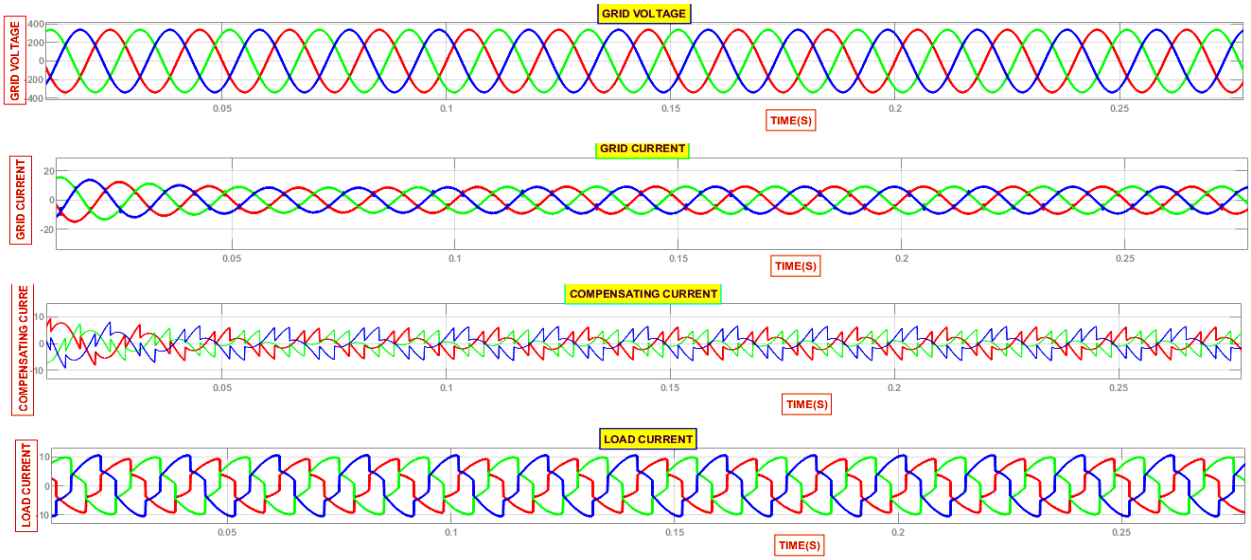

Fig. 17. The source voltage, source current, compensation current, and load current wave forms of PSO-ANN controller based SAPF.

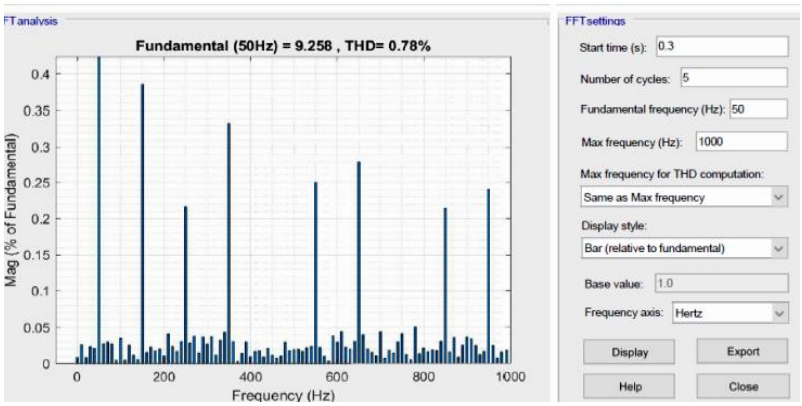

Fig. 18. Grid current THD of distribution system with PSO-ANN controller based SAPF.

D. SAPF with PSO-ANN Controller

In this particular instance, The PSO-PI controller is replaced by PSO-ANN controller Simulink block which was obtained from Fig. 9 Simulink representation with feed forward neural network block as shown in Fig 16. The findings that were collected suggest that the THD of the source current has been drastically reduced to 0.78%.

The source current, load current, and SAPF compensatory current waveforms are depicted in Fig. 17. Fig. 18 depicts the source current's harmonic spectrum. Fig. 19 depicts the converging spectrum for PSO-ANN controller.

PSO-ANN parameters are listed in Table III (next page). The SAPF performances of all four cases are given in Table IV (next page).

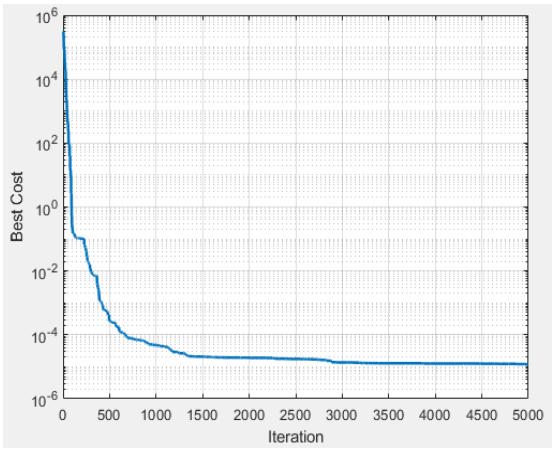

Fig. 19. Converges graph for the PSO-ANN controller.

TABLE III: PSO-ANN PARAMETERS

Maximum iterations	5000
Total Population	50
Weight of Inertia	0.89
Constant of Acceleration(C_1), (C_2)	2
Hidden Neurons	10
Total Variables	1
Higher Limit of weights	200
Lower limit of weights	0

TABLE IV: COMPARISON TABLE

Case studies	FFT -Analysis	Parameters	THD in %
1	Without SAPF	Grid current	18.42
2	SAPF with PI controller	Grid current	3.76
3	SAPF with PSO-PI controller	Grid current	0.93
4	SAPF with PSO-ANN controller	Grid current	0.78

The SAPF performance interns of power factor for all four scenarios as follows: Without SAPF, the power factor is 0.81, with conventional PI being 0.89, with PSO-PI being 0.94, and with proposed PSO-ANN being 0.96.

VIII. CONCLUSION AND FUTURE WORK

The power quality issues, such as harmonics and reactive power, are always expanding and becoming more complex. It has been discovered that implementing strategies derived from artificial intelligence on active filters can produce excellent results in the reduction of harmonics and the correction of reactive power. In this article, the PSO-ANN control method is proposed for use with the SAPF in order to lower the amount of total harmonic distortion occurring on the source side of the distribution system. The SAPF's effectiveness in a wide range of situations is studied and contrasted. The tool MATLAB/SIMULINK is used to perform simulations of four distinct scenarios, and the findings are reported. According to the results of simulations, both the PSO-PI-based SAPF and the traditional PI-based SAPF perform effective in terms of minimizing THD. It has been found that the proposed ANN-PSO-based SAPF is more effective in simulation in terms of achieving a lower THD value. This improved performance has been determined to be acceptable (within 5% of the IEEE standard), according to the findings of the investigation.

In future work, a hardware-in-loop implementation will be added to the proposed shunt active filter. Also, an ANFIS controller with PSO and other optimization methods will be used to make the SAPF's response even better.

CONFLICT OF INTEREST

The authors declare no conflict of interest.

Abstract: The increased utilization of nonlinear devices is resulting in damage to power distribution infrastructure by introducing harmonics into power system networks, which in turn causes distortion in voltage and current signals. A novel solution called Shunt Active Power Filter (SAPF) has been developed to address this issue using power electronics. This study aims to provide a method that is efficient and cost-effective for lowering harmonics and improving power quality in distribution infrastructure. The proposed method combines the Teaching learning-based optimization (TLBO) technique with an Artificial Neural Network Controller (TLBO-ANN) in conjunction with SAPF. The primary objective of the TLBO-ANN algorithms in SAPF is to minimise total harmonic distortion (THD) for maximum system efficiency. Initially, Gain values (K_i, K_p) for a regular Proportional-Integral controller are optimised with the Particle Swarm Optimisation (PSO) technique. Those optimized parameters obtained from the PSO-tuned PI controller serve as input and target datasets for training the ANN controller. Subsequently, the TLBO algorithm is utilized to further refine the ANN controller by finding the optimal weight and bias values. Using MATLAB/SIMULINK software, we compare the performance of the proposed algorithm to that of the PSO-tuned PI controller and traditional PI controller. The findings from the simulation suggest that a SAPF utilizing a TLBO-trained ANN controller could improve THD in the supplying current while maintaining harmonics within IEEE-519 accepting levels.

Introduction

Bonding An imbalance between the quality of power available and the power needed by the load apparatus indicates a power quality issue. In order to protect electronic components from power outages, many power enhancement devices have been developed over time (Vishwakarma, 2020). These can be anything from specifically designed power sources to power conditioning devices. Isolation transformers and power conditioning equipment include capacitors, filters, voltage regulators, and uninterruptible sources of power (UPS) to prevent power outages caused by lightning and power surges. Surge capacitors for transient voltage are another type of power conditioning equipment. The Shunt Active Power Filter (SAPF) (Rajeshwari et al., 2017) is an example of a device that enhances power quality. There are many potential sources of damage in alternating current (AC) supply systems. Natural causes include lightning strikes, flashovers, equipment breakdowns and faults, whereas voltage distortions and notches are examples of human-made factors. Because it acts as a nonlinear load and develops non-sinusoidal current, much of the customer's equipment contributes to pollution in the supply system. Power quality is measured in terms of these factors because of the potential for damage to electronic devices due to fluctuations in

voltage, current, or frequency. Power quality problems can often be traced back to the voltage at the point of common coupling (PCC), where numerous loads are connected (Gowtham et al., 2016; Dorigo et al., 1999; Janga et al., 2020; Huaisheng et al., 2012) Some examples of such problems are harmonics in the voltage, surges of electricity spikes, notches, and sag/dip/swell/imbalance/fluctuations/glitches/flickers/outages.

Non-linear loads, such as heaters, UPSs and variable-speed motors, can place a burden on the power grid and cause outages and other problems in the supply system. Some nonlinear loads can cause power quality concerns by drawing excessive current from the AC mains, creating the low power factor, harmonic currents, reactive power stress, imbalanced currents, and an excess neutral current in three-phase systems are all caused by the unbalancing and harmonic currents that come from using certain non-linear loads. Problems with dielectric breakdown, communication system interference, breaker issues, incorrect measurement, negative sequence currents in rotating electrical machines (especially rotors overheating) and disturbances affecting motor control units and technological control devices., and many others can all contribute to poor power quality (Sabarimuthu et al., 2021).

In some loads, however, the current changes in a way that is out of proportion with the voltage changes that occur at each half-cycle. Non-linear loads refer to this category of conditions. These non-linear loads produce the current and voltage harmonics. Many issues that utilities and power supply organizations face, such as low power factor, inefficient consumption of energy, and voltage fluctuations in the power system, can be traced back to non-sinusoidal current. A perfect compensator is necessary to prevent the harm caused by harmonics (Soliman et al., 2022). Over time, many different types of power enhancement devices have been developed to shield electronics from the consequences of grid failures. Methods that are both effective and efficient include those that are listed below. Implementing power conditioners and substitute energy sources. Power conditioning equipment includes isolation transformers, lightning arrestors, surge capacitors, filters, voltage regulators and an uninterruptible power supply. (Mikkili S et al., 2012; Om P et al., 2016). A Shunt Active Power Filter (SAPF) is one power conditioning device that enhances the supplied electricity's quality. By synchronizing the source current and voltage, current harmonics on the alternating current (Grid) side are cancelled out, and the DC link voltage is maintained at a constant level (Chelli et al., 2015). In order to achieve this goal, the real power flow in the system as well as the there must be no fluctuation in the amount of reactive power flowing into or out of the source.

The SAPF can be controlled by a single controller or multiple controllers working together to maintain a constant DC voltage. This is accomplished by balancing the real power flow in the system with the reactive power flow that comes from or towards the source, which brings the source current in phase with the source voltage (Babu et al., 2020). This cancels out current harmonics on the AC side. SAPF is necessary to eliminate current harmonics. The fundamental compensation principle of the active power filter is depicted in Figure 1. This principle serves as a form of energy storage to provide the real power difference between the load and the source throughout the transient period. When the load state changes, it affects the system's actual power; when that happens, the system will automatically. When compared to the reference voltage, the value of the voltage that is measured across the DC link capacitor is found to be different (Diab et al., 2019; Diab et al., 2018; Wen-guan Wang et al., 2012; Vadi et al., 2021) which leads to the dysfunction of the system. The reduction of the real power disturbance by using different controllers including chicken swarm optimization (Ramesh et al., 2023; Venkata and Reddy, 2023) at the DC link capacitor.

In this study, the utilization of IRP principles is employed to establish the desired current reference (referred to as PQ-theory). The hysteresis current controller technique estimates the reference currents to generate the required gating pulses (Kazemzadeh et al., 2014). Achieving optimal performance of an artificial neural network (ANN)-controller (Tekwani et al., 2020) based on PQ theory for a direct current (dc) link voltage necessitates precise adjustment of weight and bias values (Wilamowski et al., 2010). To determine the optimal state of the ANN controller, a Teaching learning-based optimization (TLBO) (Satapathy et al., 2013) algorithm is implemented, enabling the fine-tuning of weight and bias values.

PQ-Theory-based Reference Current Generation

PQ theory-based constant instantaneous power control is for 3-phase, 3-wire power distribution systems with sinusoidal and symmetrical source voltages. To apply this theory, the three-phase source voltage (V_a, V_b, V_c) and load current (I_{la}, I_{lb}, I_{lc}) must be sensed and transformed by the Clarke transformation into the (α, β) components.

DOI: https://doi.org/10.52756/ijerr.2023.v34spl.002

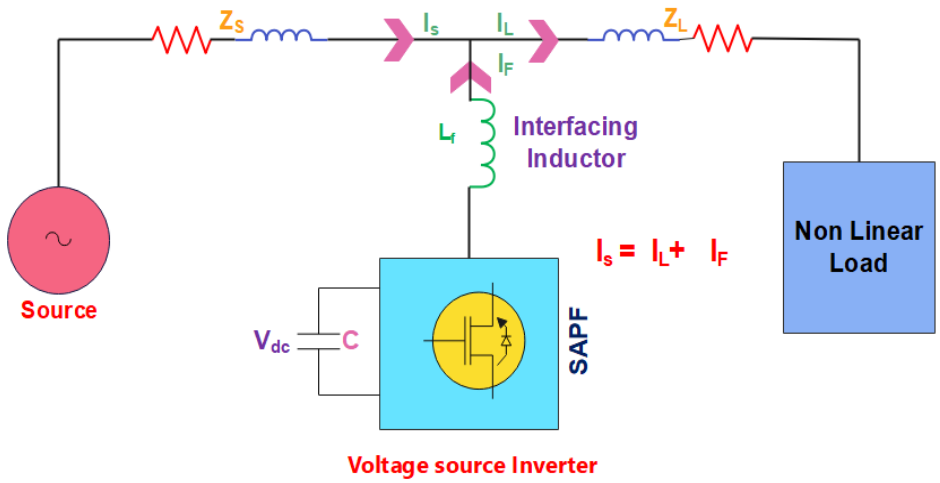

Figure 1. Schematic diagram of a Shunt Active Power Filter (SAPF).

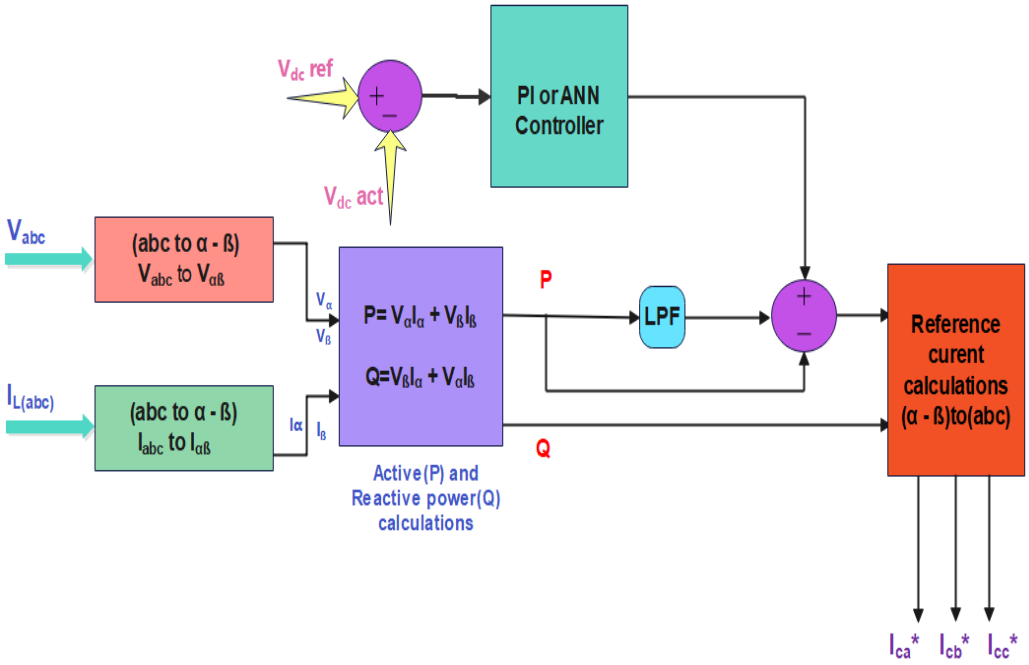

Figure 2. Reference generation diagram with PQ theory.

These components are input for instantaneous power calculations (Akagi et al., 2017). An error signal from the reference and measured dc-link voltages determines the power losses component. A PI controller receives this error signal to calculate power losses (Ploss). The (α, β) components, active and reactive powers, and current calculation are used to estimate the reference (α, β) components. An inverted Clarke transformation transforms these components to 3 phase abc values ($I_{abc,}V_{abc}$) as shown in Figure 2, to obtain the desired reference current signals.

Artificial Neural Network

An "Artificial Neural Network" is a system inspired by the way the human brain works, which is composed of interconnected neural networks Similar to the human brain. Multiple layers of neurons that are coupled to one another constitute artificial neural networks. These neurons, represented as nodes in Figure 3, are responsible for processing information. Typically, a neuron will have a single or multiple outputs and n inputs (x1, x2,... xn) that will receive or send information to other neurons in the network. In equation 1, the neuron's output, denoted by Yi (Asadi et al., 2022), is the result of multiplying the sum of its inputs by the activation function.

$$Y_i = f_i\left(\sum_{j=1}^{n} w_{i,j}x_j + b_i\right) \quad (1)$$

DOI: https://doi.org/10.52756/ijerr.2023.v34spl.002

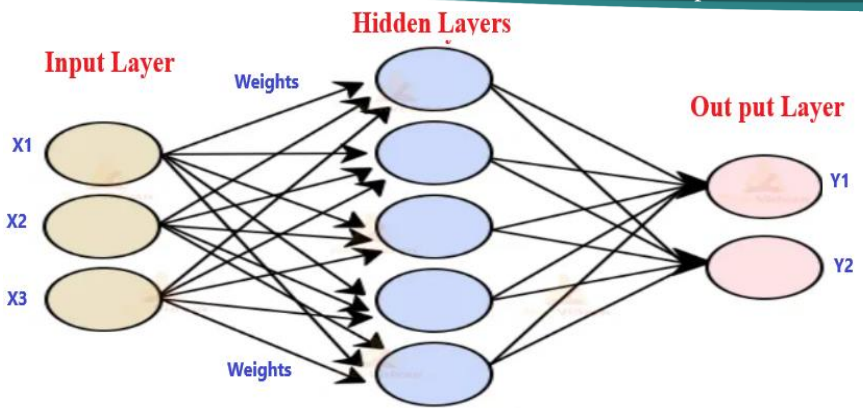

Figure 3. The fundamental structure of an artificial neural network

The $w_{i,j}$ notation represents the connection weight between a neuron on the input and a neuron at target. while b_i represents the neuron's bias. The input to the neuron is represented by x_j and the activation function f determines the neural network's actions. By changing the weights and biases and, in some cases, the number of layers and neurons, neural networks can adapt to new data.

Introduction to TLBO algorithm

Teaching-learning-based optimization, frequently referred to as TLBO, is an acronym given to one of the population-based algorithms that was recently proposed. In the year 2011, Rao et al. presented the teaching learning-based optimization (TLBO) method (Rao et al., 2011). It was inspired by the teaching and learning phenomenon that takes place in a classroom (Rao et al., 2012). In the context of the population-based algorithm TLBO, the class is considered as a population, and each individual learner within the class is considered as an individual member of this population. It is intended that the students in the class will have a greater level of knowledge by the end of the lesson to fulfill this objective. The process has two stages, known as the "teacher phase" and the "learner phase," respectively. This serves as the foundation for achieving this goal.

A. Teacher phase

The student who presents the most outstanding solution in the class is chosen as the teacher. The teacher is regarded as the most proficient learner among the entire population, possessing extensive knowledge and experience in a particular subject. As a result, other students enhance their understanding by leveraging the expertise of the teacher. If a student provides a superior solution compared to the teacher, they will replace the teacher's role. In the k^{th} iteration, the knowledge of the ith learner is updated using the following equation 2.

$$X_i^{new} = X_i + r_I(X_T - T_F{}^i . X_{mean}) \quad (2)$$

In the above scenario, knowledge of the teacher refers to "X_T,","r_I "is a random two-digit number between zero and one, mean results of the learners refers to "X_{mean}," and teaching factor refers to $T_F{}^i$ which can be obtained by the following equation 3.

$$T_F{}^i = round\,[1 + rannd(0,1)] \quad (3)$$

At the end of the teacher phase, all of the learners' knowledge is updated, and these values are now ready to be used as input values in the learner phase.

B. Learner phase

When students are in a real classroom, they can learn more by talking to the other students. This is what the TLBO learner phase is built on. During this step, the knowledge of the i^{th} student is compared to that of a randomly chosen j^{th} student as given in equation 4. When students are in a real classroom, they can learn more by talking to the other students. This is what the TLBO learner phase is built on. During this step, the knowledge of the i^{th} student is compared to that of a randomly chosen j^{th} student as given in equation 5.

If $f(X_i) < f(X_j)$ $then,$ $X_i^{new} = X_i + r_I(X_i - X_j)$ (4)

If $f(X_i) > f(X_j)$ $then,$ $X_i^{new} = X_i + r_I(X_j - X_i)$ (5)

If the knowledge of the **j^{th}** student is better at the end of the learner phase, the knowledge of the **i^{th}** student can be improved as given in equation 6.

If $f(X_i^{new}) < f(X_i)$ $than,$ $X_i = X_i^{new}$ (6)

The TLBO algorithm, consisting of the teacher and learner phases, will continue until either the termination condition or the maximum number of iterations has been reached.

Proposed Methodology

PI controller tuned by PSO

For SAPF, a particularly important role depends on the abilities of a standard PI controller to regulate the DC link voltage. This controller probably produces for kp and ki will not be optimal values. Because it needs a great degree of mathematical calculation, The PSO method can be used to determine the best possible values for both kp and ki.

As shown in Figure 4, the PSO-PI controller will be given an error signal based on the difference between the actual and reference DC voltages. The PSO method must minimize the Integral Absolute Error (IAE) objective function to acquire the ideal gain values. With 1000 maximum number of iterations and 50 Populations, the Optimum values of gains (K_i, K_p) are 5.65119 and 7.93019 (Venkata et al., 2023).

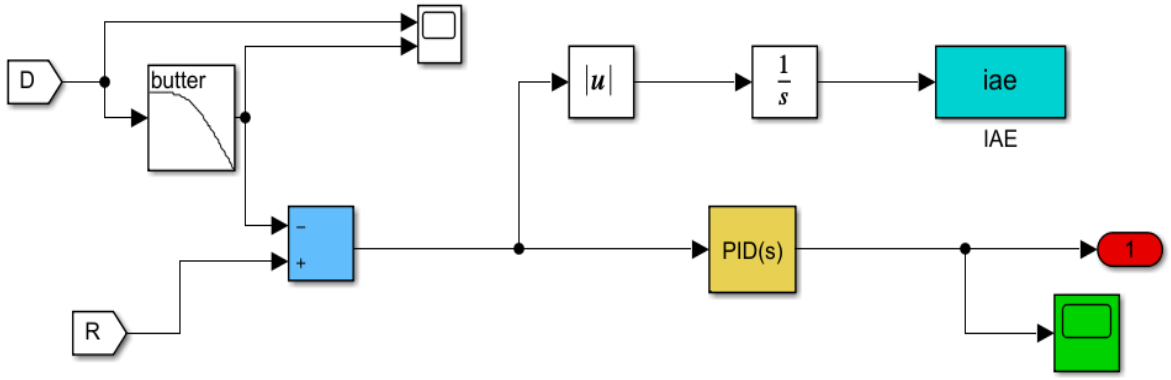

Figure 4. DC link voltage regulation by PSO trained PI based SAPF

TLBO trained ANN Controller

The main objective of a Neural Network algorithm is to obtain the appropriate weights and biases of the network to be as accurate as possible. ANN's weights and biases are given the right values using various methodological approaches. This paper used a method called TLBO. Figure 5 shows that the inputs (e) and outputs (out) of the PSO-PI controller are going to be used as a source of data for the neural network controller.

The necessary code to set up the neural network is provided below. The PSO-PI controller's input and target values are retrieved, hidden neurons are initialised. This data is used to configure the ANN, and finally, the network's weights and biases are extracted. Then, we'll define a pre-trained neural network's weights and bias using the TLBO algorithm, with the objective function defined as the root mean square error.

Step by Step approach of TLBO trained ANN

Step1: Take the input (e) from the workspace of PSO-PI controller.

Step 2: Take the Target (output) from the workspace of PSO-PI controller.

Step 3: Assign the number of Hidden Neurons.

Step 4: Define the Feed Forward Neural network based on hidden Neurons.

Step 5: Set up the Neural Network with the specified input and output values..

Step 6: Generate the initial weight and biases

Step 7: Use the root-mean-square-error as the objective function, by utilizing the weights and bias, Feed Forward Neural network, inputs and target values.

Step 8: The neural network is trained using the TLBO algorithm, resulting in the updated weights, biases and error.

Step 9: With this updated weights and biases again

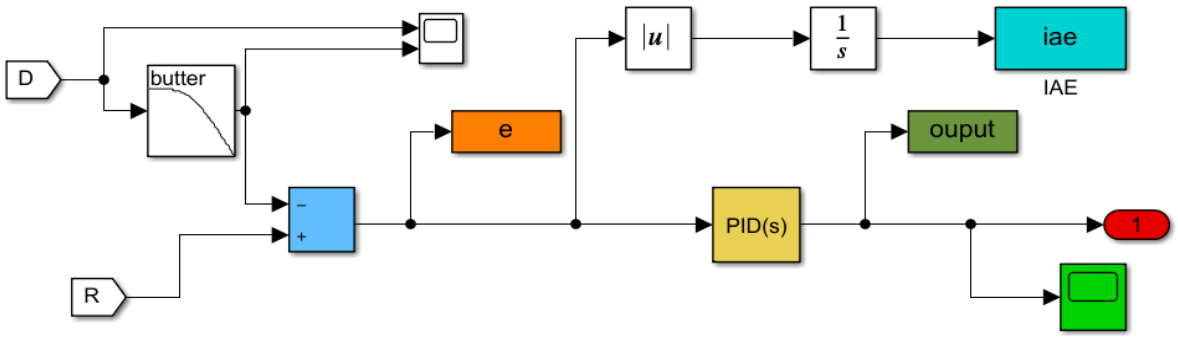

Figure 5. Output (o) and input (e) representation in the workspace for the PSO-PI controller.

DOI: https://doi.org/10.52756/ijerr.2023.v34spl.002

configure the Feed Forward Neural network.

Step 10: Repeat steps 7 to 9 until objective function is at a minimum.

Synaptic coefficients converge when they have settled on steady-state value and the network's Root Mean Square Error (NMSE) decreases below a predetermined threshold. Another approach to stop the learning process is to set a limit on the maximum number of iterations. The flowchart of the training algorithm is illustrated in Figure 6.

We will ultimately obtain the feed-forward neural network block and inside layering structure shown in Figure 7 response to a given input and output. The PSO-PI controller will substitute this feed-forward neural network block.

Results and discussions

The proposed methods for a SAPF's current control and reference generation were implemented with the help of the MATLAB simulative environment. This study was carried out taking into account the various possibilities that were presented below. A tabulation of the simulation's parameters that were used for the simulation's purposes can be found in Table 1.

Table 1. Modeling framework in Simulink

Particulars	Values
Voltage at the Grid	415V
Frequency at the Grid	50 Hz
Impedance at the Source	0.15 ohm,15mH
Coupling inductance	15mH
Active Power at the Load	4472 W
Reactive Power at the Load	1718 VAR
Connected DC Capacitance	100µF

Without SAPF

In this case, we turn off SAPF and use Fast Fourier Transform (FFT) analysis to look at how the nonlinear load distorts the source current. This analysis showed that the distortion was close to 18.42%. The harmonic spectrum of the source current, as calculated by the fast Fourier transform, is shown in Figure 8. Figure 9 shows the waveforms of the I_S (Grid current), I_L (load current) that resulted from the simulation. The SAPF converter is not injecting a compensating current to reduce grid-side harmonics, as shown in Figure 9.

TLBO-trained ANN-based SAPF

Here, the TLBO-ANN controller Simulink block has taken the place of the PSO-PI controller. This Simulink block was taken from Figure 7 and is shown interacting with a feed-forward neural network in Figure 10. According to the results, the source current's total harmonic distortion (THD) appears to have dropped to 0.86%.

Table 2. Parameters of TLBO-trained ANN

Maximum iterations	5000
Total no of Students	25
Teaching Factor	0.5
Hidden Neurons	10
No of Variables	1
Weight Scale Upper Limits	200
Weight Scale Lower Limits	0

Figure 11 illustrates the waveforms of the currents flowing from the source, the load, and the SAPF compensating current. The harmonic spectrum of the source current is depicted in Figure 12. The TLBO-ANN controller's converging spectrum can be seen as depicted in Figure 13. This indicates that the MSE is steadily reducing and eventually reaching a constant value.

The parameters for the TLBO-ANN are detailed in Table II (on the following page). Table III (on the following page) provides an overview of how the SAPF performed in each of the four scenarios.

Table 3. Table of Comparison

Slno	Type of Controller	Component	THD value(%)
1	Without using SAPF	I_S (Source Current)	18.42
2	PI based SAPF	I_S (Source Current	3.76
3	PSO tuned PI Based SAPF	I_S (Source Current	0.93
4	TLBO tuned ANN based SAPF	I_S (Source Current	0.86

Conclusion

Harmonics and reactive power are just two examples of the increasing complexities of power quality issues.Active filters that employ strategies developed through artificial intelligence are particularly effective at mitigating harmonics and resolving reactive power. Within the scope of this article, we propose the TLBO-trained ANN control technique. as an alternative solution to be used in conjunction with the SAPF. The SAPF's effectiveness is measured and compared in a variety of settings. Matlab-Simulink runs simulations of four different scenarios and presents the findings. According to simulation findings, the proposed ANN-TLBO-based SAPF outperforms alternative scenarios in reducing THD in the source current. The PSO-tuned PI-based SAPF and SAPF with PI controller are also effective. According to the results, this performance improvement is satisfactory (within 5% of the recommended IEEE standard).

A hardware-in-the-loop version of the proposed shunt active filter will be developed for further research. In addition, we plan to improve the SAPF's flexibility by using an ANFIS controller that includes TLBO and other optimization techniques.

ABSTRACT

Harmonics are being introduced into power system networks as a result of the increasing use of nonlinear devices. These harmonics cause distortion of current and voltage signals, which in turn causes damage to power distribution systems. As a result, the suppression of harmonics is of extreme significance in power systems. This paper proposes Shunt Active Power Filters (SAPF) based on neural network algorithms like Artificial Neural Network (ANN) as a feasible approach to mitigating harmonic distortion and raising power quality in electrical distribution systems. This research shows that using shunt active power filters (SAPF), which use the Artificial Bee Colony Optimized Artificial Neural Network Controller (ABC-ANN), is an efficient method for enhancing power quality and minimizing harmonic distortion in distribution systems. The ABC-ANN algorithms have been produced for SAPF with the goal of improving system performance by reducing Grid current Harmonics. In the first stage of this work, PSO Technique is used to tune a standard PI controller to its optimum gain values (K_i ,K_p). Then, these target and input data of PSO tuned PI controller will be supplying inputs to the ANN controller. To find the optimal weight and bias values, this ANN controller has been tuned with the help of the ABC algorithm. Using MATLAB/SIMULINK software, we compare the performance of the proposed algorithm to that of other optimization algorithm like Differential Evaluation (DE) algorithm, as well as the PSO tuned PI controller and traditional PI controller. The findings from the simulation suggest that a SAPF utilizing an ABC trained ANN controller could improve THD in the supplying current while maintaining harmonics within IEEE-519 accepting levels.

1. Introduction

Power electronics components and large quantities of non-linear load bring about destructive harmonics in Grid current at the Point of Common Coupling or P.C.C [1]. Because harmonics in distribution system current can trigger an extensive range of problems, including loss, instability, noise, heating appliances, and so on, In order to reduce potential harm, it is essential to reduce them to an acceptable level of Total Harmonic Distortion [2] as defined by the IEEE-519 guidelines.

In the 1970s, Gyugyi [3] was the first to discuss the power quality problems that arise when the current changes. Power quality analyzers and synthesizers, also known as shunt active power filters, can be used to fix the problem of current variation. Active filters dealing with power quality variations and their measurement in processed control and power utility systems were also stressed by Akagi [4], another notable researcher. Power engineers and researchers are on the lookout for transit solutions to maintain the distributed side of the system in light of the development of flexible AC transmission devices in the transmission line, which lower the operational cost without raising the installation cost. Typically, these are referred to as "custom power devices" (CPDs). Shunt active power filters are one low-cost method for lowering current fluctuations. Topological structures, sizes, optimal placement, and control factors for SAPF have all been investigated. These have left a few gaps, including issues with improper compensation and switching. Researchers looked into improved filter architecture as a solution.

One possible way to deal with current harmonics, reactive power, and poor power factor is to install a shunt active power filter (SAPF). The SAPF configuration shown in Figure 1 consists of a voltage source inverter (VSI) and an active filter controller. For the VSI to inject compensating reverse current at PCC, the control unit must provide timely and accurate firing signals [5,6].This will make it possible for the VSI to accomplish its goal. Reactive power control is provided to the grid via a DC-link capacitor installed on the VSI's input side [7].

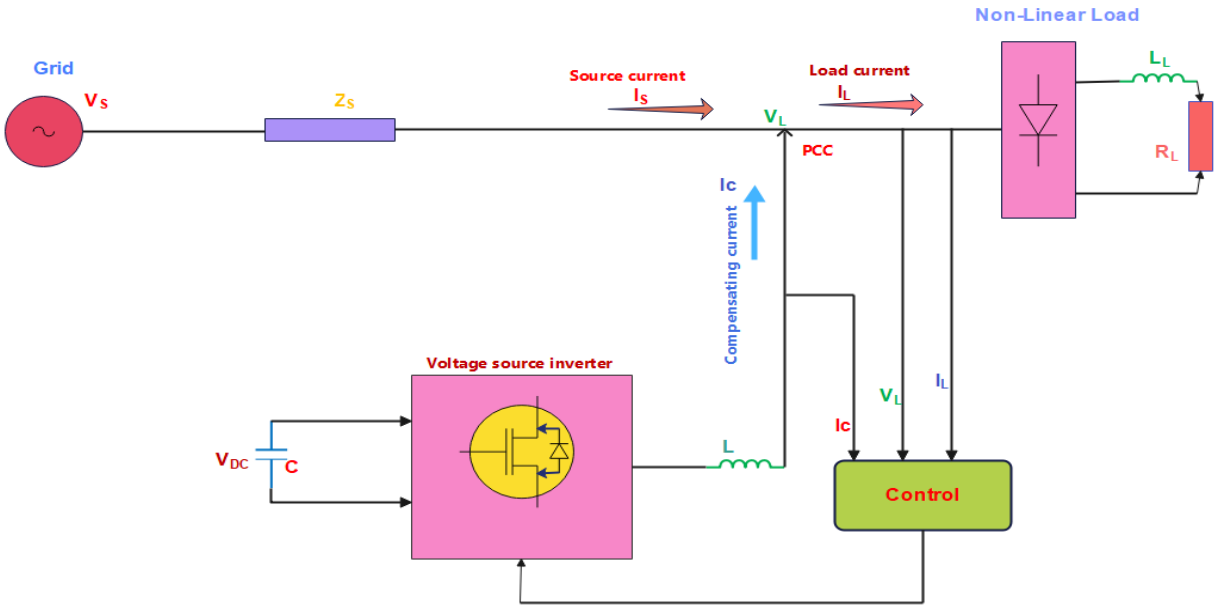

Fig. 1. Circuit diagram of the shunt active power filter

Either reference generating methods or control strategies can be utilized in the process of analyzing the VSI switching operation. Compensating signals are extracted from distorted signals using reference current generation theories, and then appropriate firing signals are generated using signal determined reference techniques to control the SAPF switching devices [8]. These two steps together constitute the SAPF control techniques. These are the two steps that are able to be implemented. Numerous authors have made comparisons between the various SAPF control strategies [9,10].

The harmonic content mitigation is performed by the PI controller that is a part of the control strategy. The PI proportional and integral gain values must be calculated for the controller. Methods such as Ziegler–Nichols and Cohen–Coon, for example, are helpful in determining the K_i and K_p values

explicitly for power systems that have linear loads. These linear control strategies will not function for a system that is subjected to nonlinear loads. In the present day, intelligent and optimal tuning algorithms such as Evolutionary Programming (EP) like Genetic Algorithm (GA) , Particle Swarm optimization (PSO), Simulated Annealing (SA), Differential Evolution (DE) [11-15] .Algorithm have been developed to solve the problems of dynamic electric system problems with enhanced optimal tuning SAPF devices.

The word Artificial Neural Network shortly ANN is used to describe a system which is designed and operates similarly to the human brain. Neurons form a network all over the brain. The overall network's behavior is determined by the strength of the connections between interneuron as well as the configuration of those connections. During network training, the weights are able to and will be adjusted and changed [15]. Only for the purpose of supplying reference compensation current is SAPF currently using Artificial Neural Network (ANN) techniques [16]. This current is then utilized to manage the compensation that SAPF provides. There are a number of approaches that can be used to learn weights. Methods include the Steepest Descent strategy to learning variables, the Levenberg-Marquardt [17] method, and the Widrow-Hoff (W-H) method are just a few examples.

In this work the reference current is calculated using instantaneous active and reactive power (PQ-theory) and hysteresis current controllers estimate reference currents to generate gating pulses [18]. Regulating dc link voltage using an ANN-controller [19] based on IRP theory requires tuning of weight and bias parameters. In addition, the Artificial Bee Colony Optimization Algorithm (ABC), which was proposed and tested against other Optimization algorithm such as Differential Evaluation (DE) algorithm, was used as the motivation for this article in order to find the ideal ANN-controller weight and bias and acquire the objective function while minimizing Total Harmonic Distortion(THD).

2. PQ Theory

PQ theory-based constant instantaneous power control is for 3-phase, 3-wire power distribution systems with sinusoidal and symmetrical source voltages. To apply this theory, the three-phase source voltage (V_a, V_b, V_c) and load current (I_{la}, I_{lb}, I_{lc}) must be sensed and transformed by the Clarke transformation into the (α,β) components. These components are input for instantaneous power calculations [20]. An error signal from the reference and measured dc-link voltages determines the power losses component. To calculate power losses (Ploss), a PI-controller receives this error signal. The (α, β) components, active and reactive powers, and current calculation are used to estimate the reference (α, β) components. An inverted Clarke transformation (α, β) transforming these components to three phase abc values ($I_{abc,}V_{abc}$) as shown in Figure 2 to obtain the desired reference current signals.

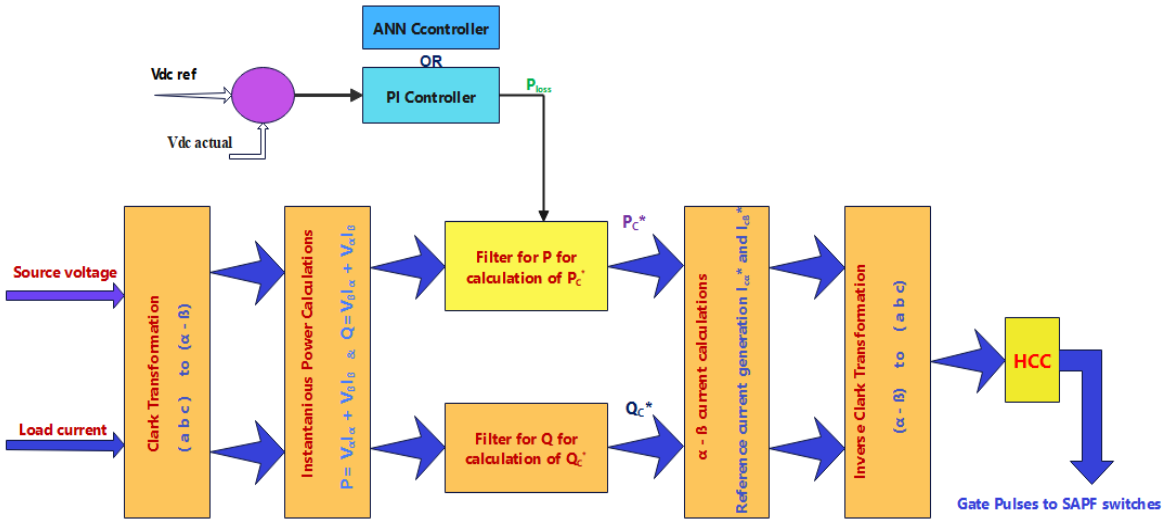

Fig. 2. Reference current generation with IRP (PQ) Technique

3. Structure of Artificial Neural Network (ANN)

The term artificial neural networks or ANN refers to a type of algorithm that is modeled after the way the brain operates and is used to model complicated patterns and predict future events. The concept of the Biological Neural Networks found in the human brain was the inspiration for the development of a technique known as the Artificial Neural Network, or ANN. An attempt was made to model the behavior of the human brain, which led to the development of artificial neural networks (ANN). The functioning of ANN is strikingly comparable to that of biological neural networks, despite the fact that the two systems are not identical. The ANN algorithm will only take in data that is numeric or structured.

- The architecture of the network is composed of three levels: the input layer, the hidden layer and the output layer as shown in Figure 3. As a result of the many layers, they are often referred to as the MLP (Multi-Layer Perceptron).
- The hidden layer can be thought of as a "distillation layer" that takes the most important patterns from the inputs and sends them to the next layer for more analysis. It speeds up the network and makes it more efficient by picking out the most important information from the inputs and getting rid of the rest.
- The activation function is useful for two reasons. First, it enables you to turn on your computer.
  - The presence of non-linear interactions between the inputs is captured by this model.
  - It aids in the transformation of the input into a more useable output.
- To construct an effective model, it's important to find the "optimal values of W—weights" that minimize Mean Square Error. This is done by the "back propagation algorithm," which turns ANN into an algorithm that learns from mistakes.
- The "gradient descent" method is used to measure prediction errors in the "optimization" approach. To find the best value for W, small changes are made and the effects on prediction errors are looked at. Lastly, those W values are chosen as the best because changing W any more doesn't make mistakes less likely.

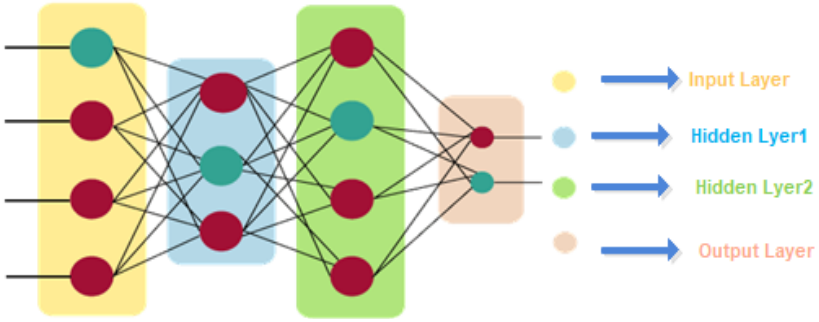

Fig. 3. Architecture of the artificial neural network.

To extract a fundamental component from SAPF while avoiding harmonic pollution, ANN architecture was utilized. For a given source voltage, it can be ensured by accurately predicting the reference current in ideal and real-time load applications. In the context of increasing reliance on nonlinear loads in residential and industrial applications, the mitigation of harmonic pollution has been a significant problem. ANN has been proven to be more applicable than p-q theory in circumstances of inaccurate voltage involving harmonic contamination in the source current and additional harmonic contamination due to the load current.

4. Artificial Bee Colony (ABC)

The ABC optimization method is an example of a meta-heuristic approach. Karaboga [21] came up with this idea first. The main idea behind ABC is how honey bees get food. In the ABC algorithm, there are three groups: worker bees, watcher bees, and scout bees. Bees were sent around the hive at random to find out where food was coming from. This information is shared with onlookers, who then decide which food source to choose. The random search is being done by Scout.

Figure 4 shows how honey bees act in general. Let's say that A and B are food. One of the possible bee starts out as a jobless bee. It has two options: it could be looking for food (S) or it could be doing the waggle dance (R). After it finds a food source, it will remember where it is and start taking advantage of it. Now, the Bee is a working bee. Once the food is turned into nectar, the same bee has three choices. may it lose its job, find new nest mates, and go back to the food source or keep looking for food in the same place.

The probability of a food source is given by the equation (1).

$$P_i = \frac{fit_i}{\sum_{n=1}^{SN} fit_i} \tag{1}$$

where, fit_i fitness value and SN is number of food sources.

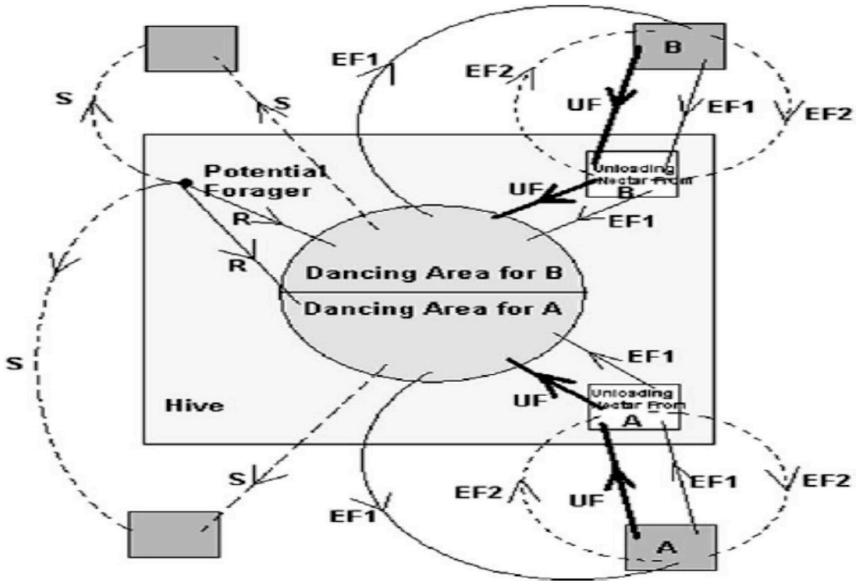

Fig. 4. ABC architecture

The candidate's food position from memory is given by equation (2).

$$v_{ij} = x_{ij} + {}^{\Phi}{}_{ij}(x_{ij} - x_{kj}) \quad (2)$$

$k\boldsymbol{\varepsilon}\{1,2,\ldots..SN\}andj\boldsymbol{\varepsilon}\{1,2,\ldots..D\}$, ϕ_{ij} random [0,1]
The following is a list of the stages that constitute the algorithm's procedure:

1. Read data
2. Read data
3. The distribution of working bees across various food sources
4. Distribute onlooker bees to the food sources in proportion to the amount of nectar they collect.
5. To find fresh sources of food, you should send the scouts to the area that is being searched.
6. In the meantime, keep the knowledge you've acquired regarding the greatest food source in storage.
7. Determine whether or not the requirements have been fulfilled.

5. Proposed Implementation

5.1 PI tuning with PSO Algorithm

The key function of SAPF is dependent on the abilities of a standard PI controller‘s regulation of the DC link voltage. It is probable that this controller produces for K_p and K_i will not be optimal values. Because it needs a great degree of mathematical calculation The PSO method can be used to determine the best possible values for both K_p and K_i.

As shown in Figure 5, the PSO-PI controller will be given an error signal based on the difference between the actual and reference dc voltages. To acquire the ideal gain values, the PSO method must minimize the Integral Absolute Error (IAE) objective function. With 1000 maximum number of iterations and 50 Populations, the Optimum values of gains (K_i, K_p) are 5.65119 and 7.93019. We set the bare minimum and highest possible values for K_p and K_i respectively at 0 and 200.

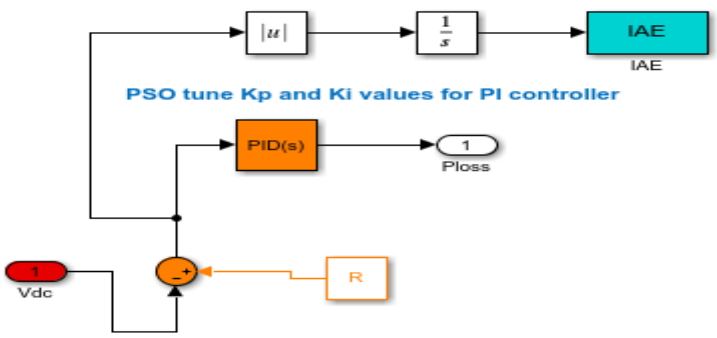

Fig. 5. DC link voltage regulation by PSO trained PI based SAPF

5.2 ABC Trained ANN Algorithm

The goal of ANN algorithm is to get the weights and biases of the network to be as accurate as possible. ANN's weights and biases are given the right values by using a variety of methodological approaches. This paper used a method called ABC. Figure 6 shows that The inputs (e) and outputs (out) of the PSO-PI controller are going to be used as a source of data for the neural network controller.

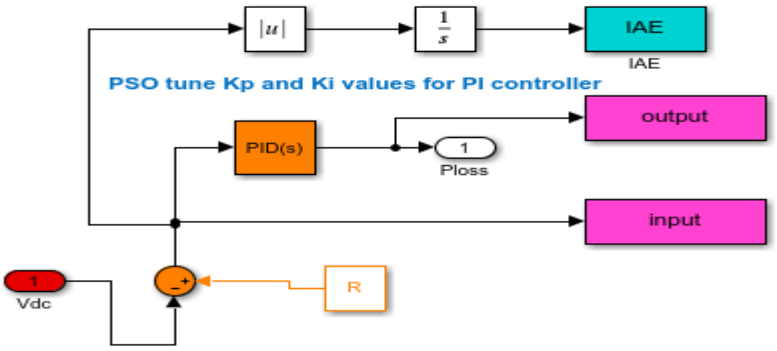

Fig. 6. PSO tuned PI controller's input and target extraction

The necessary code to set up the neural network is provided below. The PSO-PI controller's input and target values are retrieved, hidden neurons are initialised.This data is used to configure the ANN, and finally, the network's weights and biases are extracted. Then, we'll define a pre-trained neural network's weights and bias using the ABC algorithm, with the objective function defined as the root mean square error.

Initialization of ANN

- I = input(e)';
- T = output(out)';
- N = 12;
- Nnet = Feedforwardneuralnet (N);
- Nnet = configurate (Nnet, I, T);
- getingwb(Nnet) (W- weight and B- biases)
- Root-mean-squared error in expressing (g) is the objective function. and it is determined by the weights, bias(y), Nnet, I, and T.
- The ABC algorithm should be used to train the neural network.Weights, bias, and error (y, e), all updated, can be calculated from this.
- Nnet = setingwb(Nnet, y');

- getingwb(Nnet)
- error= T - Nnet (I);
- difference = mean(error.^2)/mean(var(T',1));
- generatesim(Nnet)

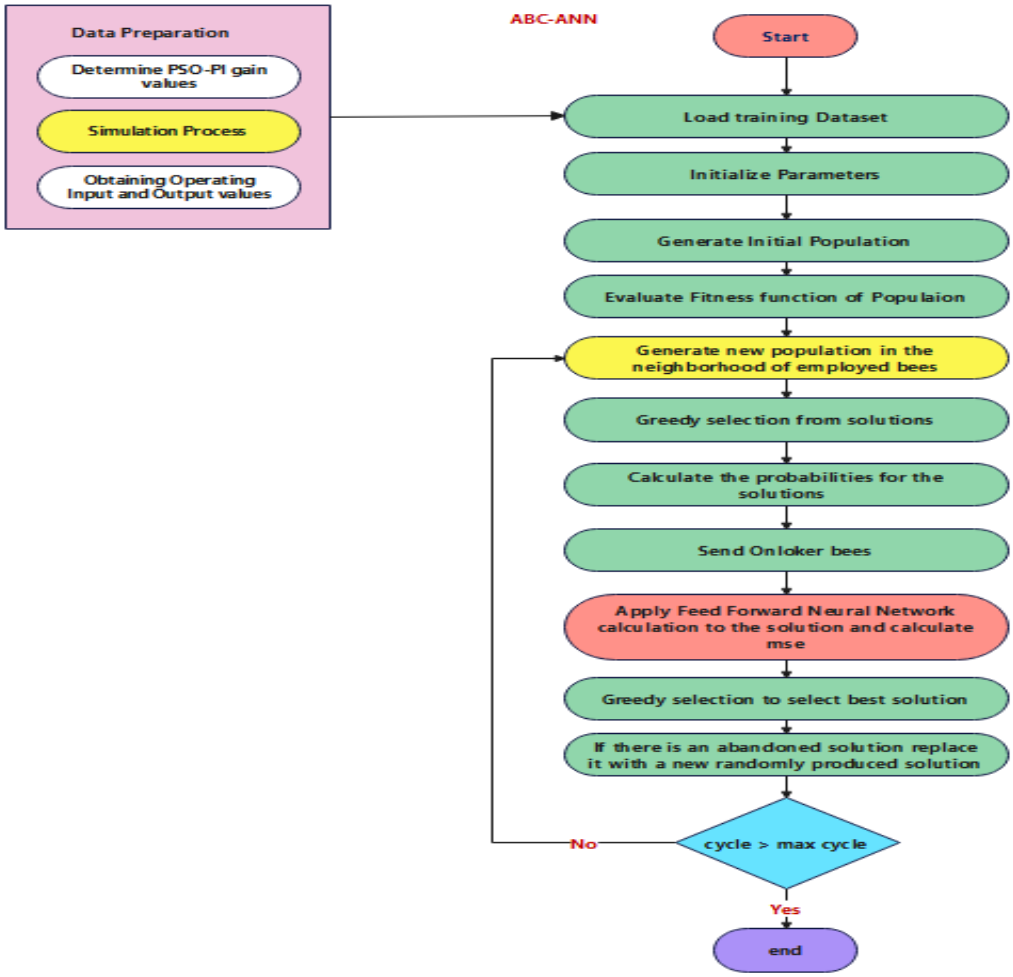

Fig. 7. Flowchart representation of ABC-ANN algorithm

Once the converges reaches steady state and the Mean Square Error (MSE) of the network decreases below a specific threshold, the network has reached convergence. Another way to stop learning is to limit the number of times something can be tried. The flowchart for the training algorithm is shown in Figure 7. Therefore, The PSO-PI controller will replace the feed-forward neural network shown in Figure 8 when input and output data are provided.

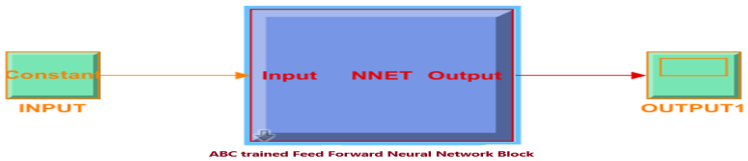

Fig. 8. Simulink block of ABC-ANN algorithm

6. Results and discussions

This section contains a discussion of the simulation results that were obtained using MATLAB. It is simulated both for the proposed ABC-ANN based controller as well as for the TLBO-ANN and DE-ANN controller based SAPF, and then comparing all of the obtained results.

The ANN- controller's weights and bias are adjusted to improve the source current THD value. Then, the controller's performance is measured with a static non-linear load connected to the PCC. The following situations were used to carry out this evaluation.

I. Without SAPF

In this case, SAPF is turned off, and a Fast Fourier Transform (FFT) analysis was used to figure out that the nonlinear load caused a 18.42% of THD change in the source current as shown in Figure 10 and Figure 9 shows how the source and load currents look in a three-phase simulation.

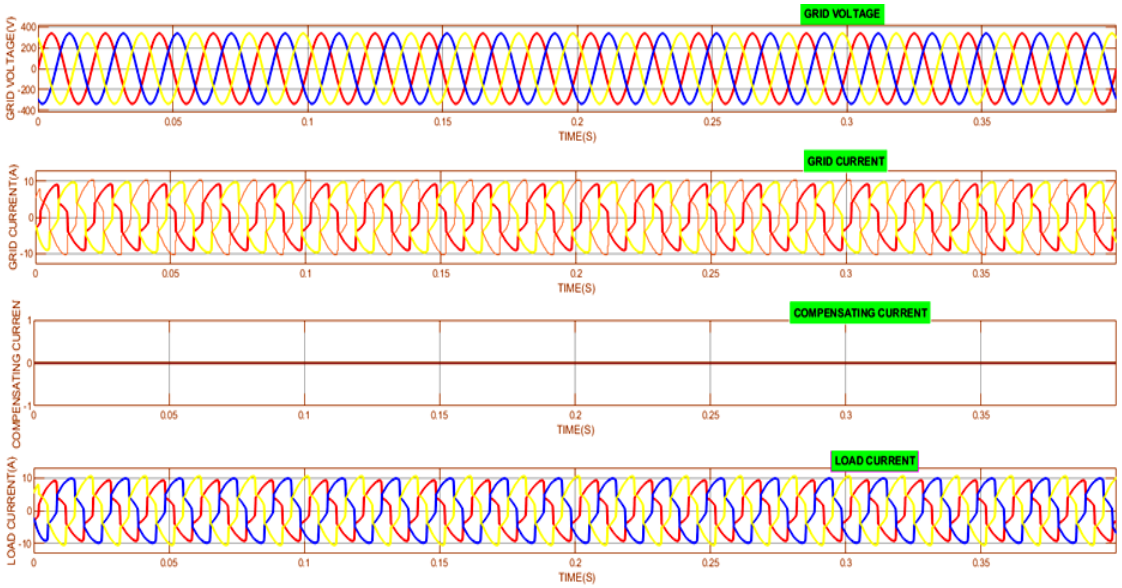

Fig. 9. The waveforms of the I_L, I_S, I_C, I_S, without using SAPF

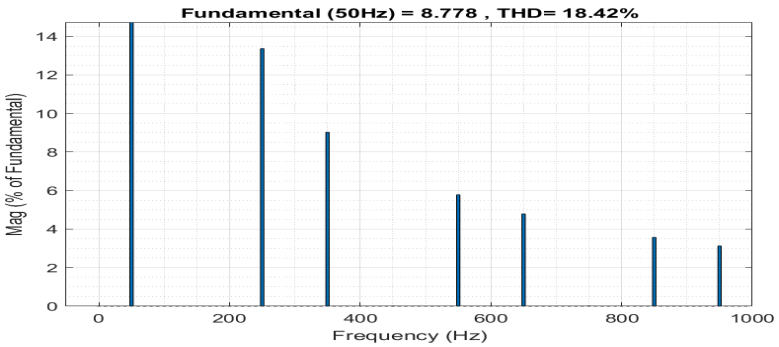

Fig. 10. THD result of source current without using SAPF

II. PI Controller based SAPF

Here, SAPF is attached to PCC, and conventional PI controller gains were used to obtain simulated results. Following the use of SAPF compensation, the distortion in the supply current was cut down

to 3.76 percent from its initial value. Moreover, the harmonic spectrum of the source current may be seen in Figure 11, as depicted correspondingly.

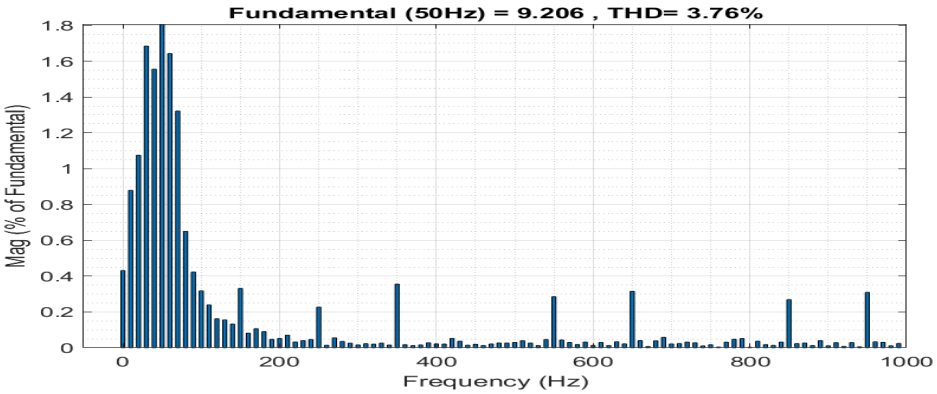

Fig. 11. THD result of I_S (Grid current) by PI based SAPF

III. PSO-PI based SAPF

In this present scenario, the SAPF compensation action was used to run the simulation, and the PI-controller gains were adjusted with the help of the PSO Algorithm. Both of these procedures were carried out in order to achieve the best possible results. According to Figure 12, the findings that were collected point to the possibility that there has been a significant decrease in the THD of the source current to an extremely manageable level of 0.93%.

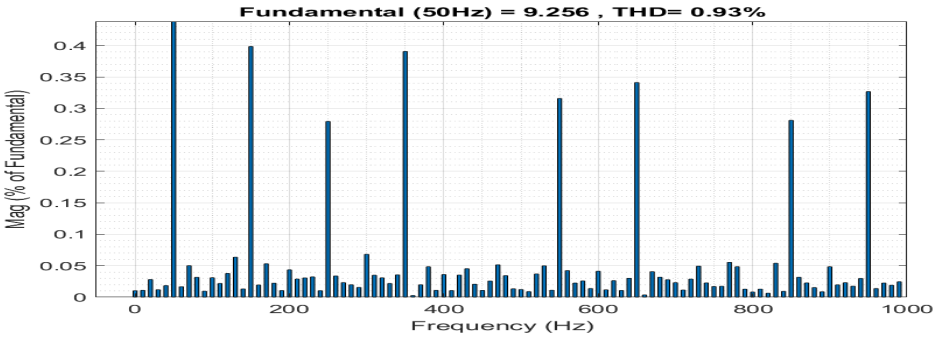

Fig. 12. THD result of I_S (Grid current) by PSO tuned PI based SAPF

IV. DE tuned ANN based SAPF

Here, instead of using a PSO-PI controller, a DE-ANN controller Simulink block was used. THD in the source current was mitigated to 0.90%, as displayed in Figure 13.

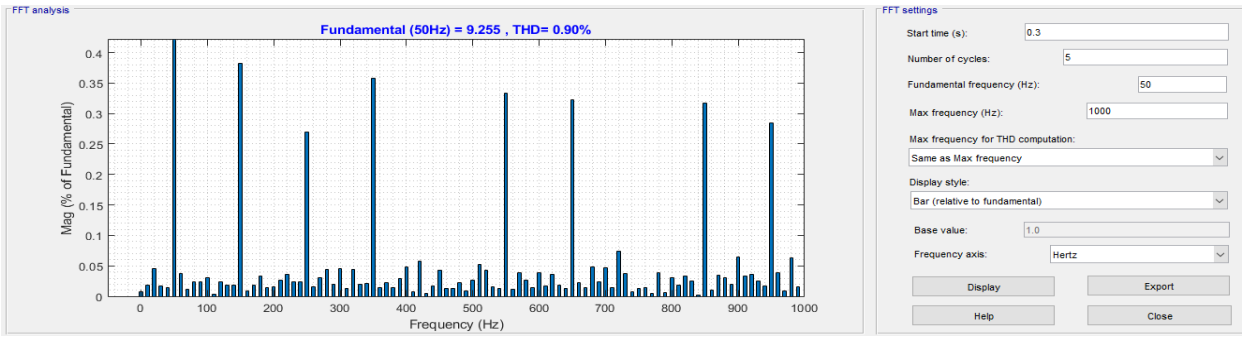

Fig. 13. THD result of I_S (Grid current) by DE tuned ANN based SAPF

V. ABC tuned ANN based SAPF

Here, the PSO-PI controller has been swapped out for the ABC-ANN controller Simulink part. Utilizing block of a feed-forward neural network, depicted in Figure 14. That is acquired from the Figure 9. Based on the results of the measurements, the total harmonic distortion (THD) of the source current appears to have diminished to 0.84%.

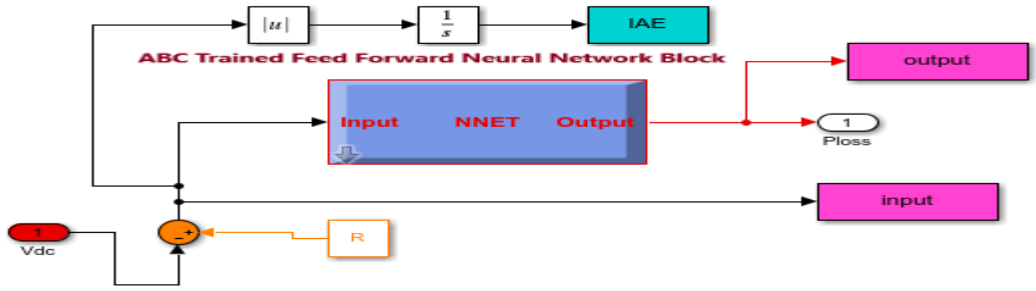

Fig. 14. Controlling the DC voltage in a SAPF with an ABC-ANN regulator

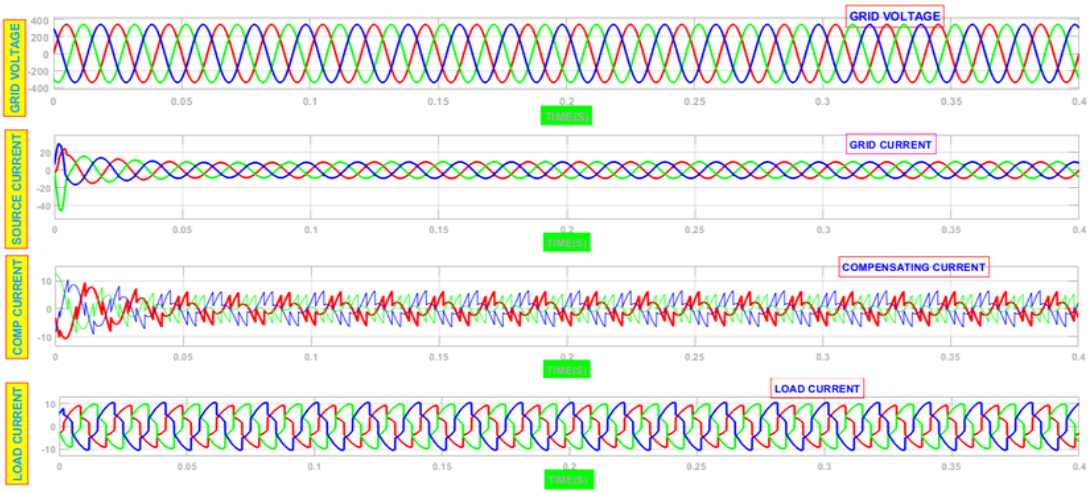

Fig. 15. The waveforms of the I_L, I_S, I_C, I_S, by using ABC trained ANN based SAPF

Figure 15 illustrates the waveforms of the currents flowing from the source, the load, and the SAPF compensating current. In order to maintain a sinusoidal source current, SAPF injects compensating current at the PCC using an ANN controller that was trained using the ABC algorithm. The harmonic spectrum of the source current is depicted in figure 16. The ABC-ANN controller's converging spectrum can be seen depicted in Figure 17. The error measured by the ABC ANN controller is shown to be smaller than that measured by the DE -ANN controller.

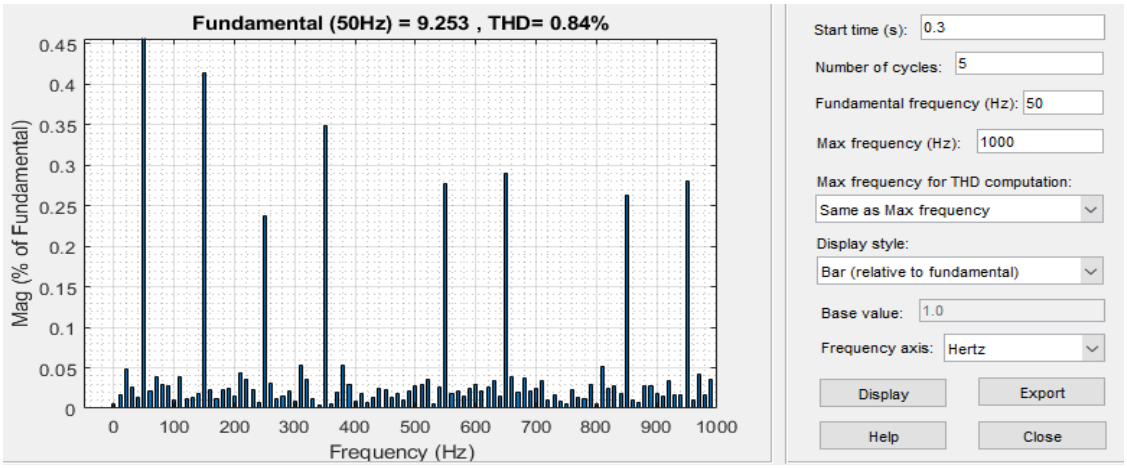

Fig. 16. THD result of I_S (Grid current) by ABC tuned ANN based SAPF

ABC-ANN parameters are listed in Table 1 and Table 2 presents the results of the SAPF investigations into all six incidents.

Table of Comparisons

S_no	Type of Controller	Component	THD value(%)
1	Without using SAPF	I_S (Source Current)	18.42
2	PI based SAPF	I_S (Source Current)	3.76
3	PSO tuned PI Based SAPF [22]	I_S (Source Current)	0.93
4	DE tuned ANN based SAPF	I_S (Source Current)	0.90
6	ABC tuned ANN based SAPF	I_S (Source Current)	0.84

7. Conclusion

A novel Artificial Bee Colony based optimized Artificial Neural Network (ANN) controller is proposed for the purpose of improving the power quality in a SAPF-based power system with non-linear loads. Harmonics from nonlinearities are compensated and THD values are far below norms. This article recommends using the ABC-ANN control approach with the SAPF to reduce the THD in the power grid's source current. The successful implementation of the SAPF is evaluated and compared across a number of circumstances. The Matlab-Simulink software simulates total five situations and reports the results. Simulations show that DE-ANN, PSO tuned PI based SAPF and SAPF with PI controller minimize the THD, The ANN-ABC-based SAPF that was suggested provides better performance in terms of reducing THD in source current in comparison to other scenarios. According to the results, this improvement in performance is satisfactory (that is, within 5% of the recommended IEEE standard).

Future work will involve incorporating a hardware-in-loop implementation of the proposed shunt active filter. To further improve the SAPF's response, an ANFIS controller will be used that is predetermined with ABC and other optimization strategies.

ABSTRACT

This article proposes a biogeography-based optimization (BBO) approach to optimizing the PI controller gains of the PV integrated shunt active power filter (SAPF). This method is also used to analyze how these optimum gains affect the performance of SAPF. When nonlinear loads draw reactive power from the source, harmonics are produced, which can lead to power quality issues for the utility. Our ultimate goal is to achieve sinusoidal source current, which can only be accomplished with the help of FACT devices that enhance power quality in the distribution network. SAPF is a commonly utilized device. Solar is the most popular alternative energy source because it is the most cost-effective. Therefore, this article takes into account PV-integrated SAPF for analysis. To get the highest amount of power from a PV panel, a technique called maximum power point tracking (MPPT) is used. This technique is based on perturbation and observation (P&O) in MPPT. When the SAPF converter uses this maximum power, it also sends active power to the load, so that the SAPF converter has dual functionality like reactive power compensation (FACT) and active power supply (DG Functionality) to the load. The performance of this PV-Integrated SAPF depends on many things, like how the reference current is made, how switching pulses are made, how the voltage on the dc link is controlled, etc. In order to obtain the best possible performance from SAPF, certain design parameters, such as the gains of the PI-controller, need to be optimized. Modeling and simulation of a PV-integrated SAPF are performed in Matlab/Simulink. Gain optimization of the PI controller-based PV integrated SAPF is performed using both the proposed biogeography-based optimization method and the PSO algorithm, and the results are compared. The proposed BBO-trained PV- SAPF converter's active power injection was also investigated.

1. INTRODUCTION

Fossil fuels have been burned to meet power demand for decades, but they are nonrenewable and cannot be reused [1]. They aren't ecologically sound. Pollution-friendly and contribute to climate change, so [2] renewable energy sources like solar, wind, and geothermal are essential. There are clean sources of energy generation, such as hydro, etc., and there is an abundance of them. Photovoltaic power plants have widespread application; solar energy is naturally abundant, and electrical power is widely available. Solar power as dc from the arrays, which is converted to an alternating current one that uses an inverter. Due to the energy's reactive power balancing capabilities, this equipment can be used anywhere [3]. There are more harmonics in the network because of the rise in nonlinear electronic loads and devices. Presents of a harmonic nature as well as voltages that are powers of the fundamental frequency led to systemic cases of power degradation, and as a result, the machinery got hot. To better understand the role of alterations that happens when voltage and Currents are not proportional. The impedance of the load [4] Short-circuit current is drawn by these loads. Damage electronic devices with pulses and harmonics. Rectifiers and other electronic devices are examples of non-linear loads. Everything from computers and motors to SMPSs (switch mode power supplies) to get rid of harmonics uses passive filters, but they have a few drawbacks. Have bounds, such as in resonance, and evolve in accordance as the workload shifts. To reduce grid current harmonics, active power filters are being developed; unlike passive filters, which require an external power source, these don't affect demand levels [5, 6]. Active filters can achieve the required gain while simultaneously addressing issues with attenuation. They're diminutive, but they're more effective than passive filtering systems. Their ability to avert major active power filters can handle wider frequency ranges. Photovoltaic shunt-clearing harmonics are a common application for active filters. The module's findings or those found Maximizing power generation from PV systems while keeping costs as low as possible necessitates the use of power point tracking (MPPT) techniques [7]. Additionally, a boost converter is used to increase the voltage output. When PV is implemented, it depends on a variety of factors in the real world, including things like climate and solar radiation. There's been a lot of

study into improving old power in the grids employing various filtering strategies [8]. SAHF yields the contrasting major-minor harmonics so that it nullifies itself. Turn a nonlinear load into a linear one with linear pressure.

The goal of this work is to lessen harmonic distortion [9] in a distribution system with a non-linear load. By utilizing a shunt active power filter that is integrated with solar panels. Figure 1 represents the PV-integrated SAPF, which typically provides a current that is 90 degrees out of phase with the source current [10, 11]. As a result of the nonlinear load, the converter's output voltage dips, and the filter capacitor draws a greater amount of current than usual during the compensation process. So, in order to mitigate these unforeseen effects, it is proposed [12] that a SAPF be constructed with optimal parameters.

There has been a lot of study done on the topic of using an active power filter with a photovoltaic (PV) system. The filter's structure and tuning parameters are ignored, while a variety of methods for controlling current in a 3-phase, 4-wire distribution network are proposed in the study [13]. An improved current control approach [14] using a maximum power point tracking controller has been implemented to lessen system harmonics via a grid-connected inverter. Filtering techniques, such as a self-tuning PI controller [15, 16], have been used to decrease harmonic distortions in a grid, which comprises a voltage source converter, a hysteresis controller, and a DC voltage capacitor.

The parameters of today's automatic control systems are often optimized with the help of state-of-the-art soft computing techniques. The gains of PI controllers are optimized using particle swarm optimization (PSO) techniques [17, 18]. Evolutionary algorithm optimization techniques such as the genetic algorithm (GA) [19], bacterial foraging (BF) [20], firefly [21], ant colony optimization (ACO) [22], and differential evolution (DE) [23] have all been applied to the problem of determining the best possible gain settings for the PI controller in SAPFs.

In this study, BBO, a stochastic optimization method based on swarm intelligence, has been used for the fine tuning of PV-integrated SAPF PI parameters to control the DC link voltage to achieve the best THD. Using active power control theory, the SAPF converter also works like the DG converter.

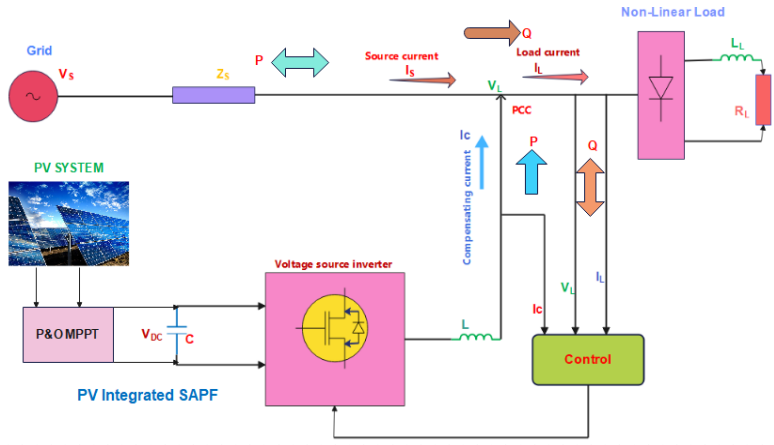

Figure 1. Model configuration of PV integrated SAPF

2. SYSTEM MODEL

The photovoltaic (PV) integrated shunt active power filter model that is the focal point of the present study is depicted in Figure 2. This model in its entirety includes the PV configuration, PV model, and PV array.

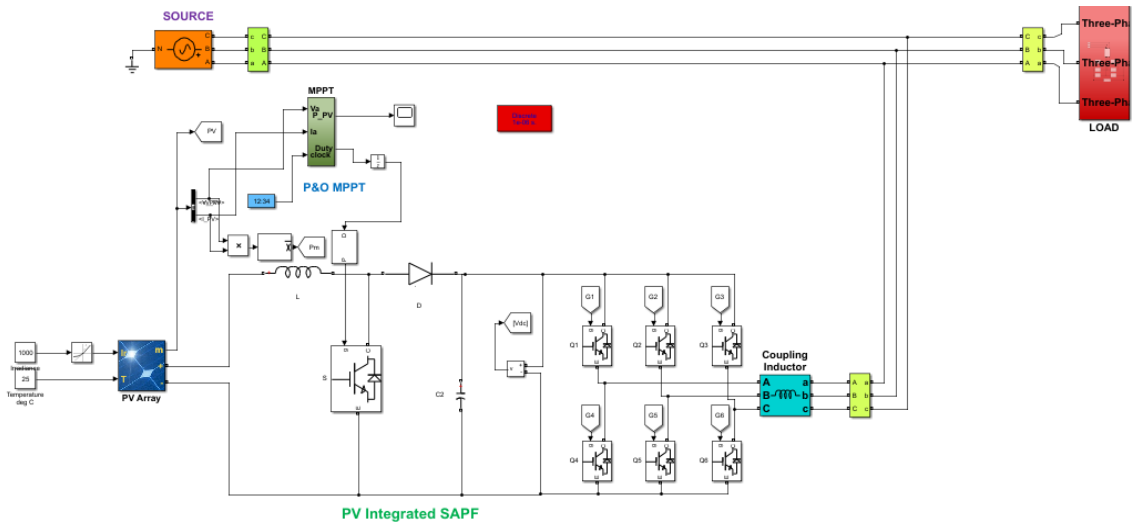

Figure 2. Simulink diagram of PV integrated SAPF when connected to non linear load

2.1 Mathematical modeling of shunt active power filters

The following assumptions need to be made in order to select the parameters for the SAPF, such as the interfacing inductance L_f and the DC capacitor C_{dc} as well as the reference dc voltage.

• The source current needs to have a sinusoidal pattern.
• The amount of distortion in the system current is no more than 5%.
• Converting takes place in a linear fashion.

The Q_C and I_h can be calculated using the two equations that are provided below.

$$Q_C=3V_CI_C = 3V_S \frac{V_C}{\omega L_f} (1 - \frac{V_S}{V_C}) \quad (1)$$

$$I_h = \frac{V_h}{m_f \omega L_f} \quad (2)$$

The V_{dcref} value can be adjusted in response to the rated voltage. The following equation is used to determine the appropriate value of C_{dc} to achieve the desired peak-to-peak voltage ripple level.

$$C_{dc} = \frac{\pi * I_c^{rated}}{\sqrt{3}\,\omega\, V_{PP}^{ripplee}} \quad (3)$$

where,

V_{dc}: The injected voltage from the filter.
L_f: The inductance of coupling for the SAPF.
C: The capacitor on the DC side of the filter.
V_s: The voltage of SAPF.
I_c: Compensating current from filter.
V_h: Harmonic voltage.

2.2 Basics of PV system

In order to convert solar energy into usable electricity, a PV system will use a series or parallel connection of PV modules or panels. Electrical output is generated via photovoltaic (PV) panels and associated mechanical and electrical connections. Solar photovoltaic (PV) output is normally dependent on solar irradiance, or the amount of sunlight available.

PV Cells, Modules, and Arrays PV cells can be connected together to make a module. Adding more modules to a PV plant works the same way, either in series or parallel, to boost the plant's power output.

A solar power plant's crucial fundamental component is PV cells. Silicon (Si) is the primary material used in solar panel construction. To generate an electric field, a thin semiconductor coating is polarized positively on one side and negatively on the other. The layer's surface is the source of the emitted electrons.

A PV cell typically produces a voltage in the range of 0.5 V to 0.7 V. As a result, the necessary output voltage and current can be obtained by connecting a series and parallel array of PV cells. In the event of partial shading, diodes in the PV array may be necessary to prevent the flow of current in the opposite direction. There is a risk of inefficiency when temperatures are very high. To counteract this, PV systems incorporate ventilation systems.

In order to convert the DC power from the PV panels into AC power for use in homes and businesses, inverter systems are installed. By connecting modules in series and parallel, higher voltage and current capacities can be achieved. The configuration is depicted in the Figure 3.

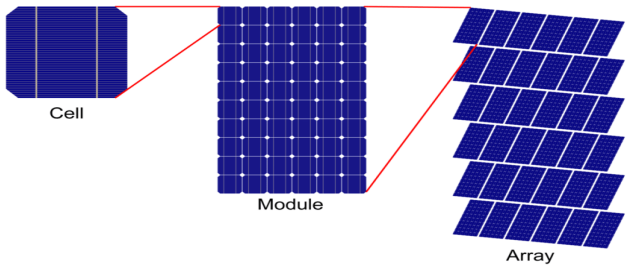

Figure 3. Interconnection diagram of solar cell, module, array

2.3 Module of PV system

The PV cell's circuit is depicted in Figure 4. It consists of only one diode, which is connected in parallel to the power supply. The function of a diode is to permit current to flow smoothly in one direction but substantially prevent it from flowing in the opposite direction. Diodes are sometimes referred to as rectifiers due to their ability to convert AC current into DC current. Both series resistance R_s and shunt resistance R_{sh} are denoted. There are two conditions for the cell, and the amount of current it draws from its source is directly related to the amount of sunlight it receives [24]. One is the potential difference between the terminals in a circuit that is open, and the other is the current in a short circuit.

When the diode is open, the voltage across it is zero, and the current through the short circuit I_{sc} is equal to the current through the current source, Voc.

The equation gives information about PV's properties.

$$I = I_L\text{-}I_0\,(e^{(v+R_s/n_s v_t Q_d)} - 1) - \frac{v+R_s}{R_{sh}}) \quad (4)$$

where, V is the array's voltage, I is the array's current, I_L is the light current, I_0 is the diode's reverse saturation current, Q_d is the diode's ideality factor, ns is the number of series cells, Rs is the series resistance, R_{sh} is the shunt resistance, V_t is the thermal voltage, and I_d is the diode current.

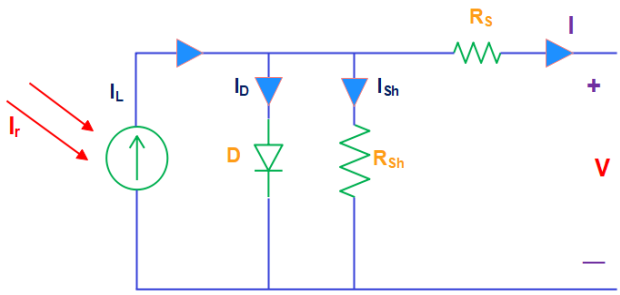

Figure 4. Single line diagram of photovoltaic system

Sun power SPR-315E-WHT-D modules were used in this study; their parameters and technical specifications are listed in Table 1.

Table 1. PV panel specifications

Parallel Strings	12
Series-connected modules per string	7
PV module name	Sun power SPR-315E-WHT-D
Max power	315.072
Open-circuit voltage (V)	64.6
Short -circuit current (A)	6.14
Voltage at MPPT (v)	54.7
Current at MPPT (a)	5.76
Irradiation (w/m^2)	1000

2.4 P&O MPPT algorithm

The P&O method uses the PV module to its full potential by maximizing efficiency in any environment. The primary benefit of this technique is the accessibility and preciseness of its algorithm, so that it can even be performed efficiently with a low-cost processor. However, a current and voltage sensor that measures the array's voltage and current is required for its implementation [25]. The power output of the PV is then calculated based on the data obtained for voltage and current.

If the duty cycle is altered by the expression P(n-1)=V(n-1)×I(n-1), and if the expression P(n)=V(n)×I(n) increases from the previous value, then n is an even number. The direction of the perturbation remains the same as P(n)=V(n)×I(n) grows larger, while when it decreases, the perturbation and, by extension, the duty cycle, switch directions [26]. Using the P&O technique, the system is represented in Figure 5.

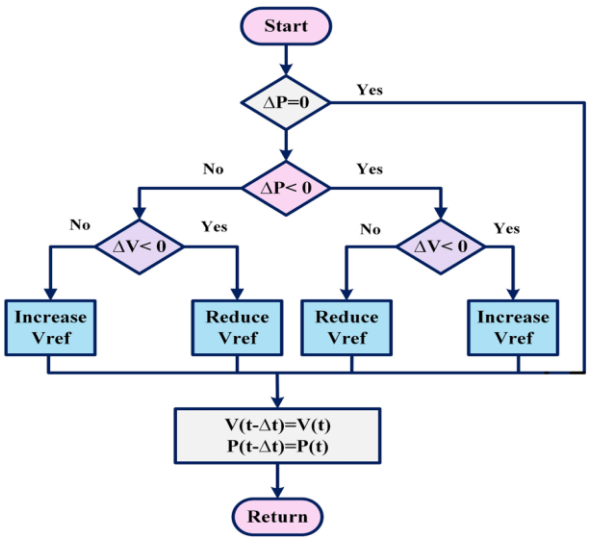

Figure 5. Flow chart representation of P&O MPPT

3. BBO OPTIMIZATION ALGORITHM

The natural phenomenon of biogeography acted as inspiration for a new metaheuristics technique called "biogeography-based optimization" (BBO). Biogeography is the study of how the geographic distribution of different species varies over time and space [27]. Simon [28] first proposed the BBO method for resolving certain continuous functions. Furthermore, this approach was developed on the basis of some principals, including species' ability to travel from island to island, the development of novel species, and the eventual extinction of extant ones. Some crucial BBO concepts are as follows:

3.1 Biogeography

According to biogeography principles, islands that are more favorable to life support systems tend to have more species, while less favorable islands tend to have fewer. Thus, the answers to the issues are like those islands. An excellent Habitat Suitability Index (HSI) value would characterize the ideal island. HSI is more commonly called "fitness" in other algorithms for population-based optimization, like the Genetic Algorithm. Suitability Index Variables (SIV) are the characteristics of the HSI. The HSI is the dependent variable in the habitat, and the SIV is taken as an independent variable.

3.2 Migration

High-HSI (or abundant species) habitats or islands will see high rates of emigration and low rates of immigration. Therefore, the higher HSI habitat is more likely to remain unchanged over time. Since these species have a high emigration rate, they are likely to relocate to nearby habitats. However, the migratory species wouldn't vanish entirely from the island of their ancestry. Those species would simultaneously appear on both islands. In most cases, the migration process would force the inferior solution to adopt the characteristics of the superior ones. If an island has a high emigration rate, it also has a low immigration rate, and vice versa. However, the island's rate of emigration is influenced by the variety of species that call it home. It stands to reason that islands with higher rates of emigration would be home to more species overall.

3.3 Mutation and elitism

In addition to migration, mutation and elitism occur during the BBO process. Mutation is a devastating ecological event. The rate at which mutations occur in various environments is known as the mutation rate. In some ecosystems, the mutation rate is proportional to the number of species present. The mutation rate in high-HSI environments is expected to be lower than in low-HSI environments. As a result, it is unusual for the mutation to preserve the good solution until the next generation is selected. Because of this mutation, novel environments would emerge to replace those with low HSI values. Without mutation, low-HSI solutions would become more prevalent, leading to a possible trap at the local optimum. Each habitat's mutation rate can be expressed as follows:

$$m_k = m_{max}\left(\frac{1 - P_k}{P_{max}}\right) \quad (5)$$

For any given habitat, the probability of having k different species is denoted by P_k, the mutation rate is denoted by m_k, and the maximum mutation rate is denoted by m_{max}, with Pmax being the maximum probability. Becauseof the mutation, a new habitat would appear in its place. The best previous solutions would also survive the elitism. All solutions, except the optimal ones with the highest probability (P_k), are equally susceptible to mutation. BBO's mutation mechanism is flexible in the same way that the mechanism of mutation that has been applied to the GA. Flow chart representation of BBO algorithm as shown in Figure 6.

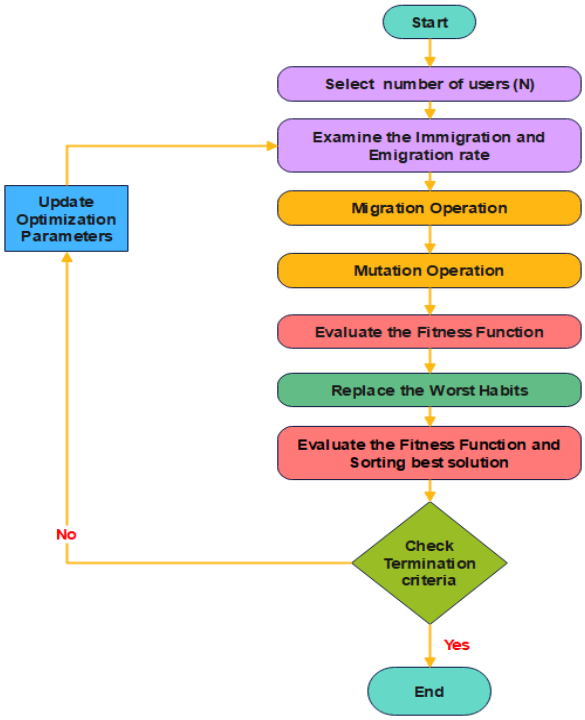

Figure 6. Flow chart representation of biogeography-based optimization (BBO)

4. PROPOSED METHODS

4.1 Tuning of PI controller by using BBO algorithm

The efficiency of a PV-integrated SAPF is dependent on the stability of the DC link voltage, which is regulated by the PI controller. Finding the gain (K_P, K_I) values of the PI controller in the critical controller is a complex mathematical process. The calculated gains are not optimal for the PI controller. To determine the best gains for the PI controller, this work implements BBO. Figure 7 shows the objective function, integral absolute error (IAE), as the discrepancy between the measured and target DC voltages. The BBO algorithm minimizes these objective functions and gives the best possible gains for the PI controller.

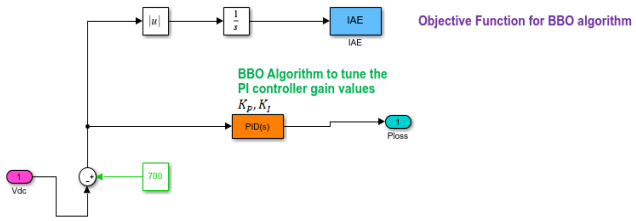

Figure 7. Simulink model of PI controller tuning with BBO algorithm

4.2 Active current coefficient control

This theory is proposed to find the actual active current required by the load, which is supplied from the PV source. Here first we need to sense the grid voltage (phase to phase) that is converted to phase to ground voltage, then these phase to ground voltages are again converted to α-β frame by using the clarck transformation, and again these α-β frame voltages are converted to an a-b-c reference frame by using the inverse clarck transformation. From that, we will get grid voltages in the a-b-c reference frame (Vg_a, Vg_b, Vg_c). These voltages pass through a band pass filter in order to remove some higher-order harmonics, and here we generate some unique vectors for synchronization of the grid with PV. And again, we need to sense the load current. With these load currents and the unique vectors, we need to find the active current coefficients for lines a, b, and c, as shown in Figure 8. Finally, we will take the average of these and get the actual active current requirement for the load (I_L).

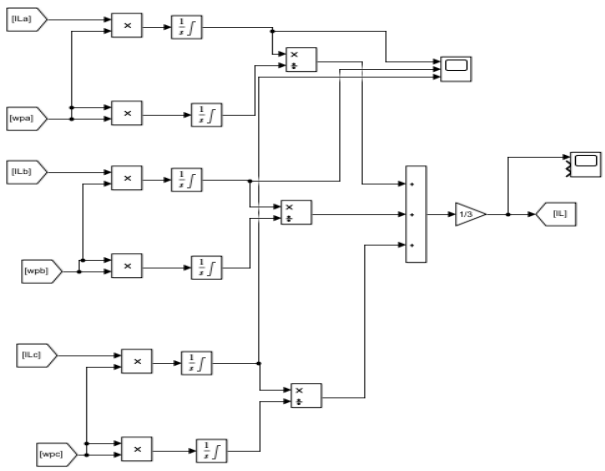

Figure 8. Simulink representation of active power coefficient theory

5. RESULTS AND DISCUSSION

This model implements a photovoltaic (PV)-based shunt active filter to mitigate undesired harmonics and enhance the power quality of the system. In order to produce gate pulses for the inverter, a hysteresis controller is built into the voltage source inverter (VSI). The model utilizes the P&O-based Maximum Power Point Tracking (MPPT) technique in order to optimize solar power extraction. The model is evaluated both with and without the inclusion of SAHF in order to analyze the network. By analyzing the data, we can determine the V-I characteristics. The shunt active filter based on photovoltaic (PV) technology is evaluated and examined using the MATLAB/SIMULINK software in order to mitigate current harmonics and facilitate power enhancement. The input supplied to the photovoltaic panel consists of solar irradiance of 1000 w/m^2 and a temperature of 25°C.Max power, open circuit voltage, and short circuit current are shown in Figure 9.

Since PV cells and other nonlinear loads are used, the source current is mostly made up of harmonic components, which affect all other loads in the distribution system. Here, the effects of a nonlinear load and the PV cell on harmonics have been looked into. A nonlinear load is used in the FFT analysis. Also, the gains of PV-SAPF's PI controller are chosen at random using trial and error. So, to improve the performance of SAPF, getting the gains of the PI controller to be as good as possible can be accomplished by employing the BBO optimization technique. In this study, the active power injection from this PV-SAPF is further examined.

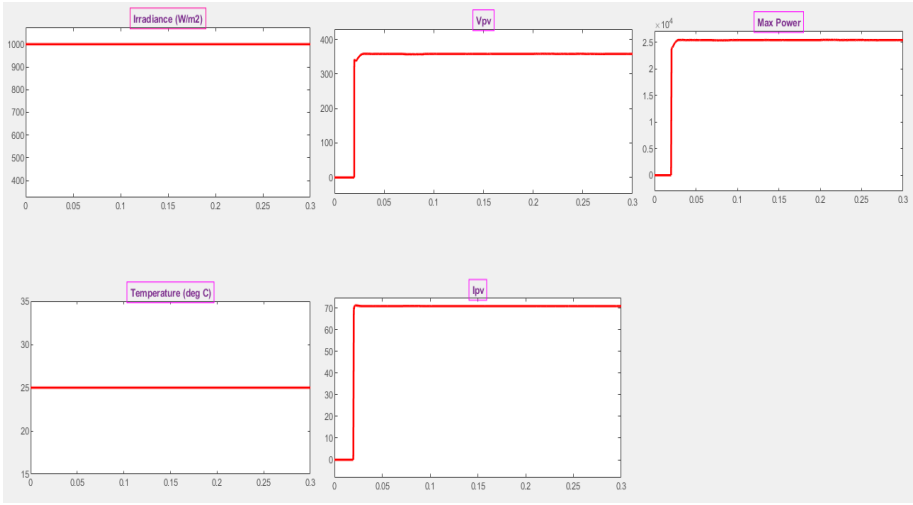

Figure 9. Output characteristics (P_{max}, V_{PV}, I_{PV}, Irradiation) of PV module

5.1 Harmonic spectrum of PV-SAPF with PSO-PI controller

Here, the PV-integrated SAPF utilizes a PSO-PI controller to control the voltage on the DC capacitor. Conventional controllers involve a lot of mathematical calculation, which is not accurate, so the gain values of the PI controller are tuned with the support of PSO's optimization algorithm. The PSO technique uses a minimization of the objective function known as the integral absolute error (IAE) to find the best possible values for the gains. With a maximum number of 100 iterations and 25 populations, For K_p and K_i, we chose 0 and 200 as the absolute minimum and maximum values, respectively.

Figure 10 shows the harmonic spectrum of PV-SAPF with the PSO-PI controller, where the THD in the grid current is 1.18%, and it shows that it is reduced from 3.08% to 1.18%.

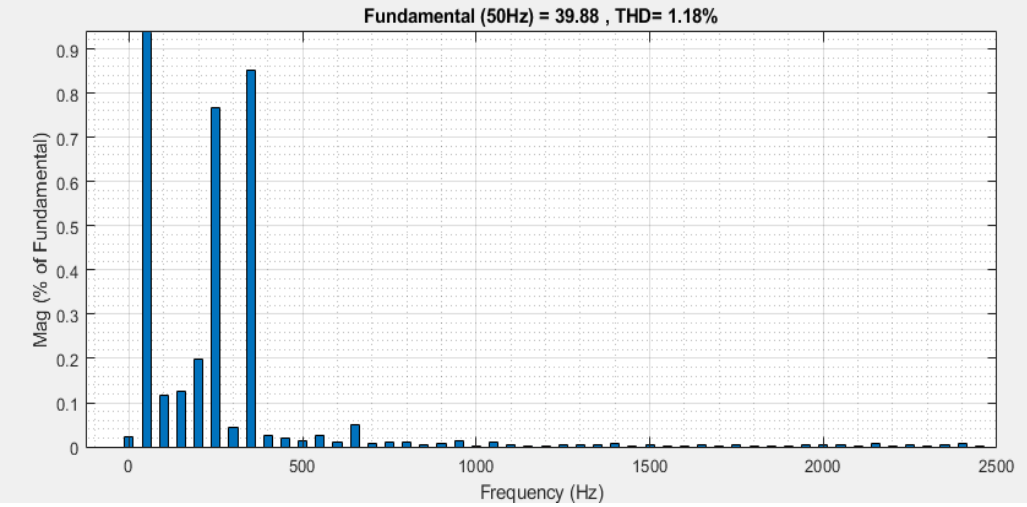

Figure 10. Grid current THD of PSO trained PI controller based PV-SAPF

5.2 Harmonic spectrum of PV-SAPF with BBO trained PI controller

Here, the PV-integrated SAPF utilizes a BBO-trained PI controller to control the voltage on the DC capacitor. A biogeography-based optimization (BBO) strategy will be used to make the necessary correction of the error voltage (IAE), which is the objective function, by adjusting the K_p and K_i gains of the PI controller. Figure 11 provides a graphic representation of source-side voltage (V_S) and source-side current (I_S) that are generated by a PV-SAPF that is controlled by a BBO-PI controller. In the event that a nonlinear load is connected to the grid at the same time, for the grid current to continue to have its normal sinusoidal shape maintained, SAPF will inject the compensating current at the PCC. Figure 12 represents the harmonic spectrum of PV-SAPF with a BBO-PI controller. From observing the figure, it is very easy to see that the THD value at the source current is 0.91%, and it shows that it is reduced from 1.18% to 0.91%. Table 2 represents the parameters of the BBO-PI controller.

Table 2. BBO configurations

BBO Parameters	Values
Maximal Iterations	100
Tuned Parameters	2
Keep Rate	0.2
Total Quantity of Reatained Habitats	5
Total Quantity of Fresh Habitats1	20
Total Populations	25
Alpha	0.9
Mutation	0.1
Emigration and Immigration Rates	1

5.2.1 Active power (P) & reactive power(Q) from PV-SAPF inverter

When PV is integrated into SAPF using active power coefficient theory, the SAPF converter will have dual functionality.

The PV-SAPF-SAPFrter works like DG; it will inject active power into the load.

The PV-SAPF-SAPFrter works like a FACT device; it will inject reactive power into the load.

Figure 13 represents the active and reactive power from the PV-SAPF inverter. From that, we can clearly observe that the PV-SAPF inverter is injecting 25.4 KW of active power and 2.054 KVAR of reactive power at the PCC.

5.2.2 Active power (P) & reactive power(Q) at load

Figure 14 represents the active power (P) and reactive power (Q) at the nonlinear load. From that, we can clearly observe that the load requires active power of 5.226 KW, which is taken from the PV-SAPF converter, and reactive power of 2.058KVAR, which is also taken from the PV-SAPF inverter.

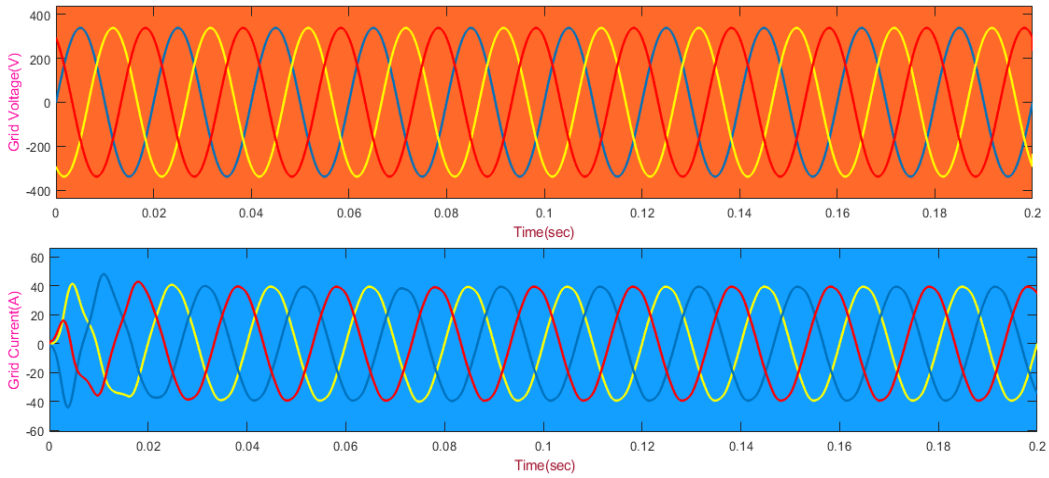

Figure 11. Source voltage and source current wave forms of BBO trained PI based PV-SAPF

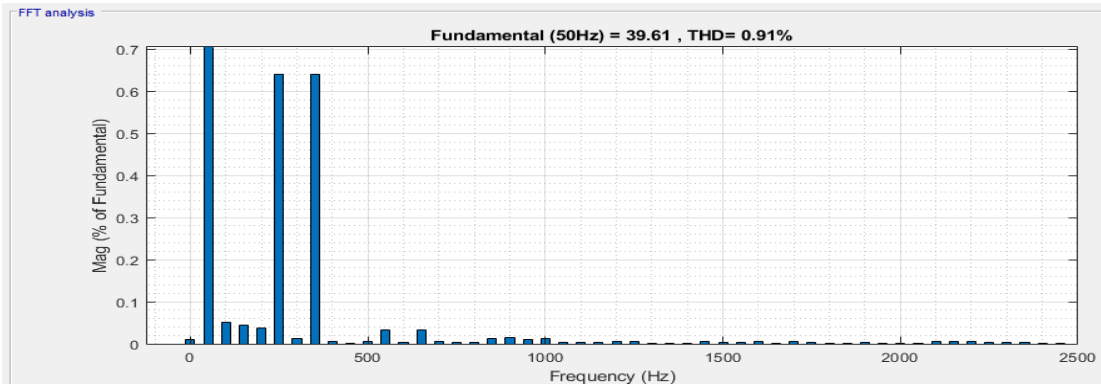

Figure 12. Grid side current THD of BBO trained PI controller based PV-SAPF

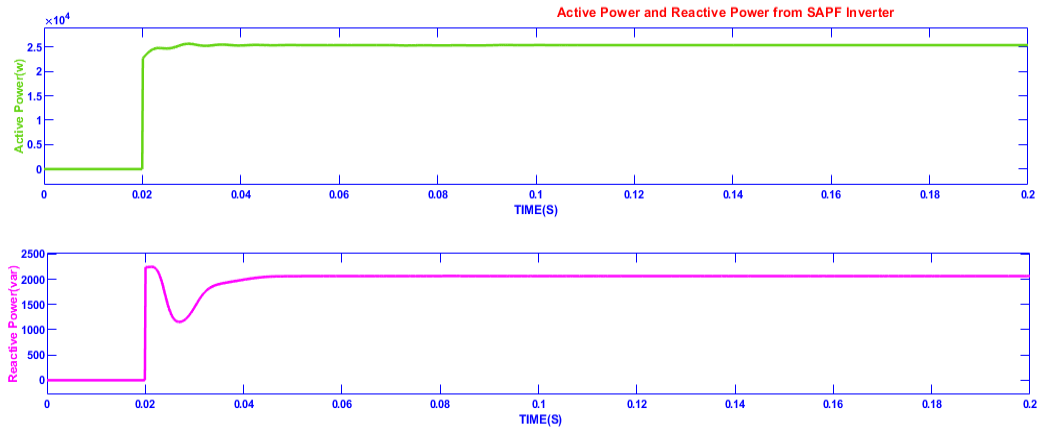

Figure 13. Active power and reactive power wave forms from PV-SAPF converter

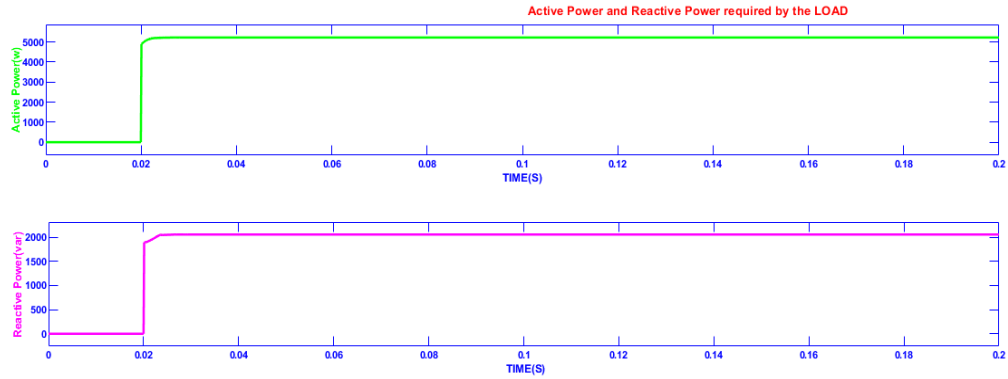

Figure 14. Active power and reactive power wave forms required by the load

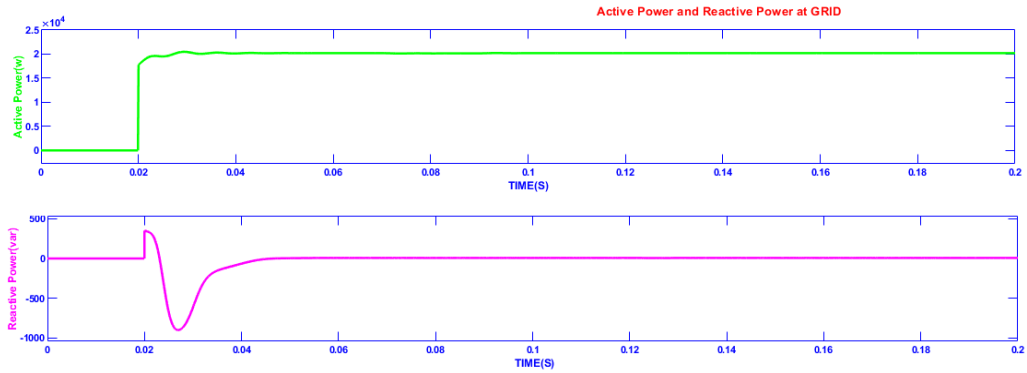

Figure 15. Active power and reactive power wave forms at GRID side

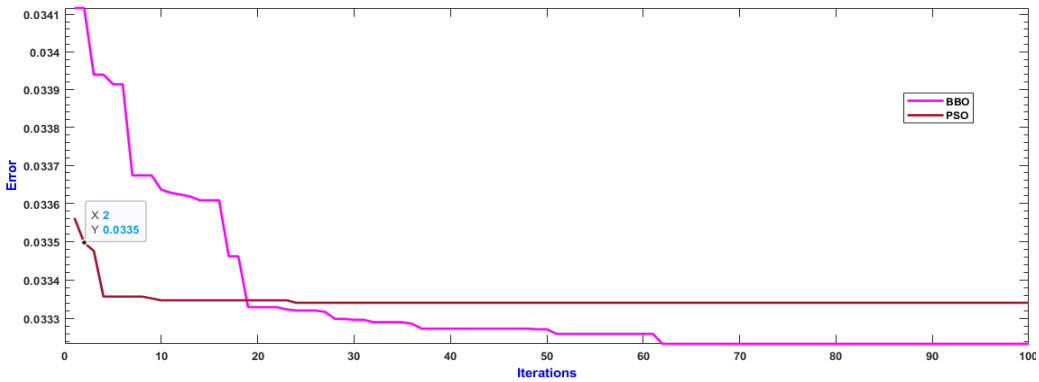

Figure 16. Converges spectrum of PSO & BBO trained PI controller based PV-SAPF

Table 3. Quantification comparisons

S_no	Type of Controller	Component	THD Value (%)
1	Without SAPF	I_S(SourceCurrent)	18.42
2	PI based PV- SAPF	I_S(SourceCurrent)	3.08
3	PV-SAPF with PSO-Trained PI cotroller	I_S(SourceCurrent)	1.18
4	PV-SAPF with BBO-Trained PI controller	I_S(SourceCurrent)	0.91

5.2.3 Active power (P) &reactive power(Q) at grid

Figure 15 represents the active power and reactive power (P&Q) at the source side; from that, we can clearly observe that the grid is not generating any reactive power (Q) for the load. At PCC PV-SAPF injecting 25.4 KW of active power, the load is taking around 5.226 KW, and the remaining 20.17 KW of active power is sent to the grid.

The converging spectrum of the BBO-PI-based PV-SAPF controller is depicted here in Figure 16, as it can be seen. It has been demonstrated that the error that is measured by the BBO-PIcontroller is less than that which is measured by the PSO-PIcontroller. The SAPF investigation findings for different incidents are listed in Table 3.

From the Table 3, we can clearly observe that the THD with a PSO-tuned PI-based PV-SAPF is 1.18%, and the proposed BBO-tuned PI-based PV-SAPF achieves a THD of 0.91%, which means the quality of grid current is better with BBO-trained PV-SAPF when compared to PSO algorithm-based PV-SAPF.

Active Power and Reactive power from SAPF inverter, Load, Grid at irradiation 0 w/m^2 and 10000 w/m^2 as given in Table 4.

Table 4. Power comparisons

Power/Irradiation	With Out DG Integration (0 W/m^2)		With DG Integration (1000 W/m^2)	
	Active Power (KW)	Reactive Power (KVAR)	Active Power (KW)	Reactive Power (KVAR)
Grid power ((P_s) & (Q_s))	5.239	0.3186	20.17	0.006
Load power ((P_L) & (Q_L))	5.226	2.058	5.226	2.058
SAPF inverte power ((P_F) & (Q_F))	0.0139	2.058	25.4	2.054

6. CONCLUSION

In this paper, we investigate the effectiveness of a PV-based shunt active filter with nonlinear loads in reducing harmonic distortion and improving overall power quality. Active filters are not the only option available, and passive filters are used for this purpose too. However, passive filters have issues such as load variation that active filters do not. It's a more cost-effective system because active filters are cheaper than passive ones. Solar irradiation and ambient temperature are two of the variables used in the PV module simulation. The P&O algorithm is used in conjunction with maximum power point tracking techniques to extract the maximum amount of power possible from PV. To increase the array's voltage, a boost converter is connected to it.

This study presents a proposed configuration for a photovoltaic (PV) integrated shunt active power filter. The configuration incorporates a biogeography-based optimization (BBO) for DC-link control, operating under ideal voltage conditions. The objective of this configuration is to improve power quality by reducing total harmonic distortion (THD). The Matlab-Simulink software runs simulations of two different scenarios and then presents the findings. The simulation results show that the THD with a PSO-tuned PI-based PV-SAPF using a PI controller is 1.18%, and the proposed BBO-tuned PI-based PV-SAPF achieves THD 0.91%, which is even better results in reducing THD in the source current than the PSO-tuned PI-based PV-SAPF. The proposed BBO-trained PV-SAPF provides not only reactive power compensation but also injects active power as required by the load.

7. FUTURE SCOPE

This suggested shunt active power filter will be implemented in hardware-in-loop in the future. The response of the PV-integrated SAPF can be improved through the implementation of an ANN, an ANFIS controller using BBO, as well as additional optimization strategies.

Abstract. Slurry Infiltrated Fibrous Concrete (SIFCON), a modified version of Fiber Reinforced Concrete (FRC), addresses the challenge of increased fiber volume fractions. Commercially produced steel fibers are typically used in FRC and SIFCON. Efforts to reduce energy use in making commercial steel fibers have led to seeking alternative sources. Vehicular tires are typically recycled when no longer usable, yielding steel fibers among the products. Emphasis lies in recovering steel fibers from used tires as part of resource recovery from waste. Experimental work explored flexural strength in SIFCON with waste steel fibers at volumes from 4% to 7%. The study extended to assess SIFCON's flexural strength with commercial steel fibers at similar volumes, aiming to correlate with those from waste steel fibers. M20 grade concrete and SIFCON slurry matrix specimens were cast as reference mixes for comparison. The flexural strength of SIFCON specimens with waste steel fibers recovered from used tires notably surpasses that of reference mixes and is comparable to SIFCON specimens with commercial steel fibers. Additionally, the two-layer technique proves effective in SIFCON using waste steel fibers from used tires, up to 6% volume. The test results show successful production of SIFCON from waste steel fibers recovered from used tires.

Keywords: Slurry Infiltrated Fibrous Concrete, Flexural strength, Waste steel fibers, Aspect ratio.

1 Introduction

Globally, energy crises and their impact on the environment are significant challenges faced in the present scenario. These issues arise due to the increase in population, rapid urbanization, and the generation of substantial quantities of solid waste. The production of automobiles and trucks has significantly increased to meet the growing demand, leading to a proportional increase in the generation of waste tires. In today's modern world, the use of

vehicles for the transportation of people and materials is steadily rising, resulting in a problem with the disposal of scrap tires at the end of their life [1, 2, 3]. Less than 40% of the embedded energy in tires that have been scrapped can be recovered as fuel energy, based upon studies [4]. The majority of discarded tires are utilized as a source of energy for cement kilns because of the high carbon content in tires [5]. It is better to embrace the concept of reusing and recycling to obtain resources from waste, which offers environmental benefits [6, 7]. Rubber recovered from scrap tires in recycling plants is used as a source of energy in industries, and the steel fibers with high strength that were extracted from scrap tires serve as raw materials for steel manufacturing plants. The focus has been made on extracting steel fibers with high strength from used tires as a concept of resource recovery from waste, reducing the need for using high-strength manufactured commercial steel fibers. Pyrolysis methods, cryogenic methods, or mechanical methods are generally employed for the recovery of rubber and steel fibers from scrap tires [8, 9]. Steel fibers extracted from used tires may not have a straight or definite aspect ratio, unlike manufactured commercial steel fibers.

It has been demonstrated that steel fibers with various aspect ratios that are extracted from used tires may be used as an alternative material while producing steel fiber-reinforced concrete. [10]. However, due to the balling effect, there is a limitation in using higher amounts of fibers in the preparation of fiber-reinforced concrete. A special form of steel fiber-reinforced concrete is Slurry Infiltrated Fibrous Concrete (SIFCON), a high-performance cementitious composite [11, 12]. The production of SIFCON is different from the conventional fiber-reinforced concrete, wherein molds are prepacked with the fibers and infiltrates the cement mortar slurry matrix. Due to the procedure of prepacking, higher amounts of fibers can be used in the manufacture of SIFCON using cement mortar slurry matrix with a low water-cement ratio, resulting in higher energy absorption or toughness compared to conventional steel fiber-reinforced concrete, as well as higher post-cracking strength. In the production of SIFCON, the fibers are placed by hand and infiltrated with a cement mortar slurry matrix, in which the balling of fibers will not be a limitation and facilitates the convenient use of the waste steel fibers extracted from scrap tires. Furthermore, waste steel fibers extracted from scrap tires are less expensive than industrial steel fibers, which is also an added advantage for SIFCON applications. Studies regarding the usage of waste steel fibers in the production of SIFCON are limited based on the available literature [13, 14, 15, 16, 17].

The maximum flexural strength of SIFCON is obtained at 9% of fiber volume with an aspect ratio of 80, and it is noted that SIFCON's flexural strength, split tensile strength, and compressive strength are optimum at 9% fiber content [18]. It is proved that the three-layer technique with hand tamping is effective in prepacking fibers in the casting of SIFCON specimens. It was observed that beyond 10% volume of hooked-end steel fibers with an aspect ratio of 70 and a length of 35 mm, the placement of fibers manually in the mold is very tedious [19]. It was shown that the compression, split tensile, and flexural strengths of SIFCON specimens will increase with an increase in the volume of the steel fiber fraction [20]. SIFCON slab specimens show superior performance in load-carrying capacity, stiffness, and energy absorption compared to fiber-reinforced concrete and plain cement concrete slab specimens in flexure [21]. Higher levels of waste fibers in SIFCON have improved its splitting and flexural strengths. However, the use of waste steel fibers had no effect on compressive strength. Waste steel fibers have the potential to be a desirable substitute in the manufacture of SIFCON, as shown by multi-objective optimization. [22]. It has been concluded adding SIFCON to regular concrete reduces the possibility of cracks spreading, improves strength, ductility, load carrying capacity, and energy absorption capability (toughness) [23].

Steel fibers are being utilized in the manufacturing of steel fiber-reinforced concrete in the construction industry. Slurry Infiltrated Fibrous Concrete (SIFCON) has been termed 'the

advanced version of Fiber-Reinforced Concrete (FRC)' due to the increased volume fraction of fibers, which contributes to improved hardened properties such as strength, toughness, and impact resistance. Generally, the fibers used in the preparation of SIFCON offer benefits similar to what reinforcing bars offer in Reinforced Cement Concrete (RCC). The improved properties of SIFCON elements depend on the type, geometry, shape, and orientation of the fibers utilized in experimental work. The main aim of this experimental work is to study the flexural strength of SIFCON, which is produced using waste steel fibers recovered from used tires.

2 Materials

2.1 Binding material

Grade 43 Ordinary Portland Cement (OPC) has been used as the binding material throughout the experimental work and conforms to Indian standards [24]. Tests were conducted on the cement used in the experimental study to determine its fineness, specific gravity, consistency, and initial-final setting times. The physical properties of the cement are shown in Table 1.

Table 1. Physical properties of Cement

Physical Properties	Test Result	Test method	Requirement
Specific gravity	3.13	IS 4031 (Part II):1988	-----
Fineness [m^2/Kg]	311.5	IS 4031 (Part II):1988	Min. 225
Normal consistency	33%	IS 4031 (Part IV):1988	-----
Initial setting time [minutes]	47	IS 4031 (Part V):1988	Min. 30
Final setting time [minutes]	252	IS 4031 (Part V):1988	Max. 600

2.2 Fine aggregate

Natural sand obtained from the riverbed has been used throughout the experimental work for the preparation of the reference mix and SIFCON specimens. However, a maximum aggregate size of 0.60 mm has been considered and used in the preparation of the SIFCON slurry matrix, and this size has been kept constant for the production of SIFCON throughout the experimental work. The fineness modulus, specific gravity, bulk density, and water absorption of the aggregates were determined according to IS codes. Table 2 shows the physical properties of the fine aggregate utilized in the experiment. However, natural sand obtained from the riverbed, conforms to Indian standards has been used fine aggregate in the preparation of M20-grade concrete.

Table 2. Fine Aggregate Test Results

Type of Test	Fine Aggregate
Fineness Modulus [%]	2.80
Specific Gravity	2.65
Water Absorption [%]	0.25
Bulk density [kg/m^3]	1750

2.3 Coarse aggregate

The maximum size of 20 mm obtained from the granite quarry, which conforms to Indian standards, has been used as coarse aggregate in the preparation of M20-grade concrete in the experimental work.

2.4 Mixing water

The laboratory's potable water has been utilized for mixing the SIFCON slurry matrix, reference mix, and curing of the specimens.

2.5 Chemical admixture

To achieve the necessary workability and flowability of the SIFCON slurry matrix, a high-range water-reducing admixture (superplasticizer) of polycarboxylic ether has been used. Manufacturer's data have been considered for the chemical admixture used in the study. Properties of the superplasticizer, i.e., AURAMIX 450 from M/s. FOSROC Chemicals, are shown in Table 3.

Table 3. Characteristics of Super plasticizer (AURAMIX 450)

Appearance	Light yellow colour liquid
pH value	Minimum 6.0
Volumetric mass @ 20°C	1.09 to 1.11
Chloride Content	Nil

2.6 Steel fibers

A survey was conducted to obtain waste steel fibers from used tires. Fibers recovered from scrap tires through a mechanical process at the recycling plant were used in this experimental study for preparing the SIFCON specimens. In the tire recycling plant, initially, collected scrap tires are shredded into small pieces using industrial shredders. After shredding, the tire pieces undergo a process called magnetic separation, in which powerful magnets are used to attract and separate the steel fibers from the shredded rubber. The shredded material is then passed through screens or filters to further separate any remaining steel fibers from the rubber particles. The steel fibers obtained from the recycling plants contained a small quantity of textiles and rubber fragments, which were manually removed to the extent possible before being used in the preparation of SIFCON. The waste steel fibers obtained from the recycling plant are irregular in shape. Waste steel fibers recovered from the used tires utilized in the study were tested to determine the diameter, length, aspect ratio, etc. Fig. 1 displays the waste steel fibers chosen for the experimental program. The length and diameter of the waste steel fibers, measured on randomly selected fibers, are shown in Table 4. Furthermore, round crimped steel fibers have been used as the commercial steel fibers in the experimental work. Manufacturer's data have been considered for the commercial steel fibers used in the study and are shown in Table 5. Fig. 2 displays the commercial steel fibers that were selected for the experiment.

3 Methodology

M20 grade concrete was designed in accordance with the guidelines specified in Indian Standards. [25]. The proportions of ingredients for the M20 grade concrete are presented in Table 6.

Table 6. Mix proportions of M20 grade design mix concrete

	Water	Cement	Fine Aggregate	Coarse Aggregate	20 mm CA	10 mm CA
By Weight [kg]	160	320	667	1131	679	452
By Volume [m^3]	0.50	1	2.08	3.53	2.12	1.41

A flow test was conducted using a mini flow cone, as recommended by EFNARC [26]. The mini flow cone measures 60 mm in height, 70 mm in the top inner dimension, and 100 mm in base inner dimension. The equipment used in this study for the mini flow test is shown in Fig. 3. The SIFCON slurry was poured into the mold, lifted, and the spread diameter of the slurry matrix was measured. The slump flow ranged between 240 mm and 260 mm, in accordance with the guidelines stipulated in EFNARC [26]. Another test conducted on the fresh SIFCON slurry matrix is the mini v-funnel test. Fig. 3 illustrates the dimensions and form of the equipment utilized in this study. The SIFCON slurry was poured into the test equipment, and the time to empty the equipment was measured. The time to empty the test equipment ranged from 7 seconds to 11 seconds, in accordance with the guidelines stipulated in EFNARC [26].

Fresh tests, as described above, have been conducted using cement and fine aggregate in the proportion of 1:1, with a water-cement ratio varying from 0.30 to 0.40 in increments of 0.01 and superplasticizer from 0.50% to 2.00% by weight of cement, in increments of 0.1%. The procedures for the flow test and mini v-funnel tests are shown in Fig. 4 and Fig. 5, respectively. After detailed test trials, it was decided to use the SIFCON slurry matrix with a proportion of 1:1 (cement: fine aggregate) using a water-cement ratio of 0.33 and a superplasticizer content of 0.80% by weight of cement. The mix proportion of the SIFCON slurry matrix is provided in Table 7.

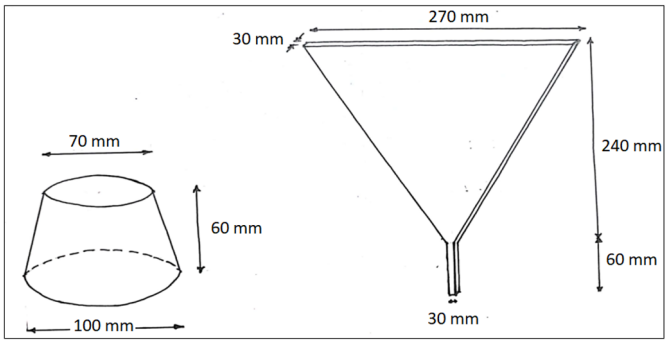

Fig. 3. Equipment for mini slump and v-funnel tests.

Fig. 4. Mini slump test.

Fig. 5. Mini v-funnel test.

Table 7. Mix proportion of SIFCON slurry matrix

Cement	Fine aggregate	W/C ratio	Super plasticizer
1	1	0.33	0.80 % by weight of cement

Upon finalizing the ratio of the SIFCON slurry matrix, the production process for SIFCON is as follows: The molds used for specimen production will be cleaned and coated with waste oil to facilitate easy demolding. Cement and fine aggregate, in a 1:1 proportion, are to be dry mixed. Subsequently, water and superplasticizer, as per the finalized ratios, are to be added to the dry mix. The total slurry must be mixed for a minimum of 2 minutes to ensure proper mixing of the slurry matrix.

A two-layer technique is employed for filling the fibers in the molds to ensure proper compaction and prevent honeycombing. Accordingly, 50% of the volume fraction of fibers is randomly hand-spread as the first layer in the mold. Once the first layer is in place, the prepared SIFCON slurry matrix is poured onto the fiber bed and compacted using hand tamping and a table vibrator.

Subsequently, a second layer of fibers is also randomly spread, followed by pouring of the SIFCON slurry matrix and compaction. The cast samples are left for 24 hours at room temperature. On completion of this time, the samples are demolded and placed in a curing chamber for the designated curing periods. Difficulties were encountered during the production of SIFCON specimens with a 6% volume fraction of steel fibers due to the irregular shape of waste steel fibers and their random placement. In consideration of this, a three-layer technique has been employed for the production of SIFCON specimens with 7% steel fibers. Fig. 6 depicts the production process of the SIFCON.

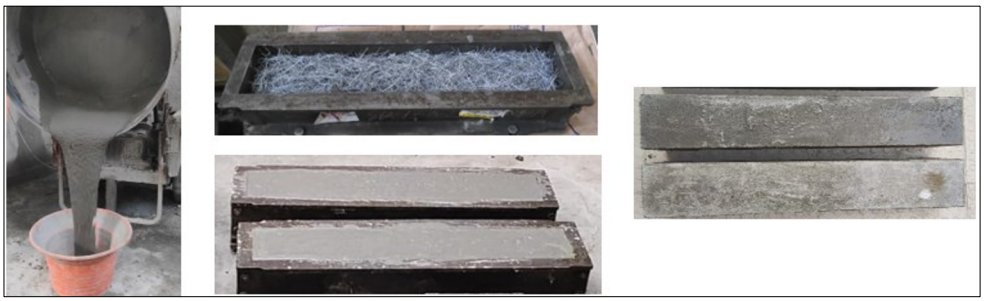

Fig. 6. Production process of SIFCON.

4 Experimental Programme

Flexural elements of 100x100x500 mm, with various volume percentages of waste steel fibers, commercial steel fibers, and reference elements, are casted. The quantity of fiber content used in the preparation of SIFCON specimens, corresponding to 4%, 5%, 6%, and 7% of the concrete volume, is 314 kg/m^3, 392.50 kg/m^3, 471 kg/m^3, and 549.50 kg/m^3, respectively. The designations for the specimens are provided in Table 8.

Table 8. Designation of specimens.

Type of Prism	Cross Section [mm]	Steel fibers		No. of speci-men	Designation
		Type	Vol.		
M 20 grade	100x100x500	----	----	9	RMPM20-1 to RMPM20-9
SIFCON slurry	100x100x500	----	0%	9	RMPF0-1 to RMPF0-9
SIFCON with fibers	100x100x500	Waste steel fibers	4%	9	S1PWF4-1 to S1PWF4-9
			5%	9	S1PWF5-1 to S1PWF5-9
			6%	9	S1PWF6-1 to S1PWF6-9
			7%	9	S1PWF7-1 to S1PWF7-9
SIFCON with fibers	100x100x500	Commer-cial steel fibers	4%	9	S1PMF4-1 to S1PMF4-9
			5%	9	S1PMF5-1 to S1PMF5-9
			6%	9	S1PMF6-1 to S1PMF6-9
			7%	9	S1PMF7-1 to S1PMF7-9

All specimens were tested for flexural strength using two-point loading. The universal testing machine has been used for testing the specimens, and the tests were carried out in accordance with the procedures outlined in IS: 516-1959. Fig. 7 depicts the test setup of the flexural strength. At the ages of 3, 7, and 28 days, tests were performed on the specimens. All necessary safety precautions have been followed during testing of the specimens.

Fig. 7. Test setup of flexural strength.

5 Results and Discussions

In Table 9, the flexural strength results of SIFCON specimens at 3, 7, and 28 days of age, produced with various percentages of waste and commercial steel fibers and the reference mixes, are displayed.

Table 9. Flexural strength of specimens

Sl. No.	Type of Specimen	Steel Fibers		Specimen designation	Average Flexural strength [N/mm^2]		
		Type	Per-centage		3 days	7 days	28 days
I	M20 grade prism	----	----	RMPM20	2.98	4.32	5.77
II	SIFCON slurry prism	----	0 %	R1MPF0	3.89	5.61	7.19
III	SIFCON prism	Waste steel fibers	4 %	S1PWF4	5.33	9.95	10.96
IV	SIFCON prism		5 %	S1PWF5	8.24	10.77	12.52
V	SIFCON prism		6 %	S1PWF6	11.66	12.97	13.42
VI	SIFCON prism		7 %	S1PWF7	16.33	16.21	15.04
VII	SIFCON prism	Commer-cial steel fibers	4 %	S1PMF4	17.17	21.64	21.98
VIII	SIFCON prism		5 %	S1PMF5	24.24	25.58	27.59
IX	SIFCON prism		6 %	S1PMF6	25.59	27.60	28.83
X	SIFCON prism		7 %	S1PMF7	27.53	29.91	32.49

From Table 9 and Fig. 8, it is observed that the average flexural strength of the M20 grade reference mix and the SIFCON slurry matrix at 3 days is 2.98 N/mm^2 and 3.89 N/mm^2 respectively. Additionally, at 7 days, the average flexural strength of the M20 grade reference mix and the SIFCON slurry matrix is 4.32 N/mm^2 and 5.61 N/mm^2 respectively. Furthermore, at 28 days, the average flexural strength of the M20 grade reference mix and the SIFCON slurry matrix is 5.77 N/mm^2 and 7.19 N/mm^2 respectively. The higher difference in flexural strength in the SIFCON slurry matrix is due to the increased amount of binding material and the absence of coarse aggregate.

From Table 9 and Fig. 8, it is observed that the average flexural strength of SIFCON with 4%, 5%, 6%, and 7% waste steel fibers at 3 days is 5.33 N/mm², 8.24 N/mm², 11.66 N/mm², and 16.33 N/mm² respectively. Similarly, the average flexural strength of SIFCON with the same fiber percentages at 7 days is 9.95 N/mm², 10.77 N/mm², 12.97 N/mm², and 16.21 N/mm² respectively. Furthermore, at 28 days, the average flexural strength of SIFCON with 4%, 5%, 6%, and 7% waste steel fibers is 10.96 N/mm², 12.52 N/mm², 13.42 N/mm², and 15.04 N/mm² respectively.

The results indicate that at 3 days of age, SIFCON produced with 4%, 5%, 6%, and 7% waste steel fibers exhibits flexural strengths 79%, 177%, 291%, and 448% higher than M20 grade concrete, and 37%, 112%, 200%, and 320% higher than the SIFCON slurry matrix respectively. Similarly, at 7 days of age, SIFCON produced with 4%, 5%, 6%, and 7% waste steel fibers shows flexural strengths 130%, 149%, 200%, and 275% higher than M20 grade concrete, and 77%, 92%, 131%, and 189% higher than the SIFCON slurry matrix

respectively. Furthermore, at 28 days of age, SIFCON produced with 4%, 5%, 6%, and 7% waste steel fibers exhibits flexural strengths 90%, 117%, 133%, and 161% higher than M20 grade concrete, and 52%, 74%, 87%, and 109% higher than the SIFCON slurry matrix respectively. The increase in flexural strength of SIFCON produced with waste steel fibers, compared to reference mixes, is attributed to the SIFCON slurry matrix with various percentages of fiber volume fraction.

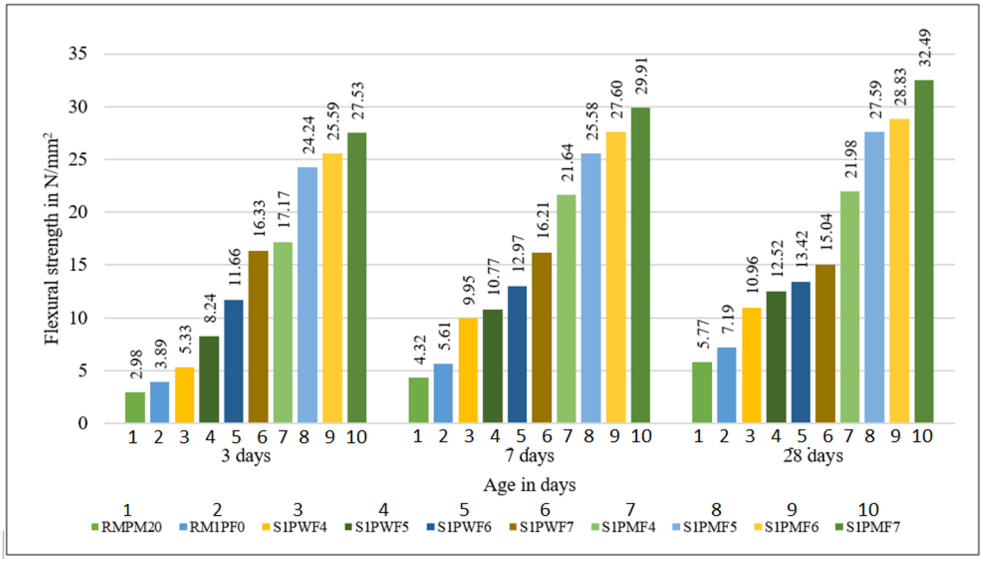

Fig. 8. Comparison of Flexural strength of SIFCON and reference mixes.

From Table 9 and Fig. 8, it is observed that the average flexural strength of SIFCON with 4%, 5%, 6%, and 7% commercial steel fibers at 3 days is 17.17 N/mm², 24.24 N/mm², 25.59 N/mm², and 27.53 N/mm² respectively. Similarly, the average flexural strength of SIFCON with the same fiber percentages at 7 days is 21.64 N/mm², 25.58 N/mm², 27.60 N/mm², and 29.91 N/mm² respectively. Furthermore, at 28 days, the average flexural strength of SIFCON with 4%, 5%, 6%, and 7% commercial steel fibers is 21.98 N/mm², 27.59 N/mm², 28.83 N/mm², and 32.49 N/mm² respectively.

The results indicate that at 3 days of age, SIFCON produced with 4%, 5%, 6%, and 7% commercial steel fibers exhibits flexural strengths 476%, 714%, 759%, and 824% higher than M20 grade concrete, and 341%, 523%, 558%, and 608% higher than the SIFCON slurry matrix respectively. Similarly, at 7 days of age, SIFCON produced with 4%, 5%, 6%, and 7% commercial steel fibers shows flexural strengths 401%, 492%, 539%, and 592% higher than M20 grade concrete, and 286%, 356%, 392%, and 433% higher than the SIFCON slurry matrix respectively. Furthermore, at 28 days of age, SIFCON produced with 4%, 5%, 6%, and 7% commercial steel fibers demonstrates flexural strengths that are 281%, 378%, 400%, and 463% higher than M20 grade concrete, and 206%, 284%, 301%, and 352% higher than the SIFCON slurry matrix respectively. The increase in flexural strength of SIFCON produced with commercial steel fibers, compared to reference mixes, is attributed to the SIFCON slurry matrix with various percentages of fiber volume fraction.

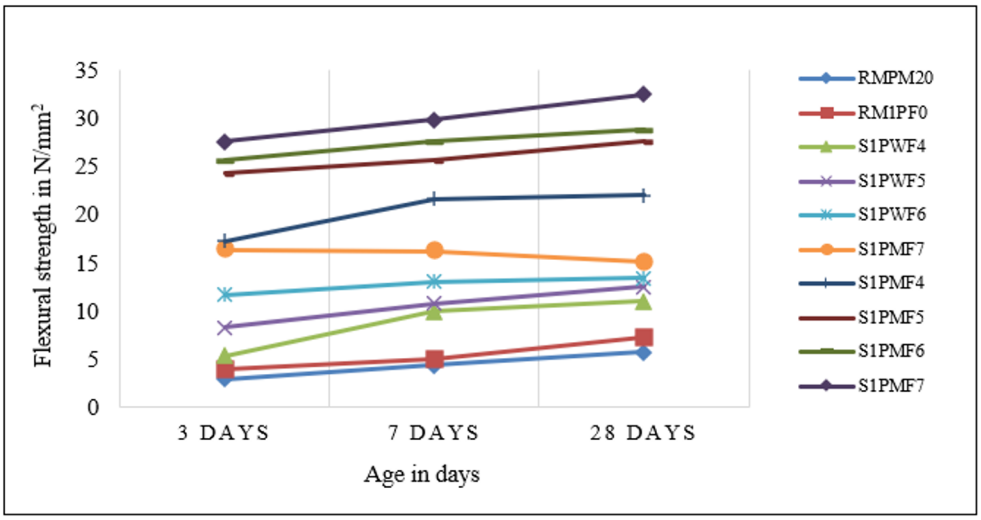

Fig. 9. Comparison of Flexural strength of SIFCON and reference mixes.

From the results, it is observed that at 3 days of age, SIFCON produced with 4%, 5%, 6%, and 7% waste steel fibers exhibits flexural strengths 69%, 66%, 54%, and 41% less than SIFCON produced with 4%, 5%, 6%, and 7% commercial steel fibers, respectively. Similarly, at 7 days of age, SIFCON produced with 4%, 5%, 6%, and 7% waste steel fibers shows flexural strengths 54%, 58%, 53%, and 46% less than SIFCON produced with 4%, 5%, 6%, and 7% commercial steel fibers, respectively. Furthermore, at 28 days of age, SIFCON produced with 4%, 5%, 6%, and 7% waste steel fibers demonstrates flexural strengths that are 50%, 55%, 53%, and 54% higher than SIFCON produced with 4%, 5%, 6%, and 7% commercial steel fibers, respectively. The increase in flexural strength of SIFCON produced with commercial steel fibers, compared to SIFCON produced with waste steel fibers, is attributed to the shape and aspect ratio of the waste steel fibers utilized in the experimental program.

6 Summary and Conclusions

The experimental work has been conducted in order to find out the flexural strengths of the SIFCON produced with waste steel fibers recovered from used tires and commercial steel fibers. Waste steel fibers recovered from used tires can be utilized in the production of Slurry Infiltrated Fibrous Concrete (SIFCON), despite their irregular shape and varying aspect ratios.

The slurry matrix used for the production of SIFCON exhibits flexural strengths that are 31%, 30%, and 25% higher than M20 grade concrete at 3, 7, and 28 days respectively. This increase in strength is attributed to the absence of coarse aggregate in the SIFCON slurry matrix and its richness in cementitious material.

It has been demonstrated that the flexural strength of SIFCON produced with 4% to 7% waste steel fibers increases by 90% to 161% compared to the M20 grade reference mix at the age of 28 days. Furthermore, it has been shown that the flexural strength of SIFCON produced with 4% to 7% waste steel fibers increases by 52% to 109% compared to the SIFCON slurry reference mix at the age of 28 days.

It has been demonstrated that the flexural strength of SIFCON produced with 4% to 7% commercial steel fibers increases by 281% to 463% compared to the M20 grade reference mix at the age of 28 days. Furthermore, it has been shown that the flexural strength of

SIFCON produced with 4% to 7% waste steel fibers increases by 206% to 352% compared to the SIFCON slurry reference mix at the age of 28 days.

It has been exhibited that the flexural strength of SIFCON produced with 4% to 7% waste steel fibers has a decrease of 50% to 54% with respect to SIFCON produced with 4% to 7% commercial steel fibers at the age of 28 days. The decrease in flexural strength of SIFCON produced with waste steel fibers, with respect to SIFCON produced with commercial steel fibers, is due to small fragments of rubber present on the surface of the waste steel fibers, their irregular shape, different aspect ratio, and fiber orientation.

From the experimental study, it can be mentioned that 6% of waste steel fibers with the two-layer technique is found optimal in producing SIFCON with waste steel fibers. The flexural strength of SIFCON produced with waste steel fibers recovered from used tires significantly increases compared to reference mixes and is comparable to SIFCON produced with commercial steel fibers. Waste steel fibers recovered from used tires can be effectively utilized up to a fiber volume fraction of 6% with a two-layer technique in the production of SIFCON.

It can be summarized that the waste steel fibers recovered from used tires exhibit significant variations in their geometrical properties, with lengths ranging from 3 to 73 mm and diameters from 0.14 to 0.47 mm. The dimensional diversity and bulk nature of the waste steel fibers have been shown not to be a concern in the production of SIFCON. There is a significant increase in the flexural strength of SIFCON produced with waste steel fibers, making it suitable for applications where there are flexural stresses that need to be handled. The cost-effectiveness of SIFCON elements with waste steel fibers is approximately 67% lower than that of SIFCON elements with commercial steel fibers. The multiple benefits confirm that the waste steel fibers recovered from used tires are an alternative reinforcement in the production of SIFCON.

Abstract: The electrical utility systems are well-liked as local energy systems because of their capacity to incorporate renewable energy, enhance energy effectiveness and strengthen the resilience of the power system. These benefits do, however, come with specific complications regarding control and power quality (PQ). PQ within a utility system is paramount to ensure the appropriate operation of connected devices and the well-being of the overall system. As a result, both voltage quality & current quality are significant. Control strategies in conjunction with cutting-edge power electronics devices (PED) offer a solid framework to handle PQ challenges. Hence, this paper's proposed work discusses the application of a Solar-Photovoltaic (PV) fed Unified Power Quality Conditioner (UPQC) for power quality enhancement towards the supply grid network. The Solar-PV fed UPQC enhances PQ and maximizes solar energy utilisation, leading to an eco-friendly and cost-effective solution while injecting clean, renewable energy into the grid. In this paper, the control strategies for UPQC are based primarily on the Adaptive Leaky Least Mean Square (AL_LMS) algorithm as compared with the Synchronous Reference Frame (SRF) based theory for switching of series and shunt active converters of UPQC. This AL_LMS approach extracts reference signals to switch UPQC's shunt and series voltage source converters (VSCs) by iteratively updating the weights. Thus, the control strategy applied to Solar-PV fed UPQC mitigates voltage problems like voltage sag and swell, current harmonic distortions and other PQ issues. The work is done in MATLAB/ Simulation software and simulation outcomes show the effectiveness of Solar-PV fed UPQC in improving power quality by maintaining within the IEEE-519 Standards.

Introduction

Supplying consumers with electricity in the custom of sinusoidal voltages and currents with adequate magnitudes and frequencies near the point of common coupling (PCC) is one of the Utility system's main responsibilities. System and user equipment are designed and inspected based on sinusoidal voltages and currents with standardized/rated amplitudes and frequencies (Sabin et al., 2022). Power Quality (PQ) has always been a regular issue, and with the increase in the number of electrical appliances, these issues have increased significantly over the years. PQ problems, like voltage sag, voltage swell, harmonics, and flicker, can lead to disruptions, damage to sensitive equipment, and reduced efficiency in power supply systems. In this context, the application of Power Quality Enhancement (PQE) techniques has gained significant attention to mitigate power disturbances and voltage fluctuations (Bollen, 2000). To improve the functionality and stability of electric power systems and resolve issues with power quality, numerous devices and technologies have been proposed and put into practice. Flexible AC Transmission Systems (FACTS) devices are cutting-edge technological solutions for enhancing voltage regulation, besides stable and immediate apparent controlling of active and reactive powers at the fundamental frequency. methods rely on distinctive power apparatuses that provide a range of alternatives, such as both shunt and series compensation of active along with reactive power to enhance power quality, voltage control associated with performance at fundamental and harmonic frequencies w.r.t. steady-state and dynamic situations (Fuchs et al., 2023; Hingorani and Gyugyi, 2000; Watanabe et al., 2018). UPQC is regarded as a customized power device that has emerged as a promising solution in alleviating both Voltage and Current PQ issues to electrical supply systems and it can be installed at the PCC in the distribution network (Agarwal et al., 2021). Its primary objective is ensuring continuous power quality improvement by regulating voltage and mitigating various PQ issues, such as voltage sags, swells, and harmonics. It consists of two components: an active power filter in series (SeAPF) and in the shunt (ShAPF) with a common DC link. The SeAPF is responsible for compensating voltage-related conflicts, such as sags and swells, while ShAPF mitigates current-related issues, such as harmonics and reactive power demand and makes regulations of DC-link voltage (Heenkenda et al., 2021; Satish et al., 2023).

Currently, a major area of research in industry and academia is the network interaction of renewable energy sources (RES) for improved system performance (Alam et al., 2021; Bajaj and Singh, 2020; Mlilo et al., 2021). The increasing integration of RES, particularly Solar-Photovoltaic (PV) systems, into the power grid has brought numerous benefits in terms of sustainability and reduced carbon emissions. Several advantages can be realized by integrating solar-PV system with UPQC. Firstly, Solar-PV system can serve as a clean RES, reducing the inevitability of traditional fossil fuel-based electricity generation and contributing to a more sustainable electricity supply. Secondly, the PV system can provide dynamic support to the active power, enabling the UPQC to regulate voltage under different load conditions and maintain a stable power grid (Jha et al., 2023; Suresh et al., 2018). To switch the series compensator and the shunt compensator, respectively, a reference load voltage signal and source current signals must be generated via the proper control structure for UPQC. Conventional time-domain techniques like Instantaneous Symmetric Component Theory (ISCT), Synchronous-Reference-Frame (SRF or d-q-0) technique, Instantaneous-Reactive-Power (IRPT or p-q) Theory have been utilized in several studies (Diab et al., 2021; Venkata and Reddy, 2023). The performance of these classical algorithms formed on p-q and d-q-0 theories is unsatisfactory when the load is unbalanced due to the low pass filters' insignificant performance. Several frequency domain methods are realized by means of Wavelet Transform and the Fast Fourier method, but these approaches consume more memory, elasticities, slower response, and require additional computational efficacy (Chawda et al., 2020; Martinez et al., 2022). A modified generalized second-order integrator-based control system is used to remove DC Offset current from the load (Chandrakala Devi et al., 2020). Soft Computing Techniques based control schemes (e.g., Neural Networks) are likewise used to distinguish and categorize power quality issues (Khetarpal et al., 2020; Sudheer et al., 2022; Venkata and Reddy, 2023).

In order to regulate a 3-Φ DSTATCOM providing harmonic and reactive power compensation for linear and nonlinear loads, research (Patel et al., 2019) affords an optimum step size Least Mean Square (LMS) algorithm. This algorithm adaptively calculates the step factor conditioned to calculate the active and reactive weights, establishes reference currents, and sets the VSC trigger pulses. In (Devena et al., 2023) study, a Variable Leaky Least Mean Square (VLLMS) control is used with an adaptive shunt active filter. By using the suggested method, a non-linear load's harmonic content, power quality, power losses, and power factor can all be improved. To lower THD in the Solar-PV system, study (Alhafadhi et al., 2022) suggests a strategy focusing on the Leaky LMS adaptive filter algorithm. The suggested filter significantly lowers the input's signal harmonic content and delivers to the load.

This paper is structured as follows: The main system architecture is discussed in Section-II. The procedure of the control mechanism is elucidated in Section-III. Section-IV suggests controlling examination and explanations of MATLAB/Simulink results for non-linear load conditions and Section-V states the conclusions of the paper.

Proposed System Model

Figure 1 depicts the schematic representation of a proposed system model comprising of Solar-PV fed UPQC in a grid-connected mode. A coupled inductor (L_{se}) and a 3-Φ series injection transformer (T_{se}) are used to link the series VSC component of UPQC in series with the distribution grid. The Shunt VSC component has joined in parallel to the load point over the interface inductor (L_{sh}) and a capacitor (C_{dc}) links amongst the two compensators. To cut out the high-frequency constituent of voltage as a result of switching of VSCs, Ripple filters (L_r & C_r) are used. A reverse blocking diode across the DC-link capacitor links a Solar-PV module.

DOI: https://doi.org/10.52756/ijerr.2023.v35spl.001

A Non-Linear (R-L) load is connected to the circuit using the 3-Φ diode bridge rectifier.

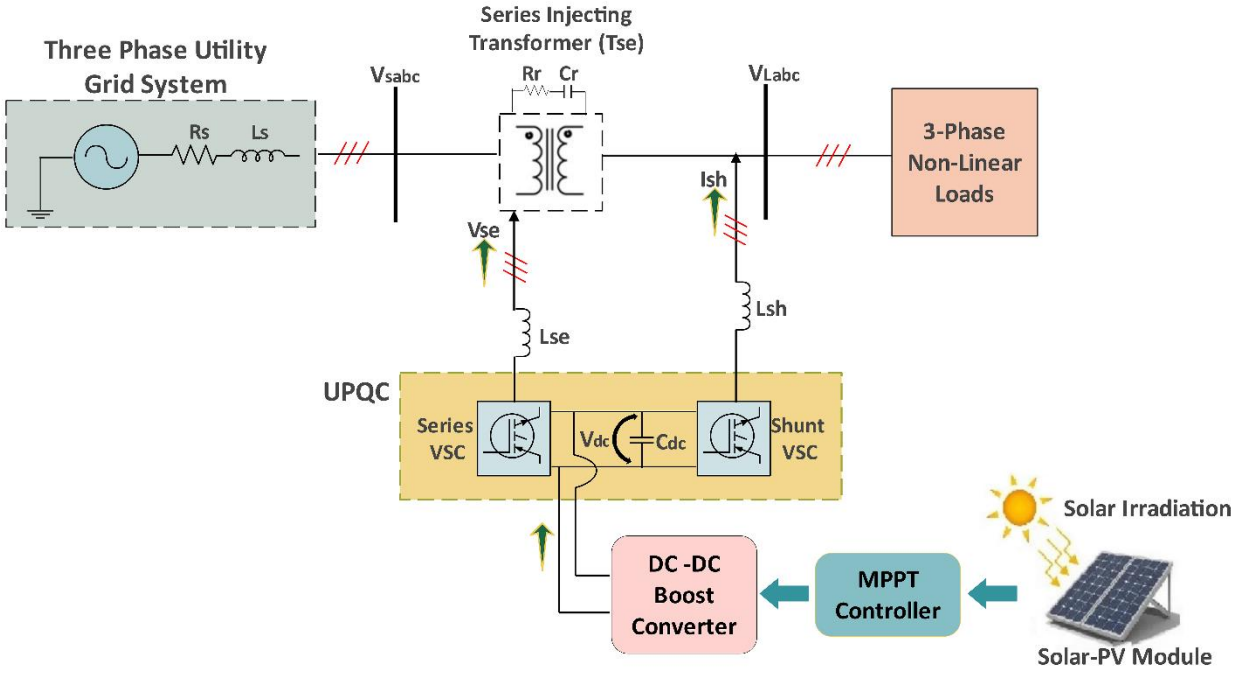

Figure 1. Illustration of a proposed Solar-PV fed UPQC system model

UPQC Control Methodologies

In the proposed Solar-PV fed UPQC integrated into the grid system, the main objective is meant to address the PQ challenges brought on by the 3-Φ non-linear load. Here, Shunt VSC is ensured by reducing the harmonics in the network source current and retaining DC-link voltage significantly. Additionally, it helps PCC meet its demand for reactive power. The load voltage's harmonics, Voltage sag and swell are all reduced through the series VSC. In this paper, in order to conjecture the reference signals meant to directive together shunt and series VSCs of UPQC, controlled approaches based on the SRF theory and the proposed AL_LMS algorithm are discussed to estimate the reference voltage and current for operating both series and shunt compensators. The proposed method gives a superior condition than the conventional SRF theory as the adaptive leakage parameter feature of the AL_LMS method offers higher performance in both steady-state and dynamic circumstances without the drift of weighted parameters exceeding the limits. So, the Solar-PV fed UPQC's performance is enhanced by fast and more precise estimate of the reference signals used for switching the VSCs.

Conventional SRF technique

The Synchronous Reference Frame (SRF) technique is often referred to as direct-quadrature-zero (or d-q-0) axis theory (Ahmad et al., 2020). This transformation results in the combination of Clarke's and Park's transformations. At first, voltages and currents in "a-b-c coordinates" are transfigured into "α-β-0 coordinates" by Clarke's transformant. Again, these are changed from "α-β-0 coordinates" to rotating "d-q-0 coordinates" through Park's transform in the process. In this case, 'θ = ωt' denotes the angle through which d-q-0 frame rotates. The source voltage is considered when calculating this 'θ = ωt' and Phase Locked Loop (PLL) method (Hoon et al., 2019) is employed to this aspect.

SRF Control Scheme for Shunt VSC

The Figure 2 shows the d-q-0 Control Strategy for shunt VSC and reference signals to estimate are described as below. Firstly, Source's Currents (I_{sa}, I_{sb}, I_{sc}) & Voltages (V_{sa}, V_{sb}, V_{sc}), Load Currents (I_{La}, I_{Lb}, I_{Lc}) and DC-link voltage (V_{dc}) are detected. The load currents being then transfigured from "a-b-c coordinates" to "d-q-0 frame" using the below equation 1.

$$\begin{bmatrix} I_d \\ I_q \\ I_0 \end{bmatrix} = \frac{2}{3}\begin{bmatrix} \cos\theta & -\sin\theta & \frac{1}{2} \\ \cos(\theta - \frac{2\Pi}{3}) & -\sin(\theta - \frac{2\Pi}{3}) & \frac{1}{2} \\ \cos(\theta + \frac{2\Pi}{3}) & \sin(\theta - \frac{2\Pi}{3}) & \frac{1}{2} \end{bmatrix}\begin{bmatrix} I_{La} \\ I_{Lb} \\ I_{Lc} \end{bmatrix} \ldots\ldots (1)$$

The components 'Id and Iq' are processed via a filter to obtain constant DC-components. The current signal Iddc is paired with the loss component produced by the tuned dc link error signal to obtain the direct axis reference current (Idref) as given in equations 2 and 3.

$$I_{l(t+1)} = I_{lt} + k_{pd}(V_{dc(t+1)} - V_{dc(t)}) + k_{id}V_{dc(t)} \ldots\ldots (2)$$

and

$$I_d^* = I_l + I_{ddc} \ldots\ldots (3)$$

Similarly, the current Iqdc is paired to tune supply voltage error signal for getting quadrature reference current (I_{qref}) as given by equation 4.

DOI: https://doi.org/10.52756/ijerr.2023.v35spl.001

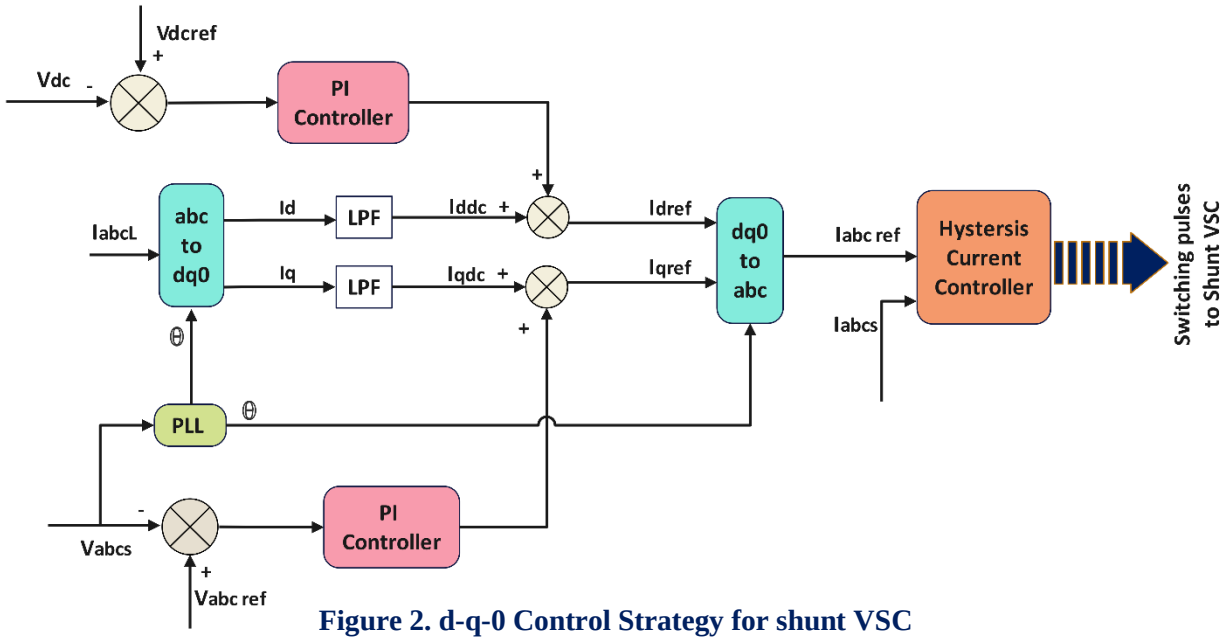

Figure 2. d-q-0 Control Strategy for shunt VSC

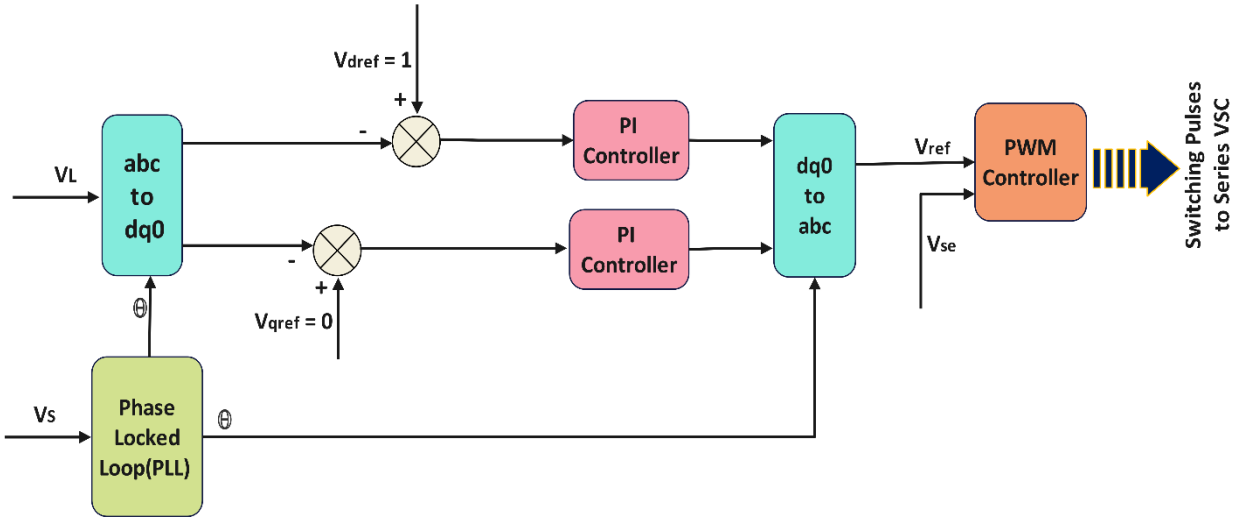

Figure 3. d-q-0 Control Strategy for Series VSC

$$I_{qr(t+1)} = I_{qr(t)} + k_{pq}(V_{t(t+1)} - V_{t(t)}) + k_{id}V_{t(t)} \text{.....(4)}$$

These reference currents (I_{dref} and I_{qref}) are transfigured back to "a-b-c reference" coordinates using the Inverse Park's transformant, through which the final reference currents can be obtained and as given by equation 5.

$$i_q^* = i_{qr} + i_{qdc} \text{ ……..(5)}$$

By means of Hysteresis Current Controller (HCC) controller (Pengaluru Suresh et al., 2019), Switching Gate pulses are formed using the variance among the reference currents and actual source currents. With these Gate pulses, at PCC point, the ShAPF inoculates the currents for suppressing the harmonics within the current in addition to paying off the reactive power demand.

Control Scheme for Series VSC

The Figure 3 illustrate the "d-q-0" control strategy for Series VSC and reference signals to estimate are described as below. At first, source voltages are transformed into synchronous "d-q-0 reference" frame with the equation 6.

$$V_s^{dq0} = \frac{2}{3}\begin{bmatrix} \cos\theta & -\sin\theta & \frac{1}{2} \\ \cos(\theta - \frac{2\Pi}{3}) & -\sin(\theta - \frac{2\Pi}{3}) & \frac{1}{2} \\ \cos(\theta + \frac{2\Pi}{3}) & \sin(\theta - \frac{2\Pi}{3}) & \frac{1}{2} \end{bmatrix} * V_s^{abc}$$

$$= V_{sp} + V_{sn} + V_{s0} + V_{sh} \text{ ……..…….. (6)}$$

Where V_{sp}, V_{sn}, V_{s0}, and V_{sh} are positive, negative, zero sequences and harmonic components respectively.

The primary aim is in obtaining sinusoidal voltages, accordingly "d-q-0 reference" frame of load voltage is given by the equation 7 below.

$$V_L^{dq0} = V_s^{*abc} =$$

$$\begin{bmatrix} \cos\theta & -\sin\theta & \frac{1}{2} \\ \cos(\theta - \frac{2\Pi}{3}) & -\sin(\theta - \frac{2\Pi}{3}) & \frac{1}{2} \\ \cos(\theta + \frac{2\Pi}{3}) & \sin(\theta - \frac{2\Pi}{3}) & \frac{1}{2} \end{bmatrix} \begin{bmatrix} U_m \\ 0 \\ 0 \end{bmatrix} \text{……..…. (7)}$$

DOI: https://doi.org/10.52756/ijerr.2023.v35spl.001

The compensating "d-q-0 reference" coordinates voltage is given by equation 8 and this voltage is transformed again back to "a-b-c reference" frame.

$$V_{dq0}^{ref} = V_s^{dq0} - V_L^{dq0} \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots (8)$$

Using the Sinusoidal PWM technique (Pal et al., 2020), the switching gate pulses are produced to compensate for the load voltage disturbances.

Proposed Adaptive Leaky LMS (AL_LMS) Technique

In a customized filtering application, a modified conventional LMS method called as the Adaptive Leaky LMS (AL_LMS) algorithm is employed. In this context of adaptive filtering, the determination is to find an optimal set of filter coefficients (weights) that minimizes the eeriness amongst the desired output and the filter's output. Here, in the applied AL_LMS algorithm, a leakage factor is introduced to regulate the rate at which the filter coefficients are updated, thus achieving a trade-off between tracking speed and stability. The mathematical equation correlated to AL_LMS and its estimator (Ray et al., 2022; Bag, A. et al., 2020) are described by below equations 9 and 10.

$$W(t+1) = [1 - \mu\,\lambda(t)] * W(t) + \mu E(t) * X(t) \ldots. (9)$$

$$\text{and } Y(t) = W^T(t) * X(t) \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots (10)$$

Where

X(t): Input vector at time step 't'

W(t): Weight vector of filter coefficients at the time step 't'

μ: Step-size or learning rate, controlling the adaption rate

λ(t): The leakage factor, which can vary at each time step 't' based on system conditions

E(t): The instantaneous error signal at time step 't', defined as desired output 'D(t)' minus predicted output 'Y(t)' i.e.

$$E(t) = D(t) - Y(t) \ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots (11)$$

The cost function $F_c(t)$ is specified by

$$F_c(t) = E^2(t) + [\lambda(t) * W^T(t) * W(t)] \quad \ldots\ldots\ldots (12)$$

And updating of weights are accomplished such that it attains a minimal value. The weight update expressions are obtained thru the equations 13 – 16.

$$W(t+1) = W(t)[1 - 2\mu(t) * \lambda(t)] + [2\mu(t) * E(t) * X(t)] (13)$$

$$\lambda(t+1) = \lambda(t) - [2\mu(t) * \rho * E(t) * X^T(t) * W(t-1)] \ldots (14)$$

$$\mu(t+1) = [\alpha * \mu(t)] + [\lambda(t) * R^2(t)] \quad \ldots\ldots\ldots\ldots\ldots (15)$$

$$R(t) = [\beta * R(t-1)] + [(1-\beta) * E(t) * E(t-1)] . (16)$$

Here, **R(t):** Autocorrelation between E(t) & E(t-1)

β : Exponential weighing parameter used to control averaged estimated time so that $0 < \beta < 1$

α and ρ : Time convergence control constraints such that $0 < \alpha < 1$ and $\rho > 0$.

Here, in this research of Solar-PV fed UPQC, The UPQC can be controlled adaptively by using the AL_LMS algorithm to produce appropriate reference signals for operating the device. The main objective is to ensure that UPQC effectively compensates for power quality issues by adaptively adjusting the control signals based on the real-time measurement of the electrical parameters. This algorithm computes the variance amongst the desired (ideal) values and the measured values of these parameters such that the difference indicates the power quality error and is used to adaptively adjust the reference signals provided to the UPQC to minimize the error. The algorithm updates the reference signals based on the error signal and a learning rate (μ), which determines the adaptation rate. The adapted reference signals generated by the algorithm are used to control the UPQC's operations. This comprises generating appropriate compensation signals to correct the power quality problems. The process continues in a feedback loop, with the UPQC continuously adjusting its control signals based on the changing electrical conditions in the system.

Proposed Control for Shunt VSC

The proposed controller representation of shunt VSC is illustrated in Figure 4. The strategy aims to produce a balanced sinusoidal source current while controlling DC-link voltage. The first step is to sense the instantaneous phase voltages (v_{sa}, v_{sb} and v_{sc}) at PCC for all the phases. Following that, the phase voltages are applied to compute the PCC voltage's phase amplitude (Vsp) as follows:

$$V_{sp} = \sqrt{\frac{2}{3}(v_{sa}^2 + v_{sb}^2 + v_{sc}^2)} \quad \ldots\ldots\ldots\ldots\ldots\ldots\ldots (17)$$

The source voltage's in-phase unit templates are defined with the formula as

$$v_{pa} = \frac{v_{sa}}{V_{sp}}; \quad v_{pb} = \frac{v_{sb}}{V_{sp}}; \quad v_{pc} = \frac{v_{sc}}{V_{sp}} \ldots\ldots\ldots\ldots\ldots (18)$$

By means of in-phase unit templates, the voltage quadrature unit templates are calculated as follows:

$$v_{qa} = \frac{-v_{pb}+v_{pc}}{\sqrt{3}}; \; v_{qb} = \frac{\sqrt{3}}{2}v_{pa} + \frac{1}{2\sqrt{3}}(v_{pb} - v_{pc});$$

$$v_{qc} = -\frac{\sqrt{3}}{2}v_{pa} + \frac{1}{2\sqrt{3}}(v_{pb} - v_{pc}) \ldots\ldots\ldots\ldots\ldots (19)$$

W.r.t the control technique, the grid, and the PV array supply the load active power requirement. The grid also affords the UPQC's internal losses by keeping the constant voltage over DC-link. The predicted DC-link voltage (V_{dcref}) given by MPPT of Solar-PV output is correlated to the measured DC-link capacitor voltage (V_{dc}), and then an error signal (E_{dc}) is attained, which is given for PI controller so as to minimize the error. Thus, the required loss component (W_{loss}) is obtained and expressed by equations (20) and (21).

DOI: https://doi.org/10.52756/ijerr.2023.v35spl.001

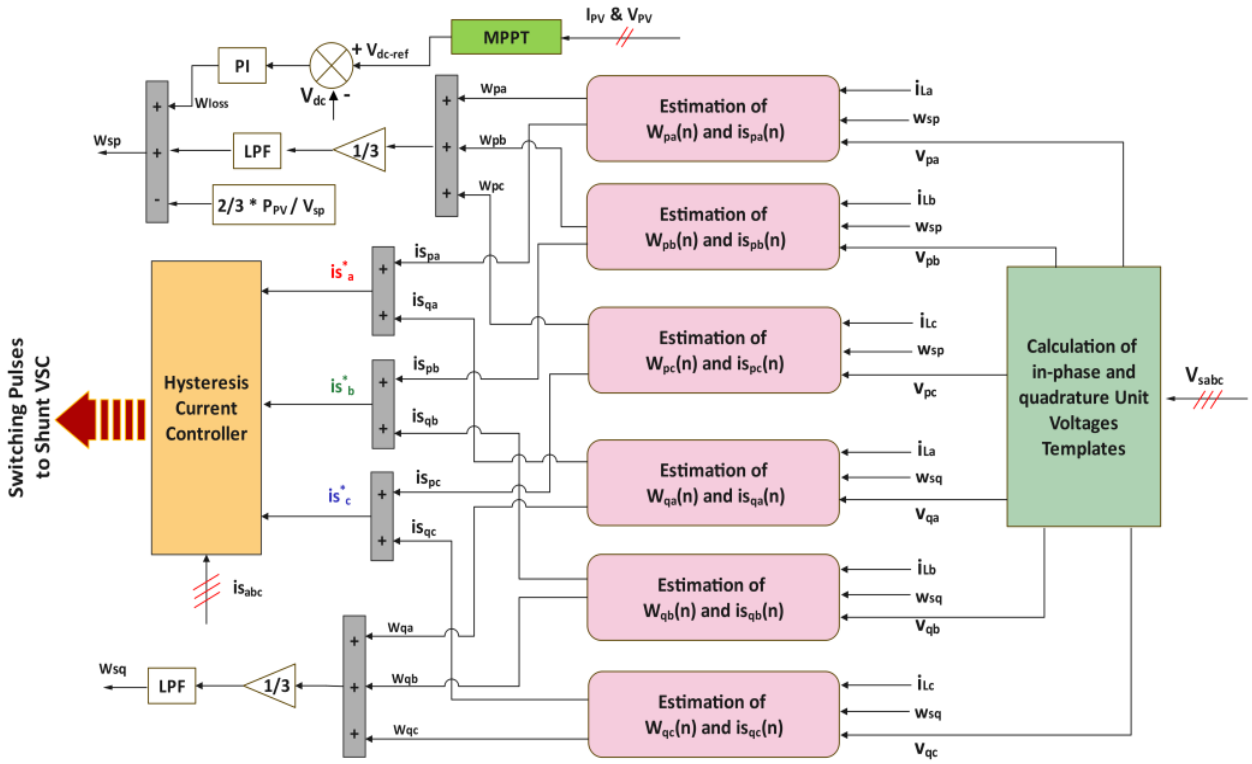

Figure 4. Proposed schematic control diagram of shunt VSC

$$E_{dc}(t) = V_{dcref}(t) + V_{dc}(t) \quad \text{..... (20)}$$

$$W_{loss}(t+1) = W_{loss}(t) + K_p * [E_{dc}(t+1) - E_{dc}(t)] + K_i * E_{dc}(t+1) \quad \text{..... (21)}$$

The fraction of active current supplied by Solar-PV array (W_{PV}) is specified by:

$$W_{pv} = \frac{2}{3} * \frac{P_{PV}}{V_{sp}} \quad \text{..... (22)}$$

Now, the fundamental constituent of phase 'a' active load current can be determined with help of basic weight update expressions given in (13), (14), (15) and (16) as follows:

$$W_{pa}(t+1) = W_{pa}(t)\left[1 - 2\mu_{pa}(t) * \lambda_{pa}(t)\right] + [2\mu_{pa}(t) * E_{pa}(t) * v_{pa}(t)] \quad \text{..... (23)}$$

$$\lambda_{pa}(t+1) = \lambda_{pa}(t) - [2\mu_{pa}(t) * \rho * E_{pa}(t) * v_{pa}(t) * W_{pa}(t-1)] \quad \text{..... (24)}$$

$$\mu_{pa}(t+1) = \left[\alpha * \mu_{pa}(t)\right] + [\lambda_{pa}(t) * R^2_{pa}(t)] \quad \text{..... (25)}$$

$$R_{pa}(t) = \left[\beta * R_{pa}(t-1)\right] + [(1-\beta) * E_{pa}(t) * E_{pa}(t-1)] \quad \text{..... (26)}$$

And the predicted error will be now as

$$E_{pa}(t) = i_{La}(t) - v_{pa}(t) * W_{pa}(t) \quad \text{..... (27)}$$

Where i_{La} is load current of phase 'a'. In a similar way, at any time instant, weights of active components (W_{pb} and W_{pc}), leakage factors (λ_{pb} and λ_{pc}), step size (μ_{pb} and μ_{pc}), error autocorrelation (R_{pb}, R_{pc}) and predicted error (E_{pb}, E_{pc}) can be updated similarly to the phases 'b' and 'c' for the shunt VSC. Hence, weighted average of the fundamental active component (W_{pave}) is specified as:

$$W_{pave} = \frac{W_{pa}(t) + W_{pb}(t) + W_{pc}(t)}{3} \quad \text{..... (28)}$$

From (22), (23) and (28), the reference grid current's total weight of active component (W_{sp}) and active components of reference grid current (i_{spa}, i_{spb} and i_{spc}) are computed as

$$W_{sp} = W_{pave} + W_{loss} - W_{PV} \quad \text{..... (29)}$$

$$i_{spa} = W_{sp} * v_{pa};\ i_{spb} = W_{sp} * v_{pb};\ i_{spc} = W_{sp} * v_{pc} \quad \text{..... (30)}$$

In the same way, load current's reactive components are obtained by having quadrature unit vector voltage templates and corresponding updated weights related towards reactive current components and are expressed as

$$i_{sqa} = W_{sq} * v_{qa};\ i_{sqb} = W_{sq} * v_{qb};\ i_{sqc} = W_{sq} * v_{qc} \quad \text{..... (31)}$$

Here, weight average of fundamental reactive components are equal to the weight of total reactive components (W_{sq}). Thus, the extracted resulting reference source currents are attained by summing up the components in (30) and (31) obtained above.

$$i^*_{sa} = i_{spa} + i_{sqa};\ i^*_{sb} = i_{spb} + i_{sqb};\ i^*_{sc} = i_{spc} + i_{sqc} \quad \text{..... (32)}$$

Henceforth, comparing the resultant reference (i^*_{sa}, i^*_{sb} and i^*_{sc}) and measured (i_{sa}, i_{sb} and i_{sc}) network source currents and also the attained erroneous signals are enumerated toward the Hysteresis Current Controller (HCC) in engendering the estimated switched signals meant for shunt VSC.

DOI: https://doi.org/10.52756/ijerr.2023.v35spl.001

Proposed Control for Series VSC

The representation of schematic control for series compensator is shown in Figure 5. The control objective is in obtaining the nominal magnitude and pure sinusoidal load voltages. The reference load voltages are evaluated using the proposed AL_LMS algorithm as described below. The 3-Φ load currents (i_{La}, i_{Lb} and i_{Lc}) are sensed for calculating the magnitude (I_{Lp}) and the load current unit templates are given by equations 33 and 34 respectively.

$$I_{Lp} = \sqrt{\frac{2}{3}(i_{La}^2 + i_{Lb}^2 + i_{Lc}^2)} \quad \ldots\ldots (33)$$

$$u_{pa} = \frac{i_{La}}{I_{Lp}};\ u_{pb} = \frac{i_{Lb}}{I_{Lp}};\ u_{pc} = \frac{i_{Lc}}{I_{Lp}} \quad \ldots\ldots (34)$$

These in-phase unit templates are used in computing the quadrature current unit templates and are given as

$$u_{qa} = \frac{-u_{pb}+u_{pc}}{\sqrt{3}};\ u_{qb} = \frac{\sqrt{3}*u_{pa}}{2} + \frac{1}{2\sqrt{3}}(u_{pb} - u_{pc});$$

$$u_{qc} = -\frac{\sqrt{3}*u_{pa}}{2} + \frac{1}{2\sqrt{3}}(u_{pb} - u_{pc}) \quad \ldots\ldots (35)$$

$$R_{vpa}(t) = [\beta * R_{vpa}(t-1)] + [(1-\beta) * E_{vpa}(t) * E_{vpa}(t-1) \quad \ldots\ldots (39)$$

And error predicted will be obtained as

$$E_{vpa}(t) = V_{sa}(t) - u_{pa}(t) * W_{vqa}(t) \quad \ldots\ldots (40)$$

where, V_{sa} is the source voltage of phase 'a'. Likewise, at any instantaneous, in-phase weights component (W_{vpb} and W_{vpc}), leakage factors (λ_{vpb} and λ_{vpc}), step size (μ_{vpb} and μ_{vpc}), error auto correlation (R_{vpb} and R_{vpc}) and error prediction (E_{vpb} and E_{vpc}) can be similarly updated in the phases 'b' and 'c' of series VSC. The in-phase component weighted average (W_{vpave}) is calculated as:

$$W_{vpave} = \frac{W_{vpa}(t) + W_{vpb}(t) + W_{vpc}(t)}{3} = W_{Lp} \quad \ldots\ldots (41)$$

The components of in-phase reference load voltage are measured as:

$$V_{Lpa} = W_{Lp} * u_{pa};\ V_{Lpb} = W_{Lp} * u_{pb};\ V_{Lpc} = W_{Lp} * u_{pc} \quad \ldots\ldots (42)$$

In the same way, the load voltage's quadrature component weights (W_{vqa}, W_{vqb} and W_{vqc}) using proposed

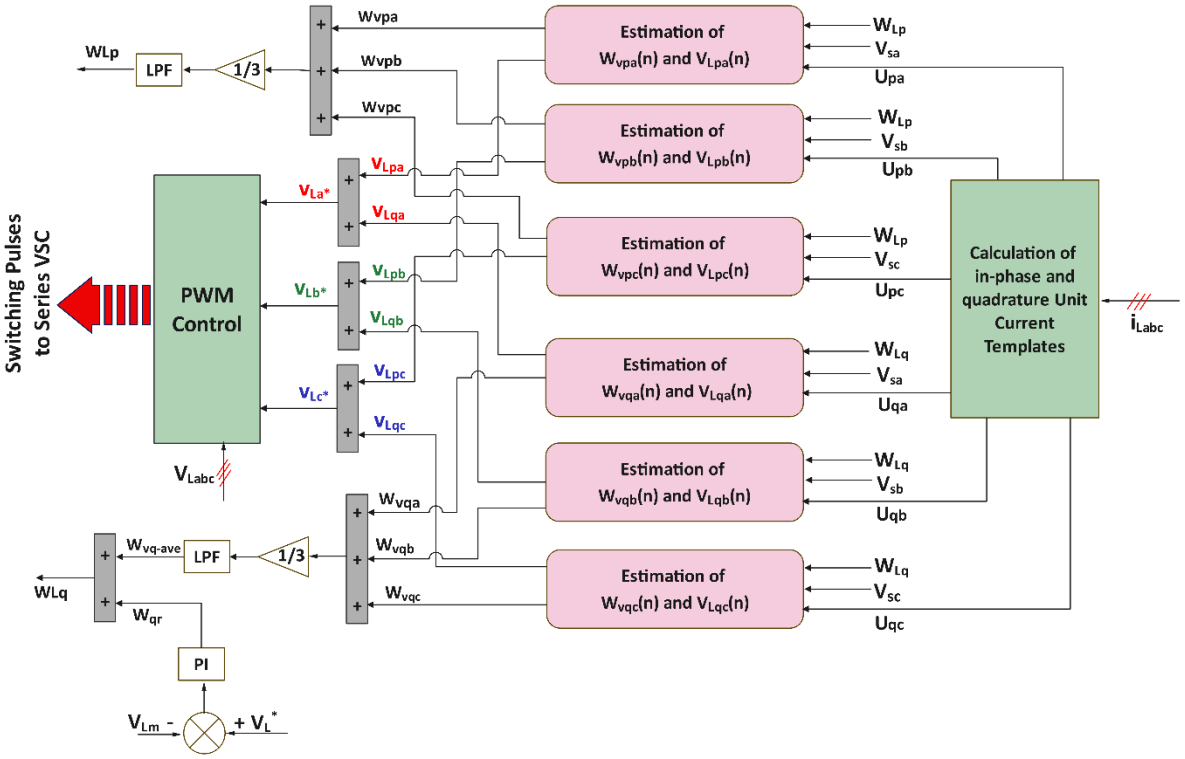

Figure 5. Schematic control representation for Series VSC

Now, load voltage weighted in-phase component (W_{vpa}) of phase 'a' is computed by means of basic weighted updated expressions given in (13), (14), (15) and (16) as follows

$$W_{vpa}(t+1) = W_{vpa}(t)[1 - 2\mu_{vpa}(t) * \lambda_{vpa}(t)] + [2\mu_{vpa}(t) * E_{vpa}(t) * u_{pa}(t)] \quad \ldots\ldots (36)$$

$$\lambda_{vpa}(t+1) = \lambda_{vpa}(t) - [2\mu_{vpa}(t) * \rho * E_{vpa}(t)] * [u_{pa}(t) * W_{vpa}(t-1)] \quad \ldots\ldots (37)$$

$$\mu_{vpa}(t+1) = [\alpha * \mu_{vpa}(t)] + [\lambda_{vpa}(t) * R_{vpa}^2(t) \quad \ldots\ldots (38)$$

AL_LMS algorithm are attained. Then, the reactive component weighted average is given by

$$W_{vqave} = \frac{W_{vqa}(t) + W_{vqb}(t) + W_{vqc}(t)}{3} \quad \ldots\ldots (43)$$

Now, a loss component (W_{qr}) is taken here into account for the regulation of the load voltage and stated as

$$W_{qr}(t+1) = W_{qr}(t) + K_{pq} * [E_{ac}(t+1) - E_{ac}(t)] + K_{iq} * E_{dc}(t+1) \quad \ldots\ldots (44)$$

DOI: https://doi.org/10.52756/ijerr.2023.v35spl.001

By comparison of the magnitudes of measured load voltages (V_{La}, V_{Lb} and V_{Lc}) and rated load voltage (V^*_L), produces an error signal and it is been fed to a PI controller for keeping load voltage's magnitude at desired value as given by the below equations

$$V_{Lm} = \sqrt{\frac{2}{3}(V_{La}^2 + V_{Lb}^2 + V_{Lc}^2)} \quad \ldots\ldots (45)$$

And $$E_{ac}(n) = V_L^*(n) - V_{Lm}(n) \quad \ldots\ldots (46)$$

The over-all quadrature component weight (W_{Lq}) of reference load's voltage is expressed as

$$W_{Lq} = W_{vqave} + W_{qr} \quad \ldots\ldots (47)$$

The over-all quadrature component of reference load's voltage is specified by the equation below

$$V_{Lqa} = W_{Lq} * u_{qa};\ V_{Lqb} = W_{Lq} * u_{qb};\ V_{Lqc} = W_{Lq} * u_{qc} \quad \ldots\ldots (48)$$

Thus, the considerable reference load voltages for all the three phases are given as

$$V^*_{La} = V_{Lpa} + V_{Lqa};\ V^*_{Lb} = V_{Lpb} + V_{Lqb};\ V^*_{Lc} = V_{Lpc} + V_{Lqc} \quad \ldots\ldots (49)$$

At last, by comparing the reference and measured load voltages, the variance is fed to a PWM generator to produce switching pulses to the series VSC. Hence, the operation of UPQC is done for the PQ enhancement.

Simulation Results and Discussions

The suggested Solar-PV fed UPQC configuration is modelled in the MATLAB/Simulink platform as shown in below Figure 6, and is then simulated for examining the performance analysis of Non-linear load condition, Voltage Sag and Swell situations using the conventional SRF theory and proposed AL_LMS algorithm. The parameters of the described system are tabulated below.

Table 1. Parameters used for Simulating the Proposed System

Parameters	Value
Supply Voltage (V_s)	415 V (L-L)
Coupling inductors (L_{se} and L_{sh})	1.5mH
DC-link capacitor (C_{dc})	8000 µF
DC-link Voltage (V_{dc})	700 V
Gains of Shunt VSC (Kp and Ki)	2 and 0.1
Gains of Series VSC (Kp and Ki)	4 and 800
Solar-PV voltage and current at MPP	700V, 60A
Non-linear load	15 KW, 7.2 KVA

Series VSC's Performance Analysis for Voltage Sag and Swell Conditions

Using Conventional SRF theory

The performance of the series component of UPQC using conventional SRF theory for voltage sag and swell conditions is shown Figure 7 below. At t=0.1Sec, a 0.5 P.U. voltage sag and on t=0.3Sec, a 1.2 P.U voltage swell has created and has been mitigated by series VSC of UPQC, resulting in rated load voltage.

From the Figure 7, it is shown that the voltage sag and swell are mitigated by UPQC using the conventional SRF theory. The %THD of load voltage using conventional SRF theory applied to UPQC is obtained as 4.8% as depicted in Figure 8. Further, it is investigated with proposed method for better enhancement of power quality as described below.

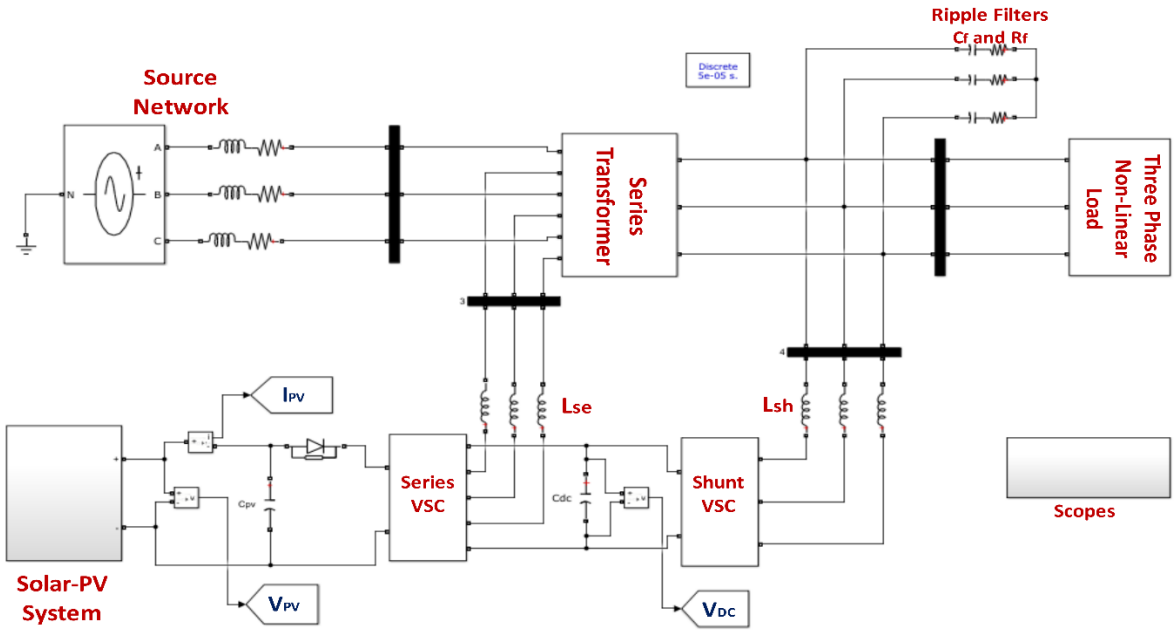

Figure 6. Simulation diagram of proposed Solar-PV fed UPQC system

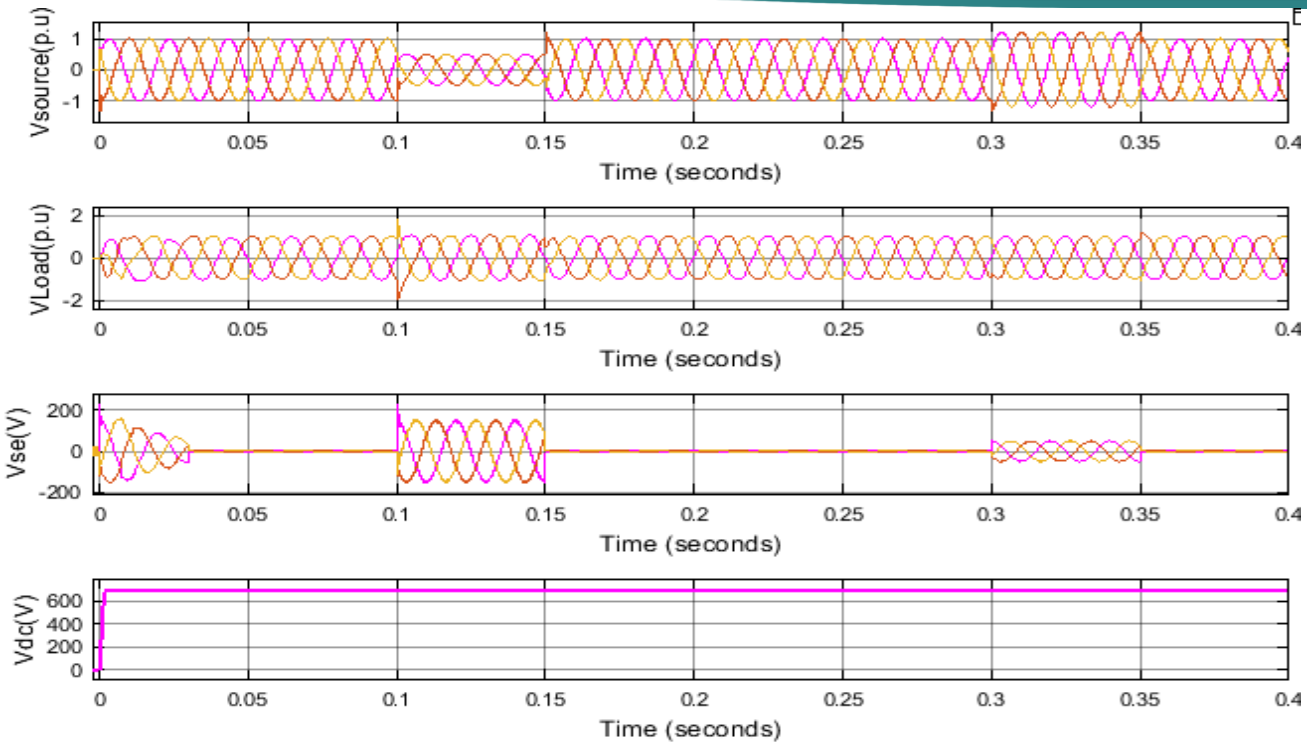

Figure 7. Compensation of Voltage Sag and Swell conditions by UPQC-SRF theory

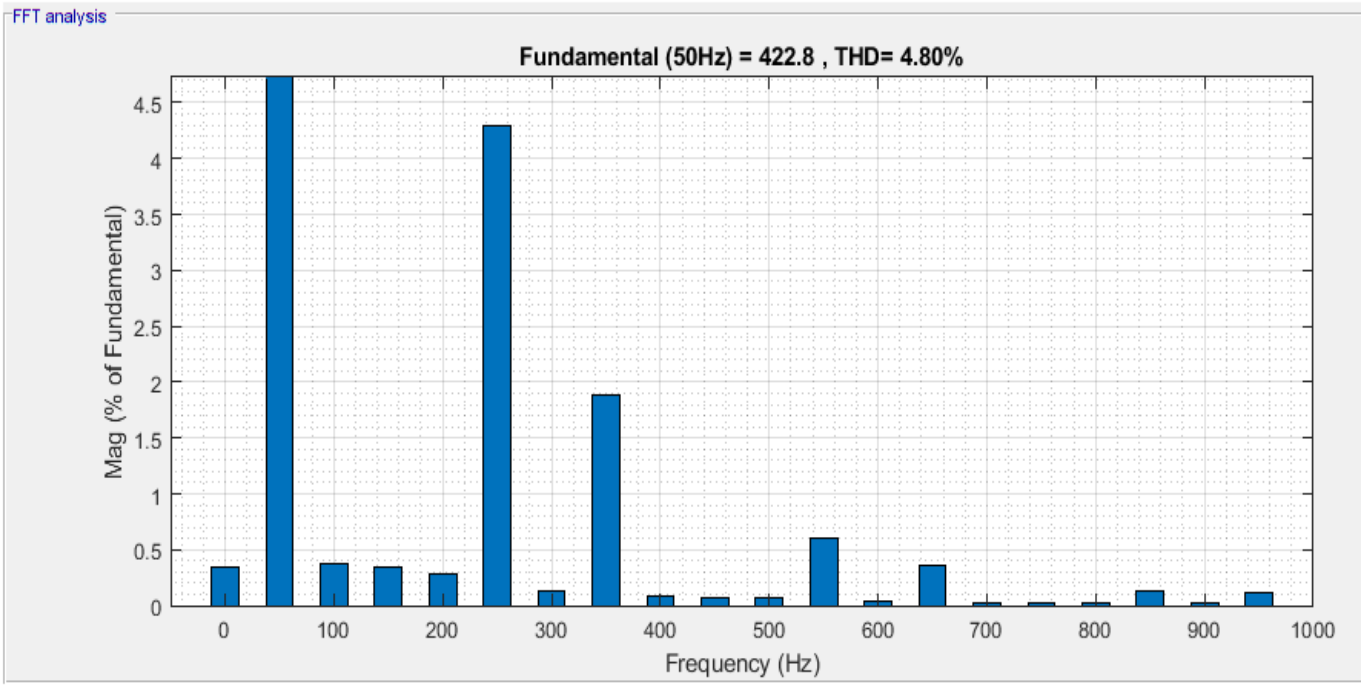

Figure 8. %THD of Load voltage by conventional SRF theory

Using proposed AL_LMS Algorithm

The performance of the series component of UPQC using the proposed AL_LMS algorithm for voltage sag and swell conditions is depicted in the graph below. At t=0.1Sec, a 0.5 P.U. sag and at t=0.3Sec, a 1.2 P.U swell has created which can be mitigated by series VSC of UPQC and results rated load voltage.

Figure 9 shows that the proposed AL_LMS algorithm better compensates voltage sag and swells with improved performance of %THD. The obtained %THD of the load voltage is 2.41% as compared to the conventional SRF theory of 4.80% as depicted in Figure 10.

DOI: https://doi.org/10.52756/ijerr.2023.v35spl.001

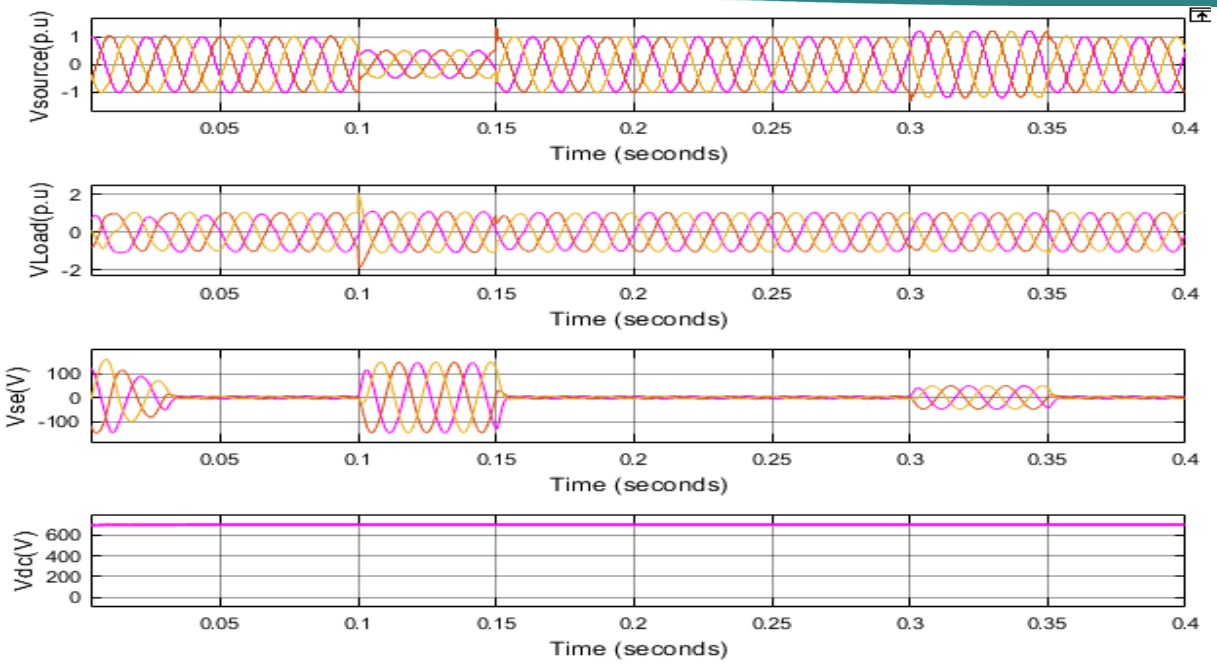

Figure 9. Compensation of Voltage Sag and Swell by proposed AL_LMS algorithm

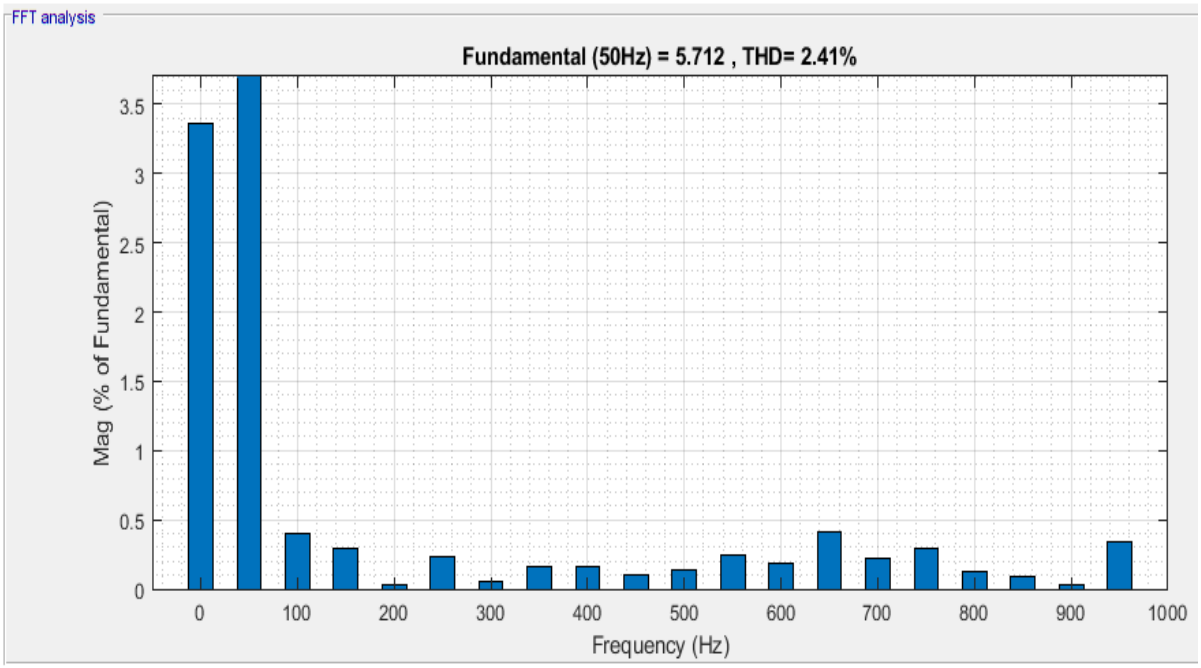

Figure 10. THD of Load Voltage with proposed AL_LMS algorithm.

Performance Analysis of Shunt VSC for Non-linear load condition

Using Conventional SRF theory

From the Figure 11, it can be observed that before t=0.04Sec, the harmonics due to non-linear load are reflected into the network source current. At t=0.04Sec, UPQC has been associated to the network. The shunt VSC of UPQC compensates the non-linearities injected into the network source current, resulting in a sinusoidal grid current.

The performance of shunt VSC for non-linear load conditions is depicted in the Figure 11 and 12 below. Using conventional SRF theory, the shunt VSC of UPQC compensates the non-linearities present in the network source current and is made sinusoidal, as depicted in a Figure 11. The Figure 12 shows %THD of source current obtained is 4.82% using conventional SRF theory. Also, W.r.t the control technique, the grid, and the PV array supply the load active power requirement and keep the DC-link voltage at a significant level.

DOI: https://doi.org/10.52756/ijerr.2023.v35spl.001

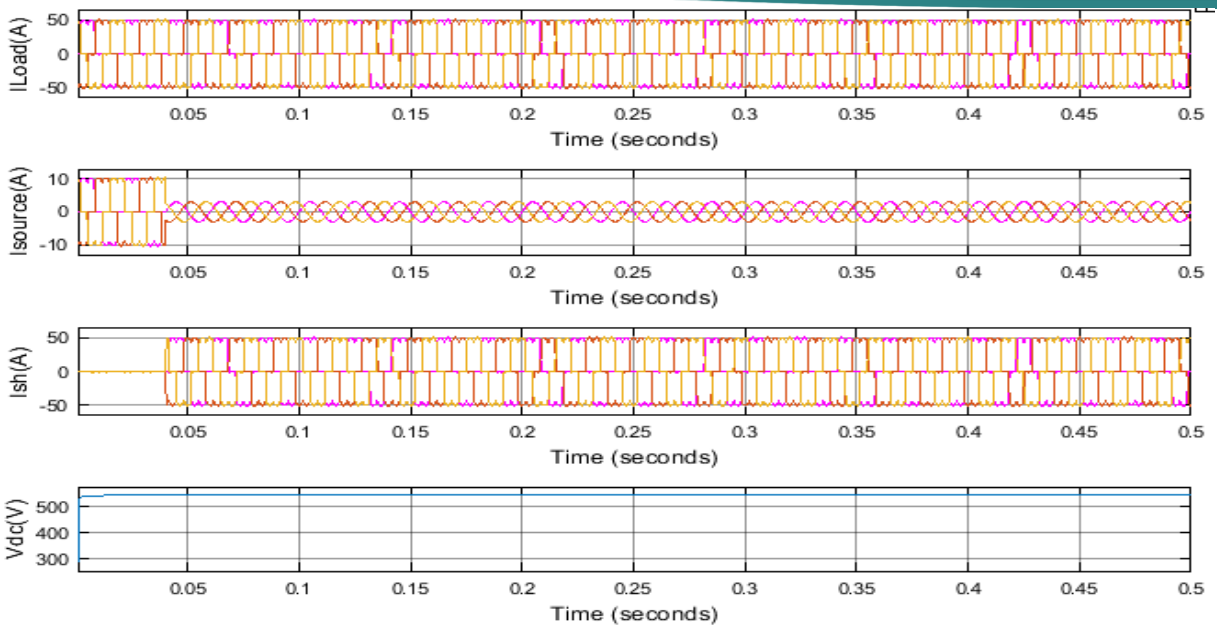

Figure 11. Performance of Shunt VSC with Non-linear load by conventional SRF theory

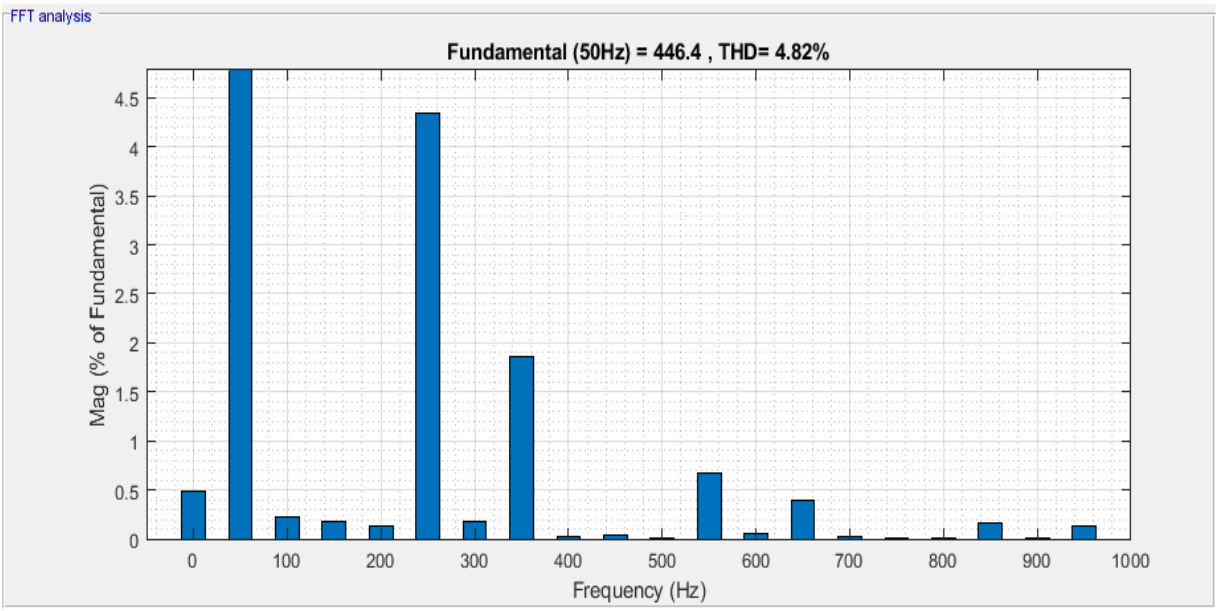

Figure 12. %THD for source current with conventional SRF theory

Using proposed AL_LMS Algorithm

Furthermore, the system is investigated for non-linear load conditions with proposed algorithm. At t=0.04Sec, the shunt VSC of UPQC compensates the non-linearities injected into the network source current, resulting in sinusoidal grid current while maintaining the constant DC-link voltage, as depicted in Figure 13.

The non-linearities in the source current and load current are further reduced by using proposed AL_LMS algorithm compared to SRF theory and %THD obtained in the source network current is 3.49% as of 4.82% in the conventional SRF theory as illustrated in Figure 13 and 14 below. Thus, it can be proved that the enhancement of power quality is superior by using the proposed AL_LMS algorithm. The outputs of control strategies of the system are featured in Table 2 below.

Table 2. %THD comparison of UPQC Control Strategies

S.No.	Parameter	Conventional SRF Theory	Proposed AL_LMS Algorithm
1	Load Voltage (Sag and Swell)	4.80%	2.41%
2	Source Current (Non-linearities)	4.82%	3.49%

DOI: https://doi.org/10.52756/ijerr.2023.v35spl.001

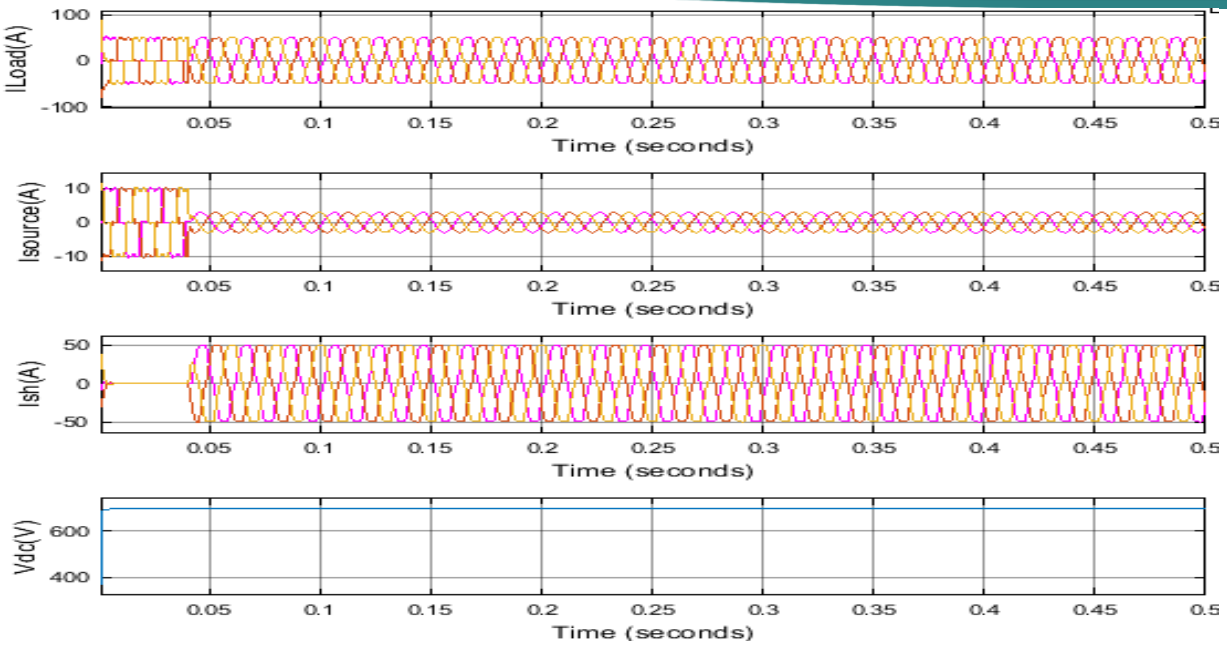

Figure 13. Performance of Shunt VSC with Non-linear load by proposed algorithm

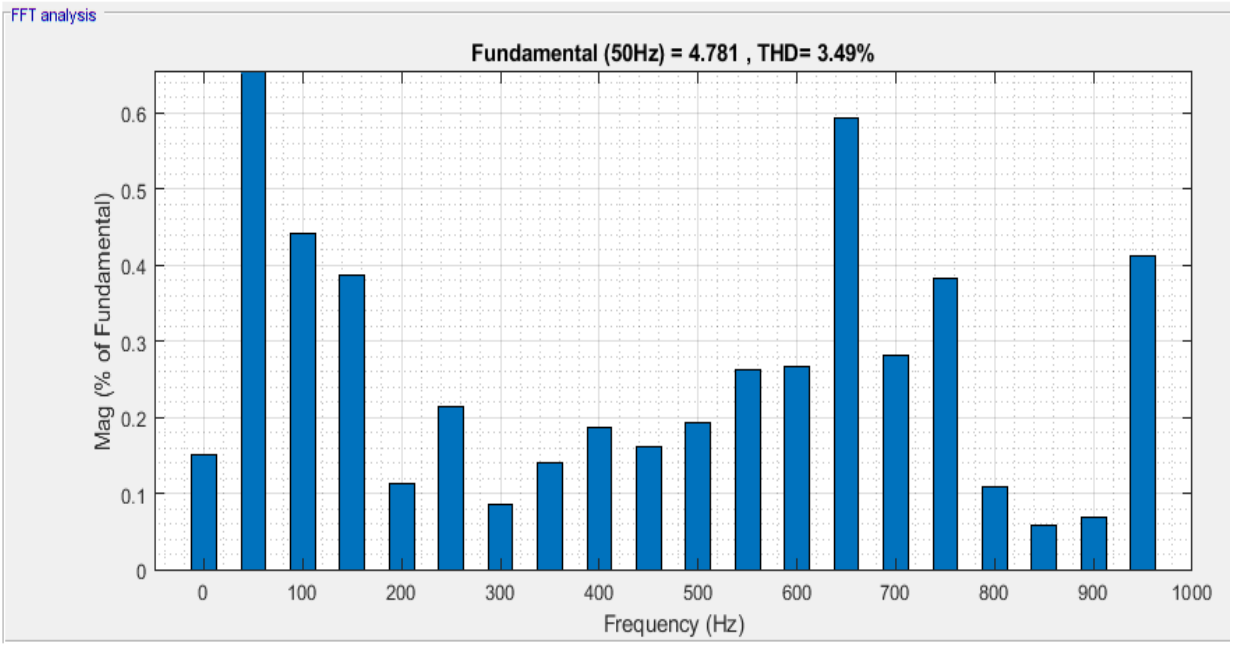

Figure 14. %THD for source current with proposed AL_LMS algorithm

Conclusion

A new control strategy based on the AL_LMS algorithm for the enrichment of the power quality with Solar-PV fed UPQC in the distributed network has been proposed in this paper. The proposed algorithm assesses the system's performance compared to the conventional SRF theory with %THD of non-linear load condition, voltage sag and swell conditions. The proposed AL_LMS algorithm has achieved better results in these conditions by generating proper reference currents to both the shunt and series VSCs of UPQC. Even in instances of voltage sag and swell situations, the load voltage is satisfactorily kept at its nominally rated voltage of 1 P.U. at a decrease in %THD of 2.41% and also source current %THD had been reduced significantly to 3.49% and made sinusoidal for non-linear load currents condition as compared to conventional SRF theory. Furthermore, the suggested strategy assists in meeting the active power requirement for loads by capturing solar-PV energy and, consequently, reducing the load burden upon the network grid.

Microgrid Power Quality Enhancement with Adaptive Control Strategies: A Literature Survey

Abstract. *Renewable energy technologies are becoming more and more common for generating electricity because they are environmentally friendly and can meet local electricity needs. They reduce network congestion and also lighten the load on conventional based power plants. Within the last few decades, grid-connected renewable energy systems have seen a rise in the significance of Power Quality issues, particularly as a result of the extensive usage of nonlinear electronics and the sporadic nature of these systems. With the emergence of power electronic converters through powerful control technology, renewable energy systems be interconnected to a large extent with the power grid or used as isolation systems in remote areas. Using additional competent control strategies can enhance not only improve the concert of these systems, but also calibre the quality of energy generated, distributed and used at the load side of Power System. Hence, this paper reviews various control strategies adopted for alleviation of power quality problems of renewable energy coordinated microgrid system and can be useful as research study for further research.*

Streszczenie. *Technologie energii odnawialnej stają się coraz bardziej powszechne w wytwarzaniu energii elektrycznej, ponieważ są przyjazne dla środowiska i mogą zaspokoić lokalne zapotrzebowanie na energię elektryczną. Zmniejszają przeciążenie sieci, a także zmniejszają obciążenie konwencjonalnych elektrowni. W ciągu ostatnich kilku dekad systemy energii odnawialnej podłączone do sieci odnotowały wzrost znaczenia kwestii jakości energii, szczególnie w wyniku szerokiego wykorzystania nieliniowej elektroniki i nieciągłego charakteru tych systemów. Wraz z pojawieniem się przetwornic energoelektronicznych dzięki zaawansowanej technologii sterowania, systemy energii odnawialnej mogą być w dużym stopniu połączone z siecią energetyczną lub wykorzystywane jako systemy izolacji w odległych obszarach. Zastosowanie dodatkowych kompetentnych strategii sterowania może nie tylko poprawić działanie tych systemów, ale także poprawić jakość energii wytwarzanej, dystrybuowanej i wykorzystywanej po stronie obciążenia Systemu Elektroenergetycznego. W związku z tym niniejszy artykuł zawiera przegląd różnych strategii sterowania przyjętych w celu złagodzenia problemów z jakością energii w skoordynowanym systemie mikrosieci energii odnawialnej i może być przydatny jako studium badawcze do dalszych badań. 1. Introduction

Now-a-days, some environmental issues arise due to carbon emissions from fossil fuel power plants, which cause environmental pollution and global warming. Alternatively, Renewable Energy (RE) based generating systems are regarded clean and cheap in comparison with conventional electricity generation. Various RE sources are Solar PV energy, Wind energy, Small Hydroelectric plants, Biogas, Geothermal energy, and Tidal and Wave energy. Of these resources, Solar PV and Wind energy systems hold the majority promise owing to the low cost of electricity production and the ability to track maximum power points over an ample range of wind and sunlight discrepancies [1]. Because of this, governments and some private firms are solicitude in increasing the production of energy from renewable sources by replacing production based on fossil fuels. By 2030, in compliance with the International Renewable Energy Agency, the worldwide plan for the integration of RE resources are of 36% of global energy demand and is expected to come from renewables [2]. Due to the unavailability and pollution of traditional energy resources, the integration of RE resources into the grid has completely changed the structure of modern power systems. Hence, the microgrid (MG) concept has attracted a lot of attention from system operators in order to improve operational efficiency and ensure a more reliable, sustainable and economical power system [3].

Microgrid can be considered an alternative to the consumption of traditional plants based on fossil fuels to reduce the energy supply deficit. It enables the benefits of efficient and sustainable energy supply, reduced carbon emissions, and delayed expansion of distribution infrastructure. A Microgrid has the ability to operate as a single system, and if there is a problem with the grid, it can be disconnected or independent from the main power system and reconnected to the grid when the problem is resolved [4]. One-off the core intention for the progress of the MG structure is the incursion of RE sources. Thus, the basic characteristic parts of MG have Dispersed Energy Resources (DER), consumers, and regulators, as depicted in the Fig.1. below. However, integrating renewable energy into the main grid becomes an exigent task due to the intermittency of energy sources nature and so adaptive control strategies are required for power converter control [5] as described in the following sections to improve Power Quality (PQ) in a microgrid.

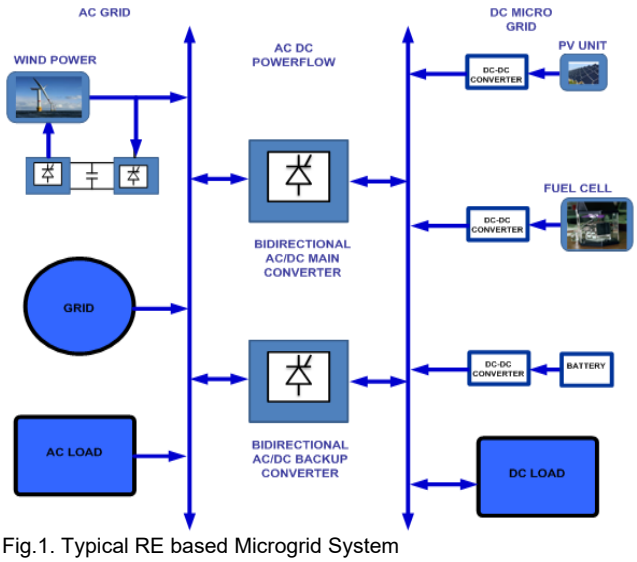

Fig.1. Typical RE based Microgrid System

In this paper, an introduction is dealt in section-1, section-2 mention Power Quality issues, challenges and possible solutions in microgrid, section-3 explains the different power quality enhancing methods, section-4 describes power converter controller strategies for PQ issues and conclusion part in section-5.

2. Power Quality Issues in a Microgrid

TIRUPATI - 517 502

The term "Power Quality" (PQ) in general refers to distribution bus voltage that remains nearly sinusoidal at rated amplitude and frequency. Furthermore, the energy made available to customers has got to be well-thought-out from a reliability viewpoint [6, 7]. The impact of power quality problems once microgrid connected to the main grid have concern due to the augmented penetration of non-linear loads and distributed energy systems with power electronic converter (PEC) interfaces. Challenging problems of grid integration are related to power quality issues related to current harmonics and that of voltage like voltage sag/swell, voltage imbalances & distortions caused by grid failures; frequency fluctuations, energy optimal layout and system isolation in abnormal conditions [8]. Proper control of the RE resources connected power electronic converter is essential that ensures stable operation in a period of transients and changes in AC system parameters. Renewable energy must be controlled using PEC to meet load requirements in stand-alone system applications and meet grid codes in grid-tied mode. It is reported that the Islanded mode is more likely to experience disturbances, such as voltage distortions and unbalances, since load distribution is unbalanced and line impedance is very high compared to grid-connected mode. To filter harmonics and smother unbalances, PE interfaced converters (inverters) could be effectively controlled [9]. In the grid-connection mode, disturbances such as grid voltage imbalance and voltage drop are the most common problems. Power Quality and stability of the system can be achieved via suitable control techniques incorporated to the power converter control circuit. Due to these impacts, improvement of the power quality of electric systems becomes a mandatory requirement. Hence, power quality problems get remunerated in control strategies applied to the interfacing inverter as mentioned in following section.

2.1 PQ Challenges and Solutions in a Microgrid

Now-a-days, some progressive technologies and techniques are being used continuously to develop and address the power quality challenges and their mitigation brought about by the incorporation of renewable energy in a microgrid [10]. Table 1. outlines the foremost challenges faced by grid-connected and islanded microgrid systems along with feasible remedies or mitigations.

Table 1. PQ Challenges and possible mitigating remedies in a microgrid [11]-[15]

Operational Mode	Challenges	Mitigating Solution
Grid Connected	Irregular Solar (PV) radiation and Voltage fluctuations due to variations in the wind speeds	Series &Shunt APFs. Power compensators like Fixed and/ or Switched Capacitor or Static Compensator. Utilities line conditioning systems and less sensitive consumer's equipment's to power disturbance/ voltage distortions.
Grid Connected	Frequency fluctuations for unexpected variations in active power caused by loads	PWM inverter control for regulating the frequency and voltage of a 3-Φ AC local bus in a Microgrid.
Grid Connected	Harmonics due to Power Electronic Controllers and non-linear appliances	Switching PWM Converter and applying the proper filters.
Grid Connected	Synchronization	Phased Locked Loop (PLL). In addition, grid voltages can be monitored for zero crossings and filter combinations can be used in conjunction with non-linear transformations
Stand-alone	Discontinuous in Energy and Power Quality	Incorporating RE resources with BESS or fuel cells, in a few situations with Diesel generator support systems.
Stand-alone	Protection	Appropriate protection & control equipment have to be incorporated for security reasons including upgrading existing systems when RE resource is connected.
Stand-alone	High Cost of Energy Storage	Incorporating both solar PV and Wind energies will curtail storage necessities and eventually on the whole system cost.
Stand-alone	Storage come to an end	Assimilate PV, Wind energies with Fuel-Cells.

3. Microgrid Power Quality

Currently, a major area of research in industry and academia is the network interaction of RE's for improved system performance. In the incidence of non-linear loads, a microgrid powered by a RE's integrated into the main grid generates harmonic currents that are in phase opposite to the reactive currents of the load [16]. Harmonic components are introduced by RE integration, which lowers the quality of the power at the point of common connection (PCC) into the network which must not exceed certain limits. The various measures have been carried out to enhance the quality RE resources generation, including that of the application of improved management strategies and the usage of various auxiliary equipment [17]. This section discusses controllers that encompass premeditated literature intended for mitigating power quality problems in a microgrid.

Power Electronics Converters are known to be the heart of the REs; these devices are responsible for injecting harmonics into the system. Various advanced methods of controlling inverters of RE systems for harmonic suppression are presented in [18]. The improvement of power quality with the use of filters or auxiliary equipment was suggested in [19] for hybrid PV/wind power plants. PQ issues namely power oscillations, harmonics, power factor, and voltage imbalances are significantly improved by FACTS controllers in highly RE perforated systems [20]. The power quality is improved by using a variety of energy storage devices, particularly for the purpose of power smoothing in RE systems discussed in [21, 22]. These include batteries, supercapacitors, and flywheel energy storage. Additionally, various techniques such as electric springs [23], soft computing-based approaches [24], and modular multilevel converters (MMC) are used in refining the power quality of RE systems [25]. The summary of the different strategies discussed in this section for improving the power quality of the system are as shown in Fig.2 below.

4. Controller Strategies for Power Quality Enhancement

This section provides an enhanced Islanded/grid-connected converter control techniques using adaptive control to enhance performance and repress harmonics in a microgrid where local steady and dynamic AC/DC loads are also coupled to the point of common connector (PCC). Controllers for these microgrids must include fast transitions between grid-tied as well as islanded modes of operation to mitigate the effects of mains outages and reduce the impact

of RE's intermittency and compensate for the existence of harmonic or unbalanced loads, thereby improving microgrid power quality.

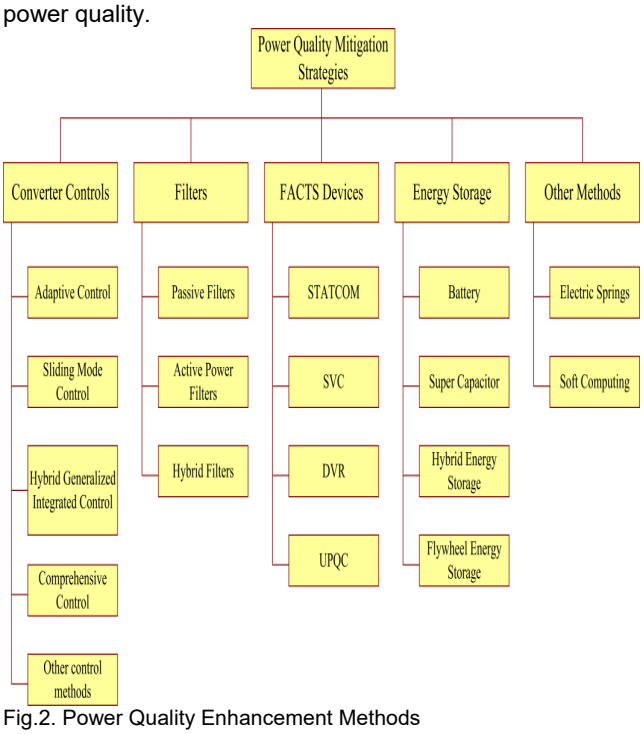

Fig.2. Power Quality Enhancement Methods

Hence, power quality problems get remunerated in control strategies applied to the interfacing inverter as shown in the Table 2. below.

Table 2. Different Power Converter Control Strategies

Reference	Controller Strategy	Features
[26, 27]	PI Controller (Natural Reference Frame)	Simple control structure. Regulates the basic component. Unbalanced systems cannot be guaranteed to perform effectively.
[28, 29]	PI Controller (Synchronous Reference frame)	It shows satisfactory performance in the regulation of DC variables. Ensure zero error in the steady-state. Poor lower order harmonic compensation
[30, 31]	Proportional Resonant (PR) Controller	Robust current controller. Ensure zero error in the steady-state. Obtains high gain values. Resonance problems are caused by changes in load parameters and in operating conditions.
[32, 33]	Hysteresis Current Control	Simple structure. Essentially robust. Not considering of changes in load parameters. It provides great dynamics. Lower order harmonics has no concern. There is no fixed switching frequency.
[34, 35]	Repetitive Controller	Periodic disturbances eliminated. Essentially robust. Ensure that the Steady-State Error is zero for all harmonic frequencies. Stability is a problem when the load disturbance is aperiodic. Slow response when load varies.
[36, 37]	Deadbeat Control	Simple in nature. Highly tracking speed and control accurateness is obtained. Performance relies on the sample frequency. Sensitive to system parameter variations.
[38, 39]	H∞ Control method	Suitable for Multi Input Multi Output (MIMO) systems. It offer less THD and better performance. Considers plant complexity, uncertainties, perturbations or dynamics. It makes sure of good performance under each type of loads. Slow dynamics. Because modelling is complex, it requires knowledge of advanced mathematics.
[40, 41]	Fuzzy Controller	Able to control the nonlinear behaviour of complex control structures using heuristic and expert knowledge of controlled process. Insensible to system changes. Slow control method.
[42, 43]	Neural Networks method	Used by current controllers because they are robust in nature. Offline training methods lack efficiency.

Table 2. lists some of the different features of distinct controller's methods. Hence, from the above discussion it can be found that PI controller, Hysteresis Current control and Fuzzy method controllers are extensively used as the power converter controller strategies. Although, many deliberations are made in the studies on control methodologies in improving power quality of the microgrid systems, no single control technique can solve all power quality problems simultaneously. Therefore, future research will capable of focusing on the development of control techniques that meet the requirements and highly dependent on proper system modelling with the application of advanced control strategies such as optimization techniques [44, 45, 46] applied to the microgrid system controller design.

4.1 Power Quality Enhancement with Optimization/AI techniques

The goal of power quality in microgrids is solved using a variety of AI-based optimization strategies. Optimized linear and nonlinear models are suitable for grid connected as well as islanded modes of microgrid [47]. PSO is an intelligent computing technique that searches for the best parameter settings in real-time [48]. For the purpose of removing voltage harmonics in microgrid systems with numerous DG sources, a union of PSO based PWM and SPWM inverters was proposed in [49]. A concurrent self-tuning technique was described in [50] as the basis for an optimal control approach considering the criteria of Voltages, frequency regulation, and power-sharing in performance evaluation during microgrid operational mode changes and sudden load variations. With the intention of improving power quality in multi-bus microgrids, the authors [51] suggested an optimization technique with primary goal was to mark voltage regulation at specific buses. A controller with gains derived from system admittance and tuned via Ant-Lion Colony (ALC) algorithm was proposed in [52]. In [53], a PI controller with settings adjusted using a whale's optimization algorithm (WOA) was suggested. The apparent controller regulates voltage and frequency within an autonomous microgrid that is powered by inverters.

The authors in [54] devised a control approach that uses the Grasshopper optimization technique to govern the optimal gains in the PI controller meant for power quality enhancement in photovoltaic-based microgrids running in the autonomous mode. A Slap Swarm Optimization (SSO) based PI controller was implemented in [55] for improving power quality under conditions of dynamic loads.

5. Conclusion

- This article provides a comprehensive review on various control strategies and state-of-art-tools utilized for extenuating power quality issues in a renewable energy coordinated microgrid.
- Different controllers and their control strategies that are intended for enhancing power quality are discussed with possible challenges and solutions thoroughly.
- Also, the study deals several optimization approaches for renewable energy resources interfacing power electronic converter in terms of power quality performance.
- Further studies are recommended in the usage of adaptive control techniques and hybrid optimization algorithms which results in better performance and efficacy in improving the power quality of a microgrid.

A Study on the Rheology of Scc with the Addition of Fly Ash in Opc, Ppc and, Psc Cements with Different Mixing Times

M M Premchand[1], Dr I V Ramana Reddy[2]

[1]Research Scholar, Department of Civil Engineering, Sri Venkateswara University College of Engineering, Sri Venkateswara University, Tirupati – 517 502, India

[2]Professor, Department of Civil Engineering, Sri Venkateswara University College of Engineering, Sri Venkateswara University, Tirupati – 517 502, India

Abstract: In this paper, a study was performed on the rheological properties of self-compacting concrete by the addition of Supplementary Cementitious Material (SCM) as Fly Ash with various percentages of 15%, 20%, 25%, and 30% in the different types of cement OPC, PPC, and PSC. The mix designs of self-compacting concrete were done by two methods of constants: Water-Binder Ratio Constant and Weight and Volume of Aggregates Constant for varying percentages of addition of Fly Ash with a fixed cement content of 380 kg per cubic meter. Flow ability (Flow Table and V Funnel) and Passing Ability (L-Box and U-Box) tests were carried out on fresh concrete in accordance to EFNARC with three different mixing times 5(initial), 30, and 90 minutes were done to find the self-compactibility of designed concrete mixes. Varying dosages of Super Plasticizer (Auromix 450) were added to obtain the required flow ability and passing ability of SCC without bleeding of water and segregation of aggregates. Self-compactibility of the designed SCCs was obtained for 20%, 25%, and 30% addition of SCM in Water-Binder Ratio Constant Method and 15%, 20%, and 30% addition of SCM in Weight and Volume Constant Method.

Keywords: Self-Compacting Concrete, Fresh Properties, Supplementary Cementitious Materials, Fly Ash, Constant methods, Mixing Time.

1. Introduction

With the rapid expansion of numerous structures throughout the world, the demand for self-compacting concrete (SCC) application is growing. Now a day's majority of the construction sites have issues of congestion of reinforcement in the structural members. The considerable seismic danger in the area, the facilities' susceptibility to cyclonic storms, and their massive capacity of expansion, all exacerbate the design flaws. SCC has become the only choice in such difficult site environments. Ideally, the development of concrete mix where placing and compaction have minimal dependence on the Standard of workmanship available on a particular site should improve the true quality of the concrete in the final structure, and hence its durability. This was an important driving force behind the development of self-compacting concrete (SCC). Self-compacting concrete is considered as a breakthrough in concrete technology due to its improved performance and working environment. It has wide application from thin elements to huge structures. SCC can be taken as the greatest technical advancement and most revolutionary development in concrete technology over the years. SCC is the concrete of the future, as it will be replacing normal concrete due to its distinct advantages.

The European Federation for Specialist Construction Chemicals and Concrete Systems (EFNARC) has developed guidelines for SCC, known as the "EFNARC Specification and Guidelines for Self-Compacting Concrete." These guidelines provide recommendations on mix design, fresh and hardened properties, and testing methods for SCC.

SCC can be produced using the same ingredients as that of normal concrete. A closer tolerance is required to ensure strict control of workability characteristics. The proportioning of SCC mix is much more scientific than that of conventional concrete mixes. SCC mix requires high powder content, lesser quantity of coarse aggregate, high range super plasticizer, and VMA (Viscosity Modifying Agent) to give stability and fluidity to the concrete

mix. The workability of SCC is the equilibrium of fluidity, deformability, filling ability, and resistance to segregation. This equilibrium has to be maintained for a sufficient time period to allow for its transportation, placing, and finishing. Combinations of tests are required to characterize the workability properties.

The most commonly used cement in self-compacting concrete (SCC) is Ordinary Portland Cement (OPC). OPC is widely available and has been extensively used in various concrete applications, including SCC. In self-compacting concrete, the cement content is usually adjusted based on the specific requirements of the project and the desired properties of the SCC mix. The selection of cement type may also depend on factors such as the project's location, local availability, and any specific performance requirements. The use of alternative types of cement is becoming more prevalent in the construction industry to address environmental concerns. For example, in some regions, where environmental regulations are stricter, or sustainability is a top priority, blended cements such as Portland Slag Cement (PSC) and Portland Pozzolana cement (PPC), have gained popularity due to their reduced carbon footprint and improved performance characteristics. Blended cements are already a combination of Ordinary Portland Cement (OPC) and supplementary materials, such as fly ash and slag. Adding more SCMs to these blended cements further enhances their properties and performance in SCC mixes such as Improved Workability, Reduced Permeability and Improved Durability, Reduced Heat of Hydration, Sustainable Solution, Setting Time, and Strength Development. The addition of SCMs to blended cements can also bring challenges to the mix design process. The interaction between various materials can affect the rheological behavior, setting time, and strength development of the SCC. Precise mix proportioning and testing are essential to ensure the desired performance of the concrete. The Percentage of dosage of SCMs in blended cements for SCC depends on various factors such as the type of SCM, Cementitious content, water-to-binder ratio, desired strength, and workability. Mix designs should be tested thoroughly to verify the fresh and hardened properties of the SCC to meet project specifications and requirements. In this study, the effect of fresh properties of SCC on addition of SCM to blended cement with different design mix methods was done.

Concrete, in general, loses workability over time because of the evaporation of water, the absorption of water through the aggregates, the hydration of cement, and increased mixing temperature. The properties of SCC deteriorate with prolonged mixing, casting, and finishing time. The effect of mixing time on concrete can be avoided or reduced by adding alternative cement materials or/and by increasing the dosage. Many researchers reported that the addition of high super plasticizer dosage may increase workability and decrease its negative effects that are caused by long mixing time. The increase in super plasticizer dosage may lead to wet surroundings, which increase workability, and the hydration process accelerates as water spreads between the cement granules. Thus, reducing concrete consistency increases bleeding and segregation. The effects of mixing time and suitable super plasticizer dosage still need further investigations to maintain the workability and consistency of concrete for a long time. In this study, workability was measured with 5, 30, and 60 minutes of mixing times with an optimized super plasticizer dosage for each mix.

2. Materials.

2.1. Cement:

In Production of SCC, Ordinary Portland Cement (OPC) - 53 grade, Portland Pozzolona Cement (PPC), and Portland Slag Cement (PSC) were used in this study. Some physical and chemical properties of cements which are collected from the cement manufacturer are shown in Table 1.

Table 1: Physical and Chemical Properties of Cements

Description	OPC		PPC		PSC

2.2. Fly Ash

For this Study, Class F Fly Ash was used which is procured from Sri Damodaram Sanjeevaiah Thermal Power Station is located in Nelatur Village, near Krishnapatnam, Andhra Pradesh, India. The power plant is one of the coal-based power plants of Andhra Pradesh Power Development Company Limited (APPDCL) and is in compliant with India Standard IS 3812:2003.

Table 2: Physical and Chemical Properties of Fly Ash

Component	SiO_2	Al_2O_3	Fe_2O_3	CaO	MgO	TiO_2	SO_3	LOI	K_2O	Na_2O	Specific Gravity	Blaines' s Fineness
%	65.80	21.32	4.87	1.00	0.53	0.50	0.20	0.16	0.81	0.21	2.14	321

2.3. Aggregates

2.3.1. Fine Aggregate

Locally available river sand is used as fine aggregate. The sand was dried before use to avoid the problem of bulking. The fine aggregate complies with Zone 2 from the sieve analysis as per Indian Standard IS 383:2016

2.3.2 Coarse Aggregate

Locally available granite with a size ranges from 12.5 mm and down was used as coarse aggregate.

Table 3: Physical Properties of Fine Aggregate

Aggregate	Specific Gravity	Fineness Modulus	Water absorption	Bulk Density	Dry Rodded Unit Weight
Fine Aggregate	2.63	3.65	0.50%	1582.85 kg/m^3	-
Course Aggregate	2.66	6.66	0.10%	1472 kg/m^3	1495 kg/m^3

2.5 Super Plasticizer

For this study, the super plasticizer used in Auramix 450 manufactured by FOSROC Chemicals which complies with Indian Standards IS 9103: 1999. Properties of Auramix 450 which are collected from the manufacturer are shown in Table 7.

Table 4: Properties of Super Plasticizer

Specific Gravity	pH	Chloride Content	Appearance
1.07	6.1	Nil	Light yellow colour liquid

2.6 Water

Potable water is used in this study.

3. Mix Design of Self Compacted Concrete

Mix design procedure of self-compacting concrete is adopted by taking guidelines from the reference of works by Dr. Okamura and Dr. Ouchi, Japanese researchers who first developed Self Compacting concrete and the norms given in EFNARC. These guidelines are not intended to provide specific advice on mix design but give an indication of the typical range of constituents in SCC by weight and by volume. These proportions are in not restrictive and SCC mixes may fall outside this range for one or more constituents.

3.1. Self Compacting Concrete Proportions

Generally, most of the researches are conducted by simple replacement method. Replacement of cement is done in different percentages of Supplementary Cementitious Material (SCM) either by volume or Weight (Mass). In this method the quantity of Binder Material (BM) is fixed and when replacement of SCM is done in different percentages of quantities, there will be change in the cement quantity and SCM quantity. The replacement method is represented in the form of equations as

C_0 + 0% SCM = BM i.e. C_0 = BM

C_1 + 5%SCM = BM

C_2 + 10%SCM = BM

C_3 + 15%SCM = BM etc

C_0, C_1, C_2, C_3 etc of quantities of Cement and %SCM is of BM

However, in this work, the addition method is adopted which involves the direct addition of SCM without changing the quantity of cement which is fixed and SCM is added with an increase of percentages of 15%, 20%, 25%, and 30% for binder material in SCC. The percentage of SCM is of the quantity of Binder Material.

$C + 15\%SCM = BM_1$

$C + 20\%SCM = BM_2$

$C + 25\%SCM = BM_3$

$C + 30\%SCM = BM_4$

C = Cement is taken as 380kg in this work. The experiments are conducted taking OPC, PPC, and PSC Cements, and SCMs are Fly Ash (F) and GGBS (G) added separately to each individual kind of cement in percentages given above

Further, the design of concrete in this work is done by addition method by taking two methods of constants.

1. Water Binder Ratio Constant Method
2. Aggregate Weight and Volume Constant Method

3.1.1. Water Binder Ratio Constant Method.

In this method as mentioned above the binder material is varied in all the types of cement (OPC, PPC, and PSC) by adding SCM percentages. The design is done by keeping the water-binder ratio constant for all quantities of binder material. The quantities of aggregates are adjusted accordingly for the volume of 1 cum of SCC satisfying the EFNARC norms and the dosage of super plasticizer is adjusted for getting the required fresh properties of SCC.

The equation of design will be as following in this method.

$SCC_1 = BM_1 + CA_1 + FA_1 + W\% + SP$

$SCC_2 = BM_2 + CA_2 + FA_2 + W\% + SP$

$SCC_3 = BM_3 + CA_3 + FA_3 + W\% + SP$

$SCC_4 = BM_4 + CA_4 + FA_4 + W\% + SP$

$W\% = 0.4\ BM_{1\ to\ 4}$

After few trails the suitable water binder ratio for this work was fixed at 0.4

3.1.2. Aggregate Weight and Volume Constant Method

In this method similar to the earlier method the binder material is varied in all the types of cement (OPC, PPC, and PSC) by adding SCM percentages. The design is done by keeping the quantities of aggregates constant. The weight and volume of aggregates are kept constant for all mixes and the water binder ratio is changed accordingly for 1 cum of SCC satisfying the EFNARC norms and the dosage of super plasticizer is adjusted for getting the required fresh properties of SCC.

The equation of design will be as following in this method.

$SCC_5 = BM_1 + CA + FA + W_1\% + SP$

$SCC_6 = BM_2 + CA + FA + W_2\% + SP$

$SCC_7 = BM_3 + CA + FA + W_3\% + SP$

$SCC_8 = BM_4 + CA + FA + W_4\% + SP$

CA = Coarse Aggregate is constantly taken as 50% weight of Dry Rodded Unit Weight, and

FA = Fine Aggregate is constantly taken as 55% of the total aggregate weight.

These values of aggregate quantities are also constant in terms of the volume of aggregates satisfying the EFNARC norms.

SP, the super plasticizer dosage was fixed on trial and error basis with number of trials to achieve at he mix with satisfactory fresh properties in both methods.

4. Results

4.1. Fresh Properties of Self Compacted Concrete

The fresh properties of Self Compacting Concrete designed and mixed with different cements and addition SCMs as per the tables given above are tested for Flow Ability and Passing Ability. The flow ability is tested by Slum Flow, T_{500} Slump Flow and V Funnel methods and passing ability is tested by L-Box and U-Box methods.

4.1.1. Slump Flow

The slump flow of fresh Self Compacting Concrete is measured on flow table using Abraham Cone. Unit of measurement of slump flow is millimeters. The acceptance levels as per EFNARC are 650 mm to 800 mm. In this work the acceptance levels of slump flow are taken from 600 mm and above.

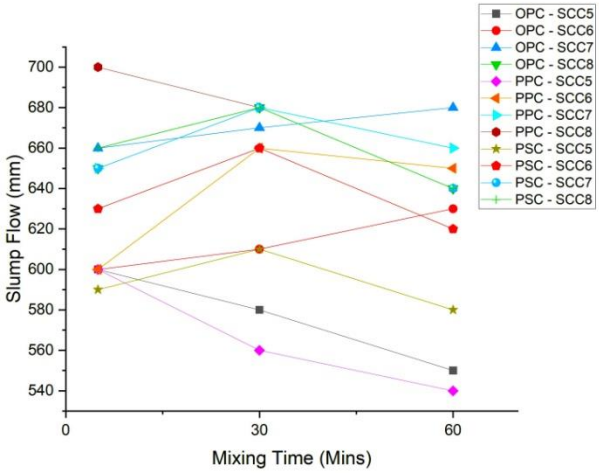

Fig.2. Slump Flow (Aggregate Weight and Volume Constant)

4.1.2. Slump Flow – T_{500}

Viscosity of the Self Compacting Concrete can be assessed by T_{500} time during slump flow test. The time value obtained does not measure the viscosity of SCC but is related to it by describing the rate of flow. Concrete with a low viscosity will have a very quick initial flow and the stop. Concrete with high viscosity may continue to creep forward over an extended time. The acceptance levels as per EFNARC are 2 sec to 5 sec. In this work the acceptance levels of slump flow are taken from 2 sec and 7 sec.

4.1.4. L-Box Test

Aggregate blocking must be avoided as Self Compacting Concrete flows through the reinforcement and the L-Box Test is indicative for passing ability of Self Compacting Concrete mix. The acceptance levels as per EFNARC are 0.8 to 1.0 (Ratio of h_2/h_1, h_1 is interior height and h_2 exterior height in L-Box base line after concrete stops flowing).

4.2. Discussion

The fresh properties of the mixes were mostly within the acceptance levels for the 20%, 25% and 30% addition with Water Binder Ratio constant method and 15%, 20% and 25% addition with Aggregate Weight and Volume Constant Method.

The slump flow in almost all mixes was observed with slight bleeding after resting of flow with initial mixing of 5 minutes. On Continuous mixing for 30 minutes the flow was good and no bleeding was observed in any of the mixes. After 60 minutes of continuous mixing the flow reduced when compared to 30 minutes with no bleeding.

The values of Slump flow $-T_{500}$ for almost all the mixes were was within the range of acceptance levels.

The V Funnel flow was good for all the mixes which had satisfactory slump flow. No blockage was found at the bottom of funnel for any of the mixes during the flow. The $T_{5Minutes}$ flow in V Funnel were also within the range of acceptance levels for all the mixes.

The values of L Box flow and U-Box Flow were observed to be good with addition of fly ash in OPC and PPC. Addition in PSC was observed with blockage and bleeding of water.

5. Conclusions

From the results and observations in this study the following conclusions may be made:

1. In Water Binder Ratio Method for 15% addition of fly ash in all types cements the quantity of aggregates was at higher side and the water was not sufficient for the binder material for getting the sufficient viscosity to get the required flow. If the super plasticizer was added more to get the flow, bleeding was observed with very low values of flow. The similar kind of observation was found in Aggregate Weight and Volume Method with addition of 30% of fly ash in all types of cements. The water content was not sufficient for the powder to get the viscosity and there were mixes with no flow. All other percentages of addition of fly ash in both the methods of mix design the results were all within the range of acceptance levels.
2. The mixing time in this study was one of the major factors. The initial mix for 5 minutes of continuous mixing in the pan mixer for all the mixes are within the acceptances levels but observed with some bleeding after the flow rested. After 30 minutes of continuous mixing almost all the mixes showed very good results with all the values within the acceptance levels. After the 60 minutes of continuous mixing almost all the flows slowed down when compared to the values 30 minutes of mixing but within the acceptance levels.
3. The mixes SCC2, SCC3, SCC4, SCC5, SCC6 and SCC7 were found to be self compactable almost satisfying the acceptance levels. All these mixes are found to be highly good with 30 minutes of continuous mixing.
4. The mixes which satisfied self compactibility can be further tested for strength properties

Abstract: This study presents a unique concept for an electric vehicle (EV) charging system that is powered by photovoltaic (PV) technology. The core of the system is a modified single-ended primary inductance converter, chosen for its high efficiency, reduced switch voltage stress, and ample operating range for maximum power point tracking (MPPT). This study details the redesigned SEPIC converter architecture, including with and without the MPPT algorithm. Additionally, an optimized parameter selection, design methodology, and simulation technique are presented for analyzing converter performance in EV charging applications. Two MPPT approaches, Perturb and Observe (P&O) and incremental conductance (IC), are investigated and compared based on their impact on the converter switching time under standard solar PV panel testing conditions. To comprehensively evaluate the system's performance, a MATLAB/Simulink model is developed, simulating the charging of a 48 V, 200 Ah battery using a 2 kW solar PV input through the modified SEPIC converter and variations in the battery state of charge (SoC), battery voltage, and charging current are monitored. The simulation results demonstrate that under identical simulated conditions (10 Sec), the battery SoC increases from 50% to 50.034% without MPPT and to 50.042% with MPPT, highlighting the effectiveness of the MPPT algorithms in maximizing harvested solar energy.

Introduction

The increasing adoption of electric vehicles necessitates the development of efficient and readily available charging infrastructure. This paper presents a novel approach to EV charging by utilizing a PV-powered system with a modified SEPIC converter. Compared to traditional boost converters, the modified SEPIC offers several advantages, including nearly double the static gain, a wider operating range for the MPPT controller and reduced switch voltage stress, thereby enhancing the converter's reliability and lifespan (Eltamaly and Abdelaziz, 2019).

The adoption of renewable energy alternatives has increased dramatically due to the rising costs and depletion of nonrenewable energy sources. Among these, photovoltaic (PV) energy has drawn much interest as a potential remedy for the problems posed by increased energy demand and global warming. Fuel independence, environmental friendliness, durability, and cheap maintenance are just a few advantages of PV energy (Chilakapati and Manohar, 2023; Ramesh et al., 2023). Many processes are involved in integrating PV systems into the grid, one of which is raising the output voltage to meet grid requirements. Boost converters or high-frequency step-up transformers are used in conventional methods. Even though DC-DC converters are frequently used to boost PV system voltage, traditional topologies frequently have poor static gain, which lowers the output voltage (Suryoatmojo et al., 2018).

For instance, the maximum input voltage increase that a SEPIC converter with a duty cycle of 0.82 can achieve is a factor of 5. A tenfold increase in the input voltage is needed to fulfil grid requirements, making the use of a

step-up transformer redundant. This study suggests a modified SEPIC converter architecture to overcome these drawbacks. With the addition of a diode and a capacitor, the converter may increase the input voltage by up to ten times. Because of these improved capabilities, a step-up transformer is no longer necessary, simplifying the system design and perhaps increasing efficiency. By investigating modified SEPIC converter architectures that deliver higher output voltages and better efficiency, this research seeks to integrate further PV systems (Suryoatmojo et al., 2018).

Background of the Work

Mouli et al. (2015) and Bhatti et al. (2016) systematically study various topologies and system architectures of PV charging systems in the context of electric vehicles. Three primary conclusions emerge regarding PV charging systems for EVs: grid-connected systems are more preferred against off-grid systems, a topology with a DC-link is the most effective for the overall system arrangement, and standards require that EV converters be isolated.

Mouli et al. (2015) present four different architectures of integrated EV-PV systems as follows: the PV system and the EV system use either a power converter integrated or separate converters for both PV and EV, and whether the connection is through AC or DC circuitry (Yadav et al., 2023; Thota et al., 2023). At the same time, many researchers (Tulpule et al., 2013; Verma et al., 2016) consider the power exchange to be carried out through AC, suggesting a separate PV inverter and an AC EV charger and possibly integrated energy storage to perform this function). The downside to this strategy is that both PV and EV equipment are essentially DC devices. Subsequently, power exchange over AC leads to added losses and necessitates two inverters in place of one. Thus, a design featuring an integrated converter and a DC link for exchanging power between the EV and the PV is more optimal (Goli and Shireen, 2014).

Methodology & Designing

Solar PV Specifications

The design and development of a MATLAB/Simulink model for a solar photovoltaic (PV) system intended to recharge an electric vehicle's (EV) battery is described in the present article. The system was configured to deliver 48 V and 200 Ah to the battery using a modified SEPIC converter. One of its main benefits is the 48V 200Ah battery's capacity to give electric cars a longer range. Electric vehicles (EVs) can cover greater distances on a single charge due to their larger capacity and higher voltage. The 48V 200Ah battery is considered for simulation since it also provides better efficiency compared to conventional battery technologies.

Table 1. Solar PV Module Specifications at STC.

Parameter	Specification
Voltage at MPP (V_{MPP})	30.9 V
Current at MPP (I_{MPP})	8.1 A
Power at MPP (P_{MPP})	250.29 W
Open Circuit Voltage (V_{OC})	36.6 V
Short Circuit Current (I_{SC})	8.75 A

A constant irradiation of 1000 W/m^2 and a temperature of 25°C are assumed in the simulation. The PV system incorporates the maximum power point tracking (MPPT) functionality to maximize the power output. The simulated system has eight parallel modules, and each module has sixty solar cells. The specific design parameters of the PV modules are detailed in Table 1 (Datasheet, 2023).

Perturb & Observe MPPT

The prime motive of Perturb and Observe is to ensure that the solar module operates at its peak efficiency by continuously perturbing the operating point of the solar panel and observing the corresponding change in power output. This algorithm alters the operating point till it attains the maximum power point (MPP). This is a widely used technique in the field of photovoltaic systems aimed at optimizing the efficiency of solar energy conversion. P&O MPPT is renowned for its simplicity, cost-effectiveness, and adaptability to various environmental conditions. The flow chart of P&O MPPT is shown in Figure 1(Eltamaly and Abdelaziz, 2019).

Incremental Conductance MPPT

The primary intention of the Incremental Conductance Maximum Power Point Tracking (MPPT) technique is to make sure that it operates at the maximum power point (MPP) under varying environmental conditions. This is a sophisticated algorithm employed in photovoltaic systems to optimize the energy output from solar panels. Unlike conventional fixed-point methods, Incremental Conductance MPPT dynamically tracks changes in the solar array's voltage and current characteristics, making it highly responsive to fluctuations in sunlight intensity. By comparing the incremental conductance, which is the rate of change of power concerning voltage, with the instantaneous conductance, the algorithm effectively and efficiently converges toward the MPP. The flow chart of incremental conductance MPPT can be seen in Figure 2 (Eltamaly and Abdelaziz, 2019).

DOI: https://doi.org/10.52756/ijerr.2024.v39spl.009

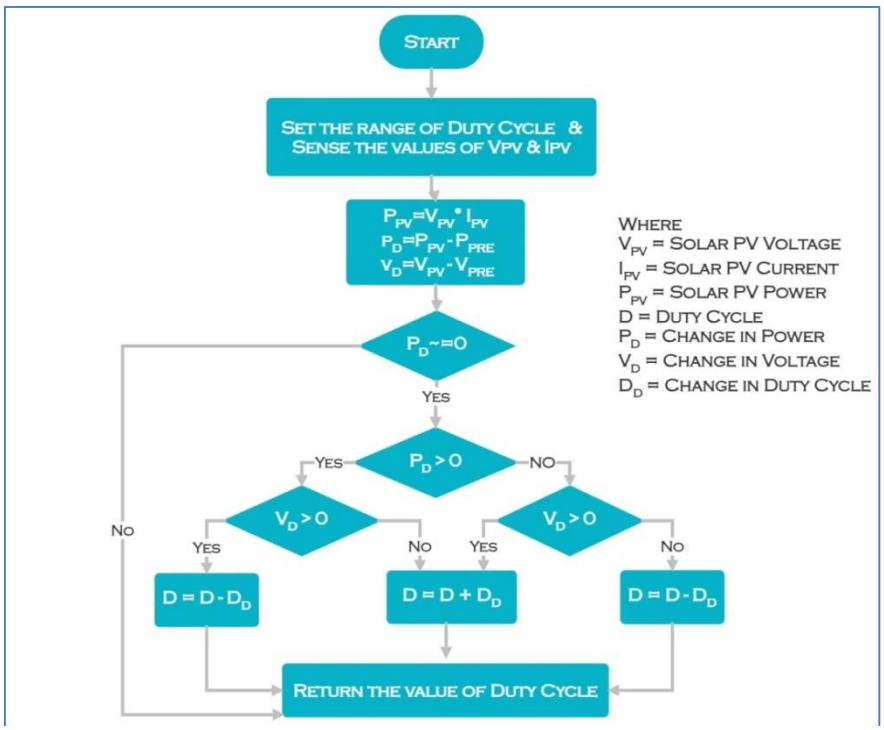

Figure 1. Flowchart for Perturb & Observe MPPT.

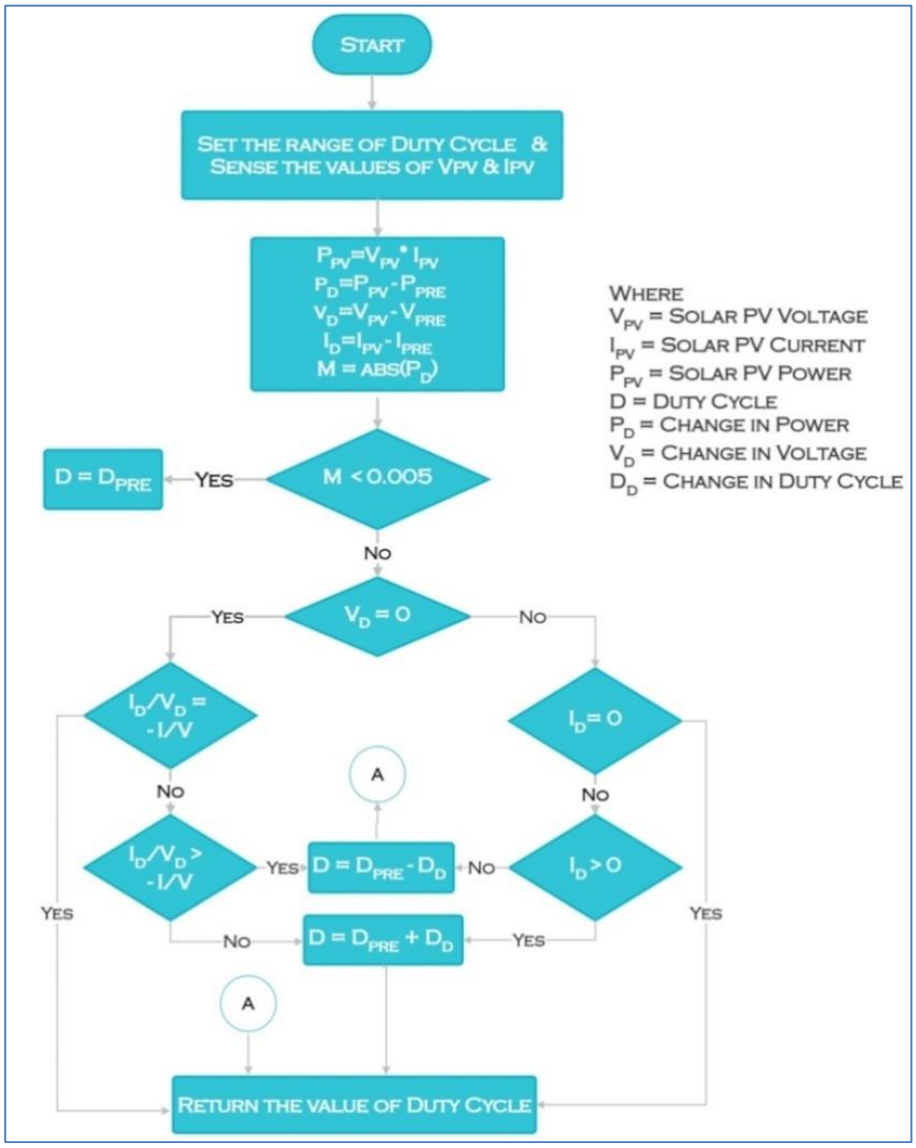

Figure 2. Flowchart for Incremental Conductance MPPT.

DOI: https://doi.org/10.52756/ijerr.2024.v39spl.009

Design of Modified SEPIC Converter

The power circuitry of the traditional SEPIC converter is presented in Figure 3. A key feature of the SEPIC converter is its ability to both boost (step-up) and buck (step-down) the input voltage, making it suitable for applications with a wide range of input voltages. However, the switch voltage is equal to the sum of the input and output voltages (Falin, 2023; Babaei and Mahmoodieh, 2014).

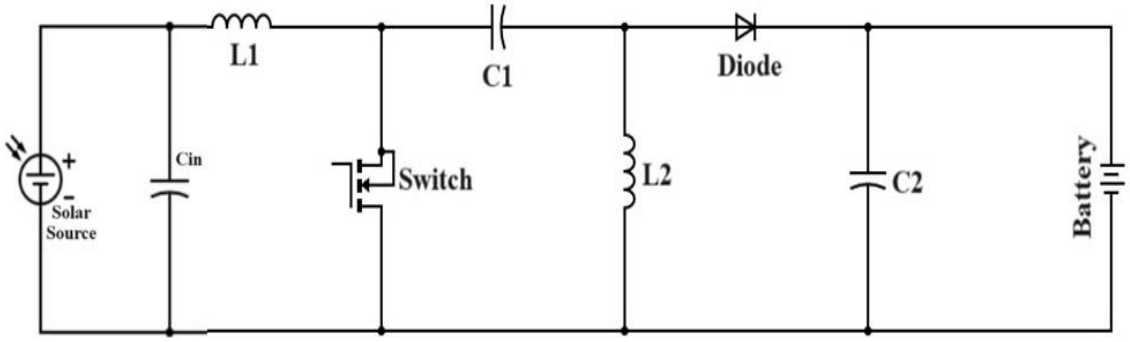

Figure 3. Schematic of the traditional SEPIC converter.

This topology is modified by incorporating additional components and rearranging the existing components. A schematic of the modified SEPIC topology is shown in Figure 4 below (Gules et al., 2011; Mishra and Singh, 2018; Maroti et al., 2019; Parthasarathy et al., 2022; Muranda et al., 2017).

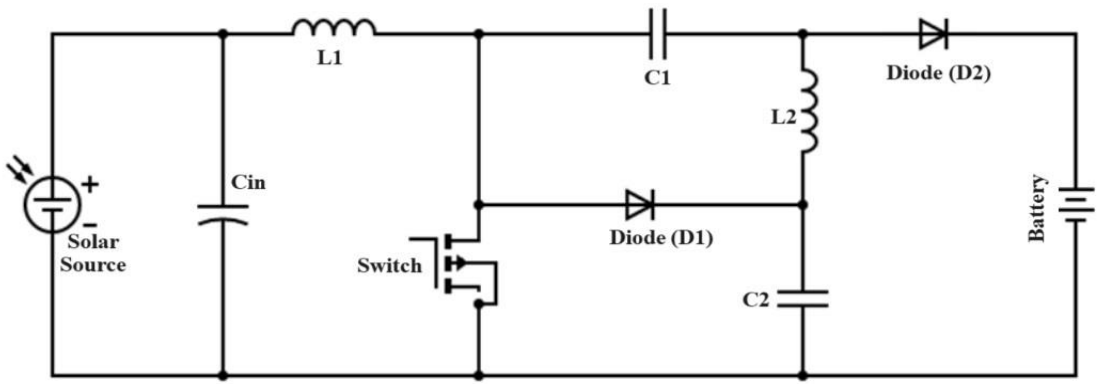

Figure 4. Schematic of the modified SEPIC converter

In continuous conduction mode, the duty cycle of the modified SEPIC converter can be determined by eq.(1).

$$Duty\ Cycle\ (D) = \frac{V_{Out} - V_{In}}{V_{Out} + V_{In}} \quad \ldots (1)$$

The input current is given by eq.(2).

$$Input\ Current\ (I_{in}) = \frac{Input\ Power}{V_{In}} \quad \ldots (2)$$

The first step in designing a PWM switching regulator is determining how much inductor ripple current (ΔI_l) to permit. The inductor ripple current of this topology can be calculated using the eq.(3).

$$Inductor\ Ripple\ Current\ (\Delta I_l) = 0.1 * I_{in} \quad \ldots (3)$$

The inductances can be calculated using eq.(4).

$$Inductances\ L_1 = L_2 = \frac{V_{In} \times D}{\Delta I_l \times F_s} \quad \ldots (4)$$

The maximum allowable output ripple is considered to be 2%. The capacitance can be determined using eq. (5).

$$Capacitances\ C_1 = C_2 = \frac{I_O}{\Delta V_C \times F_s} \quad \ldots (5)$$

The change in voltage across the capacitors is determined by eq.(6).

$$\Delta V_C = 0.02\ X\ \frac{V_{out}}{(1-D)} \quad \ldots (6)$$

For a switching frequency of 20 kHz and analogous input power and load, the various parameters of the ZETA, SEPIC and modified SEPIC converters are calculated and the values are tabulated in Table 2 (Reddy and Reddy, 2024).

Results & Discussion

This study investigated the charging performance of a 48 V, 200 Ah electric vehicle (EV) battery using a 2kW solar photovoltaic (PV) source with a modified SEPIC converter. The simulation is conducted within the MATLAB/Simulink environment.

DOI: https://doi.org/10.52756/ijerr.2024.v39spl.009

Table 2. Evaluated parameters of the ZETA, SEPIC and Modified SEPIC Topologies.

Sl. No	Parameter	ZETA Topology	SEPIC Topology	Modified SEPIC Topology
1	Switching Frequency	20kHz	20kHz	20kHz
2	Max. Duty Cycle (D_{Max})	64%	64%	25.6%
3	Min. Duty Cycle (D_{Min})	60.83%	60.83%	21.7%
4	Inductor (L_1)	362 mH	225 µH	7 mH
5	Inductor (L_2)	362 mH	350 µH	7 mH
6	Capacitor (C_1)	2.6 mf	410 µf	1.7 mf
7	Capacitor (C_2)	3.9 µf	264 µf	1.7 mf

Key parameters such as voltage, current, and power from the PV panel are monitored alongside the battery's state of charge (SoC), charging current, and voltage. The test conditions were kept consistent across all the scenarios. Figures 5 to 13 present the MATLAB/Simulink models, PV characteristics (voltage, current, and power), battery SoC, charging current, and voltage for the modified SEPIC converter under three configurations: without maximum power

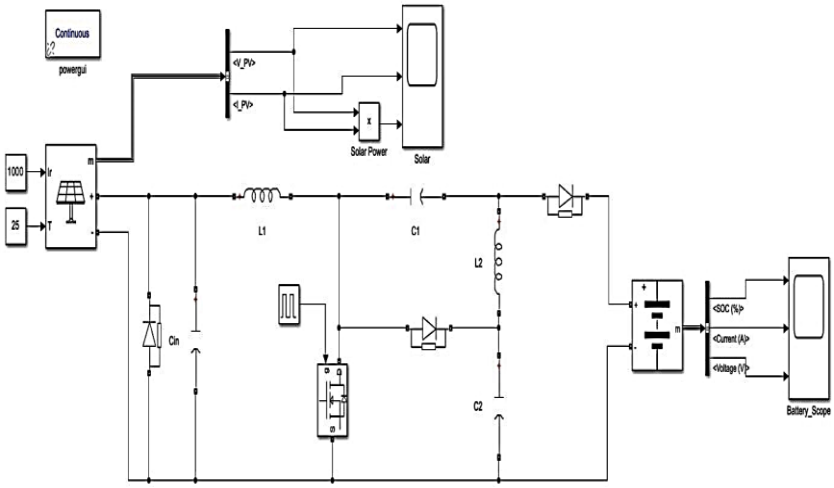

Figure 5. MATLAB/Simulink Model of the modified SEPIC converter without MPPT.

point tracking (MPPT), with Perturb and Observe (P&O) MPPT, and with incremental conductance MPPT.

Under identical test conditions, the performances of the EV charging system powered by solar PV employing ZETA, SEPIC and modified SEPIC converters with and without MPPT methodologies are presented in Table 3. Without using Maximum Power Point Tracking (MPPT), a Zeta converter takes roughly 6.94 hours to charge a battery, while a SEPIC converter completes the task in a significantly shorter 4.63 hours. This advantage persists even with MPPT techniques. For example, Incremental Conductance MPPT allows a SEPIC converter to finish charging in just 3.97 hours, whereas a Zeta converter under the same MPPT method still requires 5.5 hours (Reddy and Reddy, 2024).

Furthermore, advancements in SEPIC converter technology show even greater promise. A modified SEPIC converter can achieve the same charging level in a mere 4.09 hours without MPPT, and a remarkable 3.3 hours with MPPT. This represents a substantial improvement in charging efficiency. These results unequivocally show that utilizing solar electricity to charge the batteries of electric vehicles is a more efficient use of the modified SEPIC converter.

It is important to note that negative battery current values indicate that the battery is in charging mode.

Conclusion

This paper presented a novel PV-fed EV charging system utilizing a modified SEPIC converter. The proposed system offers several advantages, including high efficiency, reduced switch voltage stress, and the integration of MPPT algorithms to maximize power extraction from PV panels. The simulation results demonstrated the effectiveness of the implemented MPPT techniques in enhancing the system's performance compared to the scenario without MPPT. This study paves the way for further research and development
of efficient and sustainable EV charging solutions utilizing renewable energy sources. The simulation results demonstrate that the modified SEPIC converter delivers a significantly greater current than the traditional SEPIC converter and ZETA converter, leading to a faster increase in the battery's state of charge. For instance, charging a battery without maximum power point tracking (MPPT) takes approximately 6.94 hours with a ZETA converter and 4.63 hours with a SEPIC converter, while the modified SEPIC converter achieves the same result in only 4.09 hours. The advantage persists even with MPPT techniques. Regardless of the MPPT method employed, the modified SEPIC converter consistently achieves faster charging times (3.3 hours) than the ZETA and SEPIC converter. These findings indicate that the modified SEPIC converter offers a more effective solution for charging electric vehicle batteries using solar power.

PV-based Performance Evaluation of Zeta and Sepic Topologies for EV Applications

JES Journal of Electrical Systems

Abstract: - In this paper, a comparative performance analysis was proposed for PV fed EV charging system for ZETA and SEPIC DC-DC converter topologies. The utilization of Electric vehicles has gained significance in recent years due to societal awareness and increasing concern for environmental sustainability. EV charging time plays a vital role in modern-day vehicle commuting with energy-efficient performance. The selection of an appropriate DC-DC converter topology plays a significant role for fast charging with improved efficiency. The paper presents an optimized parameter selection, design, simulation methodology & relative performance analysis between the ZETA and SEPIC converter topologies with and without MPPT algorithm for EV charging applications. The MPPT algorithm based on P&O and IC techniques investigates for switching time of the ZETA and SEPIC converters under standard test conditions of solar PV panel i.e., at irradiance of 1000 W/m^2 and temperature of 25°C. In this article MATLAB/Simulink was developed to explore the performance of both topologies with and without MPPT approaches for battery SoC, battery voltage and charging current. The study shows that the battery charged from an SoC of 50% to 50.035% for SEPIC converter while the ZETA converter charges from 50% to 50.025% with a similar simulation time of ten seconds with Solar power input. The results demonstrate the DC-DC SEPIC converter is the best choice for EV charging applications through the PV system.

Keywords: Solar PV, EV Charging, Zeta Topology, SEPIC Topology, Perturb & Observe, Incremental Conductance.

I. INTRODUCTION

The advancement of PV energy technology is swiftly advancing. In order to maximize power and minimize loss, power electronic components were implemented into the MPPT [1]. The system can operate independently on very little self-produced electricity. In this study, to maximize the solar power extracted from photovoltaic panels, the MPPT technique is employed. The DC-DC converter's customizable switching cycle is produced using the MPPT approach. As a result, it regulates the PV Panel's output voltage [2].

The choice of capacitor, inductor, and switches affects the output accuracy of the converter and so the designing of the converters needs atmost attentiveness [3]. The Zeta converter and the single ended primary inductor converter (SEPIC) topologies operated in Boost mode are presented in this paper. The block diagram representation of the developed system is shown in Fig.1.

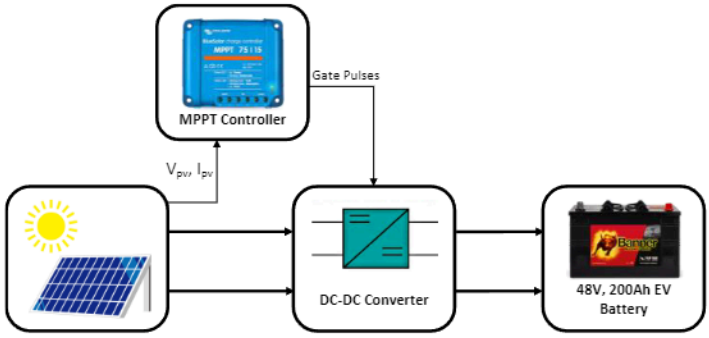

Fig 1: Block diagram of proposed system

Each DC-DC converter is driven by a gate signal, with the duty cycle of each converter being generated by the solar MPPT control. Here, P&O and incremental conductance control techniques are employed to maximise the energy from solar PV. P&O nudges the operating voltage up and down, searching for the peak value, while IC analyzes the slope to reach the summit directly. Both have their strengths, P&O is simple and cheap, while IC is faster and more accurate, especially under shifting sunlight [3].

II. MODELLING AND DESIGNING

A. Solar PV Specifications & MPPT Techniques

The MATLAB/Simulink Solar PV system was developed to charge EV battery with specifications of 48V, 200Ah through DC-DC Converters with a constant irradiance of 1000W/m2 and temperature of 25oC and the PV system is designed with MPPT to achieve a maximum power of 2002.32W. Each module in the simulated PV system consists of 60cells. The PV system is designed to have 8 parallel modules. The PV module design parameters are represented in the Table 1 below [4].

Table 1: Solar PV Module Specifications at STC

Parameter	Specification
Voltage at MPP (V_{MPP})	30.9 V
Current at MPP (I_{MPP})	8.1 A
Power at MPP (P_{MPP})	250.29 W
Open Circuit Voltage (V_{OC})	36.6 V
Short Circuit Current (I_{SC})	8.75 A

B. Design of ZETA Converter

The ZETA converter architecture transforms an input voltage that fluctuates above and below the output value into a positive output voltage. The ZETA converter is set up to operate on a high-side P-MOSFET through a buck controller. The ZETA converter is another option for regulating an unregulated input-power supply. Using linked inductor optimizes the board space. The schematic of ZETA converter with a linked inductor operating in continuous mode (CM) is shown in Fig. 2 below [5-8].

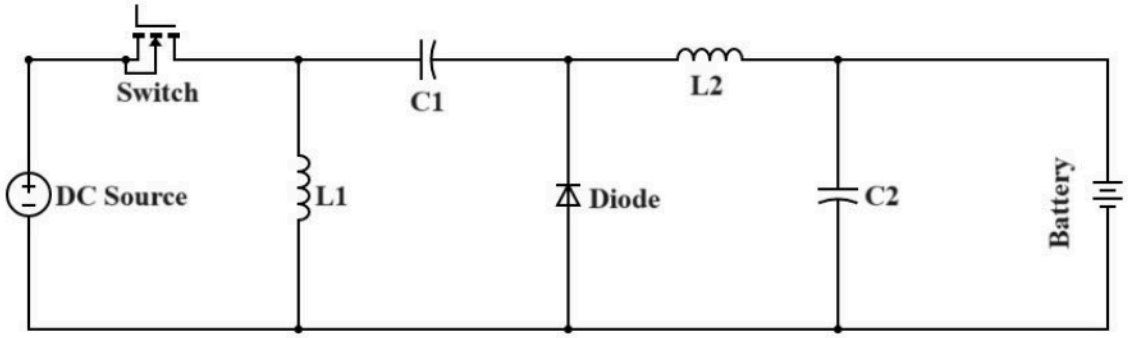

Fig.2: Schematic of Zeta Converter

When a ZETA converter runs in CM, its duty cycle (D) is given by

$$Duty\ Cycle\ (D) = \frac{V_{Out}}{V_{Out} + V_{In}}$$

The input current is given by

$$Input\ Current\ (I_{in}) = \frac{Input\ Power}{V_{in}}$$

Designing a PWM switching regulator begins with determining the amount of inductor ripple current(ΔIL) to allow. While too little can lead to unstable PWM functioning, too much increases EMI. Assigning a value around 20% to 40% of the average input current is an appropriate rule of thumb. Applying 20% as an instance, the ripple current can be computed using the formula below.

$$Inductor\ Ripple\ Current\ (\Delta I_l) = 0.2 * I_{in}$$

The value of inductances can be calculated using the formula

$$L_1 = L_2 = \frac{1}{2} \times \frac{V_{in} \times D}{\Delta I_l \times F_s}$$

Considering the maximum allowable ripple to be 1%, the coupling capacitance can be calculated using the formula.

$$C_1 = \frac{I_{Out} \times D}{0.01 \times V_{Out} \times F_s}$$

Considering the maximum allowable output ripple to be 2%, the output capacitance can be calculated using the formula.

$$C_2 = \frac{D}{8 \times 0.02 \times V_{Out} \times F_s}$$

C. Design of SEPIC Converter

In contrast to its more basic predecessors, the SEPIC converter has an exclusive architecture that combines two capacitors and two inductors, giving it unparalleled versatility. Because of its ingenious layout, it can manage a wide range of input and output voltage combinations, which makes it perfect for battery-powered systems, solar energy harvesting, and even LED drivers. Operating a SEPIC converter in continuous conduction mode (CCM) minimizes energy loss and ripple, resulting in efficient and clean power supply. The schematic of a SEPIC converter can be seen in Fig.3 below [8-10].

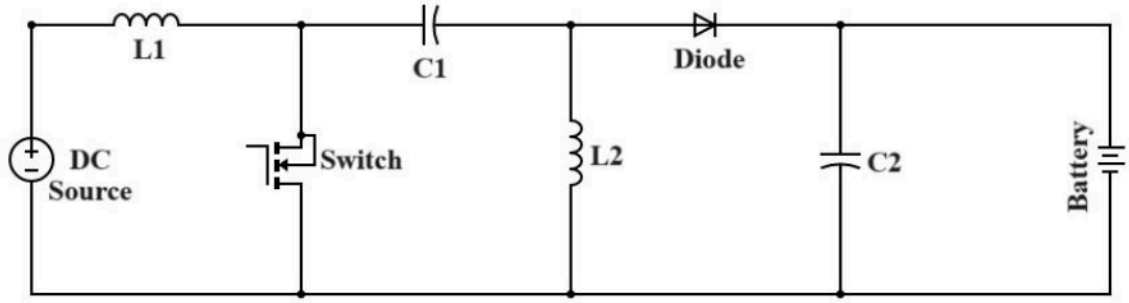

Fig. 3: Schematic of SEPIC Converter

When a SEPIC converter runs in CCM, its duty cycle (D) is given by

$$Duty\ Cycle\ (D) = \frac{V_{Out}}{V_{Out} + V_{In}}$$

The input current is given by

$$Input\ Current\ (I_{in}) = \frac{Input\ Power}{V_{In}}$$

Designing a PWM switching regulator begins with determining the amount of inductor ripple current(ΔIL) to allow. While too little can lead to unstable PWM functioning, too much increases EMI. Assigning a value around 20% to 40% of the average input current is an appropriate rule of thumb. Applying 20% as an instance, the ripple current can be computed using the formula below.

$$Inductor\ Ripple\ Current\ (\Delta I_l) = 0.2 * I_{in}$$

The value of inductances can be calculated using the formula

$$L_1 = L_2 = \frac{V_{In} \times D}{\Delta I_l \times F_s}$$

Considering the maximum allowable ripple to be 1%, the coupling capacitance can be calculated using the formula

$$C_1 = \frac{I_{Out} \times D}{0.01 \times V_{In} \times F_s}$$

Considering the maximum allowable output ripple to be 1%, the output capacitance can be calculated using the formula

$$C_2 = \frac{I_{Out} \times D}{0.01 \times V_{out} \times F_s}$$

III. SIMULATION AND RESULTS

An EV battery pack with a rating of 48V, 200Ah is charged through a 2kW PV source with ZETA & SEPIC converters are simulated in MATLAB/Simulink Environment. In simulation testing, the parameters such as voltage, current and Power from PV panel along with battery SoC, Charging current and battery voltage are observed at the same test conditions for both converters. The figures from 4 to 21 illustrates MATLAB/Simulink models, solar PV characteristics (i.e., Voltage, Current and Power), battery SoC, battery charging current and battery voltage of ZETA & SEPIC converters without MPPT, With P&O MPPT & Incremental conductance MPPT.

I_{pv} (A)	19.41	30.4	35.08	23.16	41.37	46.6
P_{pv} (W)	688.4	1035	1136	824.2	1426	1587

IV. CONCLUSIONS

A comparative performance analysis of PV fed EV charging system using ZETA and SEPIC converter topologies without and with MPPT techniques is simulated in MATLAB/ Simulink environment and the findings are evaluated. From the simulation findings, it is observed that the current delivered by SEPIC is more when compared to Zeta, and thereby a swift increase in the battery's state of charge. The time taken for charging a battery using the ZETA/SEPIC converter without MPPT is approximately 6.94Hrs. With P&O MPPT ZETA requires 5.78Hrs while SEPIC requires 4.63Hrs and finally with Incremental conductance MPPT Zeta still needs 5.5Hrs while SEPIC requires only 3.97Hrs. This illustrates that the charging is faster in the case of the SEPIC converter compared to the ZETA converter. Therefore with solar Power input, the SEPIC converter is more effective in charging the EV battery when compared to Zeta.

Abstract:

Concrete is a ubiquitous construction material that is used extensively for various applications. However, the manufacturing of cement, primary constituent in concrete is associated with significant environmental impacts, including carbon emissions, energy consumption, and depletion of natural resources. One such sustainable alternative to cement is Rice Straw Ash (RSA), which is a product obtained on burning of rice straw. RSA has been found to have pozzolanic properties, which means that it can react with calcium hydroxide to form additional binding compounds in concrete. This property makes RSA a potential replacement for cement in concrete production. The study will focus on evaluating the compressive strength of concretewhen RSA used for partial replacement of cement. The study will also investigate the influence of RSA on the workability, durability (water absorption and RCPT). Finally In our experimental study we got the following variation of percentage when compare to control concrete. The chloride permeability is very low at replacement of 10%, 15% when compare to normal (control concrete) and 5% replacement. So, finally from the present observation we can conclude that 10% replacement of cement by RSA can be suggested as the best replacement based on mechanical, workability and durability aspects.

Keywords: Chloride Permeability, Concrete, Rice Straw Ash, Strength, Water absorption

1. Introduction

The Concrete is a manmadesubstance used in construction extensively for various applications. The cement production is causing lot of environmental hazards. Therefore, sustainable alternatives to cement in concrete production are sought. One such alternative is RSA, which is a material resulting after burning of rice straw. RSA has been found to have pozzolanic properties, which means that it can react with calcium hydroxide to form additional binding compounds in concrete. This project aims to investigate the use of RSA as an alternatematerial to cement in concrete. The study will focus on evaluating the mechanical, water absorptionand chloride penetrationproperties of concrete containing different proportions of RSA. The results of this study providedprecious intuitions into the possibility of using RSA in concrete. The findings of this study may provide a magnificent insight for the entire construction industry,

Experimental Investigation on Self-Compacting Concrete Reinforced with Fibers

Abstract

Maintenance and life enhancement of buildings are crucial for infrastructure development. Concrete, composed of cement, aggregate, and water, is a composite material. However, plain concrete has limitations such as low elasticity, limited ductility, and susceptibility to cracking. Steel reinforcement is used to overcome these deficiencies and improve tensile strength. Micro cracks at the mortar-aggregate interface weaken plain concrete, leading to brittle fracture. The introduction of Self Compacting Concrete (SCC) has revolutionized the construction industry, offering improved properties. This study investigates the properties of fresh SCC and incorporates different fibers (glass, carbon, and basalt) at varying volume fractions. Remarkable improvements are observed in all properties of self-compacting concrete by adding fibers, with carbon FRSCC exhibiting the best performance in the hardened state. Basalt FRSCC follows, while glass FRSCC performs best in the fresh state. Basalt fiber is found to offer the best balance in terms of performance, dosage, and cost, enhancing the overall quality of self-compacting concrete.

Keywords: Fibrereinforcedconcrete,Self-compactingconcrete,Choppedglassfiber,Carbonfiber,Basaltfiber

1. Introduction

Self-compacting concrete (SCC) is a highly fluid and cohesive concrete mix that can flow and compact under its own weight without the need for external vibration. It is designed to improve workability, eliminate segregation, and ensure complete filling of formwork, even in congested reinforcement areas. SCC has gained significant attention in the construction

Abstract:

The construction industry is consisting of unorganized companies working as subcontractors making significant contribution to national economy both by increased GDP as well as in providing employment. In construction sector there are three segments like real estate is combined with residential and commercial constructions.

In the construction industry, in the presence of concrete elements depending on work inherent nature of the infrastructure or capital formation industry, capital goods are used directly and indirectly with all other types of resources.This study is aimed to find whether FOSROC admixture is suitable as usage of admixture in concrete mix, and whether FOSROC admixture results in providing durability to M40 grade concrete and to compare the compressive strength of conventional concrete sample with and without FOSROC admixture.

1. Introduction

Concrete is combination of material made from sand, gravel and cement. The cement is a mix of various minerals which when mixed with water, hydrate and roughly become strong binding the sand and gravel into a solid mass.

There are three basic components in the concrete mix:

- Portland cement
- Water
- Aggregates

The water and cement forms a paste that coats the aggregate and sand in the mix. The paste hardens and binds the both aggregate and sand together. Water is used to chemically react with the cement (hydration) and to produce workability in the concrete. The amount of cement is compared with the amount of water in the mix in pounds is called the water/cement ratio.

AN EXPERIMENTAL INVESTIGATION ON POLYPROPYLENE FIBER REINFORCED CONCRETE BY PARTIAL REPLACEMENT OF CEMENT WITH ALCCOFINE

Vadde Venkata Harish[1], Dr. D. V. Prasada Rao[2]

PG Student, Department of Civil Engineering, Sri Venkateswara University College of Engineering, Tirupati, India[1]

Professor, Department of Civil Engineering, Sri Venkateswara University College of Engineering, Tirupati, India[2]

ABSTRACT: *In this experimental investigation an attempt was made to study the feasibility and effectiveness of integrating Alccofine as a supplementary material in Polypropylene Fiber Reinforced Concrete of grade M25. Various concrete mixes with Alccofine substitution (5%, 10%, and 15%) were examined to determine the optimal percentage. The addition of Polypropylene fibers to concrete at 0.1%, 0.2%, 0.3%, and 0.4% by weight of concrete were prepared to determine the optimum dosage of Polypropylene fibres in concrete which is replaced with optimum Alccofine percentage. These fibers help control cracking from plastic and drying shrinkage, reduce concrete permeability, and enhance impact strength. Addition of Polypropylene fibres transforms the material from brittle to ductile. The study includes determination of compressive strength, split tensile strength, flexural strength and impact characteristics. The findings reveal that a combination of 10% Alccofine substitution along with 0.3% Polypropylene fibers leads to notable enhancement 45.3%, 35.6%, 16.67%, and 191% in compressive, split tensile, flexural, and impact strength, respectively, compared to control concrete. Based on the results it can be concluded that the combination of 10% Alccofine and 0.3% Polypropylene fibers in concrete significantly improves both the strength properties and impact strength of the concrete in comparison to control concrete.*

Keywords: Polypropylene Fiber Reinforced concrete, Alccofine, impact characteristics, impact strength

1. Introduction

The modern construction constantly evolves to meet the demands of sustainable development and enhanced performance. Conventional concrete compositions often rely heavily on Portland cement, a material associated with significant carbon emissions during its production. To address environmental concerns and improve concrete properties, innovative solutions such as Alccofine as partial replacement for cement offers multifaceted benefits. By reducing the cement content, these materials help lower carbon emissions associated with concrete production, aligning with sustainability objectives. Moreover, to enhance the mechanical properties and Impact characteristics of concrete, resulting in structures that exhibit superior performance and longevity. Polypropylene fibers, derived from a thermoplastic polymer, is increasingly recognized for its ability to enhance the impact strength of concrete. When dispersed within the concrete matrix, these fibers act as reinforcement, improving tensile strength, crack resistance, and Impact characteristics. Additionally, Polypropylene fibers mitigate plastic shrinkage cracking and improve Impact strength, making them invaluable in various construction applications. Alccofine, a supplementary cementitious material, offers a sustainable alternative to conventional cement. Produced from finely ground aluminosilicate materials, Alccofine possesses pozzolanic properties that react with calcium hydroxide forming additional calcium silicate hydrate (C-S-H) gel. This reaction not only contributes to the densification of the concrete matrix but also enhances long-term strength of the concrete. Furthermore, Alccofine reduces the heat of hydration and mitigates alkali-silica reaction, thus improving the overall sustainability and performance of concrete structures. In this investigation the effects of incorporating Polypropylene fibers and Alccofine

ABSTARCT: *"The requirement for self-compacting concrete(SCC) in the construction area is increasing due to its benefits, such as easy finishing, excellent flow even in dense reinforcement, and enhanced structural integrity. In this experimental study, the binding materials are Ordinary Portland Cement (OPC), Alccofine-1203, and Granite Powder (GP). The mineral admixture of Alccofine-1203 helps to avoid segregation and bleeding while increasing workability. Granite powder (GP) is chosen as a suitable cement replacement due to its high silica content. To study the fresh and hardened properties of M30 Grade self-compacting concrete, the binder content is fixed at 500 kg/m³, with 70% OPC, 12% Alccofine-1203, and 18% GP. Furthermore, crimped steel fibers (CSF) are added at 1%, 2%, 3%, 4%, and 5% by the weight of binder content to improve the flexural strength of hardened concrete. The water-to-binder ratio is 0.4 for all the SCC mixes. The workability tests on SCC are performed according to the EFNARC 2005 Guidelines by Slump flow test (Diameter and T_{500}), V-funnel, and L-Box. The mechanical properties of SCC studied include compressive, split tensile, flexural strength, and modulus of elasticity. Based on the test results, it can be observed the improved strength properties."*

Key words: Self-compacting concrete (SCC), Alccofine-1203, Granite powder, Crimped steel fibers, Mechanical properties

1. Introduction

Self-compacting concrete (SCC) is a special type of concrete that can settle into heavily reinforced, deep, and narrow sections by its own weight. It can consolidate itself without necessitating internal or external vibration while maintaining stability without leading to segregation and bleeding. SCC demands a large amount of powder content compared to conventional vibrated concrete to produce a homogeneous and cohesive mix. One of the disadvantages of SCC is its cost, which is associated with the use of chemical admixtures. One alternative to reduce the cost of SCC is the use of mineral additives such as limestone powder, Alccofine-1203, natural pozzolans, fly ash, slag, and granite powder, which are finely divided materials. Granite stone is one of the most commonly used building materials, leading to a high amount of waste, amounting to almost 50% of the volume of the final granite products, throughout its processing and extraction. Granite waste has accumulated over the years, with only negligible amounts being used, while the rest is dumped, resulting in environmental problems. As these mineral additives replace part of the Portland cement, the cost of SCC will be reduced, especially if the mineral additive is an industrial by-product or waste. Therefore, the use of these types of mineral additives in SCC will not only decrease the cost but also increase its long-term performance.

In this present experimental investigation, the self-compacting concrete achieved using Ordinary Portland cement, Alccofine-1203, Granite Powder, and a dosage of Chemical Admixture. In this study, the PCE-based superplasticizer BUILDPLAST-SP200(M) is used to achieve self-compacting concrete, with the dosage of chemical admixture set at 1.3% by weight of binder content, using a trial method in which the water-to-binder ratio is maintained constant at 0.4. Alccofine-1203 enhances the workability of concrete by acting as a micro-filler, reducing the water demand without

An Experimental Investigation on Glass Fiber Concrete by Partial Replacement of Cement with Alccofine

B.Girinath Naik[1], Dr. D. V. Prasada Rao[2]

PG Student, Department of Civil Engineering, Sri Venkateswara University College of Engineering, Tirupati, India[1]

Professor, Department of Civil Engineering, Sri Venkateswara University College of Engineering, Tirupati, India[2]

Abstract: Concrete is the most widely used construction material due to its strength, durability, and versatility. However, the production of cement, which is a key component of concrete, is a major contributor to greenhouse gas emission. The use of supplementary Cementitious materials (SCMs) can improve the properties of concrete, reduce use on natural resources and CO_2 emissions. The present study is directed to investigate the effect of Alccofine-1203 (AL) as partial replacement of cement on Glass Fibers (GF) reinforced M30 grade concrete. Different types of concrete mixes were prepared by replacing cement with Alccofine-1203 of 5%, 10% and 15%, respectively, then it is found to be the optimum percentage of replacement of cement with Alccofine-1203 is 10%. Further, the effect of Alccofine and Glass Fiber with different combinations, such as, 10%AL+0.1%GF, 10%AL+0.2%GF, and 10%AL+0.3%GF was also carried out. Based on the test results of Mechanical properties of concrete the optimum dosage is found to be 10% AL and 0.2% GF.

Keywords: Alccofine-1203, Glass fibre, Compressive strength, Split tensile strength, Flexural strength, Modulus of Elasticity .

1. INTRODUCTION

Cement is the most prevalent kind of concrete binder. At present sustainable development of the cement and concrete industry requires the utilization of industrial and agricultural by-products. At present, for a variety of reasons, the concrete construction industry is not sustainable. It consumes huge quantities of virgin materials and the principal binder in concrete is Portland cement, the production of which is a major contributor to greenhouse gas emissions that are implicated in global warming and climate change. So, finding a solution to substitute for part of the cement seems to be desirable for sustainable development. In the present investigation applications ofAlccofine-1203 as partial replacement of Cement for the Glass fibers reinforced concrete is adopted.

OBJECTIVES

The main objective of the present experimental investigation is to obtain the influence of Alccofine-1203 and Glass fibre on various Mechanical properties of M30 grade concrete.

It consists of following:

- To find out optimum replacement percentage of Alccofine-1203 .
- To determine the mechanical properties such as Compressive Strength, Split Tensile Strength, Flexural Strength and Modulus of elasticity of concrete prepared using alccofine-1203 and Glass fibers and to compare with conventional concrete.

ABSTRACT

Constructing a structure that minimizes earthquake damage can be challenging due to the unpredictable nature of seismic events, making it seem impractical. However, this study focuses on developing earthquake-resistant structure by incorporating Building Information Modelling (BIM) in the design and detailing process. The primary focus is on a G+5 apartment building designed to withstand seismic forces and prioritize occupant safety during earthquakes. BIM technology, using software such as Revit, ETABS, SAFE, SketchUp, AutoCAD, etc., is employed to enhance the structural design. Starting with creating a detailed architectural plan for the G+5 structure and rendered different architectural 3d views by creating models in Blender software. Then the detailed seismic analysis and design is done in ETABS & SAFE as per seismic design code (IS:1893-2016). BIM tools generate a dynamic 3D model, facilitating the visualization and simulation of seismic responses. The project encompasses comprehensive Structural, Architectural, and MEP (Mechanical-Electrical-Plumbing) BIM. The BIM model serves as a central information repository, allowing for precise quantity take-offs and cost assessments. The study's outcomes contribute significantly to the advancement of earthquake-resistant building design, highlighting the efficiency of BIM in optimizing structural performance and cost-effectiveness. These findings hold relevance for professionals in structural engineering, architecture, and construction management, underscoring the pivotal role of integrating BIM in earthquake-resistant designs. Furthermore, the detailed cost estimation for the entire G+5 building is also included.

Keywords: Building Information Modelling (BIM), seismic resilience, G+5 apartment building, earthquake-resistant structure, cost estimation, architectural, MEP BIM.

I. INTRODUCTION

1.1 General

Designing earthquake-resistant structures is crucial in civil engineering, particularly in earthquake-prone areas. Building design must consider hindrances to earthquake forces and ensure adequate support to prevent collapse. In this G+5 project, advanced BIM tools like AutoCAD, ETABS, Revit, and SAFE are employed. These tools help as digital assistants, enhance the design process, provide detailed information, and optimize the building's resilience to both routine and seismic challenges.

In India the earthquake prone area is divided into 4 zones based upon their vulnerability to earthquakes. So, for designing any type of structure in these zones, there are some design codes (see in 1.2). Following these codes will ensure that our constructions are not only safe but also capable of withstanding earthquakes.

Design Guidelines: Structural designers must adhere to key standards for earthquake-resistant design:

- IS 1893: 2016: Criteria for Earthquake Resistant Design.
- IS 13920: 1993: Ductile Detailing of Reinforced Concrete Structures subjected to seismic forces.
- IS: 456-2000: Indian Standard Plain Reinforced Concrete Code of Practice (Fourth Revision).
- IS 875 (Part 1-5): 1987: Code of Practice for Design Loads (excluding earthquake) for Buildings and Structures (Second Revision), encompassing dead loads, live loads, wind loads, snow loads, and special loads.

These streamlined guidelines ensure structures are resilient to seismic challenges in their respective zones, promoting safety and structural integrity.

ABSTARCT:

Soft soil is a worldwide issue that has caused substantial issues for Geotechnical engineers. Engineers have been endeavoring to improve the engineering characteristics of substandard soils owing to their detrimental effects on project efficacy. The utilization of stone columns for enhancing the bearing capacity and settling characteristics of soft soils has gained significant recognition and popularity due to its demonstrated effectiveness. Utilizing waste materials in civil engineering projects presents a dual advantage of promoting environmental sustainability and yielding economic benefits. Used scrap tyres and crushed bricks are two examples of waste items that have a useful purpose in civil engineering. This study describes the findings of load tests conducted in a laboratory setting on a scaled-down tank model with dimensions of 500 mm in length and 300 mm in diameter. The tank was supported by a stone column with a diameter of 50 mm. Aggregates, tyre chips, and crushed brick obtained from the local vicinity of Tirupati are utilized in our application. The load-bearing ability of the soil was seen to enhance subsequent to the introduction of these fill materials. The load carrying capacity of a clay bed has been enhanced by 40% to 110% through the construction of stone columns using aggregates, tyre chips, and crushed brick, with aspect ratios (L/D) of 5 and 8.

Key words: Stone column, Aggregates, Tyre chips, Crushed brick,

1.0. INTRODUCTION:

The global problem of soil softness has posed considerable challenges for geotechnical engineers. Engineers often encounter a prevalent challenge while constructing structures on or with soils, namely the insufficient strength of the soils to sustain the stresses exerted upon them, both during the construction phase and throughout the operational lifespan of the facility. The soils in the majority of the region exhibit low strength and possess inadequate carrying capacity. Efforts have been undertaken to improve the engineering qualities of these soils in response to their subpar performance in the field of engineering. There exist various ways that can potentially improve the efficiency of low-quality soils. The selection of an appropriate method is influenced by factors such as soil type, soil properties, and the specific objectives and scope of the desired improvement. The adoption of ground improvement techniques has the potential to increase the geotechnical qualities of soil. Numerous techniques are available for enhancing soil quality. The methods employed are contingent upon the properties of the strata and the objectives of the augmentation. Stone columns are a soil reinforcement technique that entails the installation of a network of compacted stone columns. The utilization of this technique was initially observed in France around the 1830s, and its adoption beyond Europe did not gain significant traction until the 1950s. Stone columns, similar to other techniques employed for soil improvement, function to fortify the soil, consequently augmenting its

AN EXPERIMENTAL STUDY ON BULGING BEHAVIOUR OF RAMMED STONECOLUMNS

Abstract:

Stone columns enhance the functionality of foundations in soft clays by lowering settlements and raising load bearing capacities. After being loaded, the top of a stone column, where the overburden pressures are lowest, bulges outward. The performance of stone column is greatly influenced by partial resistance of surrounding soil to lateral bulging of stone column. There is stiffer and stronger filler material around the column than the original soil. Load transfer due to lateral bulging is reported predominantly than due to end bearing at the column base and skin friction along the column soil interface. The stability of the soil around it plays a major role in determining the extent of bulging. The maximum weight that a stone column can support is directly proportional to its height. Longer stone columns, beyond a length of around 4D to 6D, are not expected to significantly improve capacity. This study aims to learn how the Consistency Index (I_C), length to diameter ratio (L/D) of stone column, soil's liquid limit (LL), and their interaction all affect with load-carrying capacity of a stone column when penetrating soft clays. The capacity for bearing capacity and resulting bulging of stone columns used as footings in soft clay beds. The impact of LL and I_C on column length will also be investigated. Furthermore, it is planned to develop and empirical equations to predict load carrying capacity of stone columns and the extent of bulging, taking into account all of Relative effect of each of three factors, namely LL, I_C, and L/D, and their interaction effects on load carrying capacity, bulging length, and bulging width is quantified using principles of 2^3 factorial experimentation influencing factors, and validating the same with reported results.

Density Index (I_D)
Consistency index (I_c)
Critical L/D ratio
Factorial Experimentation

ABSTRACT

The Stone columns are one of the main strategies for enhancing the behavior of engineering properties of soft clays. Stone columns are well known as vertical columns or inclusions of compacted, densely crushed stone piercing delicate clays. On the one hand, it acts as a drainage surface to accelerate consolidation, and on the other, it acts as a reinforcement to improve permissible bearing pressure. In this research two set of stone column capacities were determine by simultaneously varying the Mean particle size (D_{50}), L/D ratio, Density Index (I_D) and Consistency Index (I_c) of the stone columns, laboratory tests. Over a two levels, each one follows a principle of 2^4 factorial experimentation that permits quantifying relative effects of each factor and effects of interaction between four factors. An experimental programming shows that there's a critical L/D ratio beyond which there is no encourage increment in ultimate capacity due to L/D ratio. A regression empirical model was established to predict a capacity of stone columns. It was found to be a function of I_c, I_D, and interaction between I_D and I_c, L/D ratio, D_{50}, interaction among the L/D ratio and I_c and interaction between D_{50} and I_c. The validity of all developed models is verified by using data from present study and the results of others from literature that was not utilized in the model development. These predictions are useful not only for design of stone columns but also for a research into reinforced stone columns.

1. Introduction

The advancement of structures such as buildings, storage tanks, warehouses, earthen dams, etc., built on weak soils is prone to excessive settlement or stability problems. Soil enhancement may solve or mitigate the problems encountered. This technology was first used in France in the 1830s, and since the 1950s, it has become widely popular throughout Europe. Because of their granular nature, stone columns are preferable over sand drains, which provide additional shear strength to the enclosed soils. They stabilize soft soils such as soft clays, silt, and silty sand.

This technique has an advantage in progressing the soil properties underneath a structure (raft and depth) and reducing irregular settlement. Bulging and general shear failures are the two basic types of failure for stone columns under compressive stresses. It has been recorded that many academics have devised hypothetical ways to estimate a bearing capacity and fortified settlement with stone columns. Impact methods, such as falling weight, or Vibro methods, such as Vibro float, can compact the stone. For a stone column installation in cohesive soils, a Vibro-replacement method is broadly utilized [ ]. A comparative method is employed in soft, relatively impenetrable soils, as well borehole steadiness needs to be fixed in locales with high groundwater tables.

Munkfakh et al. studied the influence of Vibro replacement stone columns on the stability of an embankment that simulated the actual design of a wharf structure [ ]. Madhav and Thiruselvam investigated the impact of the installation method on granular pile-reinforced soil behavior [ ]. The influence of moisture content in soft clay and the effect of column slenderness ratio (L/D) on a single column was studied experimentally by Narasimha Rao et al [ ]. The work was continued (Rao et al., 1997) to study the effects on a group of columns consisting of 2, 3, and 4 columns in soft clay. Wood et al. conducted a model test to understand better the reaction mechanism of stone columns fortified clay beds
