حضرت عبدالحق شہ میر ثالثؒ کی نعت گوئی

حضرت سید عبدالحق شہ میر ثالثؒ خاندانِ شہ میریہ کے چشم و چراغ ہیں۔ آپ کی ولادت ۱۸۷۱ء میں شہر کڈپا میں ہوئی اور ۱۹۳۵ء میں اس دارِ فانی سے کوچ کر گئے۔ آپ ایک صوفی باصفا اور عالم باعمل بزرگ تھے۔ آپ شاعر بھی تھے اور نثر نگار بھی۔ آپ کا شعری سرمایہ دیوان شاہ میر ہے جو ۱۹۲۱ء میں زیورِ طبع سے آراستہ ہوا تھا۔ اس دیوان سے متعلق حضرت محمود بخاریؒ اپنی تصنیف شہ میری اولیاء میں لکھتے ہیں:

''دیوان شاہ میر' حضرت شاہ میر کے کلام حمد و نعت' سلام و منقبت کا لاجواب مجموعہ ہے۔ دیوان کیا ہے! تصوف کا خزانہ' مُعارف کا گنجینہ' عشقِ حقیقی کا پیغام' حُبِ نبوی کا لبریز جام ہے۔'' (ص:۱۱۲)

دیوان شاہ میر میں حضرت شہ میر ثالثؒ نے وافر نعتیں کہی ہیں اور خوب کہی ہیں۔ بقول میر انیسؔ: ''ایک پھول کا مضمون ہو تو سو رنگ سے باندھوں'' کے مصداق حضرت نے حضور اکرم حضرت محمد صلی اللہ علیہ وسلّم کی تعریف و توصیف میں عقیدت کے رنگ برنگ پھول نچھاور کیے ہیں۔ آپ کے کلام کے مطالعہ سے بخوبی اندازہ ہوتا ہے کہ یہ ایک عاشقِ رسول کا کلام ہے۔ جس میں آمد ہی آمد ہے۔ اپنی نعتیہ شاعری پر آپ کو خود ناز تھا۔ کہتے ہیں:

گوہرِ نعتِ رسولِ عربی سے پُر ہے
مرے دیوان کا لے کر یہ خزانہ دیکھو
جتنی غزلیں ہیں سب نعتِ حضرت میں ہیں
قابلِ وصف میرا یہ دیوان ہوا

حضرت کا کلام اپنے اجداد کے کلام کے مقابلے میں کافی نکھرا ہوا ہے۔ انہوں نے کلاسیکی شعری روایات بالخصوص تغزل کی آمیزش سے اپنے نعتیہ کلام کو آراستہ کیا ہے۔ پروفیسر مظفر علی شہ میری نے اپنی تصنیف: حضرت عبدالحق شہ میر ثالثؒ۔ حیات' شخصیت اور فن'' میں یوں رقم طراز ہیں:

''انہوں نے اپنے خاندانِ صوفیہ کے مخصوص موضوعاتِ شاعری کے اظہار اور زبان و بیان میں جو جدت و ندرت پیدا کی ہے' اس کی حیثیت نعتیہ و ذوقیہ شاعری میں اجتہاد کیا ہے۔ ان کے نعتیہ کلام میں غزل کا لوچ اور مٹھاس رچ بس کر باہم شیر و شکر ہو گئے ہیں۔ یہ اپنی نوعیت کا جدید رنگ ہے جو ان کے شعرائے سَلَف کے یہاں نہیں ملتا۔'' (ص:۴۲)

حضرت شہ میر ثالثؒ کی صاف زبان' شائستہ بیانی' سادگی و سلاست' نرم و شیریں لہجے نے شہ میری اولیا کے کلام میں آپ کو منفرد مقام عطا کیا ہے۔ جس کا آپ کو خود احساس تھا۔ فرماتے ہیں:

میں نازاں ہوں رسول اللہ کی مدحت سرائی پر
کوئی شہ میر مجھ جیسا غزل خواں ہو نہیں سکتا

حضرت شہ میر ثالثؒ کے نعتیہ کلام میں سرکارِ دو عالم حضرت محمد مصطفیٰ صلی اللہ علیہ وسلّم کی عظمت و بزرگی کا بیان' اوصاف حمیدہ کا عقیدت سے بھرا اظہار، قد و قامت' صورت و سیرت کا ذکر' دیدار مصطفیٰ کی تمنا اور مدینہ منورہ کی سرزمین سے محبت کا والہانہ اظہار ملتا ہے۔ ان موضوعات کو حضرت نے نہایت عمدگی سے شعر کے قالب میں ڈھالا ہے۔ حضرت کا نعتیہ

ستار فیضیؔ کی شاعری میں مذہبی عناصر

ڈاکٹر محمد نثار احمد

اسوسی ایٹ پروفیسر، شعبہ اردو ایس-وی-یونیورسٹی، تروپتی (آندھرا پردیش)

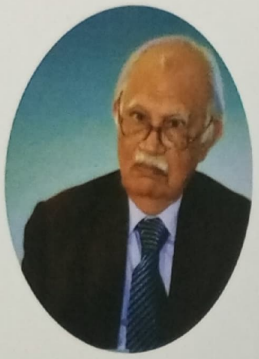
جناب ستار فیضی کا نام شیخ عبدالستار ہے۔ قلمی نام ستار فیضی اور تخلص فیضیؔ۔ یکم جون 1965 (انیس سو پینسٹھ عیسوی) کو کڈپہ میں پیدا ہوئے۔ اردو میڈیم سے تعلیم حاصل کی۔ انھیں اردو سے والہانہ محبت ہے۔ 1989ء (انیس سو نواسی عیسوی) میں اردو کے مدرس بنے۔ اُس وقت سے آج تک انھوں اردو درس و تدریس اور اردو شعر و ادب کے لیے اپنے آپ کو وقف کر دیا۔ اِن دنوں ستار فیضی کڈپہ ضلع میں میدکور کے ضلع پریشد اردو ہائی اسکول میں اسکول اسسٹنٹ کی حیثیت سے خدمات انجام دے رہے ہیں۔

ستار فیضی آندھرا پردیش کے اہم اور ممتاز شعراء میں شمار کئے جاتے ہیں۔ انہوں نے شاعری میں مختلف اصناف پر طبع آزمائی کی ہے۔ حمد، نعت، مناجات، منقبت، غزل اور نظم کے علاوہ انھوں نے کہانیاں اور مضامین بھی لکھے ہیں۔ ان کی کہانیاں اور نظمیں مختلف اخبارات، رسائل و جرائد میں شائع ہوتے ہیں۔ چند ایک کے نام یہ ہیں: گل بوٹے ممبئی، بچوں کی دنیا دہلی، الحیات رانچی، روشن ستارے حیدرآباد، دعوت دہلی، الہدیٰ نیپال، ندائے صالحات کڈپہ، قومی صحافت لکھنؤ، صدائے بسمل جارکھنڈ، تریاق ممبئی، ماہنامہ اردو دنیا، ماہنامہ تریاق، بدرِ کامل ناندیڑ کے علاوہ سالار و یکلی، روزنامہ سیاست، روزنامہ اعتماد اور روزنامہ رہنمائے دکن میں ان کے مضامین شائع ہوتے ہیں۔

ستار فیضی کا مجموعۂ کلام ''دھنک'' کے نام سے اردو اکیڈمی آندھرا پردیش کی جزوی مالی تعاون سے 2014ء شائع ہو چکا ہے۔ ان کے مضامین کا مجموعہ ''مہک'' اور شعری مجموعہ ''کسک'' زیرِ طبع ہے۔ سرورِ کونین کے نام سے ایک شراکتی نعتیہ مجموعہ بھی اردو اکیڈمی کے مالی تعاون سے منظرِ عام پر آ چکا ہے۔ اس کے علاوہ ''چھتیس حرکاتی نظمیں''، ''فیضی کے سو 100 شعر''، ''فیضی کی پچاس پہیلیاں''، ''ایکٹیوٹی بک''، ''لطیفوں کا مجموعہ ''مسکان''، بچوں کی نظمیں ''غنچہ غنچہ''، ''بھارت میرا مہان'' اور گذشتہ دنوں ان کی نعتوں پر مشتمل ایک مجموعہ ''شاہِ اُمَم'' کے نام سے شائع ہو چکا ہے۔ ستار فیضی صاحب نے تیلگو میں بھی چند کتابچے شائع کئے ہیں۔ اردو ساہتیہ نُو رتنالو، بھکتی مُکتی، بھارتیہ پرمُکھا مسلم مہیللو، وغیرہ شائع ہو چکے ہیں۔

ستار فیضی کی ادبی شخصیت کی کئی جہتیں ہیں۔ ستار فیضی نے اپنی شاعری میں مذہبی موضوعات کو مختلف جہتوں میں پیش کیا ہے۔ حمد و نعت اور دعا و مناجات کے علاوہ دیگر منظومات میں بھی دینی، اسلامی اور

Urdu Adab Ke Faroug [illegible]
Mazhabi Adab Ka [illegible]



اردو زبان [illegible] کے ظرف میں بہت وسعت ہے۔ اسلامیات اور دیگر مذہبی لٹریچر کی اردو ادب میں بڑی اچھی کھپت ہوسکتی ہے، اس سے ہمارا ادب نہ صرف تازہ اور توانا بنے گا بلکہ زبان وادب سے عوام کی دلچسپی میں جو زبردست کمی دیکھنے کو مل رہی ہے یہ کمی بھی دور ہوجائے گی۔ آج مذہبی نظریات وتعلیمات میں عوام کی دلچسپی بڑھ رہی ہے، مذہب بے زاری کے بادل جو کمیونسٹوں کے گمراہ کن پروپگنڈہ سے عوام کے ذہنوں پر چھائے ہوئے تھے وہ اب چھٹنے لگے ہیں۔ اردو ادب کو بھی ان زنجیروں سے چھٹکارا حاصل کرلینا چاہیے۔

پروفیسر بی شیخ علی کی تعلیمی خدمات - ایک جائزہ

ڈاکٹر محمد نثار احمد

صدر شعبۂ اردو، ایس۔ وی۔ یونیورسٹی

تروپتی، آندھرا پردیش

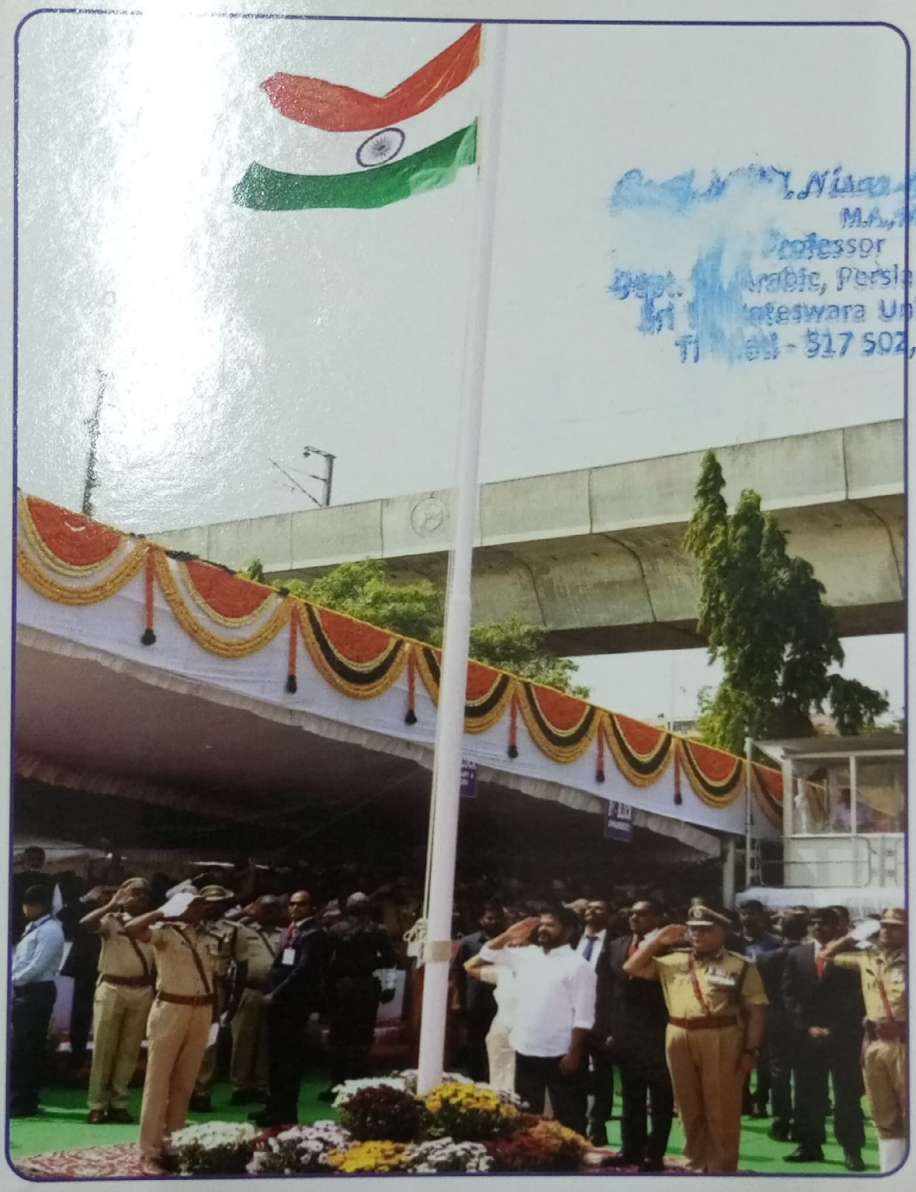
پروفیسر شیخ علی کی شخصیت کرناٹک ہی نہیں بلکہ جنوبی ہند کی قد آور شخصیت تھی۔ انہوں نے ہندوستان اور بیرون ہند بھی اپنی تحقیقات اور تصنیفات کے ذریعے ایک بلند مقام حاصل کیا۔ پروفیسر شیخ علی ایک مشہور مؤرخ، فلسفۂ تاریخ کے رمز شناس، محقق اور مصنف تھے۔ ان کا دائرہ کار صرف تاریخ تک محدود نہیں تھا بلکہ مذہب، ادب، صحافت اور سماجیات و سیاسیات پر بھی انہیں گہرا عبور حاصل تھا۔ ان کی شخصیت ہمہ جہت شخصیت تھی۔ وہ مختلف عہدوں پر فائز رہے۔ ان کی تعلیم میسور یونیورسٹی، علی گڑھ مسلم یونیورسٹی اور لندن یونیورسٹی میں ہوئی۔ انہوں نے ان دونوں یونیورسٹیوں سے تاریخ میں پی ایچ ڈی کی ڈگری حاصل کی یعنی علی گڑھ مسلم یونیورسٹی اور لندن یونیورسٹی۔

انہوں نے اپنی مادر علمی میسور یونیورسٹی سے اپنی تدریسی خدمات کا آغاز کیا۔ تقریباً چالیس سال پروفیسر کی حیثیت سے خدمات انجام دینے کے بعد ملک کی دو مؤقر یونیورسٹیوں کے وائس چانسلر کی حیثیت سے شاندار کارنامے انجام دیئے۔ یونیورسٹی آف گوا اور منگلور یونیورسٹی میں ان کی گراں بہا خدمات کا اعتراف کیا جاتا ہے۔ یہ اعزاز بہت کم افراد کو حاصل ہوتا ہے۔

اعلیٰ تعلیمی اداروں میں اعلیٰ تعلیم حاصل کرنے اور شاندار تدریسی خدمات انجام دینے کی وجہ سے انہیں تعلیم کی اہمیت اور افادیت کا بخوبی اندازہ تھا۔ تعلیمی اداروں کے انتظام اور نظم و نسق کے سلسلے میں طویل ترین تجربہ ان کے ساتھ تھا۔ وہ ہمیشہ قوم و ملت کی تعلیمی ترقی کے لیے فکرمند رہتے تھے۔ ان کا ایقان تھا کہ تعلیمی ترقی ہی کے ذریعے قوم و ملت کی ترقی ہو سکتی ہے۔

پروفیسر شیخ علی تعلیم کی اہمیت اور علم کی فضیلت کے بارے میں ایک جگہ لکھتے ہیں:

''اسی لیے کہتے ہیں کہ قوموں کا مستقبل درسگاہوں میں ڈھلتا



ہے اور قوموں کے معمار معلم ہوتے ہیں۔ علم ہی ایک ایسی واحد دولت ہے جو لٹانے سے بڑھتی ہے اور بچانے سے گھٹتی ہے۔ مذہب اسلام کی ابتداء اقراء یعنی پڑھنے کے حکم سے شروع ہوئی۔ یہ قرآن مجید کی پہلی وحی ہے۔ جو رسول اکرم صلی اللہ علیہ وسلم پر نازل ہوئی۔'' (ارمغانِ سالار، ص:68)

پروفیسر شیخ علی ایک ماہر تعلیم تھے۔ انہوں نے فلسفۂ تعلیم کی مشہور شخصیات کا گہرا مطالعہ کیا تھا۔ وہ خاص طور پر عالم اسلام کے مفکرین سے متاثر تھے جن میں مولانا رومی، حافظ شیرازی، امام غزالی، سرسید احمد خان، علامہ شبلی نعمانی، مولانا حالی، علامہ اقبال، مولانا ابوالکلام آزاد اور ڈاکٹر ذاکر حسین وغیرہ قابل ذکر ہیں۔ ان مفکرین کے افکار اور تعلیمی تصورات سے متاثر ہو کر انہوں نے ان افکار کو اپنے فکر و نظر میں شامل کر لیا تھا۔ وہ ان بزرگوں کی تعلیمی خدمات کے معترف تھے۔ انہوں نے اپنے مضامین میں خاص طور پر تعلیمی تصورات کا ذکر کیا ہے۔ انہوں نے ماہر تعلیم ڈاکٹر ذاکر حسین پر انگریزی میں ایک کتاب کرناٹک کے گورنر خورشید عالم خان کے ساتھ لکھی جسے ساہتیہ اکیڈمی نے شائع کیا۔ پروفیسر ابوالکلام قاسمی نے اس کا اردو ترجمہ کیا ہے۔ اس کتاب میں پروفیسر شیخ علی نے نہایت عمدہ اسلوب میں ڈاکٹر ذاکر حسین کے تعلیمی تصورات کو مبسوط اور مفصل پیش کیا ہے۔ اصلاحِ نصاب کے سلسلے میں سابق صدر جمہوریہ ہند ڈاکٹر ذاکر حسین کے حوالے سے ایک جگہ لکھتے ہیں:

''ایک اور اہم بات یہ ہے کہ ہمارے طرزِ تعلیم میں اصلاح چاہیے۔ ڈاکٹر ذاکر حسین صاحب ماہر تعلیم نے تعلیمی اسلوب کے جو طریقے سکھائے ہیں، ان کی تعمیل چاہیے۔ انہوں نے کہا کہ انگریزوں نے تعلیم کا جو مقصد قرار دیا تھا، وہ اب تک باقی ہے یعنی نوکری۔ اس کو بدل کر اخلاقی شخصیت کی تعمیر تعلیم کا مقصد ہونا چاہیے۔ مقصد کے تعین کی کسوٹی تہذیب ہے۔'' (ارمغانِ سالار، ص:76)

پروفیسر شیخ علی کی تعلیمی خدمات کے سلسلے میں قابل ذکر پہلو یہ ہے کہ وہ ایک طرف الامین تعلیمی تحریک سے وابستہ رہے۔ اس کے روحِ رواں اور سرپرست کی حیثیت سے ابتداء

میرؔ کے کلام میں سادگی اور پُرکاری

خدائے سخن میر تقی میرؔ (ولادت 1722 - وفات 1810) اردو کے ممتاز ترین شعراء میں سب سے نمایاں مقام کے حامل ہیں۔ ان کے کلام کی گوناگوں خصوصیات کی وجہ سے ان کی اہمیت آج بھی اردو دنیا میں امتیازی مقام اور اہمیت کی حامل ہے۔ مستقبل میں بھی ان کے کلام کو اہمیت دی جاتی رہے گی۔

میرؔ کے کلام میں بہت سی ایسی خصوصیات ہیں، جن کی وجہ سے میرؔ کو یہ مقام و مرتبہ حاصل ہوا ہے کہ ان کو خدائے سخن قرار دیا گیا۔ ان کے کلام کے بہتر نشتر تو مشہور ہیں ہی، اس کے ساتھ ساتھ ان کے کلام میں سادگی، سلاست، تاثیر اور اثر آفرینی کی خصوصیات ان کو اردو کے شعرا میں ممتاز اور منفرد مقام عطا کرتے ہیں۔

سادگی اور پُرکاری دراصل میرؔ کے کلام کی نمائندہ اور ممتاز خصوصیت ہے۔ میرؔ کے کلام میں الفاظ و معنی کی سطح پر پیچیدگی کے بجائے سادگی کا غلبہ زیادہ ہے۔ وہ سہل اور آسان الفاظ کے ذریعہ عام فہم اسلوب میں اپنے خیالات کو پیش کر کے متاثر کرنے کا گُر جانتے ہیں۔ میرؔ نے اسی سادگی کے ذیعہ اپنی پُرکاری کا جادو جگایا ہے۔ ان کا یہ جادو سر چڑھ کے بولتا ہے۔ تاثیر اور تاثُر کا وفور میرؔ کے کلام کی جان ہے۔ اسی خصوصیت نے ان کے کلام کو ایک نئی جہت عطا کی ہے۔

میر تقی میرؔ کا خیال ہے کہ ان کے اشعار اگرچہ کہ خواص کو پسند ہیں لیکن ان کے مخاطب عوام ہیں۔ گویا خواص اپنے طور پر پسند کرتے ہیں جب کہ خود انہوں نے عوام کو مخاطب کیا ہے۔ وہ خود کہتے ہیں:

شعر میرے ہیں گو خواص پسند
پر مجھے گفتگو عوام سے ہے

میرؔ کے کلام میں یہی وہ خصوصیت ہے کہ وہ خود خواص میں بھی مقبول ہیں اور عوام میں بھی۔ انہوں نے عوام سے گفتگو کرنے کو ترجیح دی اور خواص خود ان کے کلام کی جانب التفات کرنے پر مجبور ہیں۔ اس سے ان کے مزاج اور شعری رجحان کا بخوبی اندازہ لگایا جا سکتا ہے۔ میرؔ کو خود اس بات کا بھی احساس تھا کہ ان کے کلام میں جو روانی اور سلاست ہے، یہی ان کی شاعری کا کمال ہے اور اس کا اظہار انہوں نے اپنے ایک شعر میں یوں کیا ہے:

میرؔ، دریا ہے، سنے شعر زبانی اس کی
اللہ اللہ رے، طبیعت میں روانی اس کی

میرؔ کے کلام میں نہ کوئی ایہام ہے نہ ابہام ہے۔ ان کے یہاں صنائع اور بدائع یا پھر فنی مرصع کاری بھی نہیں لیکن ان کی سادگی اور سلاست نے ان کو مقبولیت عطا کی ہے۔ میرؔ کے شعر یوں متاثر کرتے ہیں۔ جذبات کی صداقت اور تجربات کی حقیقت بیانی کے ساتھ ان کے اظہار میں وہ دلکشی اور جاذبیت ہے کہ وہ متاثر کرتے ہیں اور تاثر بھی دیرپا

Abstract
Indigofera barberi belongs to Fabaceae is an endangered, high valued endemic erect, perennial under shrub. Therefore standardization of micropropagation protocol is desirable for its *ex situ* conservation. The present study describes micropropagation protocol for *I. barberi* using nodal explants. Three culture media (MS, B5 and WPM) tested for shoot initiation. MS medium was chosen based on better bud break and shoot initiation. Further, different strengths of MS major salts tried and 100% of shoot initiation observed on MS (major – HS) containing BAP/ Zeatin (0.5 mg/L) /Adenine sulphate (25 mg/L). Maximum shoot multiplication rate (17.4 ± 0.01) and shoot length (2.10 ± 0.18 cm) attained by using MS (major – HS (Half strength)) with 0.5 mg/L each BAP, KN and $AgNO_3$. Rhizogenesis of regenerated shoots successfully achieved on ½ strength MS with 1.0 mg/L IBA with root number (8.2 ± 0.44) and length (6.73 ± 0.26 cm). Hardening and acclimatization was successful with 80% of survival rate of plantlets.

Keywords *Indigofera barberi* · Culture media · Plant growth regulators · In vitro culture

Introduction

Indigofera barberi Gamble (*I.barberi)* is a rare, valuable endemic erect, perennial under shrub belongs to Fabaceae family. It is mainly distributed in Kadapa, Kurnool and Chittoor districts (Sheshachalam hills) of Andhra Pradesh at an elevation of 300 to 700 m (Madhava chetty et al. 2013). Entire plant including flowers of this plant is used traditionally as folklore medicine in India to cure liver diseases, pectic ulcers, diabetes, renal diseases, skin diseases and also as antihelminthic (Srinivasan and Sathyanarayana 2014a; Devi 2011; Palani et al. 2009, Madhava chetty et al. 2008). Pharmacognostical investigation carried out on the leaves and stems of *Indigofera barberi* (Srinivasan and Sathyanarayana 201b). Leaf extract has been used effectively for treatment of wounds, cuts, burns and boils (Sreelatha et al. 2013). This plant is also used in dealing of certain diseases like urolithiasis, arthritis & hypertension (Jaya sankar et al. 2014). The whole plant showed antimicrobial (Sreelatha et al. 2013), leaves exhibit antifungal (Srinivas et al. 2013) and ethanolic extracts of whole plant exhibit antioxidant activity (Jaya sankar et al. 2014). The leaf powder of *I. barberi* used as a dye and colouring agent (Sreelatha et al. 2013). Hepatoprotective potential of *I. barberi* evaluated using isolated compound from *I. barberi* in in vitro studies on HepG2 cells (Srinivasan 2019).

Despites of its multipurpose medicinal and economic importance, this plant species is critically endangered due to habitat destruction, fragmentation of population and poor seed germination (Jaya sankar et al. 2014). It is enlisted as an endangered plant (Sreelatha et al. 2013, Nayar and Sastry, 1990). In vitro regeneration of plant offers a potential solution not only for conservation but also for rapid propagation of rare, valuable, and endangered plants which can be used to release to their natural habitat or for mass cultivation for production of pharmaceutical product of interest (Costa et al. 2003; Nalawade and Tsay 2004). The studies on tissue culture of *I. barberi* Gamble have not been attempted. This is the first report on tissue culture of *I. barberi* Gamble.

ABSTRACT

In traditional medicine, inflammatory disorders are treated with a variety of plants and herbs. Given the numerous side effects of modern medicine, indigenous drugs with fewer side effects should be sought out as a better alternative for treating inflammation with Bougainvillaea glabra Linn. It is now widely acknowledged that medicinal plants play an important role in traditional health care practices, providing insights into new areas of drug research and biodiversity conservation. Inflammation is a complex biological response by vascular tissues to harmful stimuli such as pathogens, damaged cells, and irritants. It is the organism's protective attempt to remove injurious stimuli while also initiating the tissue healing process, and it is thought to be the primary cause of rheumatoid arthritis. Drugs used to treat pain and inflammation have toxic side effects when taken on a long-term basis. As a result, efforts are being made to investigate promising plants, which could lead to the development of newer or safer drugs.

ABSTRACT
The Nyctaginaceae family includes the climbing plant known as Bougainvillaea, or Bougainvillaea glabra, which is native to South America. Because of the colour of its bracts, which are often referred to as "flowers" and are composed of bracts, which are the striking parts, and the true flowers, which are small and white, the Bougainvillaea is widely acknowledged for its significance in horticulture. In traditional medicine, Bougainvillaea is commonly used to treat gastrointestinal disorders, respiratory conditions like bronchitis, asthma, and cough, as well as insecticidal and antibacterial properties. Information regarding the botanical description, ecological significance, phytochemistry, antimicrobial toxicology, and traditional uses of B. glabra are compiled in this review.

I. OVERVIEW

According to estimates from the World Health Organisation, 80% of people in developing nations still get their primary medical care from traditional medicines, which are primarily plant-based medications. Although many dangerous and deadly side effects have recently been reported, herbs are supposed to be safe [1]. Therefore, research into the antimicrobial qualities of herbs is desperately needed as it will aid in the treatment of a number of illnesses brought on by microbes. Numerous plant families are important sources of natural antimicrobials and serve as reservoirs for potent chemotherapeutics. Consequently, plant extracts have been utilised for a vast range of applications for thousands of years. The genus *Bougainvillae*, which belongs to the *Nyctaginaceae* (4 O'clock) plant family, contains 18 species, three of which are horticulturally important:

Abstract:

In recent years, antibiotics have been used widely in intensive shrimp culture and this may lead to their contamination of the environment. Surveys on residues of Nitro furan metabolites [AOZ, AMOZ, AHD, SEM], Chloramphenicol in water and mud in shrimp ponds in mangrove areas were conducted in then or this well as in south of Viet Namin July and August,2002.The results show that these antibiotics are found in all samples in both shrimp ponds and surrounding canals. The highest concentrations ofNitrofuranmetabolites[AOZ,AMOZ,AHD,SEM].Chloramphenicolare1.04,2.39,6.06,and2.50ppm in waters amples;and734.61,820.49,2615.96,426.31ppm(based on wet mud weight), respectively. The comparison of antibiotics residues between study sites and types of shrimp ponds will be discussed in this paper. The results also suggest that antibiotics residues may cause harmful effect on ecosystems in the study sites. An analytical method based on LCMS was developed and optimized in order to determine the most useful antibiotics (Nitrofuranmetabolites [AOZ, AMOZ, AHD, SEM], Chloramphenicol) used in aquaculture. A simple extraction procedure, without any clean-up step, was evaluated in order to obtain maximum analyte recovery from shrimp samples (Machobrachiumrosenbergi, Machobrachiummalcolmsoni, Panaeusmonodo, Fenneropanaeusindicus, Litopanaeus Vannamei, and Litopanaeus).

Introduction:

Inhalation of pollutants such as volatile organic compounds (VOCs) has been shown to have many side-effects on human health. A group referred to as BTEX (benzene, toluene, ethyl benzene and the three isomers of xylene) has been found to be potentially hazardous to environmental and human health. These volatile chemicals are genotoxic compounds. Inhaling these volatile compounds can produce DNA damage in the form of strand breaks. If the level of such DNA damage is high, result in somatic mutations and also in certain genetic effects and it can produce pathological changes in various tissues or systems in the body. This may be carried over to subsequent generations. Hence it is highly important to test the chemical compounds in the environment of man for their mutagenicity. In the present study clearly indicates that the level of DNA damage in petrol pump workers is significantly high, if such damage persists in them it may leads to clinical problems. They should take preventive measures to reduce the exposure to such vapor and thereby avoid clinical problems in future.

Abstract

Glioblastoma is a highly aggressive and lethal form of brain cancer characterized by its complex molecular landscape. Understanding the underlying gene expression patterns and their relationships is essential for unraveling the mechanisms driving this disease. In this study, we conducted a Weighted Gene Co-expression Network Analysis (WGCNA) on Glioblastoma gene expression microarray data to identify co-expressed gene modules and potential key regulatory genes associated with the disease. Utilizing a comprehensive dataset of Glioblastoma samples, we performed quality control and preprocessing to ensure the reliability of the data. WGCNA was employed to construct a weighted gene co-expression network, enabling the identification of modules of co-expressed genes. The correlation between these modules and clinical characteristics such as patient survival, tumor grade, and other relevant factors was assessed. Additionally, we conducted functional enrichment analysis to gain insights into the biological processes and pathways associated with the identified gene modules. Our findings revealed distinct gene modules associated with Glioblastoma progression and patient outcomes. Notably, we identified key hub genes within these modules, which may serve as potential biomarkers or therapeutic targets. Furthermore, functional enrichment analysis provided a comprehensive understanding of the biological processes and pathways influenced by these co-expressed gene modules. In conclusion, our Weighted Gene Co-expression Network analysis of Glioblastoma gene expression microarray data has shed light on the complex gene interactions and regulatory networks underlying this aggressive brain cancer. This knowledge may ultimately contribute to the development of novel diagnostic and therapeutic strategies, improving the prognosis for Glioblastoma patients..

1. Introduction

Glioblastoma, also known as Glioblastoma Multiforme (GBM) is an aggressive type of cancer most commonly occurred in supratentorial region (frontal, temporal-parietal, and occipital lobes) and also rarely located in cerebellum and very rare in the spinal cord(1). It forms from cells called astrocytes that support nerve cells and spreads easily within months(2,3) and one of the most aggressive, invasive, and undifferentiated type of tumor which eventually results death within a short period of time. The median survival rate from the time of diagnosis was just 15 months(4,5). And 90% of glioblastoma multiforme cases develop from glial cells by multistep tumorigenesis and remaining 10% from secondary neoplasm, takes 4-5 years to develop(6). GBM, which develops as a fresh or new grows within 3 months with symptoms such as headaches, nausea, and symptoms similar to stroke and further during the progress of the disease may cause unconsciousness(7,8). The incidence of central nervous system (CNS) tumors in India ranges from 5 to 10 per 0.1 million populations with an increasing trend and accounts for 2% malignancies. This is usually from the hospitalized data of a neuro-oncology, where the majority of tumors are high-grade Glioma's accounting for 59.5% of all CNS tumors with higher urbanized male population (9). Overall, the incidence rate in males was 1.62 times higher than females across the globe(10). In the case of the United States, the incidence rate of

Enigmatic role of T cells in pancreatic ductal adenocarcinoma: An introspective study

C.H. Swetha[a], *M. Hemalatha*[a], *Kotlapati Divya Teja*[b], *and B.P. Girish*[c]

[a]Department of Biotechnology, Sri Venkateswara University, Tirupati, Andhra Pradesh, India [b]Department of General Medicine, Sri Balaji Medical College Hospital and Research Institute, Tirupati, Andhra Pradesh, India [c]Nanotechnology Laboratory, Regional Agricultural Research Station, Acharya N.G. Ranga Agricultural University, Tirupati, Andhra Pradesh, India

Abstract

By 2030, pancreatic ductal adenocarcinoma is predicted to be the second most common cause of cancer deaths. In pancreatic cancers, T-cell numbers are limited in the tumor microenvironment without eliciting any anti-tumor activity. Recent studies showed that triggering T-cells to elicit anti-tumor activity may provide better outcomes in immunologically cold cancers like pancreatic cancer. To improve the outcome in a 5-year survival period of a pancreatic cancer patient, the identification of factors downregulating T cell activity in the tumor microenvironment plays an important role in the development of effective translational therapy. In this review, we summarized the role of T cells and their phenotypes in pancreatic cancer progression and pathogenesis, mechanisms behind T-cell exhaustion, and T-cell-based immunotherapies to understand the factors involved in T cell inactivation are crucial for the development of effective translational therapies.

ABSTRACT

Bivalvia are a group of marine and freshwater mollusks that used to be known as the lamellibranchiate and pelecypoda. They have bodies that are compressed laterally and are enclosed by a shell that has two hinged parts. The radula and odontophore, two common moll scan organs, are absent from bivalves as a group. They include the freshwater clams, oysters, cockles, mussels, and scallops, among many other families. The majority feed on filters. Ctenidia, which are specialized organs for breathing and feeding, have developed from the gills. The majority of bivalves bury themselves in sediment, a relatively safe place from predators. Others rest their bodies on the sea floor or on rocks or other hand surfaces. A few bivalves, for example, the scallops and document shells, can swim. The shipworms live inside materials like wood, clay, or stone that they bore into.

PHOSPHATE SOLUBILIZING MICROORGANISMS ASSOCIATED WITH MANGROOVE SOIL IN EAST COASTAL OF INDIA

P. M. Ravi kumar[1], Modugapalem Hemalatha[2]

[1]Assistant Professor, Department of Biotechnology, S.G.S. Arts College, TTD, Tirupati
[2]Assistant Professor, Department of Biotechnology, S.V. University, Tirupati

1. INTRODUCTION

Phosphate solubilizing bacteria (PSB) are beneficial bacteria capable of solubilizing inorganic phosphate from insoluble compounds. P-Solubilization ability of Rhizosphere microorganisms is considered to be one of the most important traits associated with plant phosphate nutrition[1]. It is generally accepted that the mechanism of mineral phosphate solubilization by PSB strains is associated with the release of low Molecular weight organic acids, through which their hydroxyl and carboxyl groups chelate the actions bound to phosphate, there by converting it into soluble forms. PSB have been introduced to the Agricultural community as phosphate Biofertilizer[2], [3], [o4], [5].

Microbial biodiversity inmangrove ecosystem is one of thedifficult areas of biodiversity research.Study of biogeography, communityassembly and ecological processes inmangrove ecosystem require extensiveexploration, isolation and identificationof potential microorganisms havingspecificity for recalcitrant compounds[6].Physical and chemical factors ofmangrove ecosystem control theabundance and activities of bacteria inmangrove environment. Mangroveforests in India are productiveecosystems and sensitive to theenvironmental changes. In themangrove ecosystem, microorganismsperform various activities such asphotosynthesis[7], nitrogen fixation[8],methanogenesis[9],agarolysis,production[10] of antibioticsand enzymesetc., result in high productivity[11], [12].

Special Mangrove soil niches possess valuable microbial resources. Unfortunately, up to the present, so far there is very little knowledge on the mangrove soil microbial communities. It mainly due to the limitations of research methods. Cultureindependent approaches based on 16S rRNA, 18S rRNA gene analysis open the window to study microbial diversity in mangrove soil. The progress had achieved about studying on mangrove soil microbial species diversity, metabolic diversity and treating environmental pollutions was summarized in the paper. In addition, the bright future of mangrove soil microorganisms was describedPhosphate (p) is one of the major essential Macronutrients for plants and is applied to soil in the same form of phosphate fertilizer[11], [13], [14].

However, a large portion of soluble inorganic phosphate, which is applied to the soil as chemical fertilizer is immobilized rapidly and become unavailable to plants. Currently the main purpose in managing soil phosphate is to optimize crop production and minimize p loss from soils. PSB have attracted the attention agriculturists as soil Inoculumns to improve planet growth and yieald. When PSB as Inoculants increase p uptake by plants. Simple inoculation of seeds with PSB gives crop yield response equivalent to 30kg p2 O5 ha or 50 percent of the need for phosphatic fertilizers. Alternatively, PSB can be applied through Fertigation Or in hydroponic operations. Many different strains of then bacteria have been identified as PSB including pantoea agglomerans, mycobacterium lacvaniforms and pseudomonas putida[15], [16].

Additionally, phosphate (p) compounds are capable of immobilizing heavy metals, especially ph, in contaminated environments through phosphate – heavy metal precipitation. However, most p compounds are not readily soluble in soils so it is not readily used for metal immobilization[17].

Some soil bacteria, isolated from the root region ofplants, are known to enhance growth of the plants. These beneficial free-living soil bacteria are termedas plant growth promoting rhizobacteria (PGPR).These include nitrogen-fixing azotobacters andphosphate solubilizing bacteria etc. The beneficialeffect of PGPR is mediated through either direct orindirect mechanisms [18]. The direct effectsare most commonly attributed to the production ofplant hormones such as auxins, gibberellins andcytokinins; or by supplying biologically fixednitrogen. The PGPR also improve growth byindirectmechanisms such as, suppression of bacterial, fungaland nematode pathogens, and production ofsiderophores, HCN, ammonia, antibiotics, volatilemetabolites etc. [18]. Some studies areavailable for the beneficial bacteria associated withthe natural mangrove habitats [19].However, no such studies are available foratificially developed mangrove habitats. Hence, tHence, thepresent study has been undertaken to isolate andenumerate the azotobacters and phosphateHence, thephosphatesolubilizing bacteria associated with the rhizospheresoil of mangrove tree species, and to relate them withthe nutrient levels.

Genetic alteration

ABSTRACT

Obesity is a prominent health issue worldwide and directly impacts pancreatic health, with obese individuals exhibiting a significant risk for increasing pancreatic ductal adenocarcinoma (PDAC). Several factors potentially explain the increased risk for the development of PDAC, including obesity-induced chronic inflammation within and outside of the pancreas, development of insulin resistance and metabolic dysfunction, promotion of immune suppression within the pancreas during inflammation, pre- and malignant stages, variations in hormones levels (adiponectin, ghrelin, and leptin) produced from the adipose tissue, and acquisition of somatic mutations in tumor once- and suppressor proteins critical for pancreatic tumorigenesis. In this manuscript, we will explore the broad impact of these obesity-induced risk factors on the development and progression of PDAC, focusing on changes within the tumor microenvironment (TME) as they pertain to prevention, current therapeutic strategies, and future directions for targeting obesity management as they relate to the prevention of pancreatic tumorigenesis.

1. Introduction

The epidemiology of obesity and pancreatic ductal adenocarcinoma (PDAC) is of significant interest due to the strong association between these conditions [1]. Obesity is a global public health concern. In the United States, over 30% of individuals are overweight (BMI>25), with 50% of those individuals being severely overweight (BMI>30). Obese individuals are more likely to develop cardiovascular diseases, type 2 diabetes, hypertension, and certain cancers, including PDAC [2,3]. The occurrence of overweightness (obesity) has steadily increased over recent decades [4]. In contrast, PDAC, while relatively rare compared to other cancer types, ranks among the deadliest [5]. Development of PDAC is associated with several risk factors, including smoking, a family history of PDAC, chronic pancreatitis, specific genetic syndromes, and obesity, which is the focus of this review [6].

Obesity is a pivotal modifiable risk factor associated with the incidence of PDAC [7], mainly exerting its impact on the progression of PDAC through various mechanisms, including the promotion of chronic inflammation [8], the influence of adipose tissue derived soluble mediators on oncogenic Kirsten rat sarcoma viral oncogene homolog (KRAS) signaling [9], the presence of single-nucleotide polymorphisms (SNPs) associated with childhood obesity [10], and the disruption of metabolic pathways [11]. Notably, obesity driven chronic inflammation leads to dysregulation of adipocytokines, insulin resistance, and sex hormones [12]. Furthermore, the inflammation of obesity-associated adipose tissue has garnered significant attention due to its effect on the activity of KRAS, a prominent oncogenic driver in PDAC [13]. An immunosuppressive tumor microenvironment (TME) is also implicated in the correlation between obesity and PDAC [14]. In conclusion, comprehending the intricate connections between obesity and PDAC and recognizing the multifaceted risk factors associated with PDAC enriches our understanding of this complex disease and presents

A substantial increase in colorectal cancer (CRC)–associated fatalities can be attributed to tumor recurrence and multidrug resistance. Traditional treatment options, including radio- and chemotherapy, also exhibit adverse side effects. Ancient treatment strategies that include phytochemicals like resveratrol are now widely encouraged as an alternative therapeutic option. Resveratrol is the natural polyphenolic stilbene in vegetables and fruits like grapes and apples. It inhibits CRC progression via targeting dysregulated cancer-promoting pathways, including PI3K/Akt/Kras, targeting transcription factors like NF-κB and STAT3, and an immunosuppressive tumor microenvironment. In addition, combination therapies for cancer include resveratrol as an adjuvant to decrease multidrug resistance that develops in CRC cells. The current review discusses the biology of resveratrol and explores different mechanisms of action of resveratrol in inhibiting CRC progression. Further, the detrimental role of resveratrol on the immunosuppressive tumor microenvironment of CRC has been discussed. This review illustrates clinical trials on resveratrol in different cancers, including resveratrol analogs, and their efficiency in promoting CRC inhibition.

Key words: *analogs, colorectal cancer, multidrug resistance, tumor microenvironment, resveratrol.*

INTRODUCTION

Colorectal cancer (CRC) is the second most recurrent malignant disease recorded globally, accounting for approximately 10% of diagnosed cancers and deaths.[1] As estimated by the American Cancer Society, the novel cases of CRC diagnosed in 2023 will be approximately 153 020, and predicted deaths of approximately 52 550.[1] The incidence and fatality rate varies with gender and geographical location. Higher incidence and mortality rates have been predicted in males than in females and in more developed countries. In addition to age, dietary habits and factors, including smoking, alcoholism, obesity, and lack of physical exercise, have been associated with the increased risk of CRC.[2,3] The advancement of CRC or the progression of conventional adenomas results from the accumulation of various genetic mutations and epigenetic alterations.[4] These are also called chromosomal instability, causing microsatellite stable and unstable tumors. Table 1 shows the development of CRC and related pathways. Surgical resection is the primary treatment option for localized CRC. Additional treatment options include pre- and postoperative conventional therapies,

TNBC

ABSTRACT

Immunotherapy is gaining prominence as a promising strategy for treating triple-negative breast cancer (TNBC). Neoantigens (neoAgs) and cancer-testis antigens (CTAs) are tumor-specific targets originating from somatic mutations and epigenetic changes in cancer cells. These antigens hold great promise for personalized cancer vaccines, as supported by preclinical and early clinical evidence in TNBC. This review delves into the potential of neoAgs and CTAs as vaccine candidates, emphasizing diverse strategies and delivery approaches. It also highlights the current status of vaccination modalities undergoing clinical trials in TNBC therapy. A comprehensive understanding of neoAgs, CTAs, vaccination strategies, and innovative delivery methods is crucial for optimizing neoAg-based immunotherapies in clinical practice.

1. Introduction

Cancer vaccines (CVs) leverage the host's immune system's specific targeting capability to selectively eliminate malignant cells [1]. CVs prompt the immune system to recognize antigens present in tumor cells. The effectiveness of CVs is influenced by the immunogenicity and avidity of the tumor antigens, which impact their ability to stimulate an immune response [2].

The landscape of tumor antigens can be categorized into three distinct groups, each with unique implications for cancer therapy. Tumor-associated antigens (TAAs) exhibit broad expression in both cancer and normal tissues, potentially posing a risk of autoimmune responses. On the other hand, cancer-specific neoantigens (neoAgs) arise from somatic mutations and hold promise as ideal vaccine targets despite their individuality. In contrast, cancer-testis antigens (CTAs) are a group of proteins typically found in the testis, abnormally expressed in various types of cancers. They offer a convenient avenue for developing off-the-shelf CVs, given their consistent expression across various cancers [3].

NeoAgs differ from CTAs in terms of their origin, expression pattern, and specificity. NeoAgs arise in cancer cells due to mutations in genes, leading to the expression of abnormal proteins or protein fragments. They are not expressed in normal cells and are highly specific to individual patients. In contrast, CTAs are typically expressed in germ cells, aberrantly expressed in cancer cells, and not in normal adult cells. They

Functional analysis and screening small molecules to RpfF protein in *Xanthomonas oryzae* involved in rice bacterial blight disease

Mundla SRILATHA[1], Naina PATYAL[2], Madhu Sudhana SADDALA[3]

[1] *Department of Biotechnology, Sri Venkateswara University, Tirupati 517502, India*
[2] *Department of Bioinformatics and Computational Biology, Central University of Himachal Pradesh, Kangra 176206, India*
[3] *Mason Eye Institute, University of Missouri School of Medicine, Columbia 65202, USA*

Abstract

Xanthomonas oryzae pv. *oryzae* (Xoo) is an important rice pathogen. This is a vascular pathogen entering the plant *via* the hydathodes causing rice bacterial blight. It has been known that most regulation of pathogenicity factor F (RpfF) genes in *Xanthomonas* regulates virulence in response to the diffusible signal factor (DSF). The RpfF recognized as an attractive drug target in bacterial rice blight disease. In this study, we performed the gene-gene interaction of RpfF and pathway functional analysis. 3D structure of RpfF protein was predicted using a homology modelling tool Swiss-Model and refined by molecular dynamics (MD) simulation. The refined model protein was predicted structural assessment using various tools such as PROCHECK, ERRAT, and VERIFY-3D. We have collected 2 500 rifampicin analogues from Zinc Database by virtual screening. The screened compounds were docked into the active site of the RpfF protein using AutoDock Vina in PyRx Virtual Screening Tool. Furthermore, docking result and *in silico* ADMET analysis described that the compounds ZINC03056414, ZINC03205310, ZINC08673779, ZINC09100848, ZINC09729566, ZINC11415953, ZINC12810788, ZINC24989313, ZINC27441787 and ZINC32739565 have best binding energies and less toxicity than reference compound. This study revealed that the active site residues such as HIS-118, HIS-147, THR-148, ARG-179, ASP-207, ARG-240 and THR-244 are key roles in the pathogenicity. It could be beneficial in the design of small molecule therapeutics or the treatment of rice bacterial blight disease.

Keywords: RpfF, virtual screening, molecular dynamics, docking, Zinc Database

1. Introduction

The genus *Xanthomonas* comprises an important group of Gram-negative plant pathogenic bacteria, which infect approximately 350 different plants, and cause great economic losses worldwide (Watt *et al*. 2005; Buttner and Bonas 2010). One member of this genus, *Xanthomonas oryzae* pv. *oryzae* (Xoo) is an important rice pathogen. This is a vascular pathogen entering the plant *via* the hydathodes causing bacterial rice blight (Ray *et al*. 2000). Symptoms are observed at the tillering stage, disease incidence increases

Chapter 6

Single-Cell RNA Sequencing (scRNA-Seq) Data Analysis of Retinal Homeostasis and Degeneration of Microglia

Madhu Sudhana Saddala, Srilatha Mundla, Naina Patyal, and Srujanika Dash

Abstract

Single-cell RNA sequencing (scRNA-seq) experiment reveals previously unseen molecular features. The number of sequencing procedures and computational data analysis approaches has been increasing rapidly in recent years. This chapter provides a general idea of the single-cell data analysis and visualization. An introduction and practical guidance for the 10× sequencing data analysis and visualization are presented. Basic data analysis approaches are highlighted, followed by quality control of data, filtering in cell level and gene level, normalization, dimensional reduction, clustering analysis, and marker identification.

Key words Microglia, Retinal degeneration, Diabetic retinopathy, scRNA-Seq, Visualization

1 Introduction

Diabetic retinopathy (DR) is the leading cause of vision loss in individuals 20–75 years of age. It remains a frightening prospect to patients and physicians as the causes remain unclear. While DR has been described classically as a microvascular disease, recent evidence suggests that changes to retinal microglia are an early feature of retinopathy [1–3].

The retinal microglia cells showed two different activation forms, pro-inflammatory (M1) and anti-inflammatory (M2) by sensome [4, 5]. The sensome signals are promote the microglial cells to activate numerous pathological signals like secretion of neurotoxins, cytokines, and chemokines, local proliferation, migration, and enhanced phagocytosis. These responses and the loss of restrictive switch mechanisms may contribute to retinal tissue impairment and pro-apoptotic actions in retinal degeneration (RD) [6]. The study of microglia at different stages of diabetes, and its interaction with peripheral leukocytes and retinal cells, is

Abstract:

Andrographis echioides (Acanthaceae) is widely distributed in South Asian nations and is recognized for its potent biological properties in the Indian Materia Medica. phytochemical analysis reveals this plant rich in flavonoids, phenols, terpenoids, steroids, tannins, and saponins. It consist of high bioactive compounds profile which are responsible for various biological properties like anti-inflammatory, anti-bacterial, hepatoprotective, antioxidant, antidiuretic, and antidiabetic effects. *Andrographis echioides* is a high potent medicinal property plant used as remedy for various diseases in traditional system of medicine.

Key Words: *Andrographis echioides*, phytochemical, antioxidant, antimicrobial.

Introduction:

Medicinal plants plays a crucial role in traditional herbal medicine to treat various diseases and disorders in the Global scenario. Globally there are 80,000 plant species that have been recognized and utilized as medicines (1). In developing countries reports states that around 75-80% of people and 25% of people in developed countries utilizes traditional system of medicine for the first line of medication (2, 3). Medicinal plant derived bioactive compounds utilized as a potent source for alternative medicine to treat various health conditions (4).

Andrographis echioides (L.) Nees commonly called as "False water willow". It is an erect herb widely distributed in India and Sri Lanka (5). In traditional system of medicine this herb is used as folk medicine for the treatment of

Phylogenetic analysis

ABSTRACT

The study was conducted from 2017 to 2021 in sheep and goat population from Krishna, Guntur and Chittoor districts of Andhra Pradesh. A total of 1256 clinically unhealthy animals out of which 420 animals were manifested respiratory emaciated symptoms based on wheelbarrow test, all aged between 3 months to 4 years. Molecular diagnosis confirmed 38 samples out of 420 samples confirmed by wheelbarrow test. The prevalence rate of JSRV induced OPA is 3.02 % the less infection rate was observed in male as compared to females' animals and this prevalence during the late winter seasons. The size of 7462 bp genome was sequenced from pathomorphological diversified animal lung sample. The genomic analysis reveals a total of 506 SNPs variants were recorded. The phylogenetic studies reveal, the isolated strain is very similar to South African strains but it diversified from UK and China strain. The structural and functional assessment studies based on derived amino acid sequence showed nonsignificant changes in 3D structures of proteins encoded by the JSRV genome. The substitution mutations both at Nucleotide and Amino acid sequence level suggest neutral evolution and they are under minimal evolutionary pressure.

1. Introduction

Sheep farming plays a significant role in the livelihood of the rural folk in India. As per FAOSTAT, 2019 the sheep population in India is about 75.5 millions. Diseases caused by different etiological agents viz. bacteria, viruses and parasites pose a threat to animal's health and production. In addition to several viral diseases, retroviruses can cause two important contagious tumours viz. Ovine Pulmonary Adenocarcinoma (OPA) and Enzootic nasal tumour (ENA) in sheep and goats that have a great impact on health and productivity of the animals.

OPA, also known as Sheep Pulmonary Adenomatosis (SPA) was first described in South Africa during 19th century (York and Querat, 2003) and thereafter, OPA was identified in many countries around the world including India (Damodaran, 1960). OPA is a naturally occurring transmissible adenocarcinoma of lungs in sheep caused by an exogenous *Jaagsiekte Sheep Retrovirus* (exJSRV). It belongs to the family Retroviridae, subfamily Orthoretrovirinae and genus Beta retrovirus. JSRV causes oncogenic transformation of the differentiated epithelial cells of the lungs especially type II pneumocytes and Clara cells (Nisbet et al., 1970; Hod et al., 1977; Rosadio et al., 1988a). The sheep genome also contains about twenty seven endogenous retroviruses that are closely related to JSRV known as endogenous *Jaagsiekte Sheep Retroviruses* (enJSRVs) and the loci are vertically transmitted. Further, it was demonstrated that exogenous JSRV was specifically associated with

ABSTRACT

Pseudomonas aeruginosa infections are quickly increasing in association with a variety of illnesses, necessitating the development of novel medications. This study employed an *in silico* technique to find PDF inhibitors against *P. aeruginosa* Peptide deformylase (PaPDF). PaPDF's structure is comparable to that of other PDFs; however, binding site studies found that PaPDF has a smaller pocket than *Staphylococcus aureus*, covering the S1 and S2 sub pockets, and maintains a conserved hydrophobic nature. The Zn metal binding site of modified PaPDFs was examined using molecular dynamics, and the results revealed that Cys92Ala differed from His134Ala and His138Ala, respectively. Complex-based pharmacophore investigation revealed three significant pharmacophoric characteristics within the pocket: two hydrophobic and one H-bond acceptor. This allows us to perform virtual screening using the ChemBride database to uncover a variety of potential hits with specific inhibitory characteristics. Several restrictions, including docking and molecular mechanics/general born-volume integral implicit solvent (MM/GBVI), were applied, and the top-ranked ligands were tested for inhibitory characteristics against key residues in the active site. Furthermore, the bioavailability and toxicity prediction identified seven potential leads and suggested future research into the design and synthesis of a unique class of PaPDF inhibitors.

1. Introduction

Multidrug-resistant (MDR) bacteria are a significant clinical challenge in current treatment and have been a public health concern for decades. Increasing resistance to the existing and excessive use of antibiotics, as well as a drop in antibiotic development, highlight the significant failure to manage antibacterial infections and are viewed as a major obstacle in resolving the problem. The MDR Gram negative bacteria *P. aeruginosa*, *E. coli*, *A. baumanii*, and K. pneumonia bacteria are the second most dangerous pathogens, with infections that are genuinely untreatable and promising pharmacological targets for developing powerful inhibitors. Among these, *P. aeruginosa* infections are spreading dramatically alongside diverse disorders, posing numerous challenges to medical treatment. Peptidyl deformylase (PDF) is a broad-spectrum therapeutic pharmacological target, although strong inhibitors have yet to be developed. PDF is ubiquitous in bacteria, parasites, and mammals, and it plays an important function in removing the N-formyl group from freshly produced polypeptides [1–5]. PDFs are classified into three types: Type-I occurs in Gram-negative bacteria, certain Gram-positive bacteria, and all eukaryotes, Type-II in Gram positive bacteria and mycoplasma, and Type-III in Archaea, Kinetoplast, Trypanosoma, and Leishmania [6]. All PDFs share approximately 65 % homology and three conserved substrate binding pockets: S1, S2, S3, and a metal [7]. The S1 pocket is hydrophobic and has equivalent binding patterns in both Gram-positive and Gram-negative bacteria. It helps to remove the formyl group by allowing the methionine of the newly produced polypeptide chain to bind. The S2′ and S3' pockets differ in residue composition, size, and shape, with a large entrance tunnel that protrudes into the solvent. The metal binding site contains a variety of metals, including Ni2+, Co2+, Zn2+, and Fe2+, and it coordinates ligand binding using three conserved motifs HEXXH. Furthermore,

ABSTRACT

Exploratory data analysis and machine learning are the building blocks of data science. Every person on average produces terabytes of data per day. As a result, the amount of data that is available on the web has increased astronomically in the past decade. Most of us wish to analyze the data and create a machine learning model that suits the data but because of lack of coding knowledge not many are able to do so. There has been a need to develop a system where the data analysis and building machine learning models can be done with just a few mouse clicks. In this project, we try to bring exploratory data analysis and machine learning techniques under a single roof. The front-end for this project is built upon the streamlit for effective user interface of the user.

Keywords: Exploratory data analysis (EDA), machine learning, regression, classification, clustering, visualization.

I. INTRODUCTION

One of the key steps of exploratory data analysis is data visualization. Data visualization refers to the presentation of data in graphical form, such as charts and graphs to make it easier to understand and analyze. Visualization is used in various fields to reveal patterns that are not always apparent from tables or text. Effective data visualization requires careful selection of appropriate charts and graphs, and attention to design elements such as color and layout. Good data visualization can help people make informed decisions. Machine learning is a subset of artificial intelligence that involves developing algorithms and statistical models that allow computer systems to improve their performance based on a specific task by learning from data, without being explicitly programmed. In machine learning, models are trained on a dataset to find patterns, which can be applied to new data to make predictions. Some of the uses of machine learning are natural language processing, classification, regression, clustering, object detection, recommendation systems. EDA, data visualization and machine learning are all linked with one another. Before we build a machine learning model, it's always necessary to clean the data. Data cleaning involves finding missing values, replacing the missing values with appropriate values, finding outliers, and replacing them, encoding the non-numeric features, transforming the numeric features. Once the data cleaning is done, the data will be split into train and test sets. The train set is used to fit the model and the test set is used for evaluation so we can get an EDA is a mandatory step to be performed before we do any sort of machine learning. There are no systems which provide a simple interface to perform EDA and machine learning. In this project, an effort is made to develop a simple user interface where both EDA and machine learning can be done easily. The user interface is developed using python's streamlit library. The user interface contains drag and drop component for dataset uploading, buttons for performing various actions like finding nulls, creating box plots, creating histograms and scatter plots, generating a data report, building machine learning models, training the model and finally to do predictions.

II. LITERATURE SURVEY

[1]. In the first research paper, they have developed an interactive web application that simplifies and automates the exploratory data analysis stage and is extremely user-friendly and easy to use. The web application is named QuickViz. This web application can be utilized by those who don't have any prior knowledge of programming as this tool doesn't require any coding to execute EDA procedures. Users just must upload their dataset and examine the results of descriptive and graphical EDA techniques through the QuickViz tool, aiding them in gaining insights and patterns from data.

[2]. In this research paper, automation of machine learning process is done using PyCaret and streamlit. Machine learning applications for the industry have seen significant growth and attention in recent years. As a result, there is a significant need for Machine learning engineers across the business, but increasing their productivity is still a major problem. For time-consuming Machine learning pipeline operations such as data pre-processing, feature engineering, model selection, hyperparameter optimization, and prediction result

(Peer-Reviewed, Open Access, Fully Refereed International Journal)
Volume:05/Issue:04/April-2023 Impact Factor- 7.868 www.irjmets.com

analysis, Automated Machine Learning (AutoML) has arisen as a solution. In this research, we examine the condition of the AutoML application, which aims to automate ML operations. Using Streamlit, the AutoML application is made to provide a user interface.

[3]. In this research paper, a comprehensive and up-to-date review of the state of the art in AutoML is presented. According to the deep learning pipeline, they have introduced AutoML methods – covering data preparation, feature engineering, hyperparameter optimization, and neural network search. Building a machine learning or deep learning pipeline needs a lot of resources and trained experts. To reduce these development costs, a novel idea of automating the entire pipeline of machine learning has emerged.

[4]. As big data becomes ubiquitous across domains, and more and more stakeholders aspire to make the most of their data, demand for machine learning tools has spurred researchers to explore the possibilities of automated machine learning (AutoML). AutoML tools aim to make machine learning accessible for non-machine learning experts (domain experts), to improve the efficiency of machine learning, and to accelerate machine learning research. But although automation and efficiency are among AutoML's main selling points, the process still requires human involvement at several vital steps, including understanding the attributes of domain-specific data, defining prediction problems, creating a suitable training data set, and selecting a promising machine learning technique. These steps often require a prolonged back-and-forth that makes this process inefficient for domain experts and data scientists alike and keeps so-called AutoML systems from being truly automatic.

In this research paper, they have introduced a new classification system for AutoML systems. They have highlighted the subtasks which are still done manually – generally by a data scientist and explained how this limits domain experts' access to machine learning. They have introduced a novel level – based taxonomy for AutoML systems.

III. TOOLS USED

The tools used are NumPy, Pandas, Matplotlib, Seaborn, Plotly, Scikit-Learn, XGBoost, Streamlit, PyGWalker, and pandas-profiling, GitHub, Streamlit Cloud. The techniques used are Data visualization using tools such as matplotlib, seaborn, and plotly. EDA uses pandas, NumPy, PyGWalker, and pandas-profiling. Machine learning and prediction using Scikit-Learn and XGBoost. User interface using Streamlit. Version controlling is done using GitHub. The app that is developed is hosted on Streamlit's cloud platform for faster performance.

IV. METHODOLOGY

The developed system is more of a general-purpose tool so based on the dataset and based on the problem statement the approach and methodology will change. Hence the most general steps followed for any data science project are only described. There are two stages in the project. Exploratory data analysis (EDA) and machine learning (ML).

Methodology used in EDA:

The data on which we wish to apply the EDA is imported. As a first step, the top five or ten rows of the data will be displayed so we can familiarize ourselves with the data. Then the information about the data will be obtained. The information will contain column name, non-null count, and its data type. Then the data will be described. The description of the data will contain count, mean, standard deviation, minimum value, percentiles, and maximum value. All these are applied only to numerical columns. Once the description of data is done, the null values in each column are counted and are displayed against their respective column names. Histograms are used to understand the distribution of each column. Scatter plots are used to know how two columns are correlated with each other and to see if there is a trend between them. An interactive element is placed to select the column names for both histogram and scatter plots. Encoding is a most important and must step in EDA. The common encoding techniques label encoding, and one hot encoding are applied to the selected columns. In the last step of EDA, the heatmap of correlation matrix is generated so we can see how each column is correlated with each other.

Methodology used in ML:

Three types of machine learning techniques are implemented in this project. Regression, classification, and clustering. All these techniques follow a common framework of implementation. Initially the data will be split into training and test. Then the model will be created and is trained on the training set. Once the training is

done, a form will be displayed. The form takes input to perform predictions. The following techniques are implemented in regression: linear regression, lasso regression, ridge regression, elastic net, and extreme gradient boosting regression. All these will be applied on the uploaded dataset separately and the regression evaluation metrics like mean absolute error, mean squared error, and root mean squared error of each of these models will be computed and compared in a table. In classification, the following techniques are implemented: logistic regression, support vector machines, gaussian naïve bayes, multinomial naïve bayes, k nearest neighbors, decision tree and random forest. Just as in regression, each of these models are applied separately on the dataset and then the classification evaluation metrics like accuracy, precision, recall and f1-score are computed and are compared in a table. For clustering, only the most used k-means algorithm is implemented. The elbow method which calculates the best value of k is also implemented. Unsupervised learning is only used to find patterns in the data so we can get better understanding of how data is clustered. So, no evaluation metrics will be available for clustering.

Methodology used in deployment:

After building the project, it must be made available so it can be accessed and used with ease. So, to make the tool accessible, we need to deploy it. Deployment can be done in multiple hosting platforms like render.com and Heroku. Since the project is developed using streamlit, it would be better to deploy the project to streamlit cloud. Streamlit cloud increases the speed of execution of streamlit apps and provides better performance.

V. CONCLUSION

With the help of this data analysis and machine learning toolbox, it will be easy to do exploratory data analysis and then apply various machine learning algorithms on the data. Furthermore, no downloading of any software is required. All we need is a device with active internet. Different analysis techniques can be applied to the data with just a click. All the machine learning algorithms are implemented inside the project, and we can build them with just a click. Anyone who has knowledge of data can easily use the tool and can-do EDA and machine learning.

ACKNOWLEDGEMENTS

I would like to express my profound gratitude and indebtedness to my esteemed guide Dr M Humera Khanam, Professor and Head, Department of Computer Science and Engineering, Sri Venkateswara University, College of Engineering, Tirupati, for her valuable advice and inspiring guidance for successful completion of the work.

VI. FUTURE SCOPE

With the help of this data analysis and machine learning toolbox, it will be easy to do exploratory data analysis and then apply various machine learning algorithms on the data. Furthermore, no downloading of any software is required. All we need is a device with active internet. Different analysis techniques can be applied on the data with just a click. All the machine learning algorithms are implemented inside the project, and we can build them with just a click. Anyone who has knowledge of data can easily use the tool and can-do EDA and machine learning.

ABSTRACT

The increasing prevalence of plant diseases poses a significant threat to global food security. Traditional methods of disease detection and classification are often labor-intensive and time consuming. In this study, we propose a novel approach for the analysis and classification of plant diseases based on image datasets using unsupervised learning techniques. Our methodology leverages the power of unsupervised learning algorithms to automatically identify patterns and structures within the image data without the need for labeled training examples. This approach offers several advantages, including scalability, adaptability to diverse datasets, and the ability to discover previously unknown disease patterns. We begin by collecting a comprehensive image dataset consisting of healthy plant leaves as well as leaves affected by various diseases. Next, we preprocess the images to enhance their quality and extract relevant features. We then apply unsupervised learning algorithms such as clustering to partition the dataset into distinct groups based on similarities in leaf characteristics.

Keywords: Plant Disease Diagnosis, Image Classification, Deep Learning, Agricultural Automation, Computer Vision, Crop Health Monitoring, Automated Disease Detection.

I. INTRODUCTION

The increasing prevalence of plant diseases poses a significant threat to global food security, necessitating efficient methods for disease detection and classification. Traditional approaches are often laborious and time-consuming. In response, this study proposes a novel approach leveraging unsupervised learning techniques for automatic analysis and classification of plant diseases using image datasets. By eliminating the need for labeled training examples, unsupervised learning offers scalability and adaptability to diverse datasets. The methodology involves collecting an extensive image dataset comprising healthy and diseased plant leaves, preprocessing the images, and applying unsupervised learning algorithms such as clustering. This introduction outlines the necessity of such methods and sets the stage for the innovative approach presented in this study.

II. RELATED WORK

The general process of using traditional image recognition processing technology to identify plant diseases is shown in Dubey and Jalal used the K-means clustering method to segment the lesions regions, and combined the global color histogram (GCH) color coherence vector (CCV) local binary pattern (LBP), and completed local binary pattern (CLBP) was used to extract the color and texture features of apple spots. The three kinds of apple diseases were detected and identified based on improved support vector machine (SVM), and the classification accuracy reached 93% Chai et al studied four tomato leaf diseases, including early blight and late blight leaf mildew and leaf spot, and extracted 18 characteristic parameters such as color, texture, and shape information of tomato leaf spot images, using stepwise discriminant and Bayesian discriminant principal component analysis (PCA), respectively. Principal component analysis and fisher discriminant methods were used to extract the characteristic parameters and construct the discriminant model. The accuracy of the two methods reached 94.71% and 98.32%, respectively. Li and He selected 5 kinds of apple leaf diseases (speckled deciduous disease, yellow leaf disease, round spot disease, mosaic disease, and rust disease) as the research objects. By extracting 8 features of the apple leaf spot image, such as color, texture, and shape. The BP neural network model was used to classify and recognize the diseases, and the average recognition accuracy reached 92.6%. Guan et al. extracted 63 parameters including morphology, color, and texture features of rice leaf disease spots, and applied step-based discriminant analysis and Bayesian discriminant method to classify and recognize three rice diseases.

III. METHODOLOGY

A. Design

Step1: Preprocessing of Automatic Leaf Detection of Plant Disease

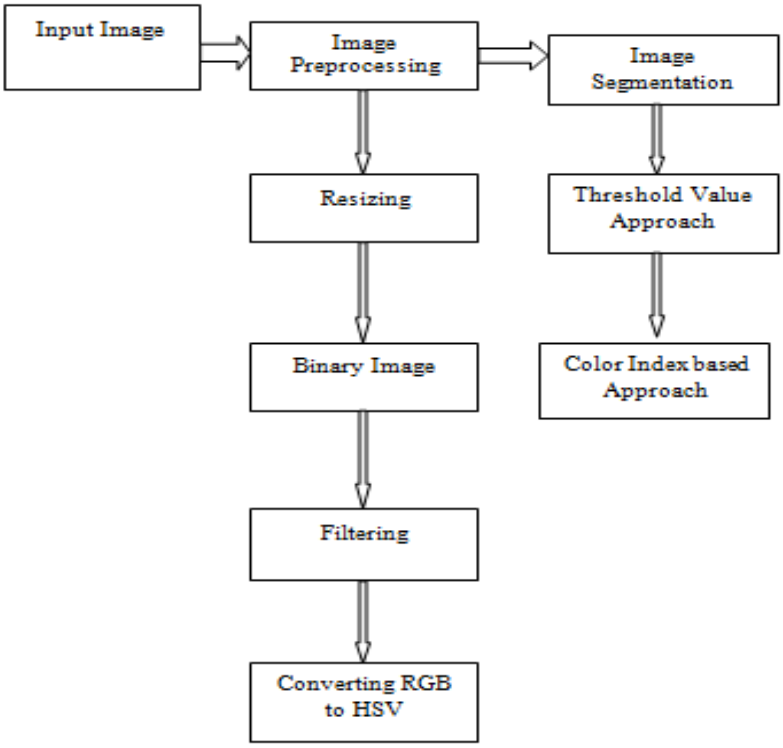

Figure 1: Preprocessing of Automatic Leaf Detection

Step2: Feature Extraction of Process Flow Chart

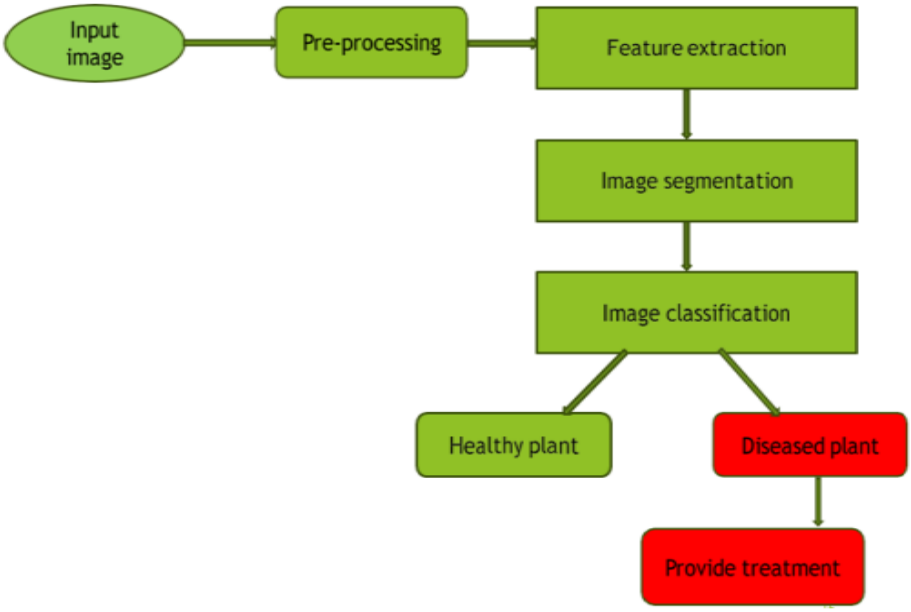

Figure 2: Feature Extraction of Process Flow Chart

We implement feature extraction using GLCM (Gray-Level Co-occurrence Matrix) to capture texture information from plant disease images. GLCM analyzes pixel intensity relationships to quantify texture patterns within the images. This technique enables the extraction of discriminative features, which are crucial for unsupervised learning-based disease classification. By incorporating GLCM-based feature extraction, we enhance the ability to differentiate between healthy and diseased plant tissues, contributing to more accurate

analysis and classification of plant diseases.

B. Methods and Algorithms

In our study, we employ deep neural network (DNN) and convolutional neural network (CNN) methodologies for analyzing and classifying plant diseases from image datasets. DNNs offer powerful feature learning capabilities, while CNNs are specialized for image-based tasks, enabling us to extract intricate patterns and structures from the data. Leveraging these techniques, we aim to achieve accurate disease classification without the need for labeled training examples, thus streamlining the analysis process and enhancing scalability.

C. Convolutional Neural Networks (CNN)

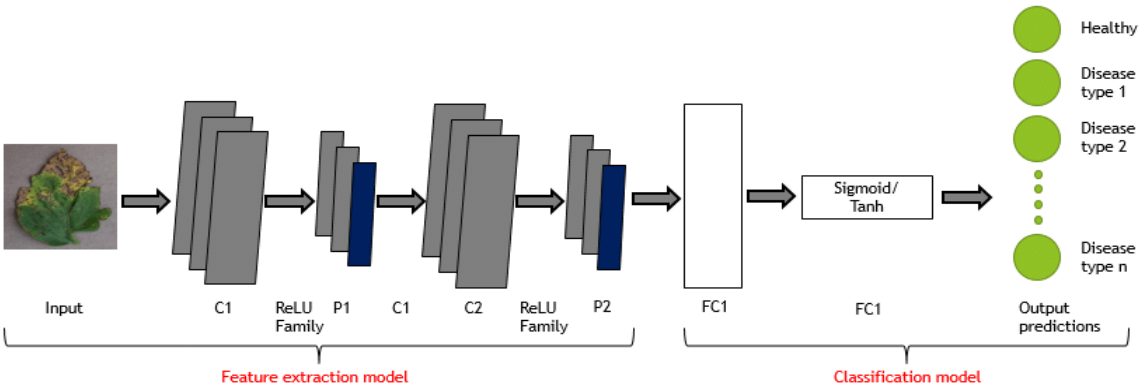

Figure 3: Convolution Neural Network Architecture

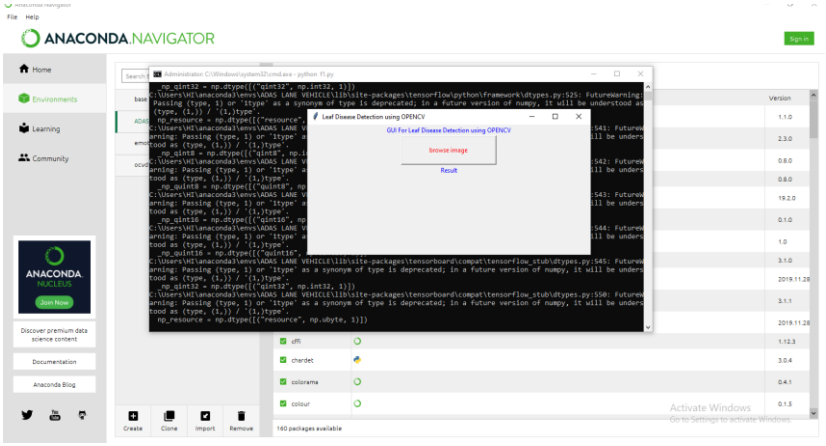
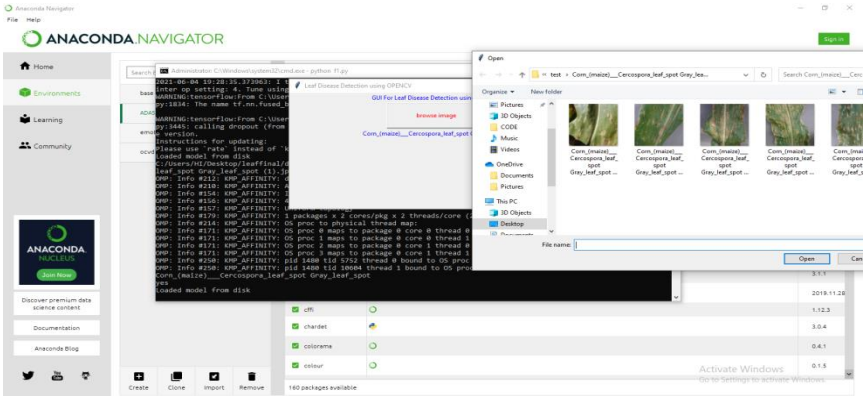
Utilizing Convolutional Neural Networks (CNNs), we deploy a deep learning architecture tailored for the analysis and classification of plant diseases from image datasets. CNNs leverage hierarchical feature extraction to automatically learn discriminative features from input images, enabling accurate disease classification. Through convolutional layers, pooling layers, and fully connected layers, CNNs capture spatial hierarchies and patterns within the image data, facilitating robust disease identification. Fine-tuning pre-trained CNN models enhances classification performance, while transfer learning enables adaptation to varying datasets, optimizing model generalization



D. Types of Leaf Diseases

There are two main types of leaf diseases: biotic and abiotic agents. Living organisms are called biotics, and nonliving organisms are called abiotics. Diseases caused by biotic agents include insects, bacteria, fungi, and viruses. At the same time, an abiotic agent includes extremes of temperature, excess moisture, poor light, poor soil, and insufficient nutrients. Although leaf diseases cause significant crop losses and directly affect the economy and animal and human health, yield losses can be reduced and specific toxoids can be adopted to battle specific pathogens if diseases are appropriately diagnosed and detected early.



IV. RESULTS

The unsupervised learning techniques effectively clustered the plant image dataset, revealing distinct patterns among healthy and diseased plants. The classification accuracy achieved demonstrates the efficacy of the approach in accurately identifying plant diseases without the need for labeled data. Through visual inspection and quantitative evaluation, we confirmed the ability of the model to differentiate between healthy and diseased plant leaves. The interpretability of the clustering results provides valuable insights into disease patterns and can aid in disease diagnosis and management strategies. Overall, our results highlight the potential of unsupervised learning techniques for automated plant disease analysis and classification.

V. CONCLUSION

In conclusion, our study demonstrates the potential of unsupervised learning techniques for analyzing and classifying plant diseases from image datasets. By leveraging these techniques, we achieved accurate disease classification without the need for labeled training data. Our findings highlight the scalability and adaptability of unsupervised learning approaches in detecting and categorizing plant diseases, paving the way for more efficient and automated disease management strategies. Further research could explore the integration of domain knowledge to enhance the interpretability and robustness of the classification results.

VI. FUTURE SCOPE

In the future, advancements in unsupervised learning techniques could enhance the accuracy and efficiency of plant disease classification. Integration with emerging technologies like deep learning may enable more robust feature extraction and pattern recognition. Additionally, collaborative efforts could lead to larger and more diverse image datasets, improving the generalization capabilities of models. Further research into interpretability methods could provide deeper insights into disease patterns and aid in the development of targeted management strategies. The incorporation of real-time monitoring systems and IoT devices may facilitate early detection and proactive disease management practices. Overall, the continuous evolution of technology and interdisciplinary collaboration holds promise for addressing challenges in plant disease analysis and classification.

Fake Account Prediction In Social Media Using Deep Learning And NLP

[1]C Bhagya Sree, [2]Prof. M. Humera Khanam
[1]M.Tech Student, [2]Professor and Head
[1]Computer Science and Engineering,
[1]Sri venkateswara University, Tirupati, India

Abstract: The rise of social media has permeated every aspect of daily life in the Internet era, having an impact on a wide range of industries, including politics, education, and business. Fake accounts are becoming more of a problem on well-known sites like Facebook, Instagram, Twitter, and LinkedIn. In social media, fake accounts are used to spread misinformation, carry out illegal tasks like spamming, promoting phishing sites, and committing financial fraud. Numerous existing techniques exist, including machine learning, graph-based, and hybrid techniques. The combination of deep learning with NLP increases accuracy. The features of an account are given to the deep learning model, which obtained about 97% accuracy and the posts of the account are categorized by the Bert algorithm, which obtained about 98% accuracy.

Keywords—Fake Accounts, Natural Language Processing, Machine Learning Deep Learning, BERT Algorithm.

I. INTRODUCTION

The globe has seen the emergence and escalating popularity of social media platforms like Facebook, Twitter, Instagram, etc. in recent years. The major social platforms facing the problem of fake accounts. Social media platforms perform their own techniques to decrease and eliminate fake accounts. A fake profile on social media is a representation of an individual, group, or business that does not actually exist or that has displayed information that is false in some other way or even fraudulent. Fake accounts are created manually or computer generated called bots or cyborgs meaning half-human and half-bot. The problem with fake accounts is that they create an unhealthy social environment, spread malicious content, and Fake Engagement. Some companies sell accounts for following others, liking, and sharing content. The major reasons for fake engagement are that fake accounts are used to show off a large fan base, hike votes, criticism, spread rumors, and trustworthiness among others. There are different types of Fake accounts as mentioned in [1] they categorized accounts on social media. Table 1.1 shows the different types of fake accounts. Bot Accounts can be useful for humans for many good purposes to automate different tasks but the usage of bots for malicious purpose is a great effect on the traffic generated in social media. All these different types of fake accounts are common on social network platforms.

Table 1.1 Types of Fake Accounts

Type of account	Definition
Sock puppet Account	Sock puppet accounts aim to deceive others or to promote someone or something
Sybil Account	Multiple accounts are manually created by malicious users to attack the trusted network.
Bot account	A Computer program that performs various tasks quickly and automatically.
Hacked Account	A compromised account or hacked account is defined as a real account user does not have control over. Might be credentials are stolen.

The work is organized so that Section II discusses a literature survey and Section III discusses the proposed methodology. Section IV mentions the Dataset and its features. Section V discusses the Implementation and design and mentions the steps for the proposed algorithms. Results are mentioned in Section VI followed by the conclusion and future scope.

II. LITERATURE SURVEY

Each type of account is detected by using different methods. Different existing methods such as Machine learning, graph-based, and Hybrid methods are used to distinguish real and fake accounts. The study [2] proposed a method called Social Engagement based News Authenticity detection (SENAD) which detects the authenticity of news articles shared on Twitter based on the authenticity and bias of the users engaging with these articles with an accuracy of 93.7%. To detect Fake images the method called CredNN which is a combination of Error Level Analysis and sentiment analysis with an accuracy of 76%.

A. Machine learning approaches:

In the article [3], a study was conducted on VK(Russian app). They used different machine learning methods like Gaussian Naive Bayes, Bernoulli Naive Bayes, Support vector machine, Decision Tree, and Random Forest. All algorithms' accuracy range from 80% to 97%. Random forest algorithm has the highest 97% accuracy.

Methodologies used to Detect Sarcasm in Sentiment Classification

Vemala Bhargavi[1], Dr. M. Humera Khanam[2]

[1,2]Computer Science and Engineering, Sri Venkateswara University, Tirupati, India

ABSTRACT

Research into Natural Language Processing (NLP) is one of the exciting and popular fields today. Sentiment classification of texts is crucial in the discipline of NLP. Sarcasm is a kind of sentiment where individual people convey their feelings or opinion about a particular topic indirectly i.e., they write something which is completely different from what they meant. Sarcasm detection comes under Sentiment analysis. An expression of criticism is called a sarcasm statement. People express their opinions on social media like YouTube, blogs, Facebook, and Twitter in a sarcastic manner. People express sarcastic statements through comments on Daily News, TV shows, political parties, etc. Perfect understanding and analysis of the sarcastic sentences are the most important factor to enhance the performance of sentiment analysis. This paper will discuss the amount of research work done on sarcasm recognition, types of sarcasm, methodologies for sarcasm detection, challenges, and the field's potential in the future.

Keywords—Sentiment analysis, Twitter, Deep Learning, Sarcasm Detection

I. INTRODUCTION

One of the most fascinating research fields is sentiment analysis, which allows researchers to examine and evaluate "a person's emotions, sentiment context, opinions, and feelings regarding a topic or incident."[1] An example of a sarcastic statement is: "I relish suffering #sarcasm". In this example, the word "relish" shows a positive sentiment but, the scenario is negative as "no one like suffering". So, the field of sentiment analysis mainly focuses on text mining. Because there are no facial emotions, it is particularly challenging to discern sarcasm in the text. Here, when people communicate with others based on their slang, tone, expression, and body gesture it is pretty easy to detect sarcasm. Due to the lack of these clues, the task of sarcasm detection in the text is difficult.

Over recent years, people are more connected with social media. With E-commerce sites like Myntra, Flipkart, Amazon, etc., and social networking sites like Facebook, Twitter, YouTube, etc., people get habituated to the usage of the internet. They post their opinions, feelings, and comments on a particular topic or event. The data from these sites increased exponentially and this can be an example of Bigdata. Nowadays, most of organizations and political parties are very interested to know public opinion. For example, if people want to purchase any product on an e-commerce site they go through the reviews of a particular product. This information is needed for promotions, especially since the political parties are showing more interest in sentiment analysis to know public opinion on their respective schemes. To find the pulse of the public, sentiment analysis came into existence. Sarcasm in sentiment is a major research problem. Because, if a sarcastic utterance is included in a statement, it can modify both the sentence's intended meaning and the sentiment analysis conclusion. [1]

Diana Maynard and Mark Greenwood [3] proved that indicating sarcastic words can strengthen the performance of sentiment analysis effectively. Efficient sarcasm detection requires proper training in learning models. There are many studies done on how, why, and when sarcasm is expressed.

Several different datasets are used for sarcasm detection, the Twitter dataset is one of many datasets that are utilized for sarcasm detection. For Indian languages, the lack of annotated datasets is a challenging task. The morphological richness of Indian languages like Telugu, Hindi, Tamil, Malayalam, etc. presents an additional problem for researchers. Telugu has a significant influence over other Indian languages. Most Telugu-speaking users on social media began conversing in their mother tongue. The examination of the conveyed text will be improved with the use of an automatic sentiment analyzer that includes a sarcasm detection approach. The paper is divided into various sections such as a literature review, challenges, characteristics, approaches, etc., to give in-detail work done on sarcasm detection in various languages.

Artificial Intelligence and Deep Learning Methods for Ophthalmic Image Processing: A Review

M.Kiran Mayee [1],
Research Scholar, Computer Science & Engineering, Sri Venkateswara University
Dr. Humera Khanam.M [2],
Professor, Computer Science & Engineering, Sri Venkateswara University

Abstract:

In Medical Imaging, deep learning techniques are gaining the attention and trust of experts for predicting diseases at early stages. The mixture of artificial intelligence and medical knowledge facilities improves the accuracy of detecting diseases. Motivated by these advances, this paper performs a literature review focused on screening eye diseases, classification, and segmentation based on eye images. Artificial Intelligence has shown high accuracy with high specificity and sensitivity in screening and excavation images. This paper presents a systematic survey on the two major types of eye diseases, detection of glaucoma and diabetic retinopathy. Accordingly, we confirmed whether Artificial Intelligence strategies might be useful in distinguishing eye illnesses with high precision and minimal expense, which might advance patient strengthening and help clinical specialists.

Index Terms: Artificial Intelligence, Deep Learning, Classification, Segmentation, Machine Learning, Fundus Image, Convolutional Neural Network.

Introduction:

Artificial Intelligence has taken control over every field, including Biomedical. Especially Deep Learning has a great impact on Image Analysis and Data Analysis. The applications of DL in ophthalmology image processing are discussed in this review, which mainly falls into two sections. 1) Detection & grading of diseases. 2) Segmentation. The main motive of detecting and identifying the disease is to analyze the disease found in a block of images. In Future work, multi-class classification can be used to know a disease's severity level more than just predecting it. Decomposition of anatomical structures from picture element wise description, such as retinal vessels, drusen, haemorrhages, or optic disks. Image analysis is divided into several parts segmentation, Feature Analysis, and Classification. Feature extraction can be done either physically or automatically. In physically feature extraction, it requires more description of the relevant features for a given problem and the execution method to extract those features. Without human intervention, deep networks or specialized algorithms are used for automated characteristic extraction. Convolutional Neural Networks (CNNs) are a popular and preferred automatic feature characteristic technique in clinical image processing[50]. In this review, publications about automatic and manual detection methods are covered. Techniques for Ophthalmic information

QUESTION ANSWERING SYSTEM WITH NATURAL LANGUAGE INTERFACE TO DATABASE

Dr. M.Humera Khanam*

S.Venkata Subbareddy*

Abstract:

Question Answering (QA) is an area of natural language processing research aimed at providing human users with a convenient and natural interface for accessing information. Nowadays, the need to develop accurate systems gains more importance due to available structured knowledge-bases and the continuous demand to access information rapidly and efficiently. The need to store data in an organized manner so that searching, retrieving and maintaining of data becomes easier. To efficiently operate these database, knowledge of Structures Query Language (SQL)becomes essential. But the usage of SQL restricts the access to databases from the users who don't have the knowledge of them. A need for interface comes into the picture to enable the access of these databases even to a non-expert users. This paper describes the design to develop Telugu language Question Answering system to database.

This paper describes about question answering system using Natural Language Interface to a database. Here we use the rule based algorithm for train the systems question classifier to achieve a high accuracy ratio.

Keywords —Natural Language Processing (NLP), Natural Language Interface To Database (NLIDB), Question Answering System(QAS), Structured Query Language(SQL).

Kidney Stone Detection Using Deep Learning Techniques

[1]Ms. D. Aruna, [2] Dr. M. Humera Khanam

[1]M. Tech, Dept. Of Computer Science and Engineering, SVU College Of Engineering, Tirupathi, Indai-517502

[2]Professor & HOD, Dept. Of Computer Science and Engineering, SVC College of Engineering, Tirupathi, Indai-517502

Abstract: Ultrasound imaging is one of the most common imaging techniques used to diagnose abnormal and normal kidney transplants. Detection of kidney stones using ultrasound imaging is a challenge as they involve low contrast and speckle sound. This challenge is overcome by using the appropriate image processing techniques. This Article introduces a method of detecting kidney stones through a separate image processing step. The first step is to preview the image. Image enhancement is part of a process that was previously used to enhance an image. Next, image separation is a processed one using a shareholder capture method. Performed on the image. Finally, different images are analyzed to locate the stone.

Keywords: Ultrasound Imaging Techniques, Kidney Stones, Image Processing, Kidney Stone Analysis, Median Filter, Noise Filtering.

Techniques Using: Matlab, Speckle noise removal.

INTRODUCTION

Kidney stones are formed when chemicals in your urine form crystals in your kidneys and the crystals grow over time. Kidney stones are increasing worldwide and most people with kidney disease do not notice the disease as it damages the organs a little before showing any symptoms. The kidneys are bean-shaped organs and are locates on either side of the spine. The main function of the kidneys is to regulate the electrolyte balance in the blood. The formation of kidney stones is caused by congenital urinary retention, cysts.

Various types of kidney stones such as straiten, deer antlers and renal calculi stones were analyzed. Kidney stone is a strong concretion or crystalline formed by the kidneys from food minerals in the urine. To eliminate this painful disease the kidney stone is detected by ultrasound images and then removed by surgical procedures such as breaking the stone into small pieces, Which are then passed through the urinary tract. If the size of the stone grows to at least 3 millimeters, then they can back and many light up to the end, Classification of urinary stones is based on the location or chemical composition of the kidneys (Nephrolithiasis), urethra (Ureterolithiasis), or bladder (Cystolithiasis).

The stone may be located inside the small and large calyces of the kidneys or in the urethra. In medical imaging techniques, ultrasonography is used because it is flexible, portable, does not use radiation and has a relatively low cost. The great disadvantages of ultrasound image is that it contains low quality images with low contrast and repetitive dot sound making it a challenging task to find kidney stones. The speckle sound present in the image lowers its quality which when disturbing the interpretation and diagnosis.

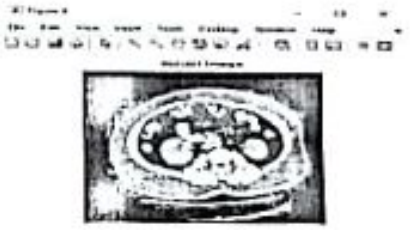

Fig 1: Kidney Stone Image.

Kidney failure may be life threatening. It is there for important to detect early kidney stones. Accurate diagnosis of the kidney stone is important to ensure surgical resection. Ultrasound imaging of the kidneys incorporates speckle sound difficult to perform. So in order to produce an effective stone detection system, dot filtering is one of the most important and possible misdiagnosis that many occur due to differences in the knowledge of forensic pathologists followed by fragmentation and analysis of the stone structure in order to detect the stone automatically.

RELATED JOB

This section provides an overview of the various techniques available for obtaining kidney stones using a variety of images. Detection of kidney stones in the human body is a tedious task, as if improperly detected this could lead to life

ABSTRACT

Exploratory data analysis and machine learning are the building blocks of data science. Every person on average produces terabytes of data per day. As a result, the amount of data that is available on the web has increased astronomically in the past decade. Most of us wish to analyze the data and create a machine learning model that suits the data but because of lack of coding knowledge not many are able to do so. There has been a need to develop a system where the data analysis and building machine learning models can be done with just a few mouse clicks. In this project, we try to bring exploratory data analysis and machine learning techniques under a single roof. The front-end for this project is built upon the streamlit for effective user interface of the user.

Keywords: Exploratory data analysis (EDA), machine learning, regression, classification, clustering, visualization.

I. INTRODUCTION

One of the key steps of exploratory data analysis is data visualization. Data visualization refers to the presentation of data in graphical form, such as charts and graphs to make it easier to understand and analyze. Visualization is used in various fields to reveal patterns that are not always apparent from tables or text. Effective data visualization requires careful selection of appropriate charts and graphs, and attention to design elements such as color and layout. Good data visualization can help people make informed decisions. Machine learning is a subset of artificial intelligence that involves developing algorithms and statistical models that allow computer systems to improve their performance based on a specific task by learning from data, without being explicitly programmed. In machine learning, models are trained on a dataset to find patterns, which can be applied to new data to make predictions. Some of the uses of machine learning are natural language processing, classification, regression, clustering, object detection, recommendation systems. EDA, data visualization and machine learning are all linked with one another. Before we build a machine learning model, it's always necessary to clean the data. Data cleaning involves finding missing values, replacing the missing values with appropriate values, finding outliers, and replacing them, encoding the non-numeric features, transforming the numeric features. Once the data cleaning is done, the data will be split into train and test sets. The train set is used to fit the model and the test set is used for evaluation so we can get an EDA is a mandatory step to be performed before we do any sort of machine learning. There are no systems which provide a simple interface to perform EDA and machine learning. In this project, an effort is made to develop a simple user interface where both EDA and machine learning can be done easily. The user interface is developed using python's streamlit library. The user interface contains drag and drop component for dataset uploading, buttons for performing various actions like finding nulls, creating box plots, creating histograms and scatter plots, generating a data report, building machine learning models, training the model and finally to do predictions.

II. LITERATURE SURVEY

[1]. In the first research paper, they have developed an interactive web application that simplifies and automates the exploratory data analysis stage and is extremely user-friendly and easy to use. The web application is named QuickViz. This web application can be utilized by those who don't have any prior knowledge of programming as this tool doesn't require any coding to execute EDA procedures. Users just must upload their dataset and examine the results of descriptive and graphical EDA techniques through the QuickViz tool, aiding them in gaining insights and patterns from data.

[2]. In this research paper, automation of machine learning process is done using PyCaret and streamlit. Machine learning applications for the industry have seen significant growth and attention in recent years. As a result, there is a significant need for Machine learning engineers across the business, but increasing their productivity is still a major problem. For time-consuming Machine learning pipeline operations such as data pre-processing, feature engineering, model selection, hyperparameter optimization, and prediction result

***Abstract*— The aim of this paper is to depict a system created which detects whether a person has worn a mask or not. For achieving this aim, a dataset consisting of 18236 images of people wearing a mask and without a mask is created. Using the same dataset, 101 layers deep, ResNet-101 convolutional neural network is trained.**

Keywords*— *Acquisition, Image Enhancement, Image Restoration, Color Image Processing, Image Compression, Segmentation, Object Detection & Recognition and Pooling Layer.

I. INTRODUCTION

This is the ongoing time of the COVID-19 pandemic. It has become necessary for the people to wear masks when they go out, especially when they go to a place which has the potential of getting crowded. It becomes a challenging task to monitor a group of people. If some individuals roam without a mask, they can become an origin of spreading COVID19 to other persons which risks others' lives.

To overcome this arduous and challenging task, the solution is to put artificial surveillance which can continuously monitor a group of people. To accomplish this task, we need a system that can recognize the face of the people from the image captured. From these recognized faces, we need to detect whether there is a mask worn or not. A few deep learning models exist which can be used for face-detection. But they lack in terms of accuracy.

Hence to achieve this goal, we have used ResNet-101. We deployed this model on the RaspberryPI board and integrated a web camera to capture images. The system constructed here by us can capture real-time images and from those images detect whether the people have worn a mask or not.

II. LITERATURE SURVEY

By and large, the vast majority of the publication relies on face construction and identity recognition when wearing a face mask. while our emphasis is on recognizing the individuals, who are not wearing face masks to help in diminishing the transmission and spreading of the COVID-19. A few developers built up facemask wearing condition identification techniques. The previous work includes the systems which characterize three classifications of facemask-wearing conditions. The classifications are correct facemask wearing, partial facemask wearing (ie nose not covered), and no facemask wearing. The developers who created the system before, have applied the Principal Component Analysis (PCA) on masked and unmasked faces to recognize an individual. Accuracy of face recognition using the PCA is extremely influenced by wearing masks in these systems. The precision of the system dropped below 70% when the perceived face is covered with masks. The developers proposed a technique that utilized for eliminating glasses from a human frontal facial picture. The eliminated part was recreated utilizing recursive compensation using PCA reproduction. Out of many systems developed, one is using YOLOv3 algorithm for face detection which secured 93.9% accuracy. Another proposed system included the use of a novel GAN-based network which is developed to remove masks covering face area automatically and regenerate the image by building the missing hole. The output of the system was consisting of a completely natural-looking face image. Another proposed system was designed to detect the presence or absence of a mask in the room. The aim of this system is to reduce the false positive face detections. This system secured approximately 95% accuracy. A system with 88% accuracy found that is made for deep learning real-time face emotion classification and recognition using a VGG-16 to classify seven facial expressions. We analyzed all applicable and available methods. Going through all these limitations and methods, we created a system, with efforts to eliminate the issues previous works have. Our proposed research project of the face mask detection system has accomplished 96.02% accuracy.

III. PROPOSED SYSTEM

The proposed model consisted of two key components, the first one is a deep transfer learning ResNet 101 as a feature extractor and the second one is a basic machine learning algorithm decision tree. ResNet is one of the most powerful deep neural networks which has proven the best results when used as a feature extractor. Subsequently, after feature extraction, a decision tree algorithm is used for classification. The following image depicts the working mechanism of the system.

A ResNet is a type of deep transfer learning based on residual learning. ResNet models are proved to be the most efficient models to diminish the problem of vanishing gradients that have their specific residual block. 101-layers deep ResNet-101 starts with a convolutional layer and ends with fully connected layers which have replaced VGG16 layers by faster R-CNN.

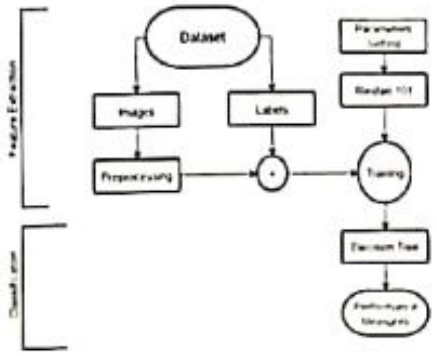

Figure1: Algorithmic flow of the proposed system

AWARENESS ON MOBILE COMMERCE: A CASE STUDY AT NAGARI MANDAL OF CHITTOOR DISTRICT IN ANDHRAPRADESH

Dr. N. Gurumurthy	Dept. of Commerce, S.V. University, Tirupati-517502, Andhra Pradesh India.
Dr. E. Gopi	Associate Professor, Dept. of Commerce, Govt.Degree College, Nagari.
Prof. K. Jayachandra Reddy	Dept. of Commerce, S.V. University, Tirupati-517502 Andhra Pradesh, India.

ABSTRACT Mobile commerce also known as E-commerce involves using wireless handheld devices like cell phones and tablets to conduct commercial transactions online, including the purchase and sale of goods and services bills, banking services through online. Mobile Commerce is mixture of information and communication technology, mobile technology and internet. The main objective of this paper focus on mobile commerce and e commerce status like that mobile operations, internet usages in india, and Geographical profile of various levels of the respondents, awareness and utilization of different services in Nagari mandalam of chittoor district in Andhra Pradesh.

KEYWORDS : M-Commerce, Geographical profiles and utilization of mobile network services

INTRODUCTION:

Mobile commerce is refers to the buying and selling of goods and services through wireless handhelds devices such as smart phones and tablets. M-Commerce is a form of E-Commerce that enables users to access online shopping platforms without the use of desktop computer. Over time, contents delivery through wireless devices had become faster, more secure. As a result mobile commerce had grown rapidly use specific industries includes the financial and telecommunications, service and retail in information services. Mobile commerce adopted today are hotel booking and reservation, purchasing airline tickets, purchasing movie tickets and restaurant booking and reservation, online shopping through Amazon, Flipkart, Big basket and the list goes on. Booking of the cab through Ola and Uber is prevalent and well appreciated by all in India.

Mobile Commerce

Mobile commerce is a large subset of electronic commerce, a model where firms or individuals conduct business over the internet. As of 2023, nearly 97 percent of the Americans own a cell phone, and 85 percent of the them owned a Smartphone. This is up from 35percent in 2011. Now a day many product and services can transacted via m-commerce, including banking, investing and purchasing books, plane tickets and digital music etc. the rapid growth of mobile commerce has been driven by several factors including increased wireless handheld devices computing power, a proliferation on m-commerce applications, and resolution of security issues.

Mobile commerce adopted today are hotel booking and reservation, purchasing airline tickets, purchasing movie tickets and restaurant booking and reservation, online shopping through Amazon, Flipkart, Big basket and the list goes on. Booking of the cab through Ola and Uber is prevalent and well appreciated by all in India.

Need for the Study

The mobile cellular market is the fastest growing market regarding subscriber numbers and popularity in India. The substantial increase of the mobile users is linked with greater adoption for mobile commerce in India. As the Internet started to proliferate in many parts of the world, the mobile phone penetration also grew rapidly. With the development of wireless and mobile technologies, Mobile Commerce is expected to make a substantial impact on the business. Mobile commerce is quite popular in the developed countries, but in India, it is in a growing stage and yet to take off. At present, Indian users indulge in mobile purchases for high-value transactions such as entertainment services, games, and music downloads. The convergence of the two fastest growing industries- the internet and the mobile communication- has led to the creation of an emerging market for mobile commerce.

Objectives of the Study

The specific objectives of the study are:

- To study the socio-economic and demographic variables among mobile commerce service users in Nagari mandal.
- To identify the level of awareness of mobile commerce service users.
- To examine the use of mobile commerce services.

Research Methodology of the Study

This study is on both the primary data is collected through a well structured questionnaire to address the research questions. The relevant secondary data was collected from various journals, magazines, news papers, published information and details on websites for the study.

Limitations of the Study

- This study is constrained to Nagari Mandal of chittoor District only.
- The behavior of the people belonging to rest of Nagari.
- This study cannot be generalized, due to quick changes in technology, Customer preferences.

Status of M- Commerce & E-commerce In India:

Now a day's mobile commerce has touched in every field of human life. People use internet for various purpose which includes emails, academic, financial and non financial information like that music video games on internet, chatting on online job searching, online banking etc,. India has day by day increasing in the number of internet and mobile commerce users in india.

Table No.1 Mobile Operators in India: Key Statistics

Telecom Operator	Total Subscriber
Airtel	22,92,67,770
VI	13,67,25,060
Reliance Communications	42,87,78,364
BSNL	2,70,66,371

Source: Internet

From the above table No.1 shows that with the growing momentum of wireless revolution and Mobile commerce explosion, it is evident that mobile devices are becoming a critical component of the new digital economy.

Table No.2 Internet penetration: India Vs World

Country	Percentage
America	96.6%
USA	98%
Japan	94%
Brazil	81.3%
China	71.3%

India	47%
France	93%

Source. Published by Statistical Research Department. July 7th 2022

As can be seen from the Table No.2, compared to the developed/ developing markets, the internet penetration in India is insufficient and hence there exist a huge potential. With the introduction of free unlimited internet access, JIO has captured 369 million customers.

From the above table illustrates the growth pattern and development over the period and the impact of the internet and mobile technology. It spells out the mobile internet users in India among urban and rural people in India. Majority of rural Indian people have started using more of internet related services are the basic reasons for the speedy growth of mobile commerce in India.

Data Analysis And Interpretation

The well framed questionnaire is used to bring out the required data regarding customer perception on the impact of mobile commerce. The collected data were analyzed and interpreted for understanding the impact of mobile commerce. The analysis is carried by using descriptive statistics.

Descriptive Analysis

In this study the descriptive analysis is used in exploring the following domains:

- Demographic profile of the respondents
- Level of awareness of mobile commerce
- Usage of mobile commerce services

From the below Table No. 3 describes various demographic profiles of the respondents namely Gender, Age, Educational qualification, marital status Occupation, Monthly income, Family size, Family type and location within Nagari Mandal. The data analysis, the demographic profiles of the respondents are:

I. 55.00% of the respondents are Male, and 45.00% of the respondents are female. ii.15.00% of the respondents belong to less than 20 years age group. One-third of the respondents belong to 21 – 30 years age group (38.75%). Then 32.5% of the respondents belong to 31 – 40 years age group. Only 13.75% of the respondents belong to above 50 years age group. It shows that younger generation is towards mobile commerce.

Table No.3 Demographic Profile of the Respondents

Demographic variables		Frequency	Percentage
Gender	Male	44	55.00
	Female	36	45.00
Age	< 20 years	12	15.00
	21-30years	31	38.75
	31-40 years	26	32.5
	>50 years	11	13.75
Education	School level	13	16.25
	Diploma Level	10	12.5

Source: Primary Data

Interpretation:

From the above table No. 4 shows that, i. More than half of the respondents 77.5% have the android type of smart phones, 11.25% of them have apple mobile phones, 10.00% of them have windows (keypad), and 1.25% of them responded that they use other types of operating system. ii. 75.50% of the respondents are using pre-paid, and 25.00% of the respondents are using the post paid connection. iii. Half of the respondents network provider is JIO 51.25%, 25% of the respondents are using Airtel, 13.75% of the respondents are using BSNL, 10.00% of them are using IDEA, networks respectively. More than 60% of the respondents have done their recharge/top up in grocery stores, through a dealer and by internet also. v.

The majority 25.00% of the respondents spend less than Rs.300 per month for mobile. 40.00% of their monthly usage is between Rs.300 – Rs.500. 11.25% of the respondent's usage is between Rs.500 – Rs.700. 8.75% of them have spent Rs.700 to Rs.1000, and only 15.00% of the respondents have spent more than Rs.1,000 for their mobile usage on a monthly basis.

Table No.5 Utilization of Mobile Commerce Services

Usage	Never	Rarely	Some-times	frequently	Always	Total
Internet	4 (5.00)	29 (35.25)	2 (2.5)	9 (11.25)	36 (45.00)	80
Entertainment	20 (25.00)	8 (10.00)	30 (37.5)	15 (18.75)	7 (8.75)	80
Message (Whats App / Hike)	7 (8.75)	11 (13.75)	17 (21.25)	36 (45.00)	9 (11.25)	80

Video Calling (Skype /Viber/IMO)	9 (11.25)	8 (10.00)	57 (71.25)	5 (6.25)	1 (1.25)	80
Shopping (eBay/Amazon / Myntra / Snapdeal)	24 (30.00)	7 (8.75)	23 (28.75)	19 (23.75)	7 (8.75)	80
Navigation (GPS)	39 (48.25)	19 (23.75)	11 (13.75)	7 (8.75)	4 (5.00)	80
VIRTUAL Wallets like paytm/mPass etc.	8 (10.00)	16 (20.00)	29 (36.25)	14 (17.7)	13 (16.25)	80

Source: Primary Data

Interpretation

The maximum mean score is 45% in a, always which is for surfing internet. The next score for utilization of mobile commerce is attained by Entertainment 37.5% in some times, it shows that most of them are using mobile commerce for entertainment purpose. Then they use mobile commerce for the sake of messaging 45.00% in frequently, then video calling 71.25% in some times. The mean of shopping, wallets like Paytm and GPS are below average. Half of the respondents used it for entertainment, internet and messaging. Since the standard deviation is more than one, it shows that there is more deviation in the level of agreement for usage.

Findings and suggestions

Findings

- It is observed that majority (75%) of the respondents have two to four family members. More than half of 56.25% them belong to the nuclear family.
- Students and employed respondents have invariably adopted Mobile commerce.
- Almost 45 % of the respondents monthly income is less than Rupees 30,000.
- It is found that Android type of Smartphone is used most in the market, followed by windows type.
- It is observed that majority of the Nagari mandalam customers are using a pre-paid connection from the service provider.
- During the study period, it is found that more than half 51.25% of the respondents network provider is JIO and about 25% of the respondents are using Airel.
- It is found that Mobile commerce services are utilised mostly for the entertainment purposes like music, cinema ticket booking and travel. This is followed by surfing internet, messaging like WhatsApp and video calling and online chatting etc,.
- It is found that most of the respondents are use of mobile commerce. They use multiple SIM cards and indulge in mobile transactions with the available kind of internet access.
- Majority of the respondents agree that mobile commerce application is very useful for quick search, which infers that they have a wide variety of alternatives during their state of purchase.
- It is observed that 82.20% of the respondents are willing to recommend their family and relatives to use mobile commerce services.

Suggestions

Based on the observations and findings of the study, the following recommendations are made to improve mobile commerce eco-system for the service provider and policy changes are given below:

- Majority of the 85% in Nagari customers are using a pre-paid type of connection and Android type of Smartphone. Any Business promotion shall target prepaid customers in android platform so that the reach is the maximum instantly and bring positive results.
- It is evident from the study that the parameters such as speed, user friendliness, easy to use and compatibility are major influencing factor for the adoption of mobile commerce services.
- What"s App, Navigation and Shopping usages are more in home town. It is recommended to service provider to focus on location based services (e.g. directions for travelling, information about of the nearest store, etc.
- Due to dynamic and ever changing business environment the tele-communication sector in India has to evolve refined model to suit new policy measures and regulatory mechanism which will certainly make customer delight and improve service satisfaction by assessing the periodical survey.

Key words: Information Technology, Customer satisfaction, Banking sector

INTRODUCTION

Banking is a highly information intensive activity and relies mostly on information technology to acquire, process and deliver the quality information to all the users. Automated delivery of banking products and services to its customers through electronic communication like internet is referred as internet banking. Banks find that to retain their demanding customers, innovation and updation along with the provision of convenient, reliable and expedient services is very important. Today, almost all the Indian banks are trying to differentiate themselves in the competitive industry and align their offerings to the constantly evolving customer needs and developments in technology in everywhere in India. Globalization and deregulations helped banks expand their reach beyond countries which made them more competitive and therefore looking forward offering internet banking services, to maximize profits as well as retain customers. However, this cannot be achieved without high quality service which when satisfied, results in improved customer satisfaction. To make customers' banking more convenient, efficient and effective it is very important to ascertain the customers' perception of overall service quality and their satisfaction with online banking services.

Conceptual frame work:

E-banking refers to banking operations, with which the customers can carry out transaction through internet, which is completely safe and secure. E- banking encourages paperless or cashless transaction in everywhere in india.

Internet Transaction: Banking facility provided the customers through the customers are able to perform a number of monetary& internet using transactions, through the bank websites.

Mobile banking: almost all the banks have designed their mobile applications with which you can perform transactions at your fingertips, which is smart phones, internet, mobile application and banking services in your bank account.

ATM: ATM is not a just a machine with which you can withdraw cash as and when required, bit it also allows you to check your accounts status , deposit funds, transfer funds, change debit card pin, personal identification number

Debit Card: now a day's debit cards used in our day to day life so as to perform end number of transactions. Debit cards are linked to the customer's bank account and so the customer's only needs to swipe the card, in order to make payment at point of sale (POS) outlets, online shopping. ATM withdrawals, in this way the amount is deducted from the customer's account directly.

Credit card: it is just like a debit card, a credit card is also a payment card which the banks issue to the customers on their on their request, after checking their credit score and history. It enables the cardholders to borrow funds up to the pre-approached limit and make a payment. The maximum limit is granted by banks with

Scanned with OKEN Scan

issue the card. The card holder promises to repay the amount within a stipulated time period. Otherwise some charges for the issue of credit card.

Point of Sale (PoS) : PoS system refers to the point, in terms of date, time and place, where the customer makes a payment, using a plastic card for the purchase made or services received.

Electronic Data Interchange (EDI): EDI is a new mode of communicating information between businesses electronically using a standardized format.

Electronic fund transfer: when money is transferred electronically from one bank to another bank. It cover direct debit, direct deposits, wire transfers, RTGS, NEFT,etc,.

OBJECTIVES OF THE STUDY

This research has been carried out with the following objectives.

- To identify the factors influencing the customers to opinion for Internet Banking service in the study area.
- To analyse the problems of internet banking customers.
- To offer suitable suggestions to promote the Internet banking service of the public and private sector banks.

Research Methodology of the Study

This study is on both the data is collected through a well structured questionnaire to address the research questions and take 60 randoms, but all the questions responses have five options, i.e., Highly satisfied, Satisfied, Neutral, Dissatisfied , Highly Dissatisfied. The relevant secondary data was collected from various journals, magazines, news papers, published information and details on websites and so on.

DATA ANALYSIS AND INTERPRETATIONS

The primary data was collected from the users of Internet banking. Interview schedule was used to collect the data from the internet banking customers of selected public sector banks were State Bank of India, Canara Bank, Indian Bank,Axis Bank and other Banks in Chittoor District of Andhra Pradesh.

GENDER WISE CLASSIFICATION

The gender wise classification of the respondents gives an outline about which category of customers highly prefers the internet banking.

Scanned with OKEN Scan

Table No.4.1
Number of Respondents

Gender	Number Of Responds	Percentage
Male	40	66.60
Female	20	33.40
Total	60	100

Source: Primary Data

Table 4.1 shows that out of the total respondents, a majority (66.60%) of respondents was male and the remaining 33.40% of the respondents were female using internet banking. Therefore, it is concluded that a majority of the male customers prefer internet banking than their females.

AGE WISE CLASSIFICATION

Age is an important demographic variable that not only determines an individual's physical and mental maturity but also depicts life experiences. As the age increases, the learned experience changes the behaviors of individuals. Learning is an action based on experience. Hence, most behavior is learned by individuals. Therefore, it is interesting to note the age - wise distribution of the respondents.

Table No.4.2
Number of Respondents

Age	Number Of Respondents	Percentage
Up to 20 years	18	30.10
21 – 30	29	48.30
Above 50 years	13	21.60
Total	60	100

Source: Primary Data

Table 4.2 from the above table no shows that the majority of the respondents belonged to the age groups 21 - 30 years using internet banking service in the modern world.

MARITAL STATUS

In Indian society, marriage is supposed to be a religious obligation. In the social context, it is the prelude to the family formation, expansion or even bifurcation. After marriage, there is a transition in the status of men and women by change in rights and obligations. More than the conventional roles of parents, today's parents play a crucial role in building up a family; inculcate values for life and so on. Hence, the marital status of the respondents is given in the table.

Scanned with OKEN Scan

Table No.4.3
Marital Status

Marital	Number Of Respondents	Percentage
Married	35	58.3
Un Married	25	41.6
Total	60	100

Source: Primary Data

Table 4.3 shows that out of the total respondents, a majority (58.3%) of respondents was married and the remaining 41.6% of respondents were unmarried. So, it is identified that most of the respondents are married. It is clear from the table married people highly prefer internet banking.

EDUCATIONAL QUALIFICATION

Education is one of the most important traits of the customers because the perception, awareness and behavior of the customers depend largely on his/her educational qualifications. Education plays a vital role for having access to basic internet banking. The level of education of the respondents is portrayed in the below table 4.4.

Table No.4.4
Educational Qualifications

Qualifications	Number Of Respondents	Percentage
SSC	12	20.2
Inter	8	13.3
Graduate	28	46.6
PG	8	13.3
Others	4	6.6
Total	60	100

Source: Primary Data

It reveals that out of the total respondents, 46.6% of the respondents were graduates, 20.2% of the respondents have completed higher secondary level, 13.3% of the respondents were post graduates, again 13.3% of the respondents have completed upto secondary level. 6.6% of the respondents were others. Hence, it is clear that a majority of the respondents are graduates as internet banking requires a little technical knowledge.

Scanned with OKEN Scan

OCCUPATION WISE CLASSIFICATION

Occupation determines the need of using internet banking service. The occupation wise classification of the respondents is given in the table.4.5.

Table No.4.5
Occupation Wise Classification

Occupation	Number Of Respondents	Percentage
Government	3	15.0
Private	20	11.1
Business	4	16.6
Agriculturist	6	10.0
Home Maker	11	20.7
Student	16	26.6
Total	60	100

Source: Primary Data

Table 4.5 shows that out of the total respondents, 26.6% of the respondents were studying, 20.7% of the respondents were homemakers, 16.6% of respondents were businessmen, 15% of the respondents were working as government employees, 11.1% of the respondents were business, and 10.% of the respondents were agriculturists.

Therefore, it is evident from the table that most of the private employees are highly interested in internet banking service as they are well aware of its nuances.

MONTHLY INCOME

Adequate income encourages the customers to opt for internet banking service. The monthly income of the respondents is disclosed in the Table 4.6 shows that out of the total respondents, 51.6% of the respondents had a monthly income of Rs. 10,001 to Rs. 20,000, 43.3% of respondents had a monthly income up to Rs. 10,000, and above Rs. 20,000 respectively.

Scanned with OKEN Scan

Table No.4.6
MONTHLY INCOME

INCOME	Number Of Respondents	Percentage
UP to Rs.10,000	26	43.3
Rs. 10,001-20,000	31	51.6
Above 20,000	3	5.1
Total	60	100

Source: Primary Data

TYPE OF FAMILY

The family background plays an important role in moulding the behavior to any person. The family provides the recognition and security for the individual identity. The living arrangements are very crucial for the socio-economic status of a person. Traditionally, Indian society preferred to live on joint family arrangements. As the economic necessitates improved, people moved towards nuclear families than of joint families. Besides this some of the cultural aspects such as family relationship, increase in style of living have made the family size to shrink. The outline about the type of family of the respondents is given in the table.

Table No.4.7
TYPE OF FAMILY

FAMILY	Number Of Respondents	Percentage
Nuclear Family	46	76.6
Joint family	14	23.3
Total	60	100

Source: Primary Data

Table 4.7 indicates that out of the total respondents, a majority (76.6%) of the respondents belonged to nuclear family and the rest 23.3% of respondents belonged to joint family.

PREFERRED BANK

There are a few reasons behind the choice of bank such as easy convenience, trust worthiness, low cost of transaction and the availability of service. The bank which is preferred by the respondents to maintain their account is shown in the table.

Scanned with OKEN Scan

Table No.4.8
PREFERRED BANK

PREFERRED BANK	Number Of Respondents	Percentage
SBI	11	18.30
Canara Bank	13	1.66
Indian Bank	19	31.60
Union Bank	12	20.11
Axis Bank	2	3.33
Other Bank	3	25.00
Total	60	100

Source: Primary Data

Table 4.8 shows that out of the total respondents, 31.60% of respondents held their account in Indian Bank, 25% of respondents held their account in other Banks, 20.11% of the respondents held their account in Union Bank, 18.30% of the respondents held their account in State Bank of India, 3.33% of respondents held their account in Axis Bank, and 1.66% of the respondents held their account in Canara Bank. Hence, it is clear that a majority of the respondents maintain their accounts in Indian Bank as it offers better quality of service.

SOURCE OF INTRODUCTION

Source of introduction refers to the person who motivates the respondents to open a bank account in a specific bank. The source of motivation of the respondents is unveiled in the table.

Table No.4.9
SOURCE OF INTRODUCTION

Source	Number Of Respondents	Percentage
Friend	27	45.0
Relative	18	30.0
Advertisement	3	5.0
Banker	12	20.0
Total	60	100

Source: Primary Data

Table 4.9 unveils that out of the total respondents, 45% of the respondents were motivated by their friends, 30% of the respondents were motivated by their relatives, 20% of the respondents were motivated by the Banker and 5% of the respondents were motivated by the advertisement to choose the respective banks. Hence, it is clear that most of the respondents were motivated by their relatives to opt for a particular bank.

Scanned with OKEN Scan

FREQUENCY OF USING INTERNET BANKING SERVICE

The frequency of using internet banking varies from one customer to another. How often the respondents are accessing internet banking service is displayed in the table.

Table No.4.10

FREQUENCY OF USING INTERNET BANKING SERVICE

ATM	Number Of Respondents	Percentage
Frequently used	16	26.66
Occasionally	11	18.34
When need arises	33	55.00
TOTAL	60	100

Source: Primary Data

Table: 4.10 shows that out of the total respondents, 55% of the respondents used internet banking service when need arises, 18.34% of the respondents used internet banking service occasionally and the rest 26.66% of the respondents used internet banking service frequently.

SATISFACTION ON INTERNET BANKING SERVICE

The satisfaction of the customers plays a crucial role in the promotion of the service. The customers' satisfaction on internet banking service is described in the below table 4.11

It increases the believability, honesty and trustworthiness of the customers	11(18.3)	17(28.3)	10(16.6)	13(21.6)	9(15.0)	60
12 Internet banking ensures accountability	11(18.3)	13(21.6)	13(21.6)	10(16.6)	3(5.0)	60

(**HS** – Highly satisfied **S**– Satisfied **N**– Neutral **DS** – Dissatisfied **HDS** – Highly Dissatisfied)

The customers were highly satisfied on availability of service is faster than traditional banking (28.3%), and it increases the believability, honesty and trustworthiness of the customers satisfied in (28.3%). It perform the overall internet banking ensures accountability is highly satisfied (18.3%) respectively.

FINDINGS AND SUGGESTIONS

- A majority (66.60%) of the male customers have preferred internet banking than their female counterparts as male is technology.
- 48.3% of the respondents who belonged to the age group of 21 - 30 years make use of internet banking service as they are exposed to technology enabled services.
- A majority (58.3%) of the respondents are married. It is identified that married people mostly prefer internet banking as they have greater responsibility.
- All (100%) the respondents are educated and there is no respondent without formal education.
- It is found out that 26.6% of the respondents are from students background.
- It is understood that 51.6 % of the respondents belong to a monthly income category of Rs. 10,001 - Rs. 20,000.
- A majority (76.6%) of the respondents belong to nuclear family as they need privacy and expect to be independent in all walks of life.
- It is understood that 31.60% of the respondents hold their accounts in Indian Bank as it offers better quality of services in this area.

Scanned with OKEN Scan

SUGGESTIONS

- Banks should take necessary steps to create awareness among rural people about the advantages of internet banking services available in the banks.
- The banks should offer internet banking service in the regional language to attract the customers to enable all the customers to make use of the service irrespective of their education bag round.
- The internet banking system should be enhanced to make the online enquiry and online payment much easier to the customers.
- The bank should not restrict the time to carryout NEFT transaction in care of transferring fund from one bank to another.
- Public sector banks should improve their internet banking services to compare with their private sector counterparts.
- The public sector banks must improve its service quality in terms of communication, responsiveness, reliability and understanding.
- The bank should provide various effective modes for promotional schemes, interaction with the customers, more accuracy in billing, and financial security and privacy in transactions.

ABSTRACT

A stock market index is created by selecting a group of stocks that are representative of the whole market or a segment of the market. NIFTY 50 is the benchmark index of India, reflecting the overall dynamics of an Indian equity market as well as the Indian economy. The NIFTY 50 is a well diversified 50 stock index, which covers all the important sectors of Indian economy and works as a face of Indian economic performance. It is used for a variety of purposes such as benchmarking fund portfolios, index-based derivatives and index funds (options and futures). The objective of this paper is to give insights about what NIFTY 50 is, how it functions, what exactly is an index and benchmark index, what types of stocks are involved in it, what are the measures to calculate market capitalization and how it developed over the years when compared to other stock exchanges,what is SGX NIFTYis andhow is SGX NIFTY is different from Indian NIFTY .

INTRODUCTION

NIFTY 50 Index is an index consisting of 50 blue chip large and liquid stocks listed on the National Stock Exchange of India. Since inception, the NIFTY 50 Index has successfully

become the ‘stock of the nation’, helping investors understand the pulse of Indian capital market. It has lived up to its core purpose of providing afair representation of the Indian equity market focusingon portfolio diversification andliquidity. Over the years, the NIFTY 50 has become one of the most widely used benchmark for exchange traded products on Indian equity market.

II. LITERATURE REVIEW OF

Swati Garg and Y. P. Singh (2013) associated the performance of NIFTY-50 and Index Funds. Five NIFTY-50 and Index Funds tracking the same benchmark indices wereanalysed in the study over a period of three years starting from June 2006 to December 2009. The analysis showed that over long-term investment horizon NIFTY-50 performed better in terms of their imitation strategy, tracking ability and performance effectiveness. However, it was evident from the study that short-term investors face a disadvantage from investing in NIFTY-50.

P.Mishra and G.Singh (2016) attempted to make an intra-class performance evaluation of some Indian Index funds. Graphical interpretations were used along with statistical tools like R-square and tracking error values. Two models of tracking error were test empirically the performance of the selected index funds. Empirical results revealed that out of the selected index funds, SBI NIFTY Index fund outperformed the other six index funds during the period under study. SBI NIFTY Index fund was also able to limit the tracking error to an acceptable limit.

S. Narend (2014) Made a comparative study of the performance of NIFTY-50 and index funds. The study was done empirically since the period of their respective initiation till July 2013. The study used three parameters for the analysis of the performance such as active

returns, tracking error and Jensen's alpha. The analysis showed that NIFTY-50were performing betterwhen compared to the index mutual funds

Falguni Pandya (2016) analysed the index fund and measuring tracking error. The study used descriptive statistics,and proved that NIFTY and banking index-based funds were found to be having lowest tracking error, while Gold NIFTY-50 didn't perform better in terms of mean return whereas, international NIFTY-50was found to be most efficient.

OBJECTIVES OF THE STUDY

1. To know about the NIFTY 50 and their constitution and the types of Sectors involved in NIFTY-50

2. To know about the Index and its methodology.

3. To know about the market capitalization and its calculation method.

4. To know about the SGX NIFTY and how it is different from Indian NIFTY.

NIFTY 50, ITS CONSTITUTION AND TYPES OF SECTORS INVOLVED IN NIFTY-50

Understanding the NIFTY 50

While the NIFTY 50 is now a much relied upon barometer for measuring the performance of Indian stock markets at large, it has been meticulously constructed over time in order to achieve this status. The benchmark index is made up of stocks belonging to 13 sectors in order to achieve diversification. The sectors are as follows:

– Oil and gas

– Consumer goods

– Information technology

– Financial services

– Automobiles

– Construction

– Telecommunication

– Pharmaceuticals

– Power

– Cement products

– Metals

– Fertilizers and Pesticides

– Media and entertainment

The NIFTY 50 functions as an indication of the performance of Indian markets because it is in and itself a small sample representation of the best offerings of the Indian markets; If the stocks in NIFTY 50 are not performing well, it is very likely that the economy at large will not be able to escape the adverse effects that bringingdown the index .

Constitution of NIFTY

To be considered for inclusion in the NIFTY 50, a firm or stock must meet the following criteria:

- The firm should be headquartered in India and should have been listed and traded on the National Stock Exchange (NSE).
- To be included in the NIFTY 50 Index, the firm must be included in the NIFTY 100 index and be accessible for trading in the NSE's futures and options market.
- The business's average free-floating market capitalization should be 1.5 times that of the index's smallest firm.
- The stock should have been traded every day for the previous six months (100 percent trading frequency).

How can a company be entered in NIFTY-50

To enlist in NIFTY, a company has to be listed on NIFTY Index and has to qualify the following criteria:

- The firm must have been enlisted on the National Stock Exchange.
- It needs to be an Indian company.
- The company's shares must be exceedingly liquid.
- The liquidity indicator is the average impact cost. The impact cost can be termed as the trading price of a single share in comparison to the index's influence on a company's market valuation.
- For the succeeding six months, the firm's impact cost should be less than 0.50 per cent. Or it should be less with at least 90% of calculations made on a portfolio of ₹10 crores.
- The frequency of the firm's business should be 100% for six months.
- The Gross Market Capitalization should be free-floating. This GMC should be 1.5 times the size of the index's smallest business.

- Differential Voting Rights or DVR with shares of companies can be eligible for inclusion in the NIFTY 50 Index.

NIFTYINDEX AND ITS METHODOLOGY.

NIFTYIndex

To explore function what NIFTY 50 and what the NIFTY 50 stocks are, one must first understand what exactly an index or a benchmark index is in the its simplest terms, an index is a basket of securities that is created as a representational sample of a certain sector in the market. This representational sample then works as a barometer to test the market performance. It is a statistic that calculates to what extent changes in the stock market. It monitors price changes and market performance. To establish an index, a few stocks are to be chosen from a list that have similar characteristics like company size, industry and total market capitalization.

The value of the stock market index can be calculated by the values of the underlying group of equities. The value of the stock index is influenced by differences in the underlying stock. If the majority of stocks grow in value, so will the index, and vice versa.

Index Methodology

Eligibility Criteria for Selection of Constituent Stocks:

i. Market impact cost is the best measure of the liquidity of a stock. It accurately reflects the costs faced when actually trading an index. For a stock to qualify for possible inclusion into the NIFTY50, it should have traded at an average impact cost of 0.50% or less during thelast six months for 90% of the observations, for a basket size of Rs. 100 Million.

ii. The company should have a listing history of 6 months.

iii. Companies that are allowed to trade in F&O segment alone are eligible to be constituent of the index.

iv. A company which comes out with an IPO will be eligible for inclusion in the index, if it fulfils the normal eligibility criteria forthe index for a 3-month period instead of a 6-month period.

Index Re-Balancing:

Index is re-balanced on semi-annual basis. The cut-off dates are is January 31 and July 31 of each year, i.e. for semi-annual review ofindices, average data for six months ending the cut-off date is considered. Four weeks prior notice is given to market from the date ofchange.

Index Governance:

A professional team manages all NSE indices. There is a three-tier governance structure comprising the Board of Directors of NSEIndices Limited, the Index Advisory Committee (Equity) and the Index Maintenance Sub-Committee.

MARKET CAPITALISZATION AND ITS CALCULATION METHOD

Market Capitalization

Definition: Market capitalization is the aggregate valuation of the company based on its current share price and the total number of outstanding stocks. It is calculated by multiplying the current market price of the company's share with the total outstanding shares of the company.

Description: Market capitalization is one of the most important characteristics that helps the investor determine the returns and the risk in the share. It also helps the investors choose the stock that can meet their risk and diversification criterion**.**

Calculation Method

Market Capitalization = Shares outstanding * Price

Free Float Market Capitalization = Shares outstanding * Price * Investible Weight Factor

Index Value = Current Market Value / Base Market Capital * Base Index Value (1000)

The IWF (Investible Weight Factor) is a factor in the formula above that is used to determine the number of shares available for trading in the market. Because the value of stocks fluctuates daily, as the index is calculated in real-time.

The method above also takes into account changes in the business environment. Stock splits, rights issues, and other similar modifications are examples of these developments. NIFTY maintains the index regularly to ensure its stability and effective operation. This is how NIFTY 50 is calculated.

SGX NIFTY and how it is different from Indian NIFTY.

SGX NIFTY

SGX NIFTY is a derivative of the NIFTY index, which is traded in the Singapore Stock Exchange platform. This trade sets a predetermined price of a share and reduces the future risk of any investments. To make it easy for one to understand, one should keep in mind that like Indian NIFTY trades on the NSE, which is the Indian stock exchange platform, the SGX NIFTY is the futures trade NIFTY in Singapore. In this SGX NIFTY,the price of the share is present, the

buyer and seller have to commit to that pre-decided price in spite of any changes that may take place in the stock market in the future.

As the Singapore Stock Exchange is a leading stock exchange in India, the SGX NIFTY helps to predict and observe the behaviour of the Indian NIFTY and thus has an important role to play in the Indian stock market.

Different between SGX NIFTYand Indian NIFTY

The main difference between the SGX NIFTY and the Indian NIFTY is that the SGX NIFTY is a futures trade platform in Singapore where the prices of stock are predetermined to avoid the future risk, whereas the Indian NIFTY trades only on the Indian stock exchange platform, which is the National Stock Exchange or NSE.

Another important difference is the contract size of the Indian NIFTY and the SGX NIFTY. In an Indian NIFTY a contract between the buyer and seller must have a minimum of 75 shares, which is not required in the SGX NIFTY. This means that SGX NIFTY does not have to include shares, whereas every Indian NIFTY must include shares.

SGX NIFTYattracts a high number of customers and trading activities because it is the most active trading platform in Singapore and the only trading platform that works for sixteen hours a day. This is definitely not the case with the Indian NIFTY, which is a National exchange platform. These characteristics of SGX NIFTY make it more profitable.

Impact of SGX NIFTYon the Indian Market

As already discussed, the SGX NIFTY proves to be helpful in predicting and observing the Indian NIFTY's behaviour. There is also a time difference between the Indian NIFTY and the SGX NIFTY, wherein the Singapore market opens about two and half hours before the Indian

market. This allows investors to keep an eye on the SGX NIFTY to know the fluctuations in the market and observe how well the overall trading process is going. By observing this, the investors get an idea about the Indian market and how does it open either with positive or negative results. Therefore, those who are sceptical about investing in the Indian market, can invest in SGX and keep an eye on the SGX NIFTY to get an idea about the Indian NIFTY and stock exchange platform.

Although this may be a convenient way to judge the Indian market and weigh out 0ne chances, not all results that these investors get are accurate and subject to the various economic factors existing in both the countries as both these countries like India and Singapore have very different economic structures and yet they have different prominent effects on the market behaviour.

Both the Indian NIFTY and SGX NIFTY are equally important as they have some effects on each other's behaviour, and one cannot be talked about without mentioning the other. Everyone who wishes to enter the stock market world and starts trading like an expert need to first know and be familiar with NIFTY and SGX NIFTY terms and many other financial terms commonly used and have important roles to play in the stock market.

CONCLUSION

The NIFTY index is an important pointer of the market, and its movements affect the Indian economy to a great extent. NIFTY is the NSE’s benchmark index (National Stock Exchange). The stock index that calculates the 50 biggest and most liquid stocks on NSE is called NIFTY. These 50 largest firms reflect India’s stock market and economic trends, and they come from a variety of industries. The top 50 largest firms are selected based on the market capitalization as shown above and the top good performing sectors are healthcare and

technology.One must note that SGX NIFTYis highly preferable platform toNIFTY due to the reasons like performing trading for sixteen hours a day, not involving any minimum number of share and the predetermined futures price .

***Abstract*- The term "weaker section" refers to a section of the population that is socially, economically, and politically behind the other sections of the population and has been experiencing various forms of inabilities as a result of their backwardness. The Government of India Act, 1935, defines "weaker sections" as class or classes of people who are suffering from educational and economic backwardness, as well as some aspects of social life, due to traditional customs of untouchability, tribal background, tribal way of life, or other backwardness. In India weaker sections encompassing marginalized groups such as Scheduled Castes, Scheduled Tribes, Other Backward Classes, and economically disadvantaged individuals. The research focuses on the objectives of identifying the problems and perceptions of sample entrepreneurs in the Nellore district, particularly those who received financial assistance from the Andhra Pradesh State Finance Corporation (APSFC) between 2022 and 2023. The sample design involves 3658 entrepreneurs from four revenue divisions, with a convenience sampling method adopted for selection. The study spans a ten-year period from 2012-13 to 2021-22, with primary data collected in 2022-23 and secondary data gathered from 2013 to 2022. The problems faced by the sample entrepreneurs are categorized into financial, raw material, marketing, labour, and infrastructural issues. The study also assesses general problems in obtaining assistance from Nellore branch APSFC, highlighting concerns such as delays in loan processing, inadequate sanctions, excessive terms and conditions, high-interest rates, and delays in disbursements. Perceptions of sample entrepreneurs regarding APSFC's activities, sources of information, and opinions about obtaining complete information are analyzed.**

***Keywords*: APSFC, Weaker sections, Disbursement, Perception.**

Introduction

India, with its rich tapestry of cultural diversity and economic dynamism, grapples with the intricate challenge of addressing the needs and aspirations of its weaker sections. The term "weaker sections" encompasses various marginalized groups such as Scheduled Castes (SCs), Scheduled Tribes (STs), Other Backward Classes (OBCs), and economically disadvantaged individuals facing socio-economic vulnerabilities, often due to historical injustices, caste-based discrimination, economic disparities, and lack of access to opportunities.

Historical Perspectives: The roots of the challenges faced by the weaker sections in India can be traced back to historical injustices, deeply embedded in the country's social fabric. The caste system, a centuries-old hierarchical social structure, has perpetuated discrimination and created a stark divide between the privileged and the marginalized. Despite constitutional safeguards and affirmative action measures, the persistent effects of historical oppression continue to hinder the progress of these sections.

Economic Disparities: One of the primary issues faced by weaker sections is economic inequality. Limited access to education, healthcare, and employment opportunities exacerbates their socio-economic vulnerabilities. As a result, a significant portion of the population finds itself trapped in a cycle of poverty, making upward social mobility a distant dream for many.

Educational Challenges: Education, often considered a potent tool for social transformation, remains elusive for many in the weaker sections. Lack of adequate infrastructure, discrimination in educational institutions, and socio-economic constraints contribute to lower enrollment and high dropout rates among these communities. This educational gap perpetuates a cycle of poverty, limiting the potential for overall development.

Caste-Based Discrimination: Despite legal prohibitions, caste-based discrimination continues to persist, affecting the daily lives of those in weaker sections. Social stigmas and prejudices impede their access to basic amenities, healthcare, and even employment opportunities. Addressing these deeply ingrained biases is crucial for fostering an inclusive and equitable society.

Perceptions and Stereotypes: Perceptions surrounding the weaker sections often perpetuate stereotypes, further marginalizing these communities. These preconceived notions hinder their integration into mainstream society and

contribute to the perpetuation of systemic inequalities. Challenging these stereotypes is essential for creating a more just and inclusive society.

Objectives of the study

The main objective of the study is to identify the problems and perceptions of sample entrepreneurs in the study area.

Sample design

The study is to probe into the availability of finance for the weaker sections of entrepreneurs from Nellore branch APSFC in Nellore district. The sample size of the present study includes only the weaker sections of entrepreneurs who got financial assistance from Nellore branch APSFC. The weaker sections of entrepreneurs financed by Nellore branch APSFC during the period 2022 to 2023 have been taken into consideration to collect the required data. Nellore district has been divided into four divisions namely Kandukur, Kavali, Nellore and Atmakur. A total of 3658 entrepreneurs of weaker sections who have taken loan in the above said branch by APSFC have been selected for study in the first stage. The convenience sampling method has been adopted for the selection of the sample respondents as a result of which 15 per cent of weaker sections of entrepreneurs assisted during this period were chosen conveniently for the study. Out of the total 549 sample respondents,129 sample respondents are from Kandukur revenue division,136 sample respondents from Kavali revenue division,175 sample respondents from Nellore revenue division and 109 sample respondents are from Atmakur revenue division. The strength particulars of the sample borrowers of weaker sections entrepreneurs from the four revenue divisions of Nellore branch Andhra Pradesh State Finance Corporation are furnished in the below table 1.

Table No. 1

Sample borrowers of weaker sections of entrepreneurs from four revenue divisions of Nellore branch of Andhra Pradesh State Finance Corporation in Nellore district

Revenue Divisions	**Total number of borrowers in each revenue division**	**Sample number of borrowers in each revenue division (15 Per cent of Total number of borrowers)**
Kandukur	862	129
Kavali	903	136
Nellore	1165	175
Atmakur	728	109
TOTAL	**3658**	**549**

Source: Nellore branch APSFC.

Period of the study

The period of study is for 10 years from 2012-13 to 2021-22. The primary data pertains to the field of study of the weaker sections of entrepreneurs of the four revenue divisions namely Kandukur, Kavali, Nellore and Atmakur in Nellore district and the study was conducted in the year 2022-23. The secondary data were collected during the period from 2013 to 2022.

Problems faced by the sample entrepreneurs

The entrepreneurs of any category or nature of business in the world face different kinds of problems like infrastructure, financial, labour, raw material, marketing and technology, etc., and the degree of severity of the problem varies based on the nature of business, size of business, location of business, form of business organization, etc. Though problems of an entrepreneur of an enterprise can be classified into two categories namely, internal and external problems. Internal problems affect the operating performance of an enterprise to a great extent. The problems are size of the organization and structure, process of production, training of the personnel, scantiness of management etc. External problems result from factors outside the control of entrepreneurs, such as the availability of water, power and other infrastructure facilities required for the smooth management of an enterprise, finance, marketing, etc. In the present research study, the role of Nellore branch APSFC in promoting the Weaker sections entrepreneurs, some of the problems of sample entrepreneurs in the sample district of Nellore have been highlighted to have an understanding about the common problems faced by the entrepreneurs in general in India. The key issues where problems arise in the institution and in the smooth running of entrepreneurs are mobilizing finance, acquiring of raw material, engaging labour, marketing, management, infrastructure facilities, government regulations, technological up-gradation, license, recovery of debts, etc.

Financial Problems of Sample Entrepreneurs

One of the important problems for a business concern is scanty financial resources. Most of the entrepreneurs are suffering from insufficient financial sources. These enterprises are not able to mobilize required finance from different sources because of the small size of the enterprise. The funding agencies arc also imposing number of terms and conditions to provide finance to meet entrepreneurial fixed and working capital requirements. The entrepreneurs have to depend on more than one source and pay heavy investment charges, and the huge rate of interest on loans raised. The other common problems faced by the entrepreneurs are also briefed hereunder. The opinions of the sample entrepreneurs about various aspects of financial problems are depicted in the table no. 2.

Table No. 2-Financial Problems of Sample Entrepreneurs

Problems	Revenue divisions								Total	
	Kandukur		Kavali		Nellore		Atmakur			
	No.	%	No.	%	No.	%	No.	%	No.	%
Shortage of long term loans	49	37.98	51	37.50	77	44.00	50	45.88	**227**	**41.34**
Shortage of working capital	42	32.56	44	32.35	52	29.72	26	23.85	**164**	**29.87**
Both of the above	38	29.46	41	30.15	46	26.28	33	30.27	**158**	**28.79**
Total	**129**	**100**	**136**	**100**	**175**	**100**	**109**	**100**	**549**	**100**

Source: Primary Data

The sample entrepreneurs were mainly facing the problem of scarce long-term loans and working capital funds. From the table 2 it is clear that out of 549 sample entrepreneurs, 41.34 per cent were facing the problem of shortage of long-term finance, 29.87 per cent were facing the problem of shortage of working capital and the rest of 28.79 per cent of entrepreneurs were facing shortage of both long-term funds and working capital in the sample district. The shortage of long-term loans and working capital was high in Nellore revenue division when compared to the remaining revenue divisions.

Raw Material Problems of sample entrepreneurs

Majority of the enterprises are facing the problem of production interruptions due to non-availability of raw materials on time. These enterprises have been established in rural and backward areas mainly because of subsidies and incentives offered to them in rural areas. The growth and sustainability of an enterprise depend on the timely supply of raw materials. Sometimes the cost of raw material increases due to short supply and that leads to increase in production cost. The steps initiated by the governments from time to time to supply raw materials at subsidized prices to the entrepreneurs are not supporting the successful functioning of the enterprises and also these enterprises are not following any scientific method of material management to reduce the cost of production. In addition, the problems of transportation, strikes, floods, scarcity and other natural dis-orders affect the supply of raw materials. The table no. 3 reveals the sample entrepreneurs' raw-material problems in the study area i.e., Nellore district.

Table No. 3- Raw Material Problems of sample entrepreneurs

Problems	Revenue divisions								Total	
	Kandukur		Kavali		Nellore		Atmakur			
	No.	%	No.	%	No.	%	No.	%	No.	%
Non-availability	27	20.93	25	18.38	29	16.58	24	22.02	**105**	**19.13**
Short supply	22	17.06	24	17.65	31	17.72	18	16.52	**95**	**17.30**
High prices	43	33.33	46	33.83	61	34.85	38	34.86	**188**	**34.24**
Poor quality	12	9.30	14	10.39	19	10.85	10	9.17	**55**	**10.02**
Transportation	25	19.38	27	19.85	35	20.00	19	17.43	**106**	**19.31**
Total	**129**	**100**	**136**	**100**	**175**	**100**	**109**	**100**	**549**	**100**

Source: Primary Data

The table 3 reveals about the sample entrepreneurs' raw-material problems in the study area of Nellore district. It is clear that out of the total 549 sample entrepreneurs 19.13 per cent opined that the non-availability of raw materials was their major problem, 17.30 per cent were facing the problem of shortage of raw materials, 34.24 per cent of entrepreneurs had the problem of high prices, 10.02 per cent faced the problem of low quality of raw materials and 19.31 per cent experienced difficulties in the transportation of goods. Further, it is observed that the high prices are the major problem in the study area.

Labour problems of sample entrepreneurs

Labour is another crucial problem of entrepreneurs in the present-day competitive business environment in India in general and in the sample district of Nellore in particular. Low productivity of labour a persistent problem in the rural and backward areas. Due to job security, the absenteeism, migration and non-availability of skilled labour is a serious problem to enterprises. The labour problem of sample entrepreneurs in various aspects was examined in the sample district of Nellore and the details are presented in the table no. 4.

Table No. 4- Labour problems of sample entrepreneurs

Problems	Revenue divisions								Total	
	Kandukur		Kavali		Nellore		Atmakur			
	No.	%	No.	%	No.	%	No.	%	No.	%
Scarcity of skilled labour	36	27.90	38	27.94	58	33.16	33	30.27	**165**	**30.05**

Total	**129**	**100**	**136**	**100**	**175**	**100**	**109**	**100**	**549**	**100**

Source: Primary Data

It is clear from the table 4 that in Nellore district 30.05 Per cent of enterprises were facing the problem of lack of skilled labour, 17.13 per cent of entrepreneurs faced the problem of demand for high salary and wages, 12.38 per cent were facing difficulty of irregularity of labour, 29.69 per cent faced the problem of migration of skilled labour for better opportunity and 10.75 per cent enterprises faced the problem of strikes out of 549 sample enterprises. The scarcity of skilled labour was the major problem of majority of sample enterprises in the sample divisions of the study.

Marketing problems of the sample entrepreneurs

Problem of marketing is more complicated in the case of enterprises in India. These units are not in a position to face the onslaught of large-scale units, to assess the prevailing market scenario or changes which are taking place such as tastes, likes, dislikes, competition, technology etc. The major problems are lack of market intelligence, poor marketing network, lack of market information, deficiency of worthwhile marketing assistance from government agencies, cut-throat competition, lack of proper marketing channels, poor quality of products, lack of quality control, poor bargaining power, lack of knowledge of marketing, ignorance of potential markets, unfamiliarity with export activities, lack of knowledge of consumer preferences and tastes, lack of proper advising and lack of high quality salesmanship. Details of marketing problems of the sample entrepreneurs in the Nellore district are furnished in the table no. 5.

Table No. 5- Marketing problems of the sample entrepreneurs

Nature of problem	Revenue divisions								Total	
	Kandukur		Kavali		Nellore		Atmakur			
	No.	%	No.	%	No.	%	No.	%	No.	%
Competition from other enterprises	41	31.78	48	35.29	66	37.72	36	33.03	**191**	**34.79**
Competition from large scale units	23	17.83	21	15.45	24	13.72	18	16.51	**86**	**15.66**
Slackness demand	11	8.53	10	7.36	17	9.72	12	11.00	**50**	**9.11**

Total	**129**	**100**	**136**	**100**	**175**	**100**	**109**	**100**	**549**	**100**

Source: Primary Data

The above table 5 shows that in Nellore district, among 549 sample enterprise entrepreneurs, 34.79 per cent of respondent entrepreneurs faced the problem of competition from other enterprises, 15.66 per cent of entrepreneurs

faced severe competition from large enterprises, 9.11 per cent faced the problem of slackness demand, 12.39 per cent were facing the problem of seasonal demand, 14.57 per cent faced problems with regard to transportation and 13.48 per cent were facing difficulty in sales promotion. Further, it is observed from the study that majority of the sample entrepreneurs were facing problems with their peer group members doing business in the same line of activity.

Infrastructural Problems of sample entrepreneurs

The success of any enterprise greatly depends on the availability of all kinds of infrastructure facilities like roads, power, telecommunication, post-office, location, water, warehousing, etc. The micro, small, and medium enterprises are located in rural and backward areas and not able to access all kinds of essential infrastructure facilities. Adequate infrastructure facilities contribute to the physical and financial growth of entrepreneurs. The infrastructural problems of sample entrepreneurs in the Nellore district are presented in the table no. 6.

Table No. 6- Infrastructural Problems of sample entrepreneurs

Problems	**Revenue divisions**								**Total**	
	Kandukur		**Kavali**		**Nellore**		**Atmakur**			
	No.	**%**	**No.**	**%**	**No.**	**%**	**No.**	**%**	**No.**	**%**
Power	27	20.93	28	20.58	37	21.14	22	20.18	**114**	**20.76**
Water	9	6.97	11	8.08	18	10.30	8	7.33	**46**	**8.38**
Transport	23	17.82	24	17.64	30	17.14	18	16.51	**95**	**17.30**
Warehousing	21	18.60	22	16.17	28	16.00	17	15.59	**88**	**16.04**
Technology	42	32.55	44	32.35	53	30.28	38	34.86	**177**	**32.24**
Communication	7	5.42	7	5.42	9	5.42	6	5.54	**29**	**5.28**
Total	**129**	**100**	**136**	**100**	**175**	**100**	**109**	**100**	**549**	**100**

Source: Primary Data

It is clear from table 6 that out of 549 sample entrepreneurs, 20.76 per cent of entrepreneurs faced the problem of power shortage and fluctuations, 8.38 per cent were facing the problem of insufficiency of water, 17.30 per cent faced the problem of transportation, 16.04 per cent of entrepreneurs were suffering from lack of warehousing facilities, 32.24 per cent faced the problem of changing technologies and 5.28 per cent of enterprises faced the problem of communication in the study area. The majority of the problems faced were due to lack of technology in the study area.

General problems in obtaining assistance from Nellore branch APSFC

The small-scale entrepreneurs are facing certain difficulties like delay in loan application processing, inadequate sanctions, too many terms and conditions, high rate of interest, delay in disbursements etc., while obtaining financial assistance from the Nellore branch APSFC. General problems in obtaining assistance from Nellore branch APSFC are presented in table no. 7.

Table No. 7- General problems in obtaining assistance from Nellore branch APSFC

Revenue divisions	**Delay in processing of application**	**Inadequate sanctions**	**Too many terms and conditions**	**High rate of interest**	**Delay in disbursements**	**Total**
Kandukur	22	25	26	42	14	**129**
Kavali	26	28	21	46	15	**136**
Nellore	30	29	31	59	26	**175**
Atmakur	19	21	28	29	12	**109**
Total	**97**	**103**	**106**	**176**	**67**	**549**
Chi-square	$\chi 2 = 7.366^{@}$; (p = 0.832) ; df= 12; Not Significant					

Source: Primary Data

It is clear from table 7 that for entrepreneurs high rate of interest was the primary problem followed by delay in processing of application, inadequate sanctions, too many terms and conditions and delay in disbursements. The result of Chi-square test shows the value 7.366 and Sig = 0.000 which is less than 0.05 (at 95% level of confidence) which indicates that there is not significant difference.

Government Regulations

It is a well-known fact that all kinds of enterprises should fulfil the different formalities of the governments during establishment and option of the enterprise. Different Acts are enacted by the Government of India to monitor and regulate the business operations of enterprises. Majority of the entrepreneurs have complained that the government policies towards the entrepreneurs are not flexible and friendly. Entrepreneurs are not happy with the terms of licensing, lending, subsidy and concessions given to them. Furthermore, entrepreneurs in one industrial complex complained that the government did not fulfil its promise to buy their products, especially ambe products at fair prices for industrial production.

Perceptions of sample entrepreneurs

Entrepreneurs and Entrepreneurship have assumed great importance in both developed and developing nations. Entrepreneurship plays a key role in the promotion of capital formation, creation of wealth, exploring opportunities, employment generation, balanced regional development, etc. Capital is one of the important factors of production which promotes entrepreneurship to a greater extent in any country. To procure the required capital to any venture, the entrepreneurs should have the minimum knowledge about the various sources of finance support to an enterprise at all times. The long-term and short-term loans provided by the financial institutions like development banks, corporations, commercial banks, etc., are among the important sources of finance usually provided to any enterprise. The Andhra Pradesh State Financial Corporation is extending financial support for the growth and development of industrial sector in general and enterprises in particular in the state through loans. An in-depth attempt has been made in this study to examine and evaluate the perception of the sample entrepreneurs on Nellore branch APSFC activities like sources of information, opinion about getting complete information, knowledge of the objectives of APSFC, awareness of scheme of assistance and other formalities for getting assistance follow up of action.

Sources of Information

The Andhra Pradesh State Financial Corporation is rendering financial service to all categories of entrepreneurs of the state of Andhra Pradesh through its 13 branches spread over all the districts. The knowledge about the corporation's activities, schemes of assistance, formalities, terms and conditions were essential to entrepreneurs to borrow funds to meet their financial requirements. The customers of the corporation are obtaining information from different sources about the activities of the APSFC to avail its services. The sources of information about entrepreneurial activities of Nellore branch APSFC are presented in table no. 8.

Table No. 8- Sources of information about entrepreneurial activities of Nellore branch APSFC

Sources of Information	Revenue divisions								Total	
	Kandukur		Kavali		Nellore		Atmakur			
	No.	%	No.	%	No.	%	No.	%	No.	%
Existing clients	64	49.61	71	52.21	81	46.28	55	50.45	**271**	**49.36**
Official campaigns	23	17.83	25	18.38	29	16.57	21	19.26	**98**	**17.85**
Associates	8	6.20	4	2.96	12	6.85	6	5.50	**30**	**5.46**
Publicity	14	10.85	16	11.75	26	14.85	11	10.09	**67**	**12.21**
Mass media	15	11.63	17	12.50	20	11.45	13	11.93	**65**	**11.84**
Others	5	3.83	3	22.05	7	4.20	3	2.75	**18**	**3.28**
Total	**129**	**100**	**136**	**100**	**175**	**100**	**109**	**100**	**549**	**100**

Source: Primary Data

The table 8 reveals the sources of getting information by the sample entrepreneurs of sample district of Nellore regarding the activities of Andhra Pradesh State Financial Corporation. Out of 549 sample entrepreneurs, nearly 49.36 per cent of entrepreneurs got the information about activities of Nellore branch APSFC from the existing clients, followed by 17.85 per cent of entrepreneurs got information through official campaigns of the corporation, 12.21 per cent of entrepreneurs got it through publicity, 3.28 per cent of entrepreneurs who got information from other sources, 11.84 per cent got it through mass media and 5.46 per cent got information from the associates in APSFC Nellore branch. The same trend of sources of information was observed from the individual sample district entrepreneurs also. The majority of entrepreneurs got the information from the existing clients.

Opinion about getting Complete Information

Obtaining complete information about any task is half of the success of that task. The table no. 9 shows the data regarding obtaining of complete information about the Nellore branch APSFC by sample entrepreneurs.

Table No. 9-Opinion about getting Complete Information

Revenue divisions	Obtained		Not obtained		Total
	No.	%	No.	%	No.
Kandukur	113	89.60	16	12.40	**129**
Kavali	126	92.65	10	7.35	**136**
Nellore	163	93.14	12	6.86	**175**
Atmakur	98	89.91	11	10.09	**109**
TOTAL	**499**	**90.89**	**50**	**9.11**	**549**

Source: Primary Data

The above table 9 reveals that out of the total 549 entrepreneurs, 90.89 per cent of entrepreneurs opined that they obtained complete information while 9.11 per cent of entrepreneurs had not obtained the complete information about the activities of APSFC at the time of applying for financial assistance. Regarding the revenue divisions of sample entrepreneurs, 93.14 per cent of Nellore division sample respondents obtained information and the remaining had not obtained.

CONCLUSION

In conclusion, understanding the problems and perceptions surrounding the weaker sections in India is imperative for fostering sustainable development and social harmony. Tackling historical injustices, addressing economic disparities, ensuring equal access to education, and challenging stereotypes are pivotal steps toward creating a more equitable and inclusive society for all. Financial challenges include a shortage of long-term loans and working capital. Raw material problems involve non-availability, short supply, high prices, poor quality, and transportation issues. Labour problems encompass scarcity of skilled labour, demand for high salaries, irregularity, migration of skilled labour, and strikes. Marketing challenges include competition from other enterprises, seasonal demand, transportation problems, and difficulties in sales promotion. Infrastructural issues involve power shortages, water insufficiency, transportation challenges, lack of warehousing facilities, technological obsolescence, and communication problems. The study also sheds light on the perceptions of sample entrepreneurs regarding the Andhra Pradesh State Financial Corporation (APSFC). While existing clients play a crucial role in disseminating information, the study reveals that a substantial majority of entrepreneurs have obtained complete information about APSFC's activities. However, challenges persist, with high-interest rates and delays in loan processing identified as prominent issues. In essence, the findings underscore the need for comprehensive and targeted interventions to address the intricate challenges faced by weaker sections in India, particularly in the entrepreneurial landscape. This includes policy measures to alleviate financial constraints, improve infrastructure, and foster a more inclusive and supportive environment for entrepreneurs from marginalized communities. Only through such concerted efforts can India truly progress towards a more equitable society.

ABSTRACT

A stock market index is created by selecting a group of stocks that are representative of the whole market or a segment of the market. NIFTY 50 is the benchmark index of India, reflecting the overall dynamics of an Indian equity market as well as the Indian economy. The NIFTY 50 is a well diversified 50 stock index, which covers all the important sectors of Indian economy and works as a face of Indian economic performance. It is used for a variety of purposes such as benchmarking fund portfolios, index-based derivatives and index funds (options and futures). The objective of this paper is to give insights about what NIFTY 50 is, how it functions, what exactly is an index and benchmark index, what types of stocks are involved in it, what are the measures to calculate market capitalization and how it developed over the years when compared to other stock exchanges,what is SGX NIFTYis andhow is SGX NIFTY is different from Indian NIFTY .

INTRODUCTION

NIFTY 50 Index is an index consisting of 50 blue chip large and liquid stocks listed on the National Stock Exchange of India. Since inception, the NIFTY 50 Index has successfully

become the ‘stock of the nation’, helping investors understand the pulse of Indian capital market. It has lived up to its core purpose of providing afair representation of the Indian equity market focusingon portfolio diversification andliquidity. Over the years, the NIFTY 50 has become one of the most widely used benchmark for exchange traded products on Indian equity market.

II. LITERATURE REVIEW OF

Swati Garg and Y. P. Singh (2013) associated the performance of NIFTY-50 and Index Funds. Five NIFTY-50 and Index Funds tracking the same benchmark indices wereanalysed in the study over a period of three years starting from June 2006 to December 2009. The analysis showed that over long-term investment horizon NIFTY-50 performed better in terms of their imitation strategy, tracking ability and performance effectiveness. However, it was evident from the study that short-term investors face a disadvantage from investing in NIFTY-50.

P.Mishra and G.Singh (2016) attempted to make an intra-class performance evaluation of some Indian Index funds. Graphical interpretations were used along with statistical tools like R-square and tracking error values. Two models of tracking error were test empirically the performance of the selected index funds. Empirical results revealed that out of the selected index funds, SBI NIFTY Index fund outperformed the other six index funds during the period under study. SBI NIFTY Index fund was also able to limit the tracking error to an acceptable limit.

S. Narend (2014) Made a comparative study of the performance of NIFTY-50 and index funds. The study was done empirically since the period of their respective initiation till July 2013. The study used three parameters for the analysis of the performance such as active

returns, tracking error and Jensen's alpha. The analysis showed that NIFTY-50were performing betterwhen compared to the index mutual funds

Falguni Pandya (2016) analysed the index fund and measuring tracking error. The study used descriptive statistics,and proved that NIFTY and banking index-based funds were found to be having lowest tracking error, while Gold NIFTY-50 didn't perform better in terms of mean return whereas, international NIFTY-50was found to be most efficient.

OBJECTIVES OF THE STUDY

1. To know about the NIFTY 50 and their constitution and the types of Sectors involved in NIFTY-50

2. To know about the Index and its methodology.

3. To know about the market capitalization and its calculation method.

4. To know about the SGX NIFTY and how it is different from Indian NIFTY.

NIFTY 50, ITS CONSTITUTION AND TYPES OF SECTORS INVOLVED IN NIFTY-50

Understanding the NIFTY 50

While the NIFTY 50 is now a much relied upon barometer for measuring the performance of Indian stock markets at large, it has been meticulously constructed over time in order to achieve this status. The benchmark index is made up of stocks belonging to 13 sectors in order to achieve diversification. The sectors are as follows:

– Oil and gas

– Consumer goods

– Information technology

– Financial services

– Automobiles

– Construction

– Telecommunication

– Pharmaceuticals

– Power

– Cement products

– Metals

– Fertilizers and Pesticides

– Media and entertainment

The NIFTY 50 functions as an indication of the performance of Indian markets because it is in and itself a small sample representation of the best offerings of the Indian markets; If the stocks in NIFTY 50 are not performing well, it is very likely that the economy at large will not be able to escape the adverse effects that bringingdown the index .

Constitution of NIFTY

To be considered for inclusion in the NIFTY 50, a firm or stock must meet the following criteria:

- The firm should be headquartered in India and should have been listed and traded on the National Stock Exchange (NSE).
- To be included in the NIFTY 50 Index, the firm must be included in the NIFTY 100 index and be accessible for trading in the NSE's futures and options market.
- The business's average free-floating market capitalization should be 1.5 times that of the index's smallest firm.
- The stock should have been traded every day for the previous six months (100 percent trading frequency).

How can a company be entered in NIFTY-50

To enlist in NIFTY, a company has to be listed on NIFTY Index and has to qualify the following criteria:

- The firm must have been enlisted on the National Stock Exchange.
- It needs to be an Indian company.
- The company's shares must be exceedingly liquid.
- The liquidity indicator is the average impact cost. The impact cost can be termed as the trading price of a single share in comparison to the index's influence on a company's market valuation.
- For the succeeding six months, the firm's impact cost should be less than 0.50 per cent. Or it should be less with at least 90% of calculations made on a portfolio of ₹10 crores.
- The frequency of the firm's business should be 100% for six months.
- The Gross Market Capitalization should be free-floating. This GMC should be 1.5 times the size of the index's smallest business.

- Differential Voting Rights or DVR with shares of companies can be eligible for inclusion in the NIFTY 50 Index.

NIFTYINDEX AND ITS METHODOLOGY.

NIFTYIndex

To explore function what NIFTY 50 and what the NIFTY 50 stocks are, one must first understand what exactly an index or a benchmark index is in the its simplest terms, an index is a basket of securities that is created as a representational sample of a certain sector in the market. This representational sample then works as a barometer to test the market performance. It is a statistic that calculates to what extent changes in the stock market. It monitors price changes and market performance. To establish an index, a few stocks are to be chosen from a list that have similar characteristics like company size, industry and total market capitalization.

The value of the stock market index can be calculated by the values of the underlying group of equities. The value of the stock index is influenced by differences in the underlying stock. If the majority of stocks grow in value, so will the index, and vice versa.

Index Methodology

Eligibility Criteria for Selection of Constituent Stocks:

i. Market impact cost is the best measure of the liquidity of a stock. It accurately reflects the costs faced when actually trading an index. For a stock to qualify for possible inclusion into the NIFTY50, it should have traded at an average impact cost of 0.50% or less during thelast six months for 90% of the observations, for a basket size of Rs. 100 Million.

ii. The company should have a listing history of 6 months.

iii. Companies that are allowed to trade in F&O segment alone are eligible to be constituent of the index.

iv. A company which comes out with an IPO will be eligible for inclusion in the index, if it fulfils the normal eligibility criteria forthe index for a 3-month period instead of a 6-month period.

Index Re-Balancing:

Index is re-balanced on semi-annual basis. The cut-off dates are is January 31 and July 31 of each year, i.e. for semi-annual review ofindices, average data for six months ending the cut-off date is considered. Four weeks prior notice is given to market from the date ofchange.

Index Governance:

A professional team manages all NSE indices. There is a three-tier governance structure comprising the Board of Directors of NSEIndices Limited, the Index Advisory Committee (Equity) and the Index Maintenance Sub-Committee.

MARKET CAPITALISZATION AND ITS CALCULATION METHOD

Market Capitalization

Definition: Market capitalization is the aggregate valuation of the company based on its current share price and the total number of outstanding stocks. It is calculated by multiplying the current market price of the company's share with the total outstanding shares of the company.

Description: Market capitalization is one of the most important characteristics that helps the investor determine the returns and the risk in the share. It also helps the investors choose the stock that can meet their risk and diversification criterion**.**

Calculation Method

Market Capitalization = Shares outstanding * Price

Free Float Market Capitalization = Shares outstanding * Price * Investible Weight Factor

Index Value = Current Market Value / Base Market Capital * Base Index Value (1000)

The IWF (Investible Weight Factor) is a factor in the formula above that is used to determine the number of shares available for trading in the market. Because the value of stocks fluctuates daily, as the index is calculated in real-time.

The method above also takes into account changes in the business environment. Stock splits, rights issues, and other similar modifications are examples of these developments. NIFTY maintains the index regularly to ensure its stability and effective operation. This is how NIFTY 50 is calculated.

SGX NIFTY and how it is different from Indian NIFTY.

SGX NIFTY

SGX NIFTY is a derivative of the NIFTY index, which is traded in the Singapore Stock Exchange platform. This trade sets a predetermined price of a share and reduces the future risk of any investments. To make it easy for one to understand, one should keep in mind that like Indian NIFTY trades on the NSE, which is the Indian stock exchange platform, the SGX NIFTY is the futures trade NIFTY in Singapore. In this SGX NIFTY,the price of the share is present, the

buyer and seller have to commit to that pre-decided price in spite of any changes that may take place in the stock market in the future.

As the Singapore Stock Exchange is a leading stock exchange in India, the SGX NIFTY helps to predict and observe the behaviour of the Indian NIFTY and thus has an important role to play in the Indian stock market.

Different between SGX NIFTYand Indian NIFTY

The main difference between the SGX NIFTY and the Indian NIFTY is that the SGX NIFTY is a futures trade platform in Singapore where the prices of stock are predetermined to avoid the future risk, whereas the Indian NIFTY trades only on the Indian stock exchange platform, which is the National Stock Exchange or NSE.

Another important difference is the contract size of the Indian NIFTY and the SGX NIFTY. In an Indian NIFTY a contract between the buyer and seller must have a minimum of 75 shares, which is not required in the SGX NIFTY. This means that SGX NIFTY does not have to include shares, whereas every Indian NIFTY must include shares.

SGX NIFTYattracts a high number of customers and trading activities because it is the most active trading platform in Singapore and the only trading platform that works for sixteen hours a day. This is definitely not the case with the Indian NIFTY, which is a National exchange platform. These characteristics of SGX NIFTY make it more profitable.

Impact of SGX NIFTYon the Indian Market

As already discussed, the SGX NIFTY proves to be helpful in predicting and observing the Indian NIFTY's behaviour. There is also a time difference between the Indian NIFTY and the SGX NIFTY, wherein the Singapore market opens about two and half hours before the Indian

market. This allows investors to keep an eye on the SGX NIFTY to know the fluctuations in the market and observe how well the overall trading process is going. By observing this, the investors get an idea about the Indian market and how does it open either with positive or negative results. Therefore, those who are sceptical about investing in the Indian market, can invest in SGX and keep an eye on the SGX NIFTY to get an idea about the Indian NIFTY and stock exchange platform.

Although this may be a convenient way to judge the Indian market and weigh out 0ne chances, not all results that these investors get are accurate and subject to the various economic factors existing in both the countries as both these countries like India and Singapore have very different economic structures and yet they have different prominent effects on the market behaviour.

Both the Indian NIFTY and SGX NIFTY are equally important as they have some effects on each other's behaviour, and one cannot be talked about without mentioning the other. Everyone who wishes to enter the stock market world and starts trading like an expert need to first know and be familiar with NIFTY and SGX NIFTY terms and many other financial terms commonly used and have important roles to play in the stock market.

CONCLUSION

The NIFTY index is an important pointer of the market, and its movements affect the Indian economy to a great extent. NIFTY is the NSE’s benchmark index (National Stock Exchange). The stock index that calculates the 50 biggest and most liquid stocks on NSE is called NIFTY. These 50 largest firms reflect India’s stock market and economic trends, and they come from a variety of industries. The top 50 largest firms are selected based on the market capitalization as shown above and the top good performing sectors are healthcare and

technology.One must note that SGX NIFTYis highly preferable platform toNIFTY due to the reasons like performing trading for sixteen hours a day, not involving any minimum number of share and the predetermined futures price .

AWARENESS ON MOBILE COMMERCE: A CASE STUDY AT NAGARI MANDAL OF CHITTOOR DISTRICT IN ANDHRAPRADESH

Dr. N. Gurumurthy	Dept. of Commerce, S.V. University, Tirupati-517502, Andhra Pradesh India.
Dr. E. Gopi	Associate Professor, Dept. of Commerce, Govt.Degree College, Nagari.
Prof. K. Jayachandra Reddy	Dept. of Commerce, S.V. University, Tirupati-517502 Andhra Pradesh, India.

ABSTRACT Mobile commerce also known as E-commerce involves using wireless handheld devices like cell phones and tablets to conduct commercial transactions online, including the purchase and sale of goods and services bills, banking services through online. Mobile Commerce is mixture of information and communication technology, mobile technology and internet. The main objective of this paper focus on mobile commerce and e commerce status like that mobile operations, internet usages in india, and Geographical profile of various levels of the respondents, awareness and utilization of different services in Nagari mandalam of chittoor district in Andhra Pradesh.

KEYWORDS : M-Commerce, Geographical profiles and utilization of mobile network services

INTRODUCTION:

Mobile commerce is refers to the buying and selling of goods and services through wireless handhelds devices such as smart phones and tablets. M-Commerce is a form of E-Commerce that enables users to access online shopping platforms without the use of desktop computer. Over time, contents delivery through wireless devices had become faster, more secure. As a result mobile commerce had grown rapidly use specific industries includes the financial and telecommunications, service and retail in information services. Mobile commerce adopted today are hotel booking and reservation, purchasing airline tickets, purchasing movie tickets and restaurant booking and reservation, online shopping through Amazon, Flipkart, Big basket and the list goes on. Booking of the cab through Ola and Uber is prevalent and well appreciated by all in India.

Mobile Commerce

Mobile commerce is a large subset of electronic commerce, a model where firms or individuals conduct business over the internet. As of 2023, nearly 97 percent of the Americans own a cell phone, and 85 percent of the them owned a Smartphone. This is up from 35percent in 2011. Now a day many product and services can transacted via m-commerce, including banking, investing and purchasing books, plane tickets and digital music etc. the rapid growth of mobile commerce has been driven by several factors including increased wireless handheld devices computing power, a proliferation on m-commerce applications, and resolution of security issues.

Mobile commerce adopted today are hotel booking and reservation, purchasing airline tickets, purchasing movie tickets and restaurant booking and reservation, online shopping through Amazon, Flipkart, Big basket and the list goes on. Booking of the cab through Ola and Uber is prevalent and well appreciated by all in India.

Need for the Study

The mobile cellular market is the fastest growing market regarding subscriber numbers and popularity in India. The substantial increase of the mobile users is linked with greater adoption for mobile commerce in India. As the Internet started to proliferate in many parts of the world, the mobile phone penetration also grew rapidly. With the development of wireless and mobile technologies, Mobile Commerce is expected to make a substantial impact on the business. Mobile commerce is quite popular in the developed countries, but in India, it is in a growing stage and yet to take off. At present, Indian users indulge in mobile purchases for high-value transactions such as entertainment services, games, and music downloads. The convergence of the two fastest growing industries- the internet and the mobile communication- has led to the creation of an emerging market for mobile commerce.

Objectives of the Study

The specific objectives of the study are:

- To study the socio-economic and demographic variables among mobile commerce service users in Nagari mandal.
- To identify the level of awareness of mobile commerce service users.
- To examine the use of mobile commerce services.

Research Methodology of the Study

This study is on both the primary data is collected through a well structured questionnaire to address the research questions. The relevant secondary data was collected from various journals, magazines, news papers, published information and details on websites for the study.

Limitations of the Study

- This study is constrained to Nagari Mandal of chittoor District only.
- The behavior of the people belonging to rest of Nagari.
- This study cannot be generalized, due to quick changes in technology, Customer preferences.

Status of M- Commerce & E-commerce In India:

Now a day's mobile commerce has touched in every field of human life. People use internet for various purpose which includes emails, academic, financial and non financial information like that music video games on internet, chatting on online job searching, online banking etc,. India has day by day increasing in the number of internet and mobile commerce users in india.

Table No.1 Mobile Operators in India: Key Statistics

Telecom Operator	Total Subscriber
Airtel	22,92,67,770
VI	13,67,25,060
Reliance Communications	42,87,78,364
BSNL	2,70,66,371

Source: Internet

From the above table No.1 shows that with the growing momentum of wireless revolution and Mobile commerce explosion, it is evident that mobile devices are becoming a critical component of the new digital economy.

Table No.2 Internet penetration: India Vs World

Country	Percentage
America	96.6%
USA	98%
Japan	94%
Brazil	81.3%
China	71.3%

India	47%
France	93%

Source. Published by Statistical Research Department. July 7th 2022

As can be seen from the Table No.2, compared to the developed/ developing markets, the internet penetration in India is insufficient and hence there exist a huge potential. With the introduction of free unlimited internet access, JIO has captured 369 million customers.

From the above table illustrates the growth pattern and development over the period and the impact of the internet and mobile technology. It spells out the mobile internet users in India among urban and rural people in India. Majority of rural Indian people have started using more of internet related services are the basic reasons for the speedy growth of mobile commerce in India.

Data Analysis And Interpretation

The well framed questionnaire is used to bring out the required data regarding customer perception on the impact of mobile commerce. The collected data were analyzed and interpreted for understanding the impact of mobile commerce. The analysis is carried by using descriptive statistics.

Descriptive Analysis

In this study the descriptive analysis is used in exploring the following domains:

- Demographic profile of the respondents
- Level of awareness of mobile commerce
- Usage of mobile commerce services

From the below Table No. 3 describes various demographic profiles of the respondents namely Gender, Age, Educational qualification, marital status Occupation, Monthly income, Family size, Family type and location within Nagari Mandal. The data analysis, the demographic profiles of the respondents are:

I. 55.00% of the respondents are Male, and 45.00% of the respondents are female. ii.15.00% of the respondents belong to less than 20 years age group. One-third of the respondents belong to 21 – 30 years age group (38.75%). Then 32.5% of the respondents belong to 31 – 40 years age group. Only 13.75% of the respondents belong to above 50 years age group. It shows that younger generation is towards mobile commerce.

Table No.3 Demographic Profile of the Respondents

Demographic variables		Frequency	Percentage
Gender	Male	44	55.00
	Female	36	45.00
Age	< 20 years	12	15.00
	21-30years	31	38.75
	31-40 years	26	32.5
	>50 years	11	13.75
Education	School level	13	16.25

Source: Primary Data

iii. Half of the respondents have completed graduation level 41.25%. Almost one-fourth of the respondents are diploma holders 12.5%. 18.75% of them are postgraduates, and 16.25% of them have completed until school level. 11.25% of the respondents have chosen others as their option, which shows that some of the respondents are having other than listed qualification, but also they are able to use mobile commerce. iv. Majority of the respondents are married 58.75% and 41.25% of them are unmarried. v.One third 27.50% of the respondents are students. Nearly 41.25% of the respondents are working in an employees in the organisation, and 12.50% of the respondents are self-employed. 13.75% of them are homemakers, and 5.00% of the respondents are retired. vi. Almost 31.25% of the respondents' monthly income is less than 15000 rupees. 45.00% of their incomes lie between Rs. 15001 –30000 and 20.00% of them earn more than Rs. 30,001-40,000. 3.75% of them earn above Rs.40000. vii. The majority 51.25% of the respondents responded that there are five to six members in their family, 32.50% of their families have two to four members and only 16.25% of them have more than six members in their family. viii. Considering 56.25% they belong to a nuclear family, and 43.75% of the respondents belong to the joint family. ix. 80 respondents 100.00% are from Nagari mandal.

Analyses of level of awareness of mobile commerce namely types of Smartphone, type of connection, the network provided, grocery store, dealer, in respect of the frequency and percentage is given in Table No. 4 below:

Table No.4 Level of Awareness of Mobile Commerce

Particulars		Frequency	Percentage
Type of your Smartphone	Android	62	77.50
	Keypad	8	10.00
	Apple	9	11.25
	Others	1	1.25
Type of Connection	Post paid	20	25.00
	Prepaid	60	75.5
Network provider	Airtel	20	25.00
	BSNL	11	13.75
	IDEA	8	10.00
	JIO	41	51.25
	Others	0	0
Mobile Usage per Month	<Rs.300	20	25.00
	Rs.300-Rs.500	32	40.00
	Rs.500-Rs.700	9	11.25
	Rs.700-Rs.1000	7	8.75
	>Rs.1000	12	15.00

Source: Primary Data

Interpretation:

From the above table No. 4 shows that, i. More than half of the respondents 77.5% have the android type of smart phones, 11.25% of them have apple mobile phones, 10.00% of them have windows (keypad), and 1.25% of them responded that they use other types of operating system. ii. 75.50% of the respondents are using pre-paid, and 25.00% of the respondents are using the post paid connection. iii. Half of the respondents network provider is JIO 51.25%, 25% of the respondents are using Airtel, 13.75% of the respondents are using BSNL, 10.00% of them are using IDEA, networks respectively. More than 60% of the respondents have done their recharge/top up in grocery stores, through a dealer and by internet also. v.

The majority 25.00% of the respondents spend less than Rs.300 per month for mobile. 40.00% of their monthly usage is between Rs.300 – Rs.500. 11.25% of the respondent's usage is between Rs.500 – Rs.700. 8.75% of them have spent Rs.700 to Rs.1000, and only 15.00% of the respondents have spent more than Rs.1,000 for their mobile usage on a monthly basis.

Table No.5 Utilization of Mobile Commerce Services

Usage	Never	Rarely	Some-times	frequently	Always	Total
Internet	4 (5.00)	29 (35.25)	2 (2.5)	9 (11.25)	36 (45.00)	80
Entertainment	20 (25.00)	8 (10.00)	30 (37.5)	15 (18.75)	7 (8.75)	80
Message (Whats App / Hike)	7 (8.75)	11 (13.75)	17 (21.25)	36 (45.00)	9 (11.25)	80

Video Calling (Skype /Viber/IMO)	9 (11.25)	8 (10.00)	57 (71.25)	5 (6.25)	1 (1.25)	80
Shopping (eBay/Amazon / Myntra / Snapdeal)	24 (30.00)	7 (8.75)	23 (28.75)	19 (23.75)	7 (8.75)	80
Navigation (GPS)	39 (48.25)	19 (23.75)	11 (13.75)	7 (8.75)	4 (5.00)	80
VIRTUAL Wallets like paytm/mPass etc.	8 (10.00)	16 (20.00)	29 (36.25)	14 (17.7)	13 (16.25)	80

Source: Primary Data

Interpretation

The maximum mean score is 45% in a, always which is for surfing internet. The next score for utilization of mobile commerce is attained by Entertainment 37.5% in some times, it shows that most of them are using mobile commerce for entertainment purpose. Then they use mobile commerce for the sake of messaging 45.00% in frequently, then video calling 71.25% in some times. The mean of shopping, wallets like Paytm and GPS are below average. Half of the respondents used it for entertainment, internet and messaging. Since the standard deviation is more than one, it shows that there is more deviation in the level of agreement for usage.

Findings and suggestions

Findings

- It is observed that majority (75%) of the respondents have two to four family members. More than half of 56.25% them belong to the nuclear family.
- Students and employed respondents have invariably adopted Mobile commerce.
- Almost 45 % of the respondents monthly income is less than Rupees 30,000.
- It is found that Android type of Smartphone is used most in the market, followed by windows type.
- It is observed that majority of the Nagari mandalam customers are using a pre-paid connection from the service provider.
- During the study period, it is found that more than half 51.25% of the respondents network provider is JIO and about 25% of the respondents are using Airel.
- It is found that Mobile commerce services are utilised mostly for the entertainment purposes like music, cinema ticket booking and travel. This is followed by surfing internet, messaging like WhatsApp and video calling and online chatting etc,.
- It is found that most of the respondents are use of mobile commerce. They use multiple SIM cards and indulge in mobile transactions with the available kind of internet access.
- Majority of the respondents agree that mobile commerce application is very useful for quick search, which infers that they have a wide variety of alternatives during their state of purchase.
- It is observed that 82.20% of the respondents are willing to recommend their family and relatives to use mobile commerce services.

Suggestions

Based on the observations and findings of the study, the following recommendations are made to improve mobile commerce eco-system for the service provider and policy changes are given below:

- Majority of the 85% in Nagari customers are using a pre-paid type of connection and Android type of Smartphone. Any Business promotion shall target prepaid customers in android platform so that the reach is the maximum instantly and bring positive results.
- It is evident from the study that the parameters such as speed, user friendliness, easy to use and compatibility are major influencing factor for the adoption of mobile commerce services.
- What"s App, Navigation and Shopping usages are more in home town. It is recommended to service provider to focus on location based services (e.g. directions for travelling, information about of the nearest store, etc.
- Due to dynamic and ever changing business environment the tele-communication sector in India has to evolve refined model to suit new policy measures and regulatory mechanism which will certainly make customer delight and improve service satisfaction by assessing the periodical survey.

ABSTRACT:

Now a day's technology has play a key role in modern society. Each and every task in the banking sector is digitalized. From the account opening to money transfer through online mode, eliminating the need for customers to visit banks and wait in long queues. This operation is very easy to customers and banking institutions. Online banking also encourages competition among banks to offer their customers better services and draw in a growing number of customers. To check the level of customer satisfaction among the 60 numbers randomly chosen. Online bill pay, money transfer, any time and any where use, update information, deliver services and save time and energy are directly related to customer satisfaction words internet banking in Pakala mandalam of chittoor district in Andhra Pradesh.

Scanned with OKEN Scan

Key words: Information Technology, Customer satisfaction, Banking sector

INTRODUCTION

Banking is a highly information intensive activity and relies mostly on information technology to acquire, process and deliver the quality information to all the users. Automated delivery of banking products and services to its customers through electronic communication like internet is referred as internet banking. Banks find that to retain their demanding customers, innovation and updation along with the provision of convenient, reliable and expedient services is very important. Today, almost all the Indian banks are trying to differentiate themselves in the competitive industry and align their offerings to the constantly evolving customer needs and developments in technology in everywhere in India. Globalization and deregulations helped banks expand their reach beyond countries which made them more competitive and therefore looking forward offering internet banking services, to maximize profits as well as retain customers. However, this cannot be achieved without high quality service which when satisfied, results in improved customer satisfaction. To make customers' banking more convenient, efficient and effective it is very important to ascertain the customers' perception of overall service quality and their satisfaction with online banking services.

Conceptual frame work:

E-banking refers to banking operations, with which the customers can carry out transaction through internet, which is completely safe and secure. E- banking encourages paperless or cashless transaction in everywhere in india.

Internet Transaction: Banking facility provided the customers through the customers are able to perform a number of monetary& internet using transactions, through the bank websites.

Mobile banking: almost all the banks have designed their mobile applications with which you can perform transactions at your fingertips, which is smart phones, internet, mobile application and banking services in your bank account.

ATM: ATM is not a just a machine with which you can withdraw cash as and when required, bit it also allows you to check your accounts status , deposit funds, transfer funds, change debit card pin, personal identification number

Debit Card: now a day's debit cards used in our day to day life so as to perform end number of transactions. Debit cards are linked to the customer's bank account and so the customer's only needs to swipe the card, in order to make payment at point of sale (POS) outlets, online shopping. ATM withdrawals, in this way the amount is deducted from the customer's account directly.

Credit card: it is just like a debit card, a credit card is also a payment card which the banks issue to the customers on their on their request, after checking their credit score and history. It enables the cardholders to borrow funds up to the pre-approached limit and make a payment. The maximum limit is granted by banks with

Scanned with OKEN Scan

issue the card. The card holder promises to repay the amount within a stipulated time period. Otherwise some charges for the issue of credit card.

Point of Sale (PoS) : PoS system refers to the point, in terms of date, time and place, where the customer makes a payment, using a plastic card for the purchase made or services received.

Electronic Data Interchange (EDI): EDI is a new mode of communicating information between businesses electronically using a standardized format.

Electronic fund transfer: when money is transferred electronically from one bank to another bank. It cover direct debit, direct deposits, wire transfers, RTGS, NEFT,etc,.

OBJECTIVES OF THE STUDY

This research has been carried out with the following objectives.

- To identify the factors influencing the customers to opinion for Internet Banking service in the study area.
- To analyse the problems of internet banking customers.
- To offer suitable suggestions to promote the Internet banking service of the public and private sector banks.

Research Methodology of the Study

This study is on both the data is collected through a well structured questionnaire to address the research questions and take 60 randoms, but all the questions responses have five options, i.e., Highly satisfied, Satisfied, Neutral, Dissatisfied , Highly Dissatisfied. The relevant secondary data was collected from various journals, magazines, news papers, published information and details on websites and so on.

DATA ANALYSIS AND INTERPRETATIONS

The primary data was collected from the users of Internet banking. Interview schedule was used to collect the data from the internet banking customers of selected public sector banks were State Bank of India, Canara Bank, Indian Bank,Axis Bank and other Banks in Chittoor District of Andhra Pradesh.

GENDER WISE CLASSIFICATION

The gender wise classification of the respondents gives an outline about which category of customers highly prefers the internet banking.

Scanned with OKEN Scan

Table No.4.1
Number of Respondents

Gender	Number Of Responds	Percentage
Male	40	66.60
Female	20	33.40
Total	60	100

Source: Primary Data

Table 4.1 shows that out of the total respondents, a majority (66.60%) of respondents was male and the remaining 33.40% of the respondents were female using internet banking. Therefore, it is concluded that a majority of the male customers prefer internet banking than their females.

AGE WISE CLASSIFICATION

Age is an important demographic variable that not only determines an individual's physical and mental maturity but also depicts life experiences. As the age increases, the learned experience changes the behaviors of individuals. Learning is an action based on experience. Hence, most behavior is learned by individuals. Therefore, it is interesting to note the age - wise distribution of the respondents.

Table No.4.2
Number of Respondents

Age	Number Of Respondents	Percentage
Up to 20 years	18	30.10
21 – 30	29	48.30
Above 50 years	13	21.60
Total	60	100

Source: Primary Data

Table 4.2 from the above table no shows that the majority of the respondents belonged to the age groups 21 - 30 years using internet banking service in the modern world.

MARITAL STATUS

In Indian society, marriage is supposed to be a religious obligation. In the social context, it is the prelude to the family formation, expansion or even bifurcation. After marriage, there is a transition in the status of men and women by change in rights and obligations. More than the conventional roles of parents, today's parents play a crucial role in building up a family; inculcate values for life and so on. Hence, the marital status of the respondents is given in the table.

Scanned with OKEN Scan

Table No.4.3
Marital Status

Marital	Number Of Respondents	Percentage
Married	35	58.3
Un Married	25	41.6
Total	60	100

Source: Primary Data

Table 4.3 shows that out of the total respondents, a majority (58.3%) of respondents was married and the remaining 41.6% of respondents were unmarried. So, it is identified that most of the respondents are married. It is clear from the table married people highly prefer internet banking.

EDUCATIONAL QUALIFICATION

Education is one of the most important traits of the customers because the perception, awareness and behavior of the customers depend largely on his/her educational qualifications. Education plays a vital role for having access to basic internet banking. The level of education of the respondents is portrayed in the below table 4.4.

Table No.4.4
Educational Qualifications

Qualifications	Number Of Respondents	Percentage
SSC	12	20.2
Inter	8	13.3
Graduate	28	46.6
PG	8	13.3
Others	4	6.6
Total	60	100

Source: Primary Data

It reveals that out of the total respondents, 46.6% of the respondents were graduates, 20.2% of the respondents have completed higher secondary level, 13.3% of the respondents were post graduates, again 13.3% of the respondents have completed upto secondary level. 6.6% of the respondents were others. Hence, it is clear that a majority of the respondents are graduates as internet banking requires a little technical knowledge.

Scanned with OKEN Scan

OCCUPATION WISE CLASSIFICATION

Occupation determines the need of using internet banking service. The occupation wise classification of the respondents is given in the table.4.5.

Table No.4.5
Occupation Wise Classification

Occupation	Number Of Respondents	Percentage
Government	3	15.0
Private	20	11.1
Business	4	16.6
Agriculturist	6	10.0
Home Maker	11	20.7
Student	16	26.6
Total	60	100

Source: Primary Data

Table 4.5 shows that out of the total respondents, 26.6% of the respondents were studying, 20.7% of the respondents were homemakers, 16.6% of respondents were businessmen, 15% of the respondents were working as government employees, 11.1% of the respondents were business, and 10.% of the respondents were agriculturists.

Therefore, it is evident from the table that most of the private employees are highly interested in internet banking service as they are well aware of its nuances.

MONTHLY INCOME

Adequate income encourages the customers to opt for internet banking service. The monthly income of the respondents is disclosed in the Table 4.6 shows that out of the total respondents, 51.6% of the respondents had a monthly income of Rs. 10,001 to Rs. 20,000, 43.3% of respondents had a monthly income up to Rs. 10,000, and above Rs. 20,000 respectively.

Scanned with OKEN Scan

Table No.4.6
MONTHLY INCOME

INCOME	Number Of Respondents	Percentage
UP to Rs.10,000	26	43.3
Rs. 10,001-20,000	31	51.6
Above 20,000	3	5.1
Total	60	100

Source: Primary Data

TYPE OF FAMILY

The family background plays an important role in moulding the behavior to any person. The family provides the recognition and security for the individual identity. The living arrangements are very crucial for the socio-economic status of a person. Traditionally, Indian society preferred to live on joint family arrangements. As the economic necessitates improved, people moved towards nuclear families than of joint families. Besides this some of the cultural aspects such as family relationship, increase in style of living have made the family size to shrink. The outline about the type of family of the respondents is given in the table.

Table No.4.7
TYPE OF FAMILY

FAMILY	Number Of Respondents	Percentage
Nuclear Family	46	76.6
Joint family	14	23.3
Total	60	100

Source: Primary Data

Table 4.7 indicates that out of the total respondents, a majority (76.6%) of the respondents belonged to nuclear family and the rest 23.3% of respondents belonged to joint family.

PREFERRED BANK

There are a few reasons behind the choice of bank such as easy convenience, trust worthiness, low cost of transaction and the availability of service. The bank which is preferred by the respondents to maintain their account is shown in the table.

Scanned with OKEN Scan

Table No.4.8
PREFERRED BANK

PREFERRED BANK	Number Of Respondents	Percentage
SBI	11	18.30
Canara Bank	13	1.66
Indian Bank	19	31.60
Union Bank	12	20.11
Axis Bank	2	3.33
Other Bank	3	25.00
Total	60	100

Source: Primary Data

Table 4.8 shows that out of the total respondents, 31.60% of respondents held their account in Indian Bank, 25% of respondents held their account in other Banks, 20.11% of the respondents held their account in Union Bank, 18.30% of the respondents held their account in State Bank of India, 3.33% of respondents held their account in Axis Bank, and 1.66% of the respondents held their account in Canara Bank. Hence, it is clear that a majority of the respondents maintain their accounts in Indian Bank as it offers better quality of service.

SOURCE OF INTRODUCTION

Source of introduction refers to the person who motivates the respondents to open a bank account in a specific bank. The source of motivation of the respondents is unveiled in the table.

Table No.4.9
SOURCE OF INTRODUCTION

Source	Number Of Respondents	Percentage
Friend	27	45.0
Relative	18	30.0
Advertisement	3	5.0
Banker	12	20.0
Total	60	100

Source: Primary Data

Table 4.9 unveils that out of the total respondents, 45% of the respondents were motivated by their friends, 30% of the respondents were motivated by their relatives, 20% of the respondents were motivated by the Banker and 5% of the respondents were motivated by the advertisement to choose the respective banks. Hence, it is clear that most of the respondents were motivated by their relatives to opt for a particular bank.

Scanned with OKEN Scan

FREQUENCY OF USING INTERNET BANKING SERVICE

The frequency of using internet banking varies from one customer to another. How often the respondents are accessing internet banking service is displayed in the table.

Table No.4.10

FREQUENCY OF USING INTERNET BANKING SERVICE

ATM	Number Of Respondents	Percentage
Frequently used	16	26.66
Occasionally	11	18.34
When need arises	33	55.00
TOTAL	60	100

Source: Primary Data

Table: 4.10 shows that out of the total respondents, 55% of the respondents used internet banking service when need arises, 18.34% of the respondents used internet banking service occasionally and the rest 26.66% of the respondents used internet banking service frequently.

SATISFACTION ON INTERNET BANKING SERVICE

The satisfaction of the customers plays a crucial role in the promotion of the service. The customers' satisfaction on internet banking service is described in the below table 4.11

The customers' satisfaction on internet banking is ranked based on the mean score. As per the mean score customers were highly satisfied on a few statements andsatisfied on a few statements. The customers were highly satisfied on internet banking provides 24×7 hours service (61.7%), it curtails the time to stand on queues in the bank branches satisfied and nutral in (35%), it helps to perform the transactions confidentiality in nutral (25%), internet banking highly satisfied (18.3%) internet banking provides up to date information regularly 23.3% in satisfies and highly dissatisfied. It offers high quality service satisfied at (31.66%).

Table No.4.11

SATISFACTION LEVEL ON INTERNET BANKING SERVICE

Statements	HS	S	N	DS	HDS	TOTAL
Internet banking provides 24 X 7 hours service	37 (61.7)	11 (18.8)	5 (8.33)	4 (6.66)	3 (5.5)	60
It curtails the time to stand in queues in the bank Branches	8 (13.33)	21(35.00)	21 (35)	5 (8.33)	5 (8.33)	60
It helps to perform the transactions confidentially	14 (23.3)	14 (23.3)	15(25.00)	13(21.6)	4 (6.66)	60
It provides necessary information to the customers	11(18.3)	15 (2.5)	13 (21.6)	12(20.00)	6 (10.0)	60

Scanned with CamScanner

It enhances the financial security	8 (13.3)	11(18.3)	15(2.5)	12(20.0)	14(23.3)	60
It reduces the cost of transaction	14(23.3)	19(1.66)	9(15.9)	10(16.6)	8(1.66)	60
Internet banking provides up–to-date information Regularly	10(16.6)	14(23.3)	15(2.5)	14(23.3)	7(11.6)	60
It performs the transaction at pre-determined time	16(23.6)	17(28.3)	9(15.0)	12(20.0)	6(10.0)	60
It offers high quality service	12(20.00)	19(31.66)	10(16.6)	11(18.3)	8(1.6)	60
Availability of service is faster than traditional banking	17(28.3)	14(23.3)	10(16.6)	7(11.6)	12(20.0)	60
It increases the believability, honesty and trustworthiness of the customers	11(18.3)	17(28.3)	10(16.6)	13(21.6)	9(15.0)	60
12 Internet banking ensures accountability	11(18.3)	13(21.6)	13(21.6)	10(16.6)	3(5.0)	60

(**HS** – Highly satisfied **S**– Satisfied **N**– Neutral **DS** – Dissatisfied **HDS** – Highly Dissatisfied)

The customers were highly satisfied on availability of service is faster than traditional banking (28.3%), and it increases the believability, honesty and trustworthiness of the customers satisfied in (28.3%). It perform the overall internet banking ensures accountability is highly satisfied (18.3%) respectively.

FINDINGS AND SUGGESTIONS

- A majority (66.60%) of the male customers have preferred internet banking than their female counterparts as male is technology.
- 48.3% of the respondents who belonged to the age group of 21 - 30 years make use of internet banking service as they are exposed to technology enabled services.
- A majority (58.3%) of the respondents are married. It is identified that married people mostly prefer internet banking as they have greater responsibility.
- All (100%) the respondents are educated and there is no respondent without formal education.
- It is found out that 26.6% of the respondents are from students background.
- It is understood that 51.6 % of the respondents belong to a monthly income category of Rs. 10,001 - Rs. 20,000.
- A majority (76.6%) of the respondents belong to nuclear family as they need privacy and expect to be independent in all walks of life.
- It is understood that 31.60% of the respondents hold their accounts in Indian Bank as it offers better quality of services in this area.

Scanned with OKEN Scan

SUGGESTIONS

- Banks should take necessary steps to create awareness among rural people about the advantages of internet banking services available in the banks.
- The banks should offer internet banking service in the regional language to attract the customers to enable all the customers to make use of the service irrespective of their education bag round.
- The internet banking system should be enhanced to make the online enquiry and online payment much easier to the customers.
- The bank should not restrict the time to carryout NEFT transaction in care of transferring fund from one bank to another.
- Public sector banks should improve their internet banking services to compare with their private sector counterparts.
- The public sector banks must improve its service quality in terms of communication, responsiveness, reliability and understanding.
- The bank should provide various effective modes for promotional schemes, interaction with the customers, more accuracy in billing, and financial security and privacy in transactions.

Department of Commerce
S. V. University, Tirupati.

***Abstract*- The term "weaker section" refers to a section of the population that is socially, economically, and politically behind the other sections of the population and has been experiencing various forms of inabilities as a result of their backwardness. The Government of India Act, 1935, defines "weaker sections" as class or classes of people who are suffering from educational and economic backwardness, as well as some aspects of social life, due to traditional customs of untouchability, tribal background, tribal way of life, or other backwardness. In India weaker sections encompassing marginalized groups such as Scheduled Castes, Scheduled Tribes, Other Backward Classes, and economically disadvantaged individuals. The research focuses on the objectives of identifying the problems and perceptions of sample entrepreneurs in the Nellore district, particularly those who received financial assistance from the Andhra Pradesh State Finance Corporation (APSFC) between 2022 and 2023. The sample design involves 3658 entrepreneurs from four revenue divisions, with a convenience sampling method adopted for selection. The study spans a ten-year period from 2012-13 to 2021-22, with primary data collected in 2022-23 and secondary data gathered from 2013 to 2022. The problems faced by the sample entrepreneurs are categorized into financial, raw material, marketing, labour, and infrastructural issues. The study also assesses general problems in obtaining assistance from Nellore branch APSFC, highlighting concerns such as delays in loan processing, inadequate sanctions, excessive terms and conditions, high-interest rates, and delays in disbursements. Perceptions of sample entrepreneurs regarding APSFC's activities, sources of information, and opinions about obtaining complete information are analyzed.**

***Keywords*: APSFC, Weaker sections, Disbursement, Perception.**

Introduction

India, with its rich tapestry of cultural diversity and economic dynamism, grapples with the intricate challenge of addressing the needs and aspirations of its weaker sections. The term "weaker sections" encompasses various marginalized groups such as Scheduled Castes (SCs), Scheduled Tribes (STs), Other Backward Classes (OBCs), and economically disadvantaged individuals facing socio-economic vulnerabilities, often due to historical injustices, caste-based discrimination, economic disparities, and lack of access to opportunities.

Historical Perspectives: The roots of the challenges faced by the weaker sections in India can be traced back to historical injustices, deeply embedded in the country's social fabric. The caste system, a centuries-old hierarchical social structure, has perpetuated discrimination and created a stark divide between the privileged and the marginalized. Despite constitutional safeguards and affirmative action measures, the persistent effects of historical oppression continue to hinder the progress of these sections.

Economic Disparities: One of the primary issues faced by weaker sections is economic inequality. Limited access to education, healthcare, and employment opportunities exacerbates their socio-economic vulnerabilities. As a result, a significant portion of the population finds itself trapped in a cycle of poverty, making upward social mobility a distant dream for many.

Educational Challenges: Education, often considered a potent tool for social transformation, remains elusive for many in the weaker sections. Lack of adequate infrastructure, discrimination in educational institutions, and socio-economic constraints contribute to lower enrollment and high dropout rates among these communities. This educational gap perpetuates a cycle of poverty, limiting the potential for overall development.

Caste-Based Discrimination: Despite legal prohibitions, caste-based discrimination continues to persist, affecting the daily lives of those in weaker sections. Social stigmas and prejudices impede their access to basic amenities, healthcare, and even employment opportunities. Addressing these deeply ingrained biases is crucial for fostering an inclusive and equitable society.

Perceptions and Stereotypes: Perceptions surrounding the weaker sections often perpetuate stereotypes, further marginalizing these communities. These preconceived notions hinder their integration into mainstream society and

contribute to the perpetuation of systemic inequalities. Challenging these stereotypes is essential for creating a more just and inclusive society.

Objectives of the study

The main objective of the study is to identify the problems and perceptions of sample entrepreneurs in the study area.

Sample design

The study is to probe into the availability of finance for the weaker sections of entrepreneurs from Nellore branch APSFC in Nellore district. The sample size of the present study includes only the weaker sections of entrepreneurs who got financial assistance from Nellore branch APSFC. The weaker sections of entrepreneurs financed by Nellore branch APSFC during the period 2022 to 2023 have been taken into consideration to collect the required data. Nellore district has been divided into four divisions namely Kandukur, Kavali, Nellore and Atmakur. A total of 3658 entrepreneurs of weaker sections who have taken loan in the above said branch by APSFC have been selected for study in the first stage. The convenience sampling method has been adopted for the selection of the sample respondents as a result of which 15 per cent of weaker sections of entrepreneurs assisted during this period were chosen conveniently for the study. Out of the total 549 sample respondents,129 sample respondents are from Kandukur revenue division,136 sample respondents from Kavali revenue division,175 sample respondents from Nellore revenue division and 109 sample respondents are from Atmakur revenue division. The strength particulars of the sample borrowers of weaker sections entrepreneurs from the four revenue divisions of Nellore branch Andhra Pradesh State Finance Corporation are furnished in the below table 1.

Table No. 1

Sample borrowers of weaker sections of entrepreneurs from four revenue divisions of Nellore branch of Andhra Pradesh State Finance Corporation in Nellore district

Revenue Divisions	**Total number of borrowers in each revenue division**	**Sample number of borrowers in each revenue division (15 Per cent of Total number of borrowers)**
Kandukur	862	129
Kavali	903	136
Nellore	1165	175
Atmakur	728	109
TOTAL	**3658**	**549**

Source: Nellore branch APSFC.

Period of the study

The period of study is for 10 years from 2012-13 to 2021-22. The primary data pertains to the field of study of the weaker sections of entrepreneurs of the four revenue divisions namely Kandukur, Kavali, Nellore and Atmakur in Nellore district and the study was conducted in the year 2022-23. The secondary data were collected during the period from 2013 to 2022.

Problems faced by the sample entrepreneurs

The entrepreneurs of any category or nature of business in the world face different kinds of problems like infrastructure, financial, labour, raw material, marketing and technology, etc., and the degree of severity of the problem varies based on the nature of business, size of business, location of business, form of business organization, etc. Though problems of an entrepreneur of an enterprise can be classified into two categories namely, internal and external problems. Internal problems affect the operating performance of an enterprise to a great extent. The problems are size of the organization and structure, process of production, training of the personnel, scantiness of management etc. External problems result from factors outside the control of entrepreneurs, such as the availability of water, power and other infrastructure facilities required for the smooth management of an enterprise, finance, marketing, etc. In the present research study, the role of Nellore branch APSFC in promoting the Weaker sections entrepreneurs, some of the problems of sample entrepreneurs in the sample district of Nellore have been highlighted to have an understanding about the common problems faced by the entrepreneurs in general in India. The key issues where problems arise in the institution and in the smooth running of entrepreneurs are mobilizing finance, acquiring of raw material, engaging labour, marketing, management, infrastructure facilities, government regulations, technological up-gradation, license, recovery of debts, etc.

Financial Problems of Sample Entrepreneurs

One of the important problems for a business concern is scanty financial resources. Most of the entrepreneurs are suffering from insufficient financial sources. These enterprises are not able to mobilize required finance from different sources because of the small size of the enterprise. The funding agencies arc also imposing number of terms and conditions to provide finance to meet entrepreneurial fixed and working capital requirements. The entrepreneurs have to depend on more than one source and pay heavy investment charges, and the huge rate of interest on loans raised. The other common problems faced by the entrepreneurs are also briefed hereunder. The opinions of the sample entrepreneurs about various aspects of financial problems are depicted in the table no. 2.

Table No. 2-Financial Problems of Sample Entrepreneurs

Problems	Revenue divisions								Total	
	Kandukur		Kavali		Nellore		Atmakur			
	No.	%	No.	%	No.	%	No.	%	No.	%
Shortage of long term loans	49	37.98	51	37.50	77	44.00	50	45.88	**227**	**41.34**
Shortage of working capital	42	32.56	44	32.35	52	29.72	26	23.85	**164**	**29.87**
Both of the above	38	29.46	41	30.15	46	26.28	33	30.27	**158**	**28.79**
Total	**129**	**100**	**136**	**100**	**175**	**100**	**109**	**100**	**549**	**100**

Source: Primary Data

The sample entrepreneurs were mainly facing the problem of scarce long-term loans and working capital funds. From the table 2 it is clear that out of 549 sample entrepreneurs, 41.34 per cent were facing the problem of shortage of long-term finance, 29.87 per cent were facing the problem of shortage of working capital and the rest of 28.79 per cent of entrepreneurs were facing shortage of both long-term funds and working capital in the sample district. The shortage of long-term loans and working capital was high in Nellore revenue division when compared to the remaining revenue divisions.

Raw Material Problems of sample entrepreneurs

Majority of the enterprises are facing the problem of production interruptions due to non-availability of raw materials on time. These enterprises have been established in rural and backward areas mainly because of subsidies and incentives offered to them in rural areas. The growth and sustainability of an enterprise depend on the timely supply of raw materials. Sometimes the cost of raw material increases due to short supply and that leads to increase in production cost. The steps initiated by the governments from time to time to supply raw materials at subsidized prices to the entrepreneurs are not supporting the successful functioning of the enterprises and also these enterprises are not following any scientific method of material management to reduce the cost of production. In addition, the problems of transportation, strikes, floods, scarcity and other natural dis-orders affect the supply of raw materials. The table no. 3 reveals the sample entrepreneurs' raw-material problems in the study area i.e., Nellore district.

Table No. 3- Raw Material Problems of sample entrepreneurs

Problems	Revenue divisions								Total	
	Kandukur		Kavali		Nellore		Atmakur			
	No.	%	No.	%	No.	%	No.	%	No.	%
Non-availability	27	20.93	25	18.38	29	16.58	24	22.02	**105**	**19.13**
Short supply	22	17.06	24	17.65	31	17.72	18	16.52	**95**	**17.30**
High prices	43	33.33	46	33.83	61	34.85	38	34.86	**188**	**34.24**
Poor quality	12	9.30	14	10.39	19	10.85	10	9.17	**55**	**10.02**
Transportation	25	19.38	27	19.85	35	20.00	19	17.43	**106**	**19.31**
Total	**129**	**100**	**136**	**100**	**175**	**100**	**109**	**100**	**549**	**100**

Source: Primary Data

The table 3 reveals about the sample entrepreneurs' raw-material problems in the study area of Nellore district. It is clear that out of the total 549 sample entrepreneurs 19.13 per cent opined that the non-availability of raw materials was their major problem, 17.30 per cent were facing the problem of shortage of raw materials, 34.24 per cent of entrepreneurs had the problem of high prices, 10.02 per cent faced the problem of low quality of raw materials and 19.31 per cent experienced difficulties in the transportation of goods. Further, it is observed that the high prices are the major problem in the study area.

Labour problems of sample entrepreneurs

Labour is another crucial problem of entrepreneurs in the present-day competitive business environment in India in general and in the sample district of Nellore in particular. Low productivity of labour a persistent problem in the rural and backward areas. Due to job security, the absenteeism, migration and non-availability of skilled labour is a serious problem to enterprises. The labour problem of sample entrepreneurs in various aspects was examined in the sample district of Nellore and the details are presented in the table no. 4.

Table No. 4- Labour problems of sample entrepreneurs

Problems	Revenue divisions								Total	
	Kandukur		Kavali		Nellore		Atmakur			
	No.	%	No.	%	No.	%	No.	%	No.	%
Scarcity of skilled labour	36	27.90	38	27.94	58	33.16	33	30.27	**165**	**30.05**
Demand of high salaries and wages	23	17.82	24	17.64	28	16.00	19	17.43	**94**	**17.13**

Strikes	13	10.07	15	11.00	20	11.42	12	10.09	**59**	**10.75**
Total	**129**	**100**	**136**	**100**	**175**	**100**	**109**	**100**	**549**	**100**

Source: Primary Data

It is clear from the table 4 that in Nellore district 30.05 Per cent of enterprises were facing the problem of lack of skilled labour, 17.13 per cent of entrepreneurs faced the problem of demand for high salary and wages, 12.38 per cent were facing difficulty of irregularity of labour, 29.69 per cent faced the problem of migration of skilled labour for better opportunity and 10.75 per cent enterprises faced the problem of strikes out of 549 sample enterprises. The scarcity of skilled labour was the major problem of majority of sample enterprises in the sample divisions of the study.

Marketing problems of the sample entrepreneurs

Problem of marketing is more complicated in the case of enterprises in India. These units are not in a position to face the onslaught of large-scale units, to assess the prevailing market scenario or changes which are taking place such as tastes, likes, dislikes, competition, technology etc. The major problems are lack of market intelligence, poor marketing network, lack of market information, deficiency of worthwhile marketing assistance from government agencies, cut-throat competition, lack of proper marketing channels, poor quality of products, lack of quality control, poor bargaining power, lack of knowledge of marketing, ignorance of potential markets, unfamiliarity with export activities, lack of knowledge of consumer preferences and tastes, lack of proper advising and lack of high quality salesmanship. Details of marketing problems of the sample entrepreneurs in the Nellore district are furnished in the table no. 5.

Table No. 5- Marketing problems of the sample entrepreneurs

Nature of problem	Revenue divisions								Total	
	Kandukur		Kavali		Nellore		Atmakur			
	No.	%	No.	%	No.	%	No.	%	No.	%
Competition from other enterprises	41	31.78	48	35.29	66	37.72	36	33.03	**191**	**34.79**
Competition from large scale units	23	17.83	21	15.45	24	13.72	18	16.51	**86**	**15.66**
Slackness demand	11	8.53	10	7.36	17	9.72	12	11.00	**50**	**9.11**
Seasonal demand	17	13.50	16	11.76	19	10.85	16	14.68	**68**	**12.39**
Transport	18	13.95	20	14.70	27	15.42	15	13.77	**80**	**14.57**
Sales promotion	19	14.73	21	15.44	22	12.57	12	11.00	**74**	**13.48**
Total	**129**	**100**	**136**	**100**	**175**	**100**	**109**	**100**	**549**	**100**

Source: Primary Data

The above table 5 shows that in Nellore district, among 549 sample enterprise entrepreneurs, 34.79 per cent of respondent entrepreneurs faced the problem of competition from other enterprises, 15.66 per cent of entrepreneurs

faced severe competition from large enterprises, 9.11 per cent faced the problem of slackness demand, 12.39 per cent were facing the problem of seasonal demand, 14.57 per cent faced problems with regard to transportation and 13.48 per cent were facing difficulty in sales promotion. Further, it is observed from the study that majority of the sample entrepreneurs were facing problems with their peer group members doing business in the same line of activity.

Infrastructural Problems of sample entrepreneurs

The success of any enterprise greatly depends on the availability of all kinds of infrastructure facilities like roads, power, telecommunication, post-office, location, water, warehousing, etc. The micro, small, and medium enterprises are located in rural and backward areas and not able to access all kinds of essential infrastructure facilities. Adequate infrastructure facilities contribute to the physical and financial growth of entrepreneurs. The infrastructural problems of sample entrepreneurs in the Nellore district are presented in the table no. 6.

Table No. 6- Infrastructural Problems of sample entrepreneurs

Problems	**Revenue divisions**								**Total**	
	Kandukur		**Kavali**		**Nellore**		**Atmakur**			
	No.	**%**	**No.**	**%**	**No.**	**%**	**No.**	**%**	**No.**	**%**
Power	27	20.93	28	20.58	37	21.14	22	20.18	**114**	**20.76**
Water	9	6.97	11	8.08	18	10.30	8	7.33	**46**	**8.38**
Transport	23	17.82	24	17.64	30	17.14	18	16.51	**95**	**17.30**
Warehousing	21	18.60	22	16.17	28	16.00	17	15.59	**88**	**16.04**
Technology	42	32.55	44	32.35	53	30.28	38	34.86	**177**	**32.24**
Communication	7	5.42	7	5.42	9	5.42	6	5.54	**29**	**5.28**
Total	**129**	**100**	**136**	**100**	**175**	**100**	**109**	**100**	**549**	**100**

Source: Primary Data

It is clear from table 6 that out of 549 sample entrepreneurs, 20.76 per cent of entrepreneurs faced the problem of power shortage and fluctuations, 8.38 per cent were facing the problem of insufficiency of water, 17.30 per cent faced the problem of transportation, 16.04 per cent of entrepreneurs were suffering from lack of warehousing facilities, 32.24 per cent faced the problem of changing technologies and 5.28 per cent of enterprises faced the problem of communication in the study area. The majority of the problems faced were due to lack of technology in the study area.

General problems in obtaining assistance from Nellore branch APSFC

The small-scale entrepreneurs are facing certain difficulties like delay in loan application processing, inadequate sanctions, too many terms and conditions, high rate of interest, delay in disbursements etc., while obtaining financial assistance from the Nellore branch APSFC. General problems in obtaining assistance from Nellore branch APSFC are presented in table no. 7.

Table No. 7- General problems in obtaining assistance from Nellore branch APSFC

Revenue divisions	**Delay in processing of application**	**Inadequate sanctions**	**Too many terms and conditions**	**High rate of interest**	**Delay in disbursements**	**Total**
Kandukur	22	25	26	42	14	**129**
Kavali	26	28	21	46	15	**136**
Nellore	30	29	31	59	26	**175**
Atmakur	19	21	28	29	12	**109**
Total	**97**	**103**	**106**	**176**	**67**	**549**
Chi-square	$\chi 2 = 7.366^{@}$; (p = 0.832) ; df= 12; Not Significant					

Source: Primary Data

It is clear from table 7 that for entrepreneurs high rate of interest was the primary problem followed by delay in processing of application, inadequate sanctions, too many terms and conditions and delay in disbursements. The result of Chi-square test shows the value 7.366 and Sig = 0.000 which is less than 0.05 (at 95% level of confidence) which indicates that there is not significant difference.

Government Regulations

It is a well-known fact that all kinds of enterprises should fulfil the different formalities of the governments during establishment and option of the enterprise. Different Acts are enacted by the Government of India to monitor and regulate the business operations of enterprises. Majority of the entrepreneurs have complained that the government policies towards the entrepreneurs are not flexible and friendly. Entrepreneurs are not happy with the terms of licensing, lending, subsidy and concessions given to them. Furthermore, entrepreneurs in one industrial complex complained that the government did not fulfil its promise to buy their products, especially ambe products at fair prices for industrial production.

Perceptions of sample entrepreneurs

Entrepreneurs and Entrepreneurship have assumed great importance in both developed and developing nations. Entrepreneurship plays a key role in the promotion of capital formation, creation of wealth, exploring opportunities, employment generation, balanced regional development, etc. Capital is one of the important factors of production which promotes entrepreneurship to a greater extent in any country. To procure the required capital to any venture, the entrepreneurs should have the minimum knowledge about the various sources of finance support to an enterprise at all times. The long-term and short-term loans provided by the financial institutions like development banks, corporations, commercial banks, etc., are among the important sources of finance usually provided to any enterprise. The Andhra Pradesh State Financial Corporation is extending financial support for the growth and development of industrial sector in general and enterprises in particular in the state through loans. An in-depth attempt has been made in this study to examine and evaluate the perception of the sample entrepreneurs on Nellore branch APSFC activities like sources of information, opinion about getting complete information, knowledge of the objectives of APSFC, awareness of scheme of assistance and other formalities for getting assistance follow up of action.

Sources of Information

The Andhra Pradesh State Financial Corporation is rendering financial service to all categories of entrepreneurs of the state of Andhra Pradesh through its 13 branches spread over all the districts. The knowledge about the corporation's activities, schemes of assistance, formalities, terms and conditions were essential to entrepreneurs to borrow funds to meet their financial requirements. The customers of the corporation are obtaining information from different sources about the activities of the APSFC to avail its services. The sources of information about entrepreneurial activities of Nellore branch APSFC are presented in table no. 8.

Table No. 8- Sources of information about entrepreneurial activities of Nellore branch APSFC

Sources of Information	Revenue divisions								Total	
	Kandukur		Kavali		Nellore		Atmakur			
	No.	%	No.	%	No.	%	No.	%	No.	%
Existing clients	64	49.61	71	52.21	81	46.28	55	50.45	**271**	**49.36**
Official campaigns	23	17.83	25	18.38	29	16.57	21	19.26	**98**	**17.85**
Associates	8	6.20	4	2.96	12	6.85	6	5.50	**30**	**5.46**
Publicity	14	10.85	16	11.75	26	14.85	11	10.09	**67**	**12.21**
Mass media	15	11.63	17	12.50	20	11.45	13	11.93	**65**	**11.84**
Others	5	3.83	3	22.05	7	4.20	3	2.75	**18**	**3.28**
Total	**129**	**100**	**136**	**100**	**175**	**100**	**109**	**100**	**549**	**100**

Source: Primary Data

The table 8 reveals the sources of getting information by the sample entrepreneurs of sample district of Nellore regarding the activities of Andhra Pradesh State Financial Corporation. Out of 549 sample entrepreneurs, nearly 49.36 per cent of entrepreneurs got the information about activities of Nellore branch APSFC from the existing clients, followed by 17.85 per cent of entrepreneurs got information through official campaigns of the corporation, 12.21 per cent of entrepreneurs got it through publicity, 3.28 per cent of entrepreneurs who got information from other sources, 11.84 per cent got it through mass media and 5.46 per cent got information from the associates in APSFC Nellore branch. The same trend of sources of information was observed from the individual sample district entrepreneurs also. The majority of entrepreneurs got the information from the existing clients.

Opinion about getting Complete Information

Obtaining complete information about any task is half of the success of that task. The table no. 9 shows the data regarding obtaining of complete information about the Nellore branch APSFC by sample entrepreneurs.

Table No. 9-Opinion about getting Complete Information

Revenue divisions	Obtained		Not obtained		Total
	No.	%	No.	%	No.
Kandukur	113	89.60	16	12.40	**129**
Kavali	126	92.65	10	7.35	**136**
Nellore	163	93.14	12	6.86	**175**
Atmakur	98	89.91	11	10.09	**109**
TOTAL	**499**	**90.89**	**50**	**9.11**	**549**

Source: Primary Data

The above table 9 reveals that out of the total 549 entrepreneurs, 90.89 per cent of entrepreneurs opined that they obtained complete information while 9.11 per cent of entrepreneurs had not obtained the complete information about the activities of APSFC at the time of applying for financial assistance. Regarding the revenue divisions of sample entrepreneurs, 93.14 per cent of Nellore division sample respondents obtained information and the remaining had not obtained.

CONCLUSION

In conclusion, understanding the problems and perceptions surrounding the weaker sections in India is imperative for fostering sustainable development and social harmony. Tackling historical injustices, addressing economic disparities, ensuring equal access to education, and challenging stereotypes are pivotal steps toward creating a more equitable and inclusive society for all. Financial challenges include a shortage of long-term loans and working capital. Raw material problems involve non-availability, short supply, high prices, poor quality, and transportation issues. Labour problems encompass scarcity of skilled labour, demand for high salaries, irregularity, migration of skilled labour, and strikes. Marketing challenges include competition from other enterprises, seasonal demand, transportation problems, and difficulties in sales promotion. Infrastructural issues involve power shortages, water insufficiency, transportation challenges, lack of warehousing facilities, technological obsolescence, and communication problems. The study also sheds light on the perceptions of sample entrepreneurs regarding the Andhra Pradesh State Financial Corporation (APSFC). While existing clients play a crucial role in disseminating information, the study reveals that a substantial majority of entrepreneurs have obtained complete information about APSFC's activities. However, challenges persist, with high-interest rates and delays in loan processing identified as prominent issues. In essence, the findings underscore the need for comprehensive and targeted interventions to address the intricate challenges faced by weaker sections in India, particularly in the entrepreneurial landscape. This includes policy measures to alleviate financial constraints, improve infrastructure, and foster a more inclusive and supportive environment for entrepreneurs from marginalized communities. Only through such concerted efforts can India truly progress towards a more equitable society.

MARKETING STRATEGIES TO OVERCOME THE CHALLENGES FACING THE PHARMACEUTICAL COMPANIES IN INDIA

M.Venkatesulu, Research Scholar, Department of Management Studies, Sri Venkateswara University, Tirupati-517502
Dr. P. Raghunadha Reddy, Professor & Research Supervisor, Department of Management Studies, Sri Venkateswara University, Tirupati -517502

Abstract:

This paper analyses and examines the current situation, recent developments, issues and challenges for Pharmaceutical companies in India from the perspective of marketing management. This paper highlights the current position of pharmaceutical companies in the Global pharma markets in order to understand its implications for current market challenges faced by the pharma industry. The challenges faced by pharmaceutical companies in the Indian market with reference to the Marketing function have been examined in this article. The discussion is focused on the marketing mix for pharmaceutical companies comprising the 4Ps, namely, Product, Price, Place and Promotion. This paper suggests a few effective strategies to overcome the challenges faced by the pharmaceutical industry.

Key terms: Product, challenges, marketing, Price, Place and Promotion.

Introduction:

Indian pharmaceutical industry is the 3rd largest in the world by volume and is USD 40 billion in terms of value. India contributes around 3.5% of total drugs and medicines exported globally. India exports pharmaceuticals to more than 200 countries and territories including highly regulated markets such as the USA, The UK, European Union, Canada etc. The Indian Pharma sector has complete ecosystem for development and manufacture of pharmaceuticals. Its Pharma companies possesses the state of the art facilities including highly skilled/technical manpower. Our

countries also has a large number of renowned pharmaceutical educational and research institutes as well as a robust ecosystem of allied industries.

India is the largest provider of generic drugs globally. Access to affordable HIV treatment from India is one of the greatest success stories in medicine. India is one of the biggest suppliers of low-cost vaccines in the world. Because of low price and high quality, Indian medicines are preferred worldwide, thereby rightly naming the country "the pharmacy of the world". The Pharmaceutical sector currently contributes around 1.72% to the country's GDP.

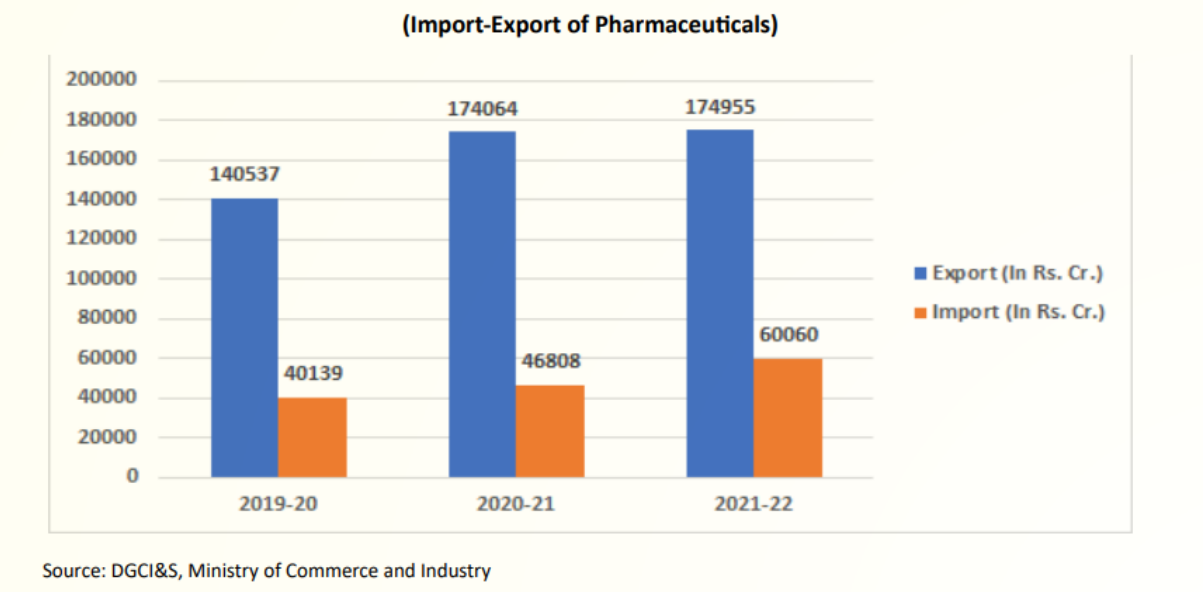
At present a major constituent of Indian exports are low value generic drugs while a large proportion of the demand for patented drugs is met through imports. This is because the Indian Pharmaceutical sector lacks in high value production along with world class pharma R&D. In order to encourage the global and domestic players to enhance their investment and production in these product categories, a well-designed and suitably targeted intervention is required. This would promote the manufacture of specific high value goods such as biopharmaceuticals, complex generic drugs, patented drugs or drugs nearing patent expiry, cell based or gene therapy drugs.

Further, in order to ensure drug security by, unbridled support to the domestic production capability in APIs/KSMs is needed. This would enhance the resilience of the Indian pharmaceutical industry to external shocks. These initiatives improve our ability to achieve the ultimate to objective of affordable healthcare in the country and the target of Health for all by 2030.

History of Pharmaceutical companies in India

Bengal Chemicals and Pharmaceutical Works is the first pharmaceutical company in India. Today, it is one of the five government-owned drug manufacturers that was incorporated on 12th April, 1901. For the next 60 years, most of the drugs in India were imported by multinationals either in fully-formulated or bulk-drug form. The government has actively encouraged the growth of drug manufacturing by Indian companies in the early 1960s, and with the Patents Act in 1970, the Indian an pharma industry emerged stronger. The patent act 1970 deleted the from food and drugs. However, retained the process patents, whose duration was shortened to a period of five to seven years. The absence of patent protection made the Indian market unattractive to the

multinational companies who had dominated the Indian market. As a result, the Indian companies gradually replaced the MNCs. The Indian companies carved a niche in both the Indian and world markets with their expertise in reverse-engineering, in innovative process design for manufacturing drugs at low costs. Although some of the larger companies have taken baby steps towards drug innovation, the industry as a whole has been following this business model until the present.



India's pharmaceutical sector is well-known for producing affordable vaccines and generic medications at a third-place global volume in pharmaceutical manufacture. In 2020–21, the industry made up around 1.32% of the Indian economy's gross value added (calculated using constant prices from 2011–2012). For the fiscal year 2021–2022, Pharmaceuticals had a total yearly sale of Rs. 3,44,125 crore (USD 42.34 billion). Generic medications, over-the-counter medications, bulk medications, vaccines, contract research and production, biosimilars, and biologics are some of the main sectors of the Indian pharmaceutical industry. When it comes to the provision of DPT, BCG, and measles vaccinations, India leads the world. About 8% of the worldwide API industry is contributed by 500 API firms. The main source of generic medications is India. It produces over 60,000 distinct generic brands in 60 therapeutic areas, making approximately 20% of the world's generic drug supply. One of the biggest medical achievements is the availability of reasonably priced HIV therapy from India. Indian pharmaceuticals are favored globally due to their affordable prices and superior quality, earning them the title of "pharmacy of the world." The industry has been expanding at a robust pace.

Table shows the sector's yearly turnover trend over the last five years.

Financial Year	Turnover (Rs. in Crore)	Growth Rate
2017-2018	2,26,423	3.03
2018-2019	2,58,534	14.18
2019-2020	2,89,998	12.17
2020-2021	3,28,054	13.12
2021-2022	3,44,125	4.89

Source: Pharmatrac/NPPA/DGCIS, Kolkata

The Indian pharmaceutical business is a major worldwide player, providing millions of people with low-cost, accessible generic medications. The industry provides lower costs without sacrificing quality, as evidenced by the fact that India is home to the greatest number of pharmaceutical facilities outside of the United States that have received approval from the US Food and Drug Administration (USFDA). Additionally, a sizable number of these facilities comply with Good Manufacturing Practices (GMP) regulations set forth by the World Health Organization (WHO) and have also received approval from foreign regulatory bodies. As can be observed from Graph 1A, India's pharmaceutical industry contributes significantly to the nation's international trade and has been steadily producing trade surplus. Pharmaceutical exports totalled Rs. 1,74,955 crore (USD 23.5 billion) in 2021–22, while pharmaceutical imports totalled Rs. 60,060 crore (USD 8.06 billion). As a consequence, there was a trade surplus of Rs. 1,14,895 crore (USD 15.44 billion).

Source: DGCI&S, Ministry of Commerce and Industry

Future growth prospects of Indian Pharmaceuticals:

The pharmaceutical sector has seen significant changes in recent years, putting new demands on payers, providers, and manufacturers. Customers today expect the same variety and convenience from the pharmaceutical sector as they do from other industries. Pharmaceutical marketing aids in raising knowledge of treatments for chronic diseases, which are the major cause

of health-care costs. India is also anticipated to become a pharmaceutical R&D hub in the coming decade, with the Department of Pharmaceuticals preparing a road map for India to become a worldwide player in the industry by 2030.

The Indian Pharmaceutical industry is predictable to grow up to USD 130 billion in value by the end of 20301. In FY22 India had exported pharmaceutical products worth USD 24.62 billion and it has been expected that Indian pharmaceutical exports will reach USD 27 billion in FY 2023. India also has the largest number of manufacturing sites approved by the United States Food and Drug Administration (US FDA) outside of the United States.

Some of the recent developments/investments in the Indian pharmaceutical sector are as follows:

1. In December 2020, Piramal Pharma Solutions announced plans to invest Rs. 235 crore (US$ 32 million) to expand its facility in Michigan, US, with additional capacity and new capabilities for development and manufacturing of active pharmaceutical ingredients (APIs).
2. In November 2020, Indian Immunologicals (IIL) commenced work on Rs. 75 crore (US$ 10.17 million) viral antigen manufacturing facility in Genome Valley, Telangana, that will enhance its vaccine production capacity by 35% by October 2021.
3. In November 2020, the Indian Institute of Technology (IIT) Bombay has stepped up research and development (R&D) amid COVID-19 and researchers are developing products such as a portable sterilization device and germicidal cabinet; wheeled sterilization unit, especially for hospitals; portable and rechargeable car sanitizer; eco-friendly sprays, and alcohol-free and bleach-free sanitizers.
4. In October 2020, six generic drug makers--Dr. Reddy's Laboratories, Zydus Cadila, Glen mark Pharmaceuticals, Torrent Pharmaceuticals, Hetero Drugs and Ackerman Pharma signed a deal with Hidalgo ,a state in Mexico, to establish a large pharmaceutical cluster for production and logistics in Mexico.
5. In October 2020, Aurobindo Pharma acquired MViyeS Pharma Ventures for Rs. 274.22 crore (US$ 37.30 million).

6. In May 2020, Jubilant Generics Ltd entered into a non-exclusive licencing agreement with US-based Gilead Sciences Inc to manufacture and sell the potential COVID-19 drug Remdesivir in 127 countries, including India.
7. Affordable medicines under Pradhan Mantri Bhartiya Janaushadhi Pariyojana (PMBJP) achieved record sales turnover of Rs 52 crore (US$ 7.38 million) in the month of April 2020.
8. During December 2019, on moving annual total (MAT) basis, industry growth was at 9.8%, with price growth at 5.3%, new product growth at 2.7%, while volume growth at 2% y-o-y.
9. In October 2019, Telangana Government proposed Hyderabad Pharma City with financial assistance from the Central government of Rs 3,418 crore (US$ 489 million).

Review of Literature:

Saurabh Kumar Saxena[9], (2008), came out with a paper titled as "A Review Of Marketing Strategies Work By Different Pharmaceutical Companies" Provides valuable insights into the supply chain processes and end customer perceptions that determine the formulation of marketing strategies.

Eric Langer, Abhijeet Kelkar (2008), in their paper entitled "Pharmaceutical Distribution in India. Biopharma International", insights the challenges faced by Indian Pharm companies in ensuring the delivery of uncompromised quality in the multilayered distributed system.

P.Parveen, P.Usha, V.Vasu naik, Rajesh Akki (2013), in their paper entitled "Pharmaceutical Distribution in India" this presents the marketing strategies of a pharma company that shifts from Acute-base to chronic therapy base. This study focus on the processes and outcomes of globally distributed pharma companies as well as the drug pricing control order. The DPCO has been a mill stone around the neck of the Indian industry as its severely restricted pharmaceutical companies.

Dr. Pramod Kumar, Dr. Pramod Kumar (2013)," Marketing Mix of Pharmaceutical Industry in India: An Exploration", this paper explores the marketing mix of pharmaceutical

industry in India**.** It provides a crical evaluation of policies and strategies of the pharma companies in the light of the complex interplay of the 4Ps or marketing mix of the pharma companies.

Anil Kalotra (2014), in the paper entitled "Marketing Strategies Of Different Pharmaceutical Companies", has focused on the three stakeholders in the pharma sector that are fundamental to the success of the marketing strategies. The success the marketing strategies in the competitive context is derived from either a cost advantage or a value advantage or ideally from a combination of both. That flows from a synergistic balance amongst the three stakeholders (the firm, its competitors and its customers)

Manvi Aayush Sood (2019), in their paper entitled "Evolution of Indian Pharmaceutical Industry-Overview" The Indian Pharmaceutical Industry has witnessed several fluctuations in its fortunes over the last three to four decades. It is one of the most efficient industry in India it provides employment and health care to the nation. This paper mainly concentrates on the evolution of the industry, its growth and recent trends.

Issues and Challenges faced pharmaceutical companies in India

Several Indian pharmaceutical companies have successfully deployed many standard strategies with a view to target the various customer types. However, the emerging business and customer trends throw up many challenges and opportunities that may improve the profitability. In the pharmaceutical and healthcare industries, a complex web of decision-makers determines the nature of the transaction (prescription) for which direct customer (doctor) of pharmaceutical industry is responsible. However, as the end-user (patient) consumes the product, he/she pays the cost. The appointment of medical representatives for marketing the products to physicians and to convenience the others in the hierarchy of decision makers has been a time-tested tradition.

The industry is still faced with some very serious strategic and operational level issues:

1. Real-time good manufacturing practices and research components are severely lacking in the Indian pharmaceutical business. This has consistently been the main challenge facing the Indian pharmaceutical business. The Pharma businesses should ideally be set up so that they have superior operational capabilities and infrastructure.

2. Indian pharmaceutical businesses are not making enough money since their revenues are essentially much lower than those of their competitors in other nations, like the US. The Indian pharmaceutical sector is thus unable to support its research initiatives.
3. The pharma industry is dependent on China for the supply of raw material for generic medicines production of Active Pharmaceutical Ingredients (API).
4. India needs user friendly government policy for the common man to establish small scale, raw material manufacturing units/ incubators in all states of the country to improve availability of raw materials to manufacture generic drugs at affordable rates.
5. The government and industry should facilitate the pharmacist community to become entrepreneurs and promote incubators' establishment.
6. Raw material produced from small scale units should be properly validated in the testing laboratory of the state to ascertain their quality specifications.
7. There is a need for a functional testing laboratory in every state to hasten the work of raw materials specification.
8. Small scale produces may be re-processed in another industry or via a chain of industry for quality products that can be used for parenteral/tailor-made formulations.
9. Skilled manpower from academic institutions can be achieved through continuing education programmes.

Marketing Mix Strategy for pharmaceutical companies in India

The classical marketing mix consists of four different Ps; product, price, place and promotion (McCarthy 1960). Conceptually, this mix may be adapted and relevant to a most product segments. However, experts are skeptical about its utility and relevance in the case of for marketing of services. Some experts also argue that marketing approach in such cases should not be imitated from Kotlerian Marketing.

In order to outline efficient marketing of services the 7Ps approach were introduced - adding people, physical evidence and process to the traditional mix.

Marketing is an essential function in any business upon which the survival of the business entity is dependent. "There can be no effective corporate strategy that is not marketing oriented, that does not in the end follow this unyielding prescription: The purpose of business is to create

and keep customer" (Theodore Levitt 1960). However, Levitt should also add that businesses must also develop products and services that customers want and at prices they are willing to pay. Marketing may be broadly conceived as the process of making decisions about what products or services to put on the market, who are the potential customers for these goods, how to reach the target markets and induce them to buy; how to price the product or service optionally so as to be make is attractive to the customers; and finally how to provide the goods physically to the ultimate customers. These matters are often expressed as the four Ps of marketing: Product, Price, Promotion and Place.

The four Ps of Pharmaceutical marketing are discussed below.

Product:

Product is an item that is created in an organization to fulfill the demand of the consumers. It can be intangible or tangible – i.e. service or goods.

The Product related decisions encompass the following aspects such as Brand name, Functionality, Product styling, Quality, Safety, Packaging and After-sales service.

The Product related decision fringes on what your customer wants from you. The Product parameters many changes according to its phase of the Product Life Cycle. For instance, during the introduction phase, the company may launch limited versions of the product just to explore adaptability to the customer needs. Similarly, the number of service centers for after-sales service as well as their location may be determined by the geographical spread of its customers**.**

The following are some of the challenges faced by the Pharma sector with respect to 'Product':

The recent COVID-19 Pandemic has highlighted the short comings of the pharma sector in providing the necessary quantities of drugs and other protective items including sanitizers to meet the unexpected surge in the international demand for drugs and accessories to tackle the Pandemic.

1. Demand forecasting and Market Potential
2. Risk management
3. Social Challenges
4. Legal and Regulatory Challenges
5. Distribution Challenges
6. Identifying Customer Pain Points

Price:

Price of the product is the amount that the customer is willing to pay for it. The 'Price' element of the marketing mix is vital for ensuring the economic viability of the Product.

The Major decision elements of 'Price' are pricing strategy (model), retail price, wholesale price, discounts offered, seasonal pricing, bundling pricing, price flexibility and price discrimination.

The decision of price depends on Product Life Cycle. A product during its journey from the Introduction stage to the Decline stage has to modify its Pricing strategies according to the changing market situation.

It gives an advantage to the company as the early adopters buy the product at the very initial stage even at a higher price.

India is recognized lowest priced drug manufacturer and marketer of pharmaceuticals products domestically and internationally. One reason for lower value share is the lower cost of drugs in India ranging from 5% to 50% less as compared to most other countries.

The Pricing Policies of the Indian Pharma sector have to overcome the following challenges. They are:

1. High 'Out of Pocket (OoP) expenditure
2. Pricing of patented drugs
3. Non-Standard drugs

4. Public and government pressure to make drug prices more affordable
5. Inadequate health insurance schemes is an impediment to high-priced drugs.
6. Higher healthcare cost forces the Pharma sector to focus on cost minimization.
7. Unknown value of revenue from each retailer in the territory.

Place:

This P is all about placement and distribution of the product in the market. The place also suggests the Point of Sale of the product. A business has to make sure that the availability of the product should be easy for the customers.

The 'Place' factor comprises of several decision elements such as (i) Distribution channels, (ii) Market coverage, (iii) Inventory, (iv) Warehousing, (v) Order processing and (vi) Transportation.

Market coverage can be intensive, selective or exclusive. For example cigarettes have intensive coverage, while Smartphones selling involves selective coverage in a city. In contrast, luxury products like Mercedes Benz have exclusive coverage.

The decision concerning the 'Place' is determined by the stage in the PLC (Product Life Cycle).

The following are some of the challenges faced by the Pharma sector with respect to 'Place':

1. Storage and Transportation of Temperature sensitive drugs.
2. The availability of adequate transportation facilities could pose a challenge in the delivery of drugs to remotely located destinations.
3. As the decision of the customer (the Patient) to use a particular drug is dependent on the Prescription of the Doctor. Hence, the success of the Distribution channel is dependent on the ability of the Drug manufacture to convince the professional Doctor who is mainly responsible for prescribing the drug. As a result, the Pharma sector faces a stiff competition with respect to cringing the Doctors recommendation for the drug.

4. Absence of transportation on the amount of time invested on profitable and not-so profitable customers and lack of time-share planning towards developing customer base for future and un-tapped markets.
5. Unavailability of go down on storage of cold medicines.

Promotion:

Promotion is comprised of elements like advertising, sales promotion, personal selling, public relation, publicity, etc.

The various phases of PLC give the different meaning of promotion. The advertising activity is extensive at the introduction stage and comes to selective channels in the maturity stage.

Sales promotion also varies at different stages. The budget of the overall advertising also gets affected. At the decline stage, a business dedicates almost nil budget for advertising. It becomes very crucial to work with the advertising or marketing agency that understands the connection of stages of PLC and Promotion.

The following are some of the major challenges faced by the Pharm sector vis-à-vis 'Promotion':

1. Increased competition and unethical practices adopted by some of the propaganda base companies.
2. Low level of customer knowledge (Doctors, Retailers, Wholesalers).
3. Poor customer (both external & internal) acquisition, development and retention strategies.
4. Varying customer perception.
5. The number and the quality of medical representatives
6. High training and re-training costs of sales personnel.
7. Busy doctors giving less time for sales calls.
8. Poor territory knowledge in terms of business value at medical representative level.
9. Unclear value of prescription from each doctor in the list of each sales person.

10. Absence of ideal mechanism of sales forecasting from field sales level, leading to huge deviations

Conclusion:

The Indian pharmaceutical industry has recognized a strong presence in the international generics market by distributing high-quality drugs at measure. The industry has made innovations in processes and formulations and developed itself as are liable, high quality and cost-effective global drug supplier. Currently the industry is worth over USD 38 billion and can hope to grow to USD 120 to 130 billion by 2030 by exploiting on the wonderful opportunities that lie ahead. However the Indian pharma companies can achieve the aspiration of eleven to twelve percent CAGR.

Marketing may be broadly conceived as the process of making decisions about what products or services to put on the market, who are the potential customers for these goods, how to reach the target markets and induce them to buy; how to price the product or service optionally so as to be make is attractive to the customers; and finally how to deliver the goods physically to the ultimate customers. The Indian pharmaceutical companies facing challenges related to the four Ps of marketing: Product, Price, Promotion and Place.

ARTICLE INFO

ABSTRACT

Marketing challenges is a crucial strategic driver for increasing operational performance and maximizing the achievement of organizational objectives, such as improved productivity, improved customer service and enhanced profitability. The age of both market globalization and outsourcing has started, and many companies tend to manage their marketing challenges activities. Most of these organizations understand that marketing challenges needs to be tested for its performance in order to create an effective and efficient marketing. The marketing challenges is the most critical element for companies to boom in pharmaceutical, which needs to be quick, uninterrupted and safe. The competition is fierce because not one or two, but hundreds of pharmaceutical companies are competing for market share, each finding and creating specific strategies for sale and distribution. The present study is an attempt to examine various marketing challenges in the pharmaceutical context. Although there is a lack of literature in this context, the current study critically reviewed the current literature and built a questionnaire with the inputs from leading pharm marketing representatives by identifying the main marketing challenges such as product, price, place, promotion and trying to find the effect of these variables on organizational efficiency. A sample size of 100 employees employed in pharmaceutical departments at different levels of ten leading pharmaceutical organizations in India was taken for a questionnaire survey as a sampling unit. The study found fascinating insights of marketing challenges in pharma, which eventually benefit the marketers to design more effective marketing challenges. Further, the study is confined to Ten Pharma organisations in India which becomes a limitation in generalizing the findings.

Key Words: Marketing Challenges, Operational Performance, Pharmaceutical Organizations

I. INTRODUCTION:

The pharmaceutical sector generates around 2.8 trillion dollars in revenue globally, making it the largest industry in the world. Recent years have witnessed significant changes in the pharmacy sector, putting new demands on payers, providers, and manufacturers. Consumers now expect the pharmaceutical business to provide them with the same options and conveniences as other market segments. The Indian pharmaceutical sector is expected to grow rapidly and steadily over the coming years due to a variety of factors.

The pharmaceutical industry in India stands at the crossroads of opportunity and challenge. With a robust domestic market fueled by a burgeoning population and increasing healthcare awareness, coupled with a strong presence in the global pharmaceutical arena, Indian pharmaceutical companies have made significant strides. However, amidst these achievements lie formidable marketing challenges that require meticulous navigation and strategic acumen to surmount.

At the heart of these challenges lies the regulatory landscape. India's pharmaceutical sector is subject to rigorous regulatory oversight, spanning drug approvals, pricing regulations, and stringent advertising

Copyright © 2024 by Author/s and Licensed by Kuey. This is an open access article distributed under the Creative Commons Attribution License which permits unrestricted use, distribution, and reproduction in any medium, provided the original work is properly cited.

guidelines. Navigating this intricate web of regulations demands not only compliance but also agility to adapt to evolving regulatory frameworks. Moreover, with recent regulatory reforms aimed at enhancing drug safety and efficacy, pharmaceutical companies face heightened scrutiny, necessitating robust compliance mechanisms and risk mitigation strategies.

Beyond regulatory hurdles, understanding the dynamics of consumer behavior and healthcare preferences is imperative. India's healthcare landscape is undergoing a paradigm shift, driven by factors such as increasing urbanization, rising disposable incomes, and a growing emphasis on preventive healthcare. Consequently, consumers are becoming more discerning, seeking value-driven healthcare solutions and placing greater emphasis on factors such as brand reputation, efficacy, and affordability. Pharmaceutical marketers must therefore unravel the complexities of consumer behavior, leveraging insights to tailor marketing strategies that resonate with target audiences and drive brand loyalty.

Amidst these shifts, competitive pressures further compound the challenges faced by pharmaceutical companies. The Indian pharmaceutical market is fiercely competitive, characterized by a myriad of domestic players vying for market share alongside multinational giants. Price competitiveness, product differentiation, and market segmentation emerge as pivotal battlegrounds, necessitating continuous innovation and strategic positioning to stay ahead of rivals. Moreover, with the emergence of disruptive technologies and digital platforms, the landscape of competition is evolving rapidly, requiring pharmaceutical marketers to embrace digital transformation and harness data-driven insights to gain a competitive edge.

II. LITERATURE REVIEW:

Giuseppe Festa, Ashutosh Kolte, Maria Rosaria Carli, Matteo Rossi (2022), in their study focussed on annual growth in pharmaceutical, medicinal chemical, and botanical production for healthcare purposes. The country sells generic medications on a big scale, having significant impact in American and European markets. Although the industry's infrastructure and R&D skills have grown, difficulties such as pricing regulation, sector fragmentation, and intellectual property continue to exist. Patents are a major topic of contention in the national industry. Despite India's large population and low per capita income, stronger patent regulations may result in reduced access to medicine for a considerable portion of the population. Affordability of drugs poses a serious challenge in India and South Asia, potentially affecting life and death. The study found a strong economic, business, and commercial outlook for the Indian pharmaceutical industry, notwithstanding certain worries. The sector's main problem is to strike a balance between commercial aspirations for innovative growth and social needs for affordable healthcare.

Abinav Sharma (2020) made an attempt, to study the creation, communication, and provision of value to the target market by healthcare professionals is greatly aided by healthcare marketing. Rather than starting with goods or services, modern marketers start with the customer. Establishing a long-lasting connection holds greater significance than completing a single transaction. Creating a high degree of customer satisfaction should be the goal of a healthcare service provider in order to encourage repeat business from satisfied clients. According to the report, hospitals face a number of difficulties when trying to sell their services, but there are also opportunities in the market that healthcare organizations can take advantage of. With a carefully thought-out marketing strategy, hospitals can maintain their competitive edge and build a long-lasting relationship with patients by providing top-notch care and building a solid reputation.

Priyanka Singh (2013) examined a particular facet of rural marketing that these markets have not been utilized in any way. Its sole objective is to draw attention to the rural markets' increasing significance in the rapidly shifting economic landscape. Due to the wide range of courses that must be taken in rural marketing, particular consideration must be given to the product, its quality, packaging, brand, price, advertisement, personal selling, and distribution channel. The rural marketing strategy must be suitable, fully understanding the dispersed nature of rural consumers and the requirement for a distinct communication mix due to the lower educational attainment and environmental variations. All of this necessitates coordinated and coordinated action from the sector and the government. Even while producers may experience early losses due to high promotion and distribution costs, they shouldn't let this stop them from entering the market because the potential in the rural area is enormous. The country's shifting economic landscape combined with the rural population's increased purchasing power means that the recently established rural markets will undoubtedly pay off handsomely.
Luv Saini and P.K. Agarwal (2023) in their study highlighted a pharmaceutical business would be a smart decision because the industry is growing and has a bright future. The process involves several steps, which present the entrepreneur with a variety of challenges. Materials and information must come from trustworthy and credible sources. This study focuses on the various challenges that come with starting a pharmaceutical business in India. The study is qualitatively descriptive and makes use of secondary data. The results show that registration and licensing, resource requirements, financial concerns, business plan formation, raw material availability, skilled labor, and workforce optimization are the primary barriers to starting a pharmaceutical company in India.

Kalyani Rajput and Dr. Rajesh Kumar Pandey (2022) examined product marketing is a standard practice recognized by the worldwide business community as being essential to organizations seeking to achieve their targeted outcomes. The pharmaceutical industry is one of the most important and widespread industries. Its scope is broad, encompassing anything from over-the-counter (OTC) goods to life-saving medications to medical equipment. So much so that pharmaceutical education is given its own area in medical education as a whole, and the foundation for the production of pharmaceutical products is laid by these excellent educational opportunities. It takes a certain set of abilities to get these medications on the market, which is why pharmaceutical marketing is involved. Pharma marketing is more essential than general product marketing because it falls into the category of necessities and useful goods rather than desired goods, as most people don't plan to purchase medications or medical equipment unless they are prescribed or advised by a healthcare professional. This element presents a significant obstacle for the pharmaceutical marketing industry.

III. METHODOLOGY:

This research study aims to assess the association among important marketing challenges components empirically, namely Product challenges, Price challenges, Place challenges, Promotion challenges and how these critical components influence effective performance, which impacts the organizational performance. The present study framed the following objective of the study to enhance the limited literature available on Marketing challenges in the Pharma context: To study the relationship between marketing effectiveness and organizational Performance in Pharmaceutical organizations in India.

The following Hypotheses were framed for the present study
Ha01: There is a significant relationship between Marketing (4P's) challenges and Organizational Performance.
Ha02: There is a significant relationship between Marketing Effectiveness and Organizational Performance.
Data was collected from both Primary and secondary sources. The primary data was collected by administering a structured questionnaire from the employees working in the selected Pharmaceutical organizational in marketing domain. The secondary data was collected from research articles, journals, company records, and manuals. Measures for the research constructs used in the present study were developed by seeking the help from real time professionals who are working in the Pharma organizations with a framework borrowed and adapted by compiling various standard studies from prior literature. Most of the items were measured using a 5-point Likert scale ranging from "very poor" to "excellent". The antecedents in our research model comprise four constructs. "Product Performance of Marketing challenges" was assessed using six items; "Price Performance of Marketing challenges" was assessed using Five items. Nine items used to capture "Place Performance". "Promotion Performance" was assessed using eight items. Finally, "Marketing Effectiveness Performance" and "Organizational Performance" were assessed by using twelve and eight items respectively. A pilot study with a sample size of 50 responses was conducted before arriving at the final questionnaire. Reliability analysis ***(Cronbach's alpha)*** was applied to check the reliability of items used in initial questionnaire which showed that *Cronbach Alpha ranges from 0.7 to 0.9*(which is quite reliable). Based on reliability analysis and feedback from the Marketing representatives working in Pharma organizations, the final questionnaire was prepared.
The population universe consists of the employees working in India's marketing management wing of the pharmaceutical organization. The present study has limited the scope by restricting the universe as a pharmaceutical organization that only deals with marketing mix challenges. A total of 100 questionnaires were distributed and collected from the employees working in marketing management in pharmaceutical organizations in India.

IV. ANALYSIS

The profile of the respondents includes age, gender, designation, and work experience. The distribution of respondents based on their characteristics is shown in table 1. Analytical aspects of these characteristics are worth noting.

Tabel: 1 Profile of the Respondents

Variables	Categories	Frequency	Per cent
Age of the Respondent	Less than 25 years	24	24.0
	25 – 35 years	56	56.0
	Above 35 years	20	20.0
	Total	100	100.0
Education	Certificate Level	23	23.0
	Diploma Level	7	4.0
	Degree	28	28.0
	Masters	42	42.0
	Total	100	100.0
Qualification	Related to Job	58	58.0

	Unrelated to Job	42	42.0
	Total	100	100.0
Place of Work	City	28	28.0
	Town	38	38.0
	Both	34	34.0
	Total	100	100.0
Experience as Medical Representative	0 – 2 years	25	25.0
	2 – 5 years	44	44.0
	> 5 years	31	31.0
	Total	100	100.0

The final sample (N=100) was respondents are in the age group less than 25 is 24(24%), age group of '25 – 35 years is 56 (56%), 20 respondents are in the age group of 'above 20 years' (20%), Designation wise, the majority of the respondents are at 'Team lead level' (N=56). Twenty respondents are at 'Executive level', and 24 respondents are managers. Similarly, majority of the respondents have experienced are 2-5 five years. 25 respondents have experienced '0-2 years', 31 respondents have experience of 'above 5 years' in the marketing department. As the present study is based on the employees' perception towards marketing challenges practices, having more respondents from team lead level and good experience in marketing departments will make the data collected more authenticate in this survey. Table 2 is designed to exhibit the mean distribution of marketing effectiveness and marketing variables along with organizational performance scale. From the table, it can be noted that the highest mean was observed to the scale 'Product challenges' (M=3.68) and 'Organizational Performance' (M=3.65), whereas low mean was observed to the scales 'Pricing Challenges' (M=3.61) and 'Marketing effectiveness'(M=3.63).

Table:2 MARKETING CHALLENGES AND ORGANIZATIONAL PERFORMANCE

S. No	**Variable**	**Mean**	**S.D.**
1	Product Challenges	3.68	0.676
2	Pricing Challenges	3.61	0.564
3	Place Challenges	3.64	0.689
4	Promotion Challenges	3.67	0.560
5	Marketing Effectiveness	3.63	0.647
6	Organizational Performance	3.65	0.624

The present paper attempts to examine the relationship between marketing effectiveness and organizational performance with two hypotheses. The following deals with hypotheses testing by applying suitable statistical tools. Ha1: There is no significant relationship between selected variables on marketing challenges and Organizational Performance H01: There is a significant relationship between selected variables on marketing challenges and Organizational Performance. The hypothesis is framed to test the statistically significant relationship between marketing effectiveness and organizational performance. To test this hypothesis, linear regression is employed by considering organizational performance as dependent variables and variable of the marketing challenges such as Product challenges, Price challenges, Place (Distribution) challenges, and Plance challenges as independent variables. Table 3a portrays the regression test results, giving that marketing effectiveness variables can explain 71.1% of organizational performance.

Ha01: There is a significant relationship between Marketing (4P's) challenges and Organizational Performance.

Table: 3a **Model Summary**

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.843[a]	**.711**	.699	.35513

Table: 3b **ANOVA[a]**

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	29.455	4	7.364	58.387	**0.000[b]**
	Residual	11.981	95	0.126		
	Total	41.436	99			

Table: 3c **Coefficients[a]**

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-0.196	0.266		0-.738	.463
	Product Challenges	0.406	0.079	0.424	5.170	**0.000**
	Pricing Challenges	0.520	0.078	0.453	6.705	**0.000**
	Distribution Challenges	0.095	0.079	0.101	1.202	0.232
	Promotion Challenges	0.030	0.119	0.026	0.248	0.804

From table 3b, it can be inferred from the ANOVA test result that the overall model is significant. Table 3c shows that all the marketing challenges variables significantly influence organizational performance except two variables: product challenges and price challenges. Thus, the null hypothesis (H01) is rejected from the regression analysis test results, and the alternate hypothesis (Ha1) is accepted. H02: There is no significant relationship between marketing effectiveness and Organizational Performance Ha1: There is a significant relationship between Marketing Effectiveness and Organizational Performance. This hypothesis is framed to examine the relationship between marketing challenges and organizational performance. The earlier hypothesis has considered the variables of marketing challenges as independent variables. In this hypothesis, the marketing challenges is regarded as an independent variable and organizational performance as a dependent variable. Linear regression is applied to examine the relationship between the two selected variables. Table 4a shows that 64.1% of organizational performance can be explained by Marketing Effectiveness, which found to be consistent with the previous finding of the present study.

Ha02: There is a significant relationship between Marketing Effectiveness and Organizational Performance.

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	0.783[a]	**0.614**	0.610	.38980

ANOVA[a]

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	23.637	1	23.637	155.564	**0.000[b]**
	Residual	14.890	98	0.152		
	Total	38.527	99			

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	0.913	0.223		4.089	**0.000**
	MARKETING EFFECTIVENESS	0.755	0.061	0.783	12.473	**0.000**

Table 4b and 4c have given a p-value less than 0.05, which means that there is a statistically significant relationship between marketing effectiveness and organizational performance. Hence, the null hypothesis (H02) is rejected, and an alternative hypothesis (Ha2) is accepted

V. LIMITATIONS

- Any study based on a survey through a predesigned questionnaire suffers from the basic limitation.
- The study is confined to Ten Pharma organisations in India which becomes a limitation in generalizing the facts.
- Non-Probabilistic Sample used in for the survey stands as another limitation of the present study.

VI. CONCLUSION

The study found that organizational performance can be attained by effective marketing management. Marketing challenges can be effective only if designed to meet the various product, price, place and promotion. The study found that product and price are the key issues that significantly impact organizational purpose. The researcher found that the place and promotion are the key issues to address while studying marketing challenges, especially in the pharmaceutical market.

As the study selected marketing segment, product and stock-out situations are unavoidable. But still, efforts should be made to reduce the occurrence of these situations in the future. There are many issues to focus on detail like the product design, accessibility, return policy etc. Hence, further study is recommended to the researchers who shown interest in marketing management.

ABSTRACT

In the contemporary and dynamic landscape of business, the retention of skilled and experienced software professionals is a critical challenge faced by organizations. High turnover within the software industry not only results in substantial costs but also leads to a loss of productivity and knowledge. To address this challenge, organizations must adopt effective strategies to attract and retain talented software professionals. This research study aims to assess the various employee retention strategies implemented by organizations within the software industry. The study will delve into factors influencing employee retention and evaluate the effectiveness of diverse strategies employed to retain software professionals. Specifically, the research will investigate the impact of organizational culture, work-life balance initiatives, career development opportunities, compensation packages, and employee engagement practices on employee retention. Through a comprehensive analysis, the study seeks to contribute valuable insights that can inform organizations in developing and enhancing their strategies to retain skilled software professionals in the competitive business environment.

Keywords: Employee retention, Productivity, Organizational strategies, Compensation packages, Employee engagement, Human resources.

1. INTRODUCTION

In the contemporary global business arena, the retention of top-tier talent has emerged as a critical concern for organizations, particularly within the fiercely competitive software industry. With India solidifying its position as a major hub for software development and technology services, companies in this sector face unique challenges in retaining skilled professionals amidst high demand and intense competition [1]. Effective employee retention is pivotal for organizational success, contributing to stability, enhanced productivity, and reduced recruitment and training costs. This study seeks to explore the diverse strategies employed by software companies in India to retain their professionals and evaluate the effectiveness of these strategies in fostering long-term commitment. Given the high demand and competition for skilled professionals in the software industry, organizations deploy a variety of retention strategies to maintain a stable workforce, minimize turnover costs, and cultivate a positive work environment conducive to employee satisfaction and loyalty [2][3]. This paper examines several commonly implemented employee retention strategies in the Indian software industry. It includes many factors such as Competitive Compensation Packages, Career Development Opportunities, Work-Life Balance Initiatives, Recognition and Rewards, Employee Engagement Programs, Transparent Communication, Employee Well-being Initiatives and Strong Leadership and Management [4]. Generally, to attract and retain top talent, companies strive to offer competitive salaries and benefits that align with industry standards, reflecting the value of employees' skills and expertise. Recognizing the motivation driven by growth, organizations invest in employee development, providing clear career paths through training programs, mentorship initiatives, and challenging project opportunities. Acknowledging the importance of balancing work and personal life, software companies often implement flexible schedules, remote work options, and paid time off policies to support work-life integration, reducing burnout and increasing employee loyalty. Fostering a positive work culture involves acknowledging and appreciating contributions through rewards, bonuses, and public appreciation programs, boosting morale and creating a sense of loyalty among employees. Recognizing the link between engagement and retention, software firms implement team-building activities, social events, and employee resource groups to create a supportive work environment that fosters a sense of belonging and camaraderie [5][6]. Open and transparent communication channels build trust and loyalty. Ensuring access to organizational information, regular feedback sessions, and performance reviews provide opportunities for employees to voice concerns and receive constructive feedback. Prioritizing employee well-being involves offering wellness programs, mental health support, and access to fitness facilities, demonstrating a genuine concern for employees' health and building trust and loyalty. Effective leadership and management practices significantly influence retention. Investments in training managers to be supportive, empathetic, and skilled in employee development foster positive relationships, reducing turnover [7]. By examining these strategies, this research paper aims to contribute valuable insights for organizations seeking to enhance their employee retention approaches in the dynamic and competitive landscape of the Indian software industry. The key factors that helps to assess the strategies implemented by Indian software industries for investigating the employee retention strategies in the Indian software industry and the benefits of the employee retention is shown in the following fig.1.

Fig 1: Employee retention in IT industry

II. LITERATURE REVIEW

Employee retention strategies play a crucial role in the contemporary business landscape, particularly within the Information Technology (IT) sector, where attracting and retaining skilled professionals is paramount. This literature review seeks to explore and synthesize existing research on the impact of employee retention strategies on the job satisfaction of IT professionals. Understanding the intricate relationship between retention strategies and job satisfaction is essential for organizations striving to create a positive work environment and retain their valuable IT workforce. Through investigation on the research papers available in the literature reveals the following observations and conclusions.

Rahman, M., Islam, M. A. presented a paper on "Effective Strategies for Employee Retention in the IT Industry"[8]. The presented research work explores, in the ever-evolving landscape of the Information Technology (IT) industry, the retention of skilled professionals stands as a critical imperative for organizational success. This literature review examines several key studies that delve into effective strategies for employee retention within the IT sector. The insights provided by these studies contribute to a comprehensive understanding of the multifaceted approaches organizations employ to reduce turnover, enhance employee satisfaction, and elevate overall organizational performance

Madhavan, A., & Mahadevan, N, presented a paper on “The Impact of Compensation and Benefits on Employee Retention in the IT Sector"[9]. Their research scrutinizes the intricate relationship between compensation and benefits and employee retention within the IT sector. The study underscores the pivotal role of competitive salaries, incentives, and comprehensive benefits packages in attracting and retaining IT professionals. Additionally, it explores the significance of non-monetary rewards, such as flexible work arrangements and career growth opportunities, in bolstering employee retention.

Mehta, P presented a paper on "Employee Retention Strategies and Organizational Performance: A Comprehensive Review with Special Reference to IT Industry"[10]. Mehta's comprehensive review delves into the nexus between employee retention strategies and organizational performance, with a specific focus on the IT industry. The study explores strategies encompassing career development, work-life balance, employee recognition, and leadership development. It provides valuable insights into the positive impact of these strategies on employee commitment, satisfaction, and overall organizational success.

Jain, A., & Kaur, P submitted study on "A Study of Employee Retention Practices and its Effectiveness in IT Sector"[11]. Jain and Kaur's study systematically explores employee retention practices within the IT sector, evaluating their effectiveness. The research meticulously examines factors such as compensation, career growth opportunities, work environment, and employee engagement. It identifies the pivotal role of a positive work culture, supportive leadership, and effective communication in retaining IT professionals.

Singh, A., & Verma, N. presented a paper on “Impact of Work-Life Balance on Employee Retention: A Study in Indian IT Industry"[12]. Singh and Verma's research focuses on the critical impact of work-life balance initiatives on employee retention within the Indian IT industry. The study accentuates the role of flexible work arrangements, family-friendly policies, and employee well-being programs in not only reducing turnover but also enhancing job satisfaction.

Altogether, these studies provide comprehensive understanding of the diverse strategies and practices employed within the IT industry to retain skilled professionals. The insights gathered from these works offer a valuable resource for organizations seeking to refine and implement effective employee retention strategies, thereby fostering a resilient and satisfied IT workforce.

III. RESEARCH METHODOLOGY

To assess the employee retention strategies of software professionals in India, a mixed-methods research approach will be employed. The study will commence with a comprehensive literature review to establish a theoretical foundation and identify existing frameworks and models relevant to employee retention in the software industry. Subsequently, qualitative data will be gathered through semi-structured interviews with HR professionals and software experts to gain insights into the industry's specific context and nuances. The interview data will be thematically analyzed to identify recurring patterns and themes related to effective retention strategies. Additionally, a quantitative survey will be administered to a representative sample of software professionals across different organizations in India. The survey will encompass standardized measures of job satisfaction, perceptions of organizational culture, and the perceived effectiveness of various retention strategies. Statistical analyses, including regression analysis and correlation assessments, will be conducted to determine the relationship between retention strategies and job satisfaction. The combined findings from qualitative and quantitative data will contribute to a holistic understanding of the efficacy of employee retention strategies in the Indian software industry [13] [14] [15].

The survey comprises two sections: The initial part delves into respondents' demographic details, while the subsequent section focuses on gathering insights into their perspectives on the correlation between strategic impact elements and customer perceptions and purchasing behaviors. Using a Likert scale ranging from 1 (strong agreement) to 5 (strong disagreement), respondents rated the claims. Disagreement is denoted by scores of 4 or 5 [16] [17]. Regarding the sample design, a convenience sample was employed, distributing a total of 300 questionnaires, with 240 being fully completed. Upon thorough examination, an impressive 80 percent response rate was achieved. Descriptive statistics indicated a final sample size of 241, comprising both males and females.

IV. CONCEPTUAL FRAMEWORK

The conceptual framework for assessing employee retention strategies among software professionals in India is structured around key dimensions: organizational context, individual factors, and retention strategy effectiveness. The organizational context involves analyzing industry dynamics, examining organizational culture, and evaluating leadership effectiveness. Individual factors encompass demographic variables, job satisfaction, and professional

development needs [18]. The retention strategy effectiveness dimension involves assessing the impact of compensation, career development programs, work-life balance initiatives, and recognition programs on employee retention. The interactions between these dimensions will be explored through qualitative interviews and quantitative surveys.

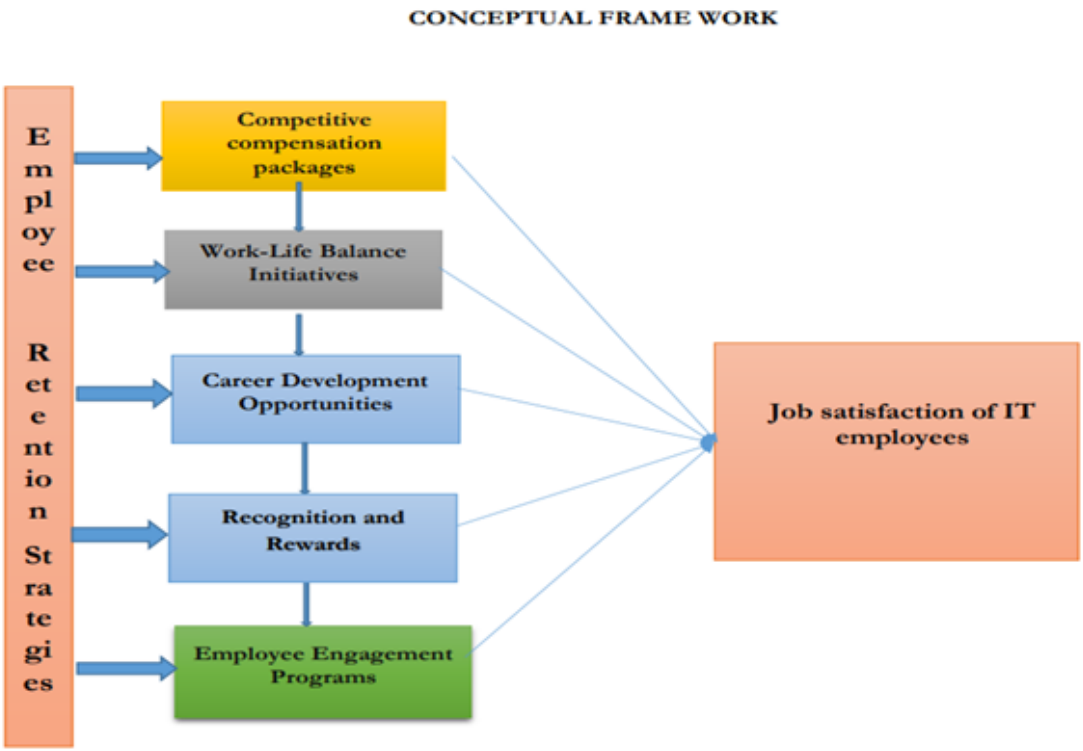

Fig 2: Conceptual frame work

The study aims to delineate the interplay of these factors in the Indian software industry, providing a nuanced understanding of effective retention strategies and their alignment with the unique needs and expectations of software professionals in this dynamic context [19]. The figure 2 revels the concept of the conceptual frame work.

V. OBJECTIVES

The main objective of this paper is to understand the influence of strategies on the job satisfaction of IT employees. The specific objectives of this research study are outlined as follows:

- Evaluate the impact of competitive compensation packages on the job satisfaction of IT employees.
- Analyze the influence of work-life balance initiatives on the job satisfaction of IT employees.
- Assess the impact of career development opportunities on the job satisfaction of IT employees.
- Examine the influence of recognition and rewards on the job satisfaction of IT employees.
- Evaluate the impact of employee engagement programs on the job satisfaction of IT employees.

VI. HYPOTHESIS

Competitive Compensation Packages:

- H0: The impact of Competitive Compensation Packages on Job satisfaction of IT employees is statistically significant.
- H1: There is no statistically significant impact of Competitive Compensation Packages on Job satisfaction of IT employees.
- Work-Life Balance Initiatives:
- H0: The impact of Work-Life Balance Initiatives on Job satisfaction of IT employees is statistically significant.
- H1: There is no statistically significant impact of Work-Life Balance Initiatives on Job satisfaction of IT employees.
- Career Development Opportunities:
- H0: The impact of Career Development Opportunities on Job satisfaction of IT employees is statistically significant.
- H1: There is no statistically significant impact of Career Development Opportunities on Job satisfaction of IT employees.
- Recognition and Rewards:
- H0: The impact of Recognition and Rewards on Job satisfaction of IT employees is statistically significant.
- H1: There is no statistically significant impact of Recognition and Rewards on Job satisfaction of IT employees.
- Employee Engagement Programs:
- H0: The impact of Employee Engagement Programs on Job satisfaction of IT employees is statistically significant.
- H1: There is no statistically significant impact of Employee Engagement Programs on Job satisfaction of IT employees.

VII. RESULTS & DISCUSSION

To attain the desired outcome of this research work, a systematic research methodology is implemented and the respective outputs were described in this section to conclude the impact of employee retention strategies on job satisfaction of it professionals. In this proposed work, Statistical Package for the Social Sciences SPSS is a software package widely used for statistical analysis in various fields, including management and social sciences. In management, SPSS is often used for tasks such as data analysis, statistical modelling, and reporting. SPSS 22 is a statistical software tool that can be utilized in management for analysing and interpreting data, making informed decisions, and gaining insights into various aspects of organizational processes and behaviour. In this research work SPSS 22 is used to analyse the data. The study under consideration employs exploratory factor analysis to illustrate concept validity and assesses internal consistency using Cronbach's alpha. To identify potential relationships between variables, the study utilizes the regression method. Principal Component Analysis (PCA) is employed in the Exploratory Factor Analysis (EFA) to validate constructs. Referring to Hair et al.'s research in 1998, a factor loading equal to or greater than 0.30 is considered to meet the minimum criterion, followed by factor loadings of 0.40 and 0.50, which are deemed progressively more crucial. This study establishes a termination point at a factor loading of 0.50. The outcomes of the factor analysis are presented in the accompanying table. KMO is a statistic used in management research, particularly in the context of factor analysis, to assess

the adequacy of the data for identifying underlying factors or constructs. The value of KMO, when it is between 0.5 and 1.0, a component analysis is advantageous for the data.

The extent of interdependence among variables is assessed through Bartlett's sphericity test, with researchers measuring the outcome by computing the test's significance level. If the resulting values are significantly small, typically below 0.05, it indicates substantial correlations between the variables. Conversely, a p-value exceeding 0.10 suggests that the data may not be well-suited for factor analysis. The findings affirm the appropriateness of employing factor analysis for the given dataset, as all twenty-one items were validated for the final analysis, with none exhibiting a loading value below 0.5.

Table 1: Results of Exploratory Factor Analysis

Table 1: Results of Exploratory Factor Analysis								
Macro Variable	**Micro Variable**	**Factor loadings**	**KMO Measureof Sample Adequacy (>0.5)**	**Bartlett's Test of Sphericity**		**Items confirmed**	**Items dropped**	**Cum % of loading**
				Chi Square	**Sig. (<.10)**			
Impact of strategies	Competitive compensation packages -1	.907	.574	211.429	.000	3	0	65.843
	Competitive compensation packages - 2	.843						
	Competitive compensation packages -3	.665						
	Work-Life Balance Initiatives-1	.878	.705	355.625	.000	3	0	78.536
	Work-Life Balance Initiatives-2	.857						
	Work-Life Balance Initiatives-3	.922						
	Career Development Opportunities: - 1	.737	.642	309.165	.000	3	0	72.860
	Career Development Opportunities: -2	.901						

Reliability Assessment:

The researchers utilized Cronbach's Alpha calculation to assess the internal consistency and reliability of the questionnaire. Nunally and Bernstein (1994) recommend an alpha value as low as 0.60 for new scales, with acceptability extending to lower values. However, common practice often dictates a requirement for an internally consistent established scale with an alpha value of 0.70 or higher. In this study, the predefined threshold for Cronbach's alpha is established at 0.7.

Table 2: Results of the Reliability Examination

	Independent Variable	Cronbach Alpha
1	Competitive compensation packages	.722
2	Building trust and credibility	.861
3	Career Development Opportunities:	.808
4	Recognition and Rewards	.669
5	Employee Engagement Programs	.946
Over all Reliability of the Questionnaire		.801

Table 2 reveals, the presents Cronbach's alpha values for various independent variables, indicating their internal consistency or reliability within a questionnaire.

1. **Independent Variable:** This column lists the different factors or constructs that were assessed in the questionnaire.
2. **Cronbach Alpha**: Cronbach's alpha is a measure of internal consistency, which assesses how closely related a set of items are as a group. It ranges from 0 to 1, where higher values indicate greater reliability. Competitive compensation packages have a Cronbach alpha of 0.722, suggesting moderate internal consistency. Building trust and credibility has a Cronbach alpha of 0.861, indicating high internal consistency. Career Development Opportunities have a Cronbach alpha of 0.808, indicating a high level of internal consistency. Recognition and Rewards have a Cronbach alpha of 0.669, suggesting moderate internal consistency. Employee Engagement Programs have a Cronbach alpha of 0.946, indicating high internal consistency. The overall reliability of the questionnaire, including all items, has a Cronbach alpha of 0.801, suggesting a good level of internal consistency.

These values provide insights into the reliability of the questionnaire items related to each independent variable, with higher Cronbach alpha values indicating greater reliability.

Table 3: Correlations

	CCP	CDO	R&R	EEP	WLB
Competitive compensation packages(CCP)	1				
Career Development Opportunities: (CDO)	.806**	1			
Recognition and Rewards(R&R))	.755**	.798**	1		
Employee Engagement Programs(EEP)	.757**	.768**	.723**	1	
Work-Life Balance Initiatives(WLB)	.308**	.348**	.343**	.367**	1

Table 3 reveals that the Cronbach's alpha values surpass the acceptable cutoff of 0.7, indicating satisfactory reliability. Specifically, the questionnaire exhibits an overall reliability demonstrated by a Cronbach's alpha value of 0.801.

Moving on to the correlation analysis, the study on independent variables indicates a robust connection among all of them. Each variable demonstrates a significant correlation with the five variables under examination in the "impact of strategies" framework. Notably, all five independent variables within the "impact of strategies" framework exhibit substantial associations with one another (refer to Table 4). The correlation between "Career Development Opportunities" and "Competitive Compensation Packages" is the highest at 0.806, while the least significant relationships are observed between "Building Trust and Credibility" and "Competitive Compensation Packages" at 0.308.

Regression Analysis:

The study utilizes stepwise regression analysis to discern the predictor-criterion relationship between dependent and independent variables. Specifically, the correlation between the impact of retention strategies on job satisfaction was explored.

Results of Hypotheses Testing for Job Satisfaction of IT Employees as Dependent Variable:

Multiple regression models were developed and tested to assess the job satisfaction of IT employees as the dependent variable. The study considered five factors related to the impact of strategies—Competitive Compensation Packages (CCP), Career Development Opportunities (CDO), Recognition and Rewards (R&R), Employee Engagement Programs (EEP), and Work-Life Balance Initiatives (WLB)—as independent variables in the regression models.

Table (4a): Model summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.863[a]	.744	.743	.355
2	.911[b]	.830	.829	.290
3	.936[c]	.876	.874	.248
4	.955[d]	.912	.910	.210
5	.962[e]	.926	.925	.192

The results of the stepwise regression analysis indicate that, according to Table 4(a), five factors (Competitive Compensation Packages, Career Development Opportunities, Recognition and Rewards, Building Trust and Credibility, Employee Engagement Programs) emerged as significant predictors of "Job satisfaction of IT employees." With an R-square value of 0.934, these five variables collectively explain job satisfaction to the extent of 93.4 percent in the dataset.

a. Dependent Variable: Job satisfaction of IT employees
b. Predictors: (Constant), Career Development Opportunities:
c. Predictors: (Constant), Career Development Opportunities: Employee Engagement Programs
d. Predictors: (Constant), Career Development Opportunities: Employee Engagement Programs,
e. Predictors: (Constant), Career Development Opportunities: Employee Engagement Programs, Recognition and Rewards

Table (4b). ANOVA

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	87.776	1	87.776	696.150	.000[b]
	Residual	30.135	239	.126		
	Total	117.911	240			
2	Regression	97.885	2	48.943	581.674	.000[c]
	Residual	20.026	238	.084		
	Total	117.911	240			
3	Regression	103.276	3	34.425	557.490	.000[d]
	Residual	14.635	237	.062		
	Total	117.911	240			
4	Regression	107.488	4	26.872	608.429	.000[e]
	Residual	10.423	236	.044		
	Total	117.911	240			
5	Regression	109.232	5	21.846	591.557	.000[f]
	Residual	8.679	235	.037		
	Total	117.911	240			

Moreover, Table 4(b) showcases the ANOVA outcomes for the regression model, affirming validity with a 95 percent confidence level.

Table (4c): Coefficients

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
	(Constant)	.498	.087		5.752	.000
1	Career Development Opportunities:	.800	.030	.863	26.385	.000
2	(Constant)	.517	.071		7.310	.000
	Career Development Opportunities:	.475	.039	.512	12.280	.000
	Employee Engagement Programs	.325	.030	.457	10.961	.000
3	(Constant)	.215	.069		3.124	.002
	Career Development Opportunities:	.440	.033	.475	13.217	.000
	Employee Engagement Programs	.284	.026	.400	11.055	.000
	Building trust and credibility	.183	.020	.231	9.343	.000
4	(Constant)	.156	.058		2.663	.008
	Career Development Opportunities:	.262	.034	.283	7.811	.000
	Employee Engagement Programs	.224	.023	.316	9.928	.000
	Building trust and credibility	.171	.017	.216	10.310	.000
	Recognition and Rewards	.271	.028	.328	9.765	.000
5	(Constant)	.074	.055		1.358	.176
	Career Development Opportunities:	.185	.033	.199	5.655	.000
	Employee Engagement Programs	.191	.021	.268	8.965	.000
	Building trust and credibility	.168	.015	.212	11.045	.000
	Recognition and Rewards	.250	.026	.302	9.758	.000
	Competitive compensation packages	.173	.025	.191	6.873	.000

a. Dependent Variable: Job satisfaction of IT employees

A brief scrutiny of the corresponding coefficients in Table 4(c) discloses beta values for the factors— "Competitive Compensation Packages (CCP), Career Development Opportunities (CDO), Recognition and Rewards (R&R), Employee Engagement Programs (EEP), Work-Life Balance Initiatives (WLB)"—as 0.129, 0.221, 0.215, 0.265, and 0.195, respectively. These findings strongly underscore the significance of these factors in influencing job satisfaction among employees.

Table 5: Test Results for Hypotheses

Hypothesis	Independent Variables	Dependent Variables	R-Square	Beta Coefficient	t-value	Sig Value
H1	Competitive compensation packages (CCP)	Job satisfaction of IT employees	0.129	3.593	0.076	Accepted
H2	Career Development Opportunities (CDO)	Job satisfaction of IT employees	0.221	7.437	0.000	Accepted
H3	Recognition and Rewards (R&R)	Job satisfaction of IT employees	0.215	11.793	0.003	Accepted
H4	Employee Engagement Programs (EEP)	Job satisfaction of IT employees	0.265	8.771	0.012	Accepted
H5	Work-Life Balance Initiatives (WLB)	Job satisfaction of IT employees	0.195	7.379	0.017	Accepted

The table 5 presents the findings of a research study examining the relationship between various factors and the job satisfaction of IT employees. The study hypothesized that factors such as competitive compensation packages, career development opportunities, recognition and rewards, employee engagement programs, and work-life balance initiatives influence job satisfaction in the IT sector. The results indicate that all hypotheses were supported, as evidenced by the statistically significant relationships between the independent variables and job satisfaction. Specifically, career development opportunities, recognition and rewards, employee engagement programs, and work-life balance initiatives showed particularly strong associations with job satisfaction, as indicated by their higher beta coefficients, t-values, and lower significance values. These findings suggest that organizations seeking to enhance job satisfaction among IT employees should prioritize initiatives related to career development, recognition, engagement, and work-life balance. Overall, the study highlights the importance of considering various organizational factors in understanding and promoting job satisfaction within the IT industry. The research findings support the hypotheses with numerical evidence and are summarized as follows. Competitive compensation packages (CCP): The relationship with job satisfaction has a beta coefficient of 0.129, a t-value of 3.593, and a significance value of 0.076.Career Development Opportunities (CDO): The association with job satisfaction is stronger with a beta coefficient of 0.221, a t-value of 7.437, and a significance value of 0.000.Recognition and Rewards (R&R): This factor has a beta coefficient of 0.215, a t-value of

11.793, and a significance value of 0.003, indicating a significant impact on job satisfaction. Employee Engagement Programs (EEP): The relationship with job satisfaction is notable, with a beta coefficient of 0.265, a t-value of 8.771, and a significance value of 0. 012.Work-Life Balance Initiatives (WLB): This factor shows a beta coefficient of 0.195, a t-value of 7.379, and a significance value of 0.017, indicating a statistically significant relationship with job satisfaction.

These numerical values provide quantitative evidence supporting the conclusion that career development opportunities, recognition and rewards, employee engagement programs, and work-life balance initiatives have significant associations with job satisfaction among IT employees.

VIII. RECOMMENDATIONS & SUGGESTIONS

Based on the extensive research conducted on employee retention strategies and their impact on job satisfaction of IT professionals, the primary recommendations and suggestions are listed below.

1. **Tailor Compensation Packages**: Customize compensation packages to align with industry standards and the unique skills and expertise of IT professionals.
2. **Invest in Career Development**: Prioritize investments in training programs, mentorship initiatives, and challenging project opportunities to support career growth and advancement.
3. **Promote Work-Life Balance**: Implement flexible work arrangements, remote work options, and paid time off policies to support work-life integration and reduce burnout.
4. **Enhance Recognition and Rewards**: Recognize and reward outstanding performance through bonuses, incentives, and public appreciation programs to boost morale and loyalty.
5. **Strengthen Employee Engagement**: Foster a supportive work environment through team-building activities, social events, and employee resource groups to promote engagement and camaraderie.
6. **Facilitate Transparent Communication**: Establish open channels of communication between management and employees to address concerns and provide feedback effectively.
7. **Prioritize Employee Well-being**: Offer wellness programs, mental health support, and access to fitness facilities to demonstrate genuine concern for employee health and well-being.
8. **Develop Leadership Skills**: Invest in training managers to be supportive, empathetic, and skilled in employee development to foster positive relationships and reduce turnover.
9. **Promote Diversity and Inclusion**: Create a diverse and inclusive workplace culture where all employees feel valued and respected.
10. **Regularly Review HR Policies**: Continuously review and update HR policies to ensure they meet the evolving needs and expectations of IT professionals and the organization.
11. **Encourage Cross-Functional Collaboration**: Facilitate collaboration between IT teams and other departments to promote innovation and problem-solving.
12. **Implement Mentorship Programs**: Pair junior IT professionals with experienced mentors to facilitate knowledge transfer and career development.
13. **Offer Performance-Based Incentives**: Tie rewards and incentives directly to individual and team performance to motivate IT professionals and drive results.

14. **Provide Leadership Opportunities**: Identify and groom future leaders within the IT department by offering leadership training and opportunities for advancement.
15. **Support Continuous Learning**: Encourage IT professionals to attend workshops, conferences, and training programs to stay updated with the latest technologies and trends.
16. **Create a Positive Work Culture**: Foster a culture of trust, collaboration, and appreciation to enhance job satisfaction and employee retention.
17. **Promote Flexibility**: Allow IT professionals to have autonomy over their work schedules and environments to accommodate personal preferences and obligations.
18. **Encourage Innovation:** Create avenues for IT professionals to contribute ideas and solutions to drive innovation within the organization.
19. **Provide Clear Expectations**: Communicate clear goals, expectations, and performance metrics to ensure alignment and accountability.
20. **Seek Feedback and Iterate**: Regularly solicit feedback from IT professionals and adapt retention strategies based on their input and changing needs.

These recommendations aim to help organizations in the IT industry develop and enhance their employee retention strategies to foster job satisfaction and create a conducive work environment for their valuable IT workforce.

Altogether, the recommendations and suggestions outlined provide a comprehensive framework for organizations within the IT industry to enhance their employee retention strategies and promote job satisfaction among their workforce. By implementing tailored compensation packages, investing in career development, promoting work-life balance, and fostering a supportive work culture, organizations can create an environment where IT professionals feel valued, motivated, and engaged. Additionally, prioritizing transparent communication, recognizing and rewarding performance, and supporting employee well-being are essential components of effective retention strategies. By continuously reviewing and updating HR policies, promoting diversity and inclusion, and encouraging innovation, organizations can adapt to the evolving needs and expectations of their workforce while staying competitive in the dynamic IT landscape.

Ultimately, by incorporating these recommendations into their retention strategies, organizations can cultivate a dedicated and loyal IT workforce, driving organizational success, growth, and innovation. As the IT industry continues to evolve, organizations must prioritize employee satisfaction and retention to remain competitive and thrive in the ever-changing market.

IX. CONCLUSION

Research on employee retention strategies within the software industry consistently emphasizes the robust correlation between these strategies and job satisfaction. The software industry, renowned for its competitiveness and high demand for skilled professionals, grapples with substantial challenges in retaining its workforce. Nevertheless, organizations can overcome these challenges by deploying effective retention strategies, thereby establishing a positive work environment conducive to job satisfaction, heightened employee commitment, and increased loyalty. Numerous studies have pinpointed key employee retention strategies integral to fostering job satisfaction in the software industry. These encompass competitive compensation packages, career development opportunities, work-life balance initiatives, recognition and rewards, employee engagement programs, transparent communication, employee well-being initiatives, and robust leadership and management practices. Research findings underscore the critical importance of offering competitive salaries and benefits in

attracting and retaining software professionals. Furthermore, providing avenues for career development, such as training programs and clear career paths, proves instrumental in promoting job satisfaction by enabling skill enhancement and career progression within the organization. In the demanding landscape of the software industry, work-life balance initiatives, including flexible work schedules and remote work options, emerge as pivotal contributors to job satisfaction, facilitating a healthy integration of work and personal life. Recognition and rewards programs significantly contribute to job satisfaction by acknowledging employee contributions and nurturing a positive work culture. Engagement programs, transparent communication channels, and employee well-being initiatives collectively play a substantial role in cultivating a supportive and fulfilling work environment, thereby enhancing job satisfaction. Finally, strong leadership and management practices that prioritize employee development and support further contribute to job satisfaction and employee retention. In summation, the literature review unequivocally supports the conclusion that the implementation of effective employee retention strategies in the software industry leads to heightened job satisfaction among software professionals. By addressing key influencers of job satisfaction, organizations can cultivate a dedicated and loyal workforce, ultimately bolstering the company's success and growth.

ABSTRACT

The Digital India Programme represents a transformative vision aimed at reshaping India's digital landscape to promote widespread digital inclusion and socio-economic development. Despite significant advancements in digital banking, e-governance, and rural development, the programme faces numerous challenges, especially in rural areas. These challenges include inadequate digital literacy, poor infrastructure, socio-economic disparities, and cybersecurity threats, which hinder the effective adoption of digital financial services. Studies highlight these impediments and underscore the need for interventions to ensure equitable distribution of digital benefits. This comprehensive evaluation identifies pain points associated with the programme's implementation and suggests measures to enhance its efficacy. This study discusses key issues such as network and infrastructure limitations, digital literacy gaps, socio-cultural resistance, economic barriers, insufficient customer support, and slow regulatory responses. The findings emphasize the importance of strategic investments, regulatory support, and community engagement to overcome these challenges and achieve the programme's full potential.

Keywords: Digital India, digital literacy, rural development, e-governance, cybersecurity.

1. INTRODUCTION

The Digital India Programme represents a transformative vision to fundamentally reshape India's digital landscape, promoting widespread digital inclusion and enhancing socio-economic development. However, the programme's implementation has encountered significant challenges, especially in rural areas where barriers such as inadequate digital literacy, poor infrastructure, and socio-economic disparities persist. Literature reviews, including studies from the Thane District, reveal that these challenges hinder the effective adoption of digital financial services, underscoring the need for interventions to ensure equitable distribution of digitalization benefits. Despite notable advancements in digital banking and e-governance, cybersecurity threats and the need for regulatory frameworks remain pressing issues. The programme's impact on rural development is evident through improved access to information, education, healthcare, and government schemes, yet

obstacles like unreliable internet connectivity and resistance to change within governmental bodies persist. Furthermore, digital initiatives in education and healthcare, such as telemedicine and mobile health applications, highlight both the potential and the hurdles of digital transformation, with infrastructural deficiencies and digital illiteracy posing significant barriers. The role of the Digital India Programme in fostering entrepreneurship and growth in MSMEs is also notable, though limited digital skills, access to finance, and infrastructural constraints need to be addressed through supportive policies and capacity-building initiatives. This comprehensive evaluation aims to identify the pain points associated with the Digital India Programme's implementation and suggests measures to enhance its efficacy. The study employs a descriptive research design, drawing on secondary data from journal articles, books, and electronic sources. Key issues discussed include network and infrastructure limitations, digital literacy gaps, socio-cultural resistance, economic barriers, insufficient customer support, and slow regulatory responses.

2. LITERATURE REVIEW:

The Digital India Programme has made significant strides in fostering digital inclusion and enhancing financial literacy among marginalized communities, yet it faces considerable challenges, particularly in rural areas. Studies, such as the one conducted in Thane District, highlight several barriers to the effective adoption of digital financial services, including a lack of digital literacy, inadequate infrastructure, and socio-economic challenges. These impediments hinder the programme's goal of creating a digitally empowered society. While the initiative has made headway in promoting digital inclusion, there is a clear need for interventions to address these challenges and ensure the equitable distribution of digitalization benefits. Furthermore, the transformative impact on the Indian banking sector through the Digital India Programme has been profound, with digital banking services like mobile and internet banking reshaping traditional models. This transformation has enhanced efficiency, customer experience, and broadened financial inclusion, especially in rural areas, though cybersecurity threats and the need for regulatory frameworks remain pertinent challenges.

The role of the Digital India Programme in enhancing e-governance and its socio-economic impact on rural communities underscores its broad influence across various sectors. The integration of digital technologies into government-led operations has improved transparency, efficiency, and citizen engagement, as evidenced by successful initiatives like the Digital Locker system and online grievance redressal mechanisms. However, persistent hurdles such as the digital divide and resistance to change within governmental bodies need addressing. In rural India, digital initiatives have facilitated access to information, education, healthcare, and government schemes, contributing significantly to rural development. Despite these positive outcomes, challenges such as inadequate internet connectivity and lack of awareness about digital services continue to pose obstacles. Sustained efforts are required to bridge these gaps and ensure inclusive digital growth, highlighting the importance of strategic investments in infrastructure and comprehensive digital literacy campaigns.

The Digital India Programme's impact on education, healthcare, and entrepreneurship further illustrates its transformative potential and the accompanying challenges. Digital education initiatives hold promise for transforming education by making learning more accessible and interactive, though infrastructural deficiencies

and digital illiteracy among students and teachers pose significant barriers. Similarly, digital health initiatives like telemedicine and mobile health applications have improved healthcare access, particularly in underserved areas, but issues related to data privacy and the digital divide persist. The programme has also spurred entrepreneurship and growth in MSMEs by creating new business opportunities and expanding market access. However, limited digital skills, access to finance, and infrastructural constraints remain challenges that need to be addressed through supportive policies and capacity-building initiatives. Overall, the Digital India Programme has made commendable progress, but achieving its full potential requires addressing these challenges through strategic investments, regulatory support, and community engagement.

3. OBJECTIVES AND RESEARCH METHODOLOGY:

Objectives:

1. To study the pain points associated with the implementation of Digital India Programme.
2. To suggest, based on the findings, various measures to the Government of India to advance the Digital India Programme.

Research Design: Used a descriptive research design.

Data Sources:

The researcher collected secondary data from journal articles, write-ups from books and electronic sources.

Discussion:

Network and infrastructure issues result in fewer digital payments, as unreliable connectivity disrupts transactions and undermines trust in digital financial systems. The limited digital infrastructure in these regions exacerbates the problem, with many rural areas lacking essential facilities like reliable internet and digital devices, thus hindering access to digital services. Poor internet connectivity further restricts the use of online platforms for education, healthcare, and government services, isolating rural populations from digital advancements. Additionally, the dependence on an unreliable power supply for digital devices poses a major challenge. Frequent power outages and unstable electricity supply disrupt the functioning of digital services, making it difficult for rural communities to maintain consistent digital connectivity.

Many rural individuals lack the basic skills to navigate and utilize digital platforms, which limits their ability to benefit from digital initiatives. The limited outreach of digital literacy campaigns exacerbates this issue, as many such efforts fail to reach remote and underserved communities, leaving a substantial portion of the rural population without essential digital knowledge. Furthermore, a lack of awareness about digital financial services leads to underutilization of digital payment systems, online banking, and other financial technologies that could enhance economic efficiency and inclusivity. Additionally, insufficient training and capacity-building programs for rural users mean that even those who have access to digital technologies struggle to keep pace with rapidly evolving digital environments.

Resistance to adopting new digital technologies in rural areas where traditional methods are preferred. This reluctance is compounded by a lack of trust in digital financial transactions, with fears of security breaches and

digital fraud discouraging engagement with online financial services. Cybersecurity concerns and the fear of fraud further deter users, as potential risks associated with cyber threats and scams create apprehension about the safety of digital transactions. Socio-cultural barriers also play a crucial role, as deeply entrenched norms and practices in rural communities foster suspicion and skepticism towards digital adoption. These socio-cultural attitudes, along with a lack of digital literacy, reinforce distrust and resistance.

High costs of digital devices and internet access create significant barriers for rural and economically disadvantaged populations, preventing them from fully participating in the digital economy. Many individuals and families in these areas cannot afford the initial investment in smartphones, computers, or consistent internet connectivity, which are essential for accessing digital services. Furthermore, limited access to financial resources for digital investments exacerbates this problem. Without sufficient financial support or affordable financing options, rural users are unable to invest in the necessary infrastructure to benefit from digital advancements.

Insufficient customer support for digital services significantly in rural and remote areas where users often require assistance to navigate new technologies. The limited availability of localized digital content and services further exacerbates this issue, as many digital platforms fail to cater to the specific needs and preferences of diverse regional populations. This gap in service availability prevents users from fully benefiting from digital initiatives designed to improve their daily lives. Additionally, the lack of multilingual support on digital platforms creates a barrier for non-English speaking users, making it difficult for them to access and utilize digital services effectively. This language barrier particularly affects rural users, who may be more comfortable with regional languages.

Many rural populations remain excluded from formal financial systems. This exclusion is exacerbated by ineffective digital payment systems in rural areas, where poor connectivity and inadequate infrastructure hinder seamless transactions. Consequently, the slow adoption of digital payment systems by small businesses further restricts the economic benefits of digitalization, as these enterprises struggle to transition from cash-based operations to digital platforms. Moreover, there is a dependency on intermediaries for digital transactions, which increases costs and reduces trust among users. These intermediaries often charge fees for facilitating transactions, making digital payments less attractive for both consumers and small businesses.

Slow regulatory responses to emerging digital challenges hinder the program's ability to adapt and evolve in a rapidly changing technological landscape, leaving gaps in legal and operational frameworks necessary for effective digital governance. Limited collaboration between the private and public sectors further exacerbates these issues, as the lack of coordinated efforts and shared goals between these entities stifles innovation and the effective implementation of digital initiatives. Additionally, limited financial incentives for digital adoption discourage businesses and individuals from transitioning to digital platforms, slowing the overall progress of the programme.

Verification challenges often stem from inconsistencies and inaccuracies in digital identity databases, leading to difficulties in authenticating users and accessing services. This undermines trust in digital systems and discourages their use. Additionally, the lack of seamless integration between digital services and existing government schemes hampers the efficiency and effectiveness of digital initiatives. Without cohesive integration, beneficiaries face obstacles in leveraging digital platforms to access various welfare and support programs.

The Digital India Programme faces significant challenges in achieving its goals due to the digital exclusion of elderly and less-educated populations. These groups often lack the necessary digital skills and familiarity with technology, which prevents them from fully participating in and benefiting from digital initiatives. The elderly, in particular, may find it difficult to adapt to new digital tools and platforms, leading to their marginalization in an increasingly digital society. Individuals with lower levels of education may struggle to understand and use digital services, further exacerbating the digital divide.

To address the challenges faced by the Digital India Programme, the Indian government needs to implement a comprehensive and integrated approach that leverages existing capacities while fostering innovation and collaboration. Enhancing network and infrastructure is paramount; thus, investments in expanding reliable internet connectivity and robust digital infrastructure, particularly in rural areas, must be prioritized. This could include initiatives such as deploying satellite internet services and strengthening the power supply to ensure consistent digital connectivity. Simultaneously, expanding digital literacy campaigns is essential to equip rural populations with the skills needed to navigate digital platforms. Tailored training programs, supported by localized and multilingual content, can bridge the knowledge gap and foster greater digital inclusion. To build trust and overcome resistance to digital adoption, the government should enhance cybersecurity measures, provide extensive awareness campaigns about the safety and benefits of digital transactions, and establish customer support networks. Encouragingly, subsidies and financial incentives for purchasing digital devices and internet access can alleviate economic barriers, enabling wider participation in the digital economy. Additionally, fostering public-private partnerships can drive innovation and resource-sharing, expediting the development and deployment of digital solutions tailored to diverse regional needs. Improving the regulatory framework to adapt swiftly to emerging digital challenges will ensure legal and operational coherence, enhancing the program's effectiveness. Furthermore, streamlining digital identity verification processes and integrating digital services with existing government schemes can bolster trust and efficiency in accessing welfare programs. To specifically address the needs of elderly and less-educated populations, targeted outreach and simplified digital interfaces can make digital services more accessible and user-friendly.

4. CONCLUSION

The Digital India Programme faces significant challenges that hinder its effectiveness, particularly in rural areas where network and infrastructure issues disrupt digital payments, education, healthcare, and government services. Limited digital literacy, resistance to adopting new technologies, and cybersecurity concerns further exacerbate these issues, creating a significant digital divide. High costs of digital devices and internet access, insufficient customer support, and verification challenges add to the complexity, preventing

many from fully benefiting from digital initiatives. To address these challenges, a comprehensive and integrated approach is essential. Prioritizing investments in reliable internet connectivity, expanding digital literacy campaigns, enhancing cybersecurity measures, and providing financial incentives can foster greater digital inclusion. Public-private partnerships and improved regulatory frameworks can drive innovation and adaptability, while tailored outreach programs can make digital services more accessible to elderly and less-educated populations. By adopting this holistic strategy, the Indian government can advance the Digital India Programme, ensuring inclusive participation in the digital revolution.

MARKETING STRATEGIES TO OVERCOME THE CHALLENGES FACING THE PHARMACEUTICAL COMPANIES IN INDIA

M.Venkatesulu, Research Scholar, Department of Management Studies, Sri Venkateswara University, Tirupati-517502
Dr. P. Raghunadha Reddy, Professor & Research Supervisor, Department of Management Studies, Sri Venkateswara University, Tirupati -517502

Abstract:

This paper analyses and examines the current situation, recent developments, issues and challenges for Pharmaceutical companies in India from the perspective of marketing management. This paper highlights the current position of pharmaceutical companies in the Global pharma markets in order to understand its implications for current market challenges faced by the pharma industry. The challenges faced by pharmaceutical companies in the Indian market with reference to the Marketing function have been examined in this article. The discussion is focused on the marketing mix for pharmaceutical companies comprising the 4Ps, namely, Product, Price, Place and Promotion. This paper suggests a few effective strategies to overcome the challenges faced by the pharmaceutical industry.

Key terms: Product, challenges, marketing, Price, Place and Promotion.

Introduction:

Indian pharmaceutical industry is the 3rd largest in the world by volume and is USD 40 billion in terms of value. India contributes around 3.5% of total drugs and medicines exported globally. India exports pharmaceuticals to more than 200 countries and territories including highly regulated markets such as the USA, The UK, European Union, Canada etc. The Indian Pharma sector has complete ecosystem for development and manufacture of pharmaceuticals. Its Pharma companies possesses the state of the art facilities including highly skilled/technical manpower. Our

countries also has a large number of renowned pharmaceutical educational and research institutes as well as a robust ecosystem of allied industries.

India is the largest provider of generic drugs globally. Access to affordable HIV treatment from India is one of the greatest success stories in medicine. India is one of the biggest suppliers of low-cost vaccines in the world. Because of low price and high quality, Indian medicines are preferred worldwide, thereby rightly naming the country "the pharmacy of the world". The Pharmaceutical sector currently contributes around 1.72% to the country's GDP.

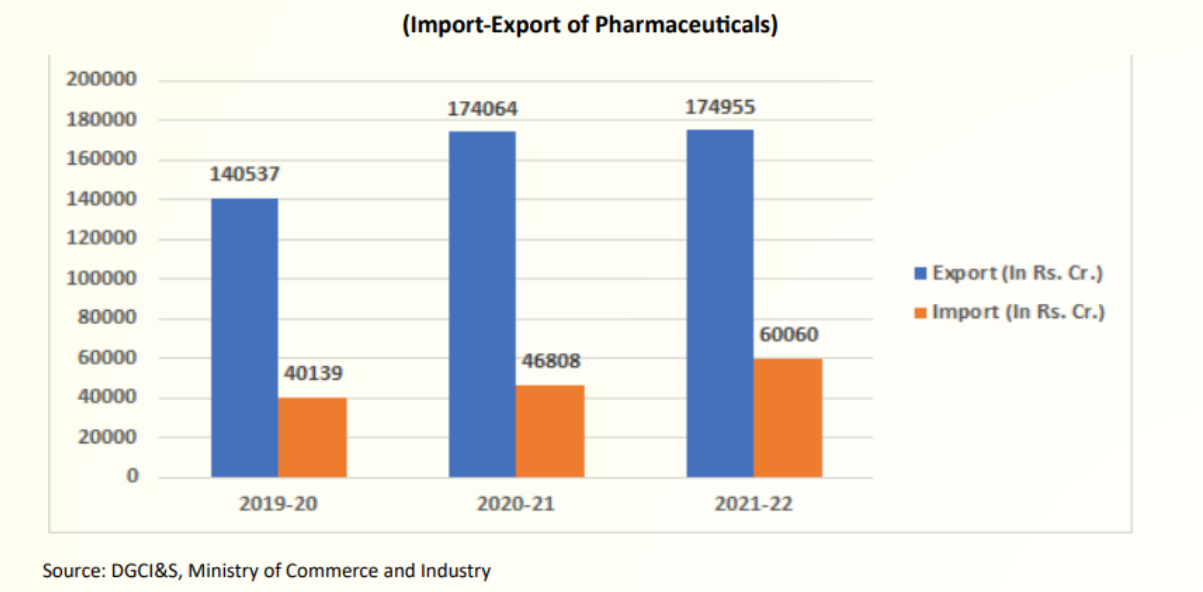
At present a major constituent of Indian exports are low value generic drugs while a large proportion of the demand for patented drugs is met through imports. This is because the Indian Pharmaceutical sector lacks in high value production along with world class pharma R&D. In order to encourage the global and domestic players to enhance their investment and production in these product categories, a well-designed and suitably targeted intervention is required. This would promote the manufacture of specific high value goods such as biopharmaceuticals, complex generic drugs, patented drugs or drugs nearing patent expiry, cell based or gene therapy drugs.

Further, in order to ensure drug security by, unbridled support to the domestic production capability in APIs/KSMs is needed. This would enhance the resilience of the Indian pharmaceutical industry to external shocks. These initiatives improve our ability to achieve the ultimate to objective of affordable healthcare in the country and the target of Health for all by 2030.

History of Pharmaceutical companies in India

Bengal Chemicals and Pharmaceutical Works is the first pharmaceutical company in India. Today, it is one of the five government-owned drug manufacturers that was incorporated on 12th April, 1901. For the next 60 years, most of the drugs in India were imported by multinationals either in fully-formulated or bulk-drug form. The government has actively encouraged the growth of drug manufacturing by Indian companies in the early 1960s, and with the Patents Act in 1970, the Indian an pharma industry emerged stronger. The patent act 1970 deleted the from food and drugs. However, retained the process patents, whose duration was shortened to a period of five to seven years. The absence of patent protection made the Indian market unattractive to the

multinational companies who had dominated the Indian market. As a result, the Indian companies gradually replaced the MNCs. The Indian companies carved a niche in both the Indian and world markets with their expertise in reverse-engineering, in innovative process design for manufacturing drugs at low costs. Although some of the larger companies have taken baby steps towards drug innovation, the industry as a whole has been following this business model until the present.



India's pharmaceutical sector is well-known for producing affordable vaccines and generic medications at a third-place global volume in pharmaceutical manufacture. In 2020–21, the industry made up around 1.32% of the Indian economy's gross value added (calculated using constant prices from 2011–2012). For the fiscal year 2021–2022, Pharmaceuticals had a total yearly sale of Rs. 3,44,125 crore (USD 42.34 billion). Generic medications, over-the-counter medications, bulk medications, vaccines, contract research and production, biosimilars, and biologics are some of the main sectors of the Indian pharmaceutical industry. When it comes to the provision of DPT, BCG, and measles vaccinations, India leads the world. About 8% of the worldwide API industry is contributed by 500 API firms. The main source of generic medications is India. It produces over 60,000 distinct generic brands in 60 therapeutic areas, making approximately 20% of the world's generic drug supply. One of the biggest medical achievements is the availability of reasonably priced HIV therapy from India. Indian pharmaceuticals are favored globally due to their affordable prices and superior quality, earning them the title of "pharmacy of the world." The industry has been expanding at a robust pace.

Table shows the sector's yearly turnover trend over the last five years.

Financial Year	Turnover (Rs. in Crore)	Growth Rate
2017-2018	2,26,423	3.03
2018-2019	2,58,534	14.18
2019-2020	2,89,998	12.17
2020-2021	3,28,054	13.12
2021-2022	3,44,125	4.89

Source: Pharmatrac/NPPA/DGCIS, Kolkata

The Indian pharmaceutical business is a major worldwide player, providing millions of people with low-cost, accessible generic medications. The industry provides lower costs without sacrificing quality, as evidenced by the fact that India is home to the greatest number of pharmaceutical facilities outside of the United States that have received approval from the US Food and Drug Administration (USFDA). Additionally, a sizable number of these facilities comply with Good Manufacturing Practices (GMP) regulations set forth by the World Health Organization (WHO) and have also received approval from foreign regulatory bodies. As can be observed from Graph 1A, India's pharmaceutical industry contributes significantly to the nation's international trade and has been steadily producing trade surplus. Pharmaceutical exports totalled Rs. 1,74,955 crore (USD 23.5 billion) in 2021–22, while pharmaceutical imports totalled Rs. 60,060 crore (USD 8.06 billion). As a consequence, there was a trade surplus of Rs. 1,14,895 crore (USD 15.44 billion).

Future growth prospects of Indian Pharmaceuticals:

The pharmaceutical sector has seen significant changes in recent years, putting new demands on payers, providers, and manufacturers. Customers today expect the same variety and convenience from the pharmaceutical sector as they do from other industries. Pharmaceutical marketing aids in raising knowledge of treatments for chronic diseases, which are the major cause

of health-care costs. India is also anticipated to become a pharmaceutical R&D hub in the coming decade, with the Department of Pharmaceuticals preparing a road map for India to become a worldwide player in the industry by 2030.

The Indian Pharmaceutical industry is predictable to grow up to USD 130 billion in value by the end of 20301. In FY22 India had exported pharmaceutical products worth USD 24.62 billion and it has been expected that Indian pharmaceutical exports will reach USD 27 billion in FY 2023. India also has the largest number of manufacturing sites approved by the United States Food and Drug Administration (US FDA) outside of the United States.

Some of the recent developments/investments in the Indian pharmaceutical sector are as follows:

1. In December 2020, Piramal Pharma Solutions announced plans to invest Rs. 235 crore (US$ 32 million) to expand its facility in Michigan, US, with additional capacity and new capabilities for development and manufacturing of active pharmaceutical ingredients (APIs).
2. In November 2020, Indian Immunologicals (IIL) commenced work on Rs. 75 crore (US$ 10.17 million) viral antigen manufacturing facility in Genome Valley, Telangana, that will enhance its vaccine production capacity by 35% by October 2021.
3. In November 2020, the Indian Institute of Technology (IIT) Bombay has stepped up research and development (R&D) amid COVID-19 and researchers are developing products such as a portable sterilization device and germicidal cabinet; wheeled sterilization unit, especially for hospitals; portable and rechargeable car sanitizer; eco-friendly sprays, and alcohol-free and bleach-free sanitizers.
4. In October 2020, six generic drug makers--Dr. Reddy's Laboratories, Zydus Cadila, Glen mark Pharmaceuticals, Torrent Pharmaceuticals, Hetero Drugs and Ackerman Pharma signed a deal with Hidalgo ,a state in Mexico, to establish a large pharmaceutical cluster for production and logistics in Mexico.
5. In October 2020, Aurobindo Pharma acquired MViyeS Pharma Ventures for Rs. 274.22 crore (US$ 37.30 million).

6. In May 2020, Jubilant Generics Ltd entered into a non-exclusive licencing agreement with US-based Gilead Sciences Inc to manufacture and sell the potential COVID-19 drug Remdesivir in 127 countries, including India.
7. Affordable medicines under Pradhan Mantri Bhartiya Janaushadhi Pariyojana (PMBJP) achieved record sales turnover of Rs 52 crore (US$ 7.38 million) in the month of April 2020.
8. During December 2019, on moving annual total (MAT) basis, industry growth was at 9.8%, with price growth at 5.3%, new product growth at 2.7%, while volume growth at 2% y-o-y.
9. In October 2019, Telangana Government proposed Hyderabad Pharma City with financial assistance from the Central government of Rs 3,418 crore (US$ 489 million).

Review of Literature:

Saurabh Kumar Saxena[9], (2008), came out with a paper titled as "A Review Of Marketing Strategies Work By Different Pharmaceutical Companies" Provides valuable insights into the supply chain processes and end customer perceptions that determine the formulation of marketing strategies.

Eric Langer, Abhijeet Kelkar (2008), in their paper entitled "Pharmaceutical Distribution in India. Biopharma International", insights the challenges faced by Indian Pharm companies in ensuring the delivery of uncompromised quality in the multilayered distributed system.

P.Parveen, P.Usha, V.Vasu naik, Rajesh Akki (2013), in their paper entitled "Pharmaceutical Distribution in India" this presents the marketing strategies of a pharma company that shifts from Acute-base to chronic therapy base. This study focus on the processes and outcomes of globally distributed pharma companies as well as the drug pricing control order. The DPCO has been a mill stone around the neck of the Indian industry as its severely restricted pharmaceutical companies.

Dr. Pramod Kumar, Dr. Pramod Kumar (2013)," Marketing Mix of Pharmaceutical Industry in India: An Exploration", this paper explores the marketing mix of pharmaceutical

industry in India**.** It provides a crical evaluation of policies and strategies of the pharma companies in the light of the complex interplay of the 4Ps or marketing mix of the pharma companies.

Anil Kalotra (2014), in the paper entitled "Marketing Strategies Of Different Pharmaceutical Companies", has focused on the three stakeholders in the pharma sector that are fundamental to the success of the marketing strategies. The success the marketing strategies in the competitive context is derived from either a cost advantage or a value advantage or ideally from a combination of both. That flows from a synergistic balance amongst the three stakeholders (the firm, its competitors and its customers)

Manvi Aayush Sood (2019), in their paper entitled "Evolution of Indian Pharmaceutical Industry-Overview" The Indian Pharmaceutical Industry has witnessed several fluctuations in its fortunes over the last three to four decades. It is one of the most efficient industry in India it provides employment and health care to the nation. This paper mainly concentrates on the evolution of the industry, its growth and recent trends.

Issues and Challenges faced pharmaceutical companies in India

Several Indian pharmaceutical companies have successfully deployed many standard strategies with a view to target the various customer types. However, the emerging business and customer trends throw up many challenges and opportunities that may improve the profitability. In the pharmaceutical and healthcare industries, a complex web of decision-makers determines the nature of the transaction (prescription) for which direct customer (doctor) of pharmaceutical industry is responsible. However, as the end-user (patient) consumes the product, he/she pays the cost. The appointment of medical representatives for marketing the products to physicians and to convenience the others in the hierarchy of decision makers has been a time-tested tradition.

The industry is still faced with some very serious strategic and operational level issues:

1. Real-time good manufacturing practices and research components are severely lacking in the Indian pharmaceutical business. This has consistently been the main challenge facing the Indian pharmaceutical business. The Pharma businesses should ideally be set up so that they have superior operational capabilities and infrastructure.

2. Indian pharmaceutical businesses are not making enough money since their revenues are essentially much lower than those of their competitors in other nations, like the US. The Indian pharmaceutical sector is thus unable to support its research initiatives.
3. The pharma industry is dependent on China for the supply of raw material for generic medicines production of Active Pharmaceutical Ingredients (API).
4. India needs user friendly government policy for the common man to establish small scale, raw material manufacturing units/ incubators in all states of the country to improve availability of raw materials to manufacture generic drugs at affordable rates.
5. The government and industry should facilitate the pharmacist community to become entrepreneurs and promote incubators' establishment.
6. Raw material produced from small scale units should be properly validated in the testing laboratory of the state to ascertain their quality specifications.
7. There is a need for a functional testing laboratory in every state to hasten the work of raw materials specification.
8. Small scale produces may be re-processed in another industry or via a chain of industry for quality products that can be used for parenteral/tailor-made formulations.
9. Skilled manpower from academic institutions can be achieved through continuing education programmes.

Marketing Mix Strategy for pharmaceutical companies in India

The classical marketing mix consists of four different Ps; product, price, place and promotion (McCarthy 1960). Conceptually, this mix may be adapted and relevant to a most product segments. However, experts are skeptical about its utility and relevance in the case of for marketing of services. Some experts also argue that marketing approach in such cases should not be imitated from Kotlerian Marketing.

In order to outline efficient marketing of services the 7Ps approach were introduced - adding people, physical evidence and process to the traditional mix.

Marketing is an essential function in any business upon which the survival of the business entity is dependent. "There can be no effective corporate strategy that is not marketing oriented, that does not in the end follow this unyielding prescription: The purpose of business is to create

and keep customer" (Theodore Levitt 1960). However, Levitt should also add that businesses must also develop products and services that customers want and at prices they are willing to pay. Marketing may be broadly conceived as the process of making decisions about what products or services to put on the market, who are the potential customers for these goods, how to reach the target markets and induce them to buy; how to price the product or service optionally so as to be make is attractive to the customers; and finally how to provide the goods physically to the ultimate customers. These matters are often expressed as the four Ps of marketing: Product, Price, Promotion and Place.

The four Ps of Pharmaceutical marketing are discussed below.

Product:

Product is an item that is created in an organization to fulfill the demand of the consumers. It can be intangible or tangible – i.e. service or goods.

The Product related decisions encompass the following aspects such as Brand name, Functionality, Product styling, Quality, Safety, Packaging and After-sales service.

The Product related decision fringes on what your customer wants from you. The Product parameters many changes according to its phase of the Product Life Cycle. For instance, during the introduction phase, the company may launch limited versions of the product just to explore adaptability to the customer needs. Similarly, the number of service centers for after-sales service as well as their location may be determined by the geographical spread of its customers**.**

The following are some of the challenges faced by the Pharma sector with respect to 'Product':

The recent COVID-19 Pandemic has highlighted the short comings of the pharma sector in providing the necessary quantities of drugs and other protective items including sanitizers to meet the unexpected surge in the international demand for drugs and accessories to tackle the Pandemic.

1. Demand forecasting and Market Potential
2. Risk management
3. Social Challenges
4. Legal and Regulatory Challenges
5. Distribution Challenges
6. Identifying Customer Pain Points

Price:

Price of the product is the amount that the customer is willing to pay for it. The 'Price' element of the marketing mix is vital for ensuring the economic viability of the Product.

The Major decision elements of 'Price' are pricing strategy (model), retail price, wholesale price, discounts offered, seasonal pricing, bundling pricing, price flexibility and price discrimination.

The decision of price depends on Product Life Cycle. A product during its journey from the Introduction stage to the Decline stage has to modify its Pricing strategies according to the changing market situation.

It gives an advantage to the company as the early adopters buy the product at the very initial stage even at a higher price.

India is recognized lowest priced drug manufacturer and marketer of pharmaceuticals products domestically and internationally. One reason for lower value share is the lower cost of drugs in India ranging from 5% to 50% less as compared to most other countries.

The Pricing Policies of the Indian Pharma sector have to overcome the following challenges. They are:

1. High 'Out of Pocket (OoP) expenditure
2. Pricing of patented drugs
3. Non-Standard drugs

4. Public and government pressure to make drug prices more affordable
5. Inadequate health insurance schemes is an impediment to high-priced drugs.
6. Higher healthcare cost forces the Pharma sector to focus on cost minimization.
7. Unknown value of revenue from each retailer in the territory.

Place:

This P is all about placement and distribution of the product in the market. The place also suggests the Point of Sale of the product. A business has to make sure that the availability of the product should be easy for the customers.

The 'Place' factor comprises of several decision elements such as (i) Distribution channels, (ii) Market coverage, (iii) Inventory, (iv) Warehousing, (v) Order processing and (vi) Transportation.

Market coverage can be intensive, selective or exclusive. For example cigarettes have intensive coverage, while Smartphones selling involves selective coverage in a city. In contrast, luxury products like Mercedes Benz have exclusive coverage.

The decision concerning the 'Place' is determined by the stage in the PLC (Product Life Cycle).

The following are some of the challenges faced by the Pharma sector with respect to 'Place':

1. Storage and Transportation of Temperature sensitive drugs.
2. The availability of adequate transportation facilities could pose a challenge in the delivery of drugs to remotely located destinations.
3. As the decision of the customer (the Patient) to use a particular drug is dependent on the Prescription of the Doctor. Hence, the success of the Distribution channel is dependent on the ability of the Drug manufacture to convince the professional Doctor who is mainly responsible for prescribing the drug. As a result, the Pharma sector faces a stiff competition with respect to cringing the Doctors recommendation for the drug.

4. Absence of transportation on the amount of time invested on profitable and not-so profitable customers and lack of time-share planning towards developing customer base for future and un-tapped markets.
5. Unavailability of go down on storage of cold medicines.

Promotion:

Promotion is comprised of elements like advertising, sales promotion, personal selling, public relation, publicity, etc.

The various phases of PLC give the different meaning of promotion. The advertising activity is extensive at the introduction stage and comes to selective channels in the maturity stage.

Sales promotion also varies at different stages. The budget of the overall advertising also gets affected. At the decline stage, a business dedicates almost nil budget for advertising. It becomes very crucial to work with the advertising or marketing agency that understands the connection of stages of PLC and Promotion.

The following are some of the major challenges faced by the Pharm sector vis-à-vis 'Promotion':

1. Increased competition and unethical practices adopted by some of the propaganda base companies.
2. Low level of customer knowledge (Doctors, Retailers, Wholesalers).
3. Poor customer (both external & internal) acquisition, development and retention strategies.
4. Varying customer perception.
5. The number and the quality of medical representatives
6. High training and re-training costs of sales personnel.
7. Busy doctors giving less time for sales calls.
8. Poor territory knowledge in terms of business value at medical representative level.
9. Unclear value of prescription from each doctor in the list of each sales person.

10. Absence of ideal mechanism of sales forecasting from field sales level, leading to huge deviations

Conclusion:

The Indian pharmaceutical industry has recognized a strong presence in the international generics market by distributing high-quality drugs at measure. The industry has made innovations in processes and formulations and developed itself as are liable, high quality and cost-effective global drug supplier. Currently the industry is worth over USD 38 billion and can hope to grow to USD 120 to 130 billion by 2030 by exploiting on the wonderful opportunities that lie ahead. However the Indian pharma companies can achieve the aspiration of eleven to twelve percent CAGR.

Marketing may be broadly conceived as the process of making decisions about what products or services to put on the market, who are the potential customers for these goods, how to reach the target markets and induce them to buy; how to price the product or service optionally so as to be make is attractive to the customers; and finally how to deliver the goods physically to the ultimate customers. The Indian pharmaceutical companies facing challenges related to the four Ps of marketing: Product, Price, Promotion and Place.

ARTICLE INFO

ABSTRACT

Marketing challenges is a crucial strategic driver for increasing operational performance and maximizing the achievement of organizational objectives, such as improved productivity, improved customer service and enhanced profitability. The age of both market globalization and outsourcing has started, and many companies tend to manage their marketing challenges activities. Most of these organizations understand that marketing challenges needs to be tested for its performance in order to create an effective and efficient marketing. The marketing challenges is the most critical element for companies to boom in pharmaceutical, which needs to be quick, uninterrupted and safe. The competition is fierce because not one or two, but hundreds of pharmaceutical companies are competing for market share, each finding and creating specific strategies for sale and distribution. The present study is an attempt to examine various marketing challenges in the pharmaceutical context. Although there is a lack of literature in this context, the current study critically reviewed the current literature and built a questionnaire with the inputs from leading pharm marketing representatives by identifying the main marketing challenges such as product, price, place, promotion and trying to find the effect of these variables on organizational efficiency. A sample size of 100 employees employed in pharmaceutical departments at different levels of ten leading pharmaceutical organizations in India was taken for a questionnaire survey as a sampling unit. The study found fascinating insights of marketing challenges in pharma, which eventually benefit the marketers to design more effective marketing challenges. Further, the study is confined to Ten Pharma organisations in India which becomes a limitation in generalizing the findings.

Key Words: Marketing Challenges, Operational Performance, Pharmaceutical Organizations

I. INTRODUCTION:

The pharmaceutical sector generates around 2.8 trillion dollars in revenue globally, making it the largest industry in the world. Recent years have witnessed significant changes in the pharmacy sector, putting new demands on payers, providers, and manufacturers. Consumers now expect the pharmaceutical business to provide them with the same options and conveniences as other market segments. The Indian pharmaceutical sector is expected to grow rapidly and steadily over the coming years due to a variety of factors.

The pharmaceutical industry in India stands at the crossroads of opportunity and challenge. With a robust domestic market fueled by a burgeoning population and increasing healthcare awareness, coupled with a strong presence in the global pharmaceutical arena, Indian pharmaceutical companies have made significant strides. However, amidst these achievements lie formidable marketing challenges that require meticulous navigation and strategic acumen to surmount.

At the heart of these challenges lies the regulatory landscape. India's pharmaceutical sector is subject to rigorous regulatory oversight, spanning drug approvals, pricing regulations, and stringent advertising

Copyright © 2024 by Author/s and Licensed by Kuey. This is an open access article distributed under the Creative Commons Attribution License which permits unrestricted use, distribution, and reproduction in any medium, provided the original work is properly cited.

guidelines. Navigating this intricate web of regulations demands not only compliance but also agility to adapt to evolving regulatory frameworks. Moreover, with recent regulatory reforms aimed at enhancing drug safety and efficacy, pharmaceutical companies face heightened scrutiny, necessitating robust compliance mechanisms and risk mitigation strategies.

Beyond regulatory hurdles, understanding the dynamics of consumer behavior and healthcare preferences is imperative. India's healthcare landscape is undergoing a paradigm shift, driven by factors such as increasing urbanization, rising disposable incomes, and a growing emphasis on preventive healthcare. Consequently, consumers are becoming more discerning, seeking value-driven healthcare solutions and placing greater emphasis on factors such as brand reputation, efficacy, and affordability. Pharmaceutical marketers must therefore unravel the complexities of consumer behavior, leveraging insights to tailor marketing strategies that resonate with target audiences and drive brand loyalty.

Amidst these shifts, competitive pressures further compound the challenges faced by pharmaceutical companies. The Indian pharmaceutical market is fiercely competitive, characterized by a myriad of domestic players vying for market share alongside multinational giants. Price competitiveness, product differentiation, and market segmentation emerge as pivotal battlegrounds, necessitating continuous innovation and strategic positioning to stay ahead of rivals. Moreover, with the emergence of disruptive technologies and digital platforms, the landscape of competition is evolving rapidly, requiring pharmaceutical marketers to embrace digital transformation and harness data-driven insights to gain a competitive edge.

II. LITERATURE REVIEW:

Giuseppe Festa, Ashutosh Kolte, Maria Rosaria Carli, Matteo Rossi (2022), in their study focussed on annual growth in pharmaceutical, medicinal chemical, and botanical production for healthcare purposes. The country sells generic medications on a big scale, having significant impact in American and European markets. Although the industry's infrastructure and R&D skills have grown, difficulties such as pricing regulation, sector fragmentation, and intellectual property continue to exist. Patents are a major topic of contention in the national industry. Despite India's large population and low per capita income, stronger patent regulations may result in reduced access to medicine for a considerable portion of the population. Affordability of drugs poses a serious challenge in India and South Asia, potentially affecting life and death. The study found a strong economic, business, and commercial outlook for the Indian pharmaceutical industry, notwithstanding certain worries. The sector's main problem is to strike a balance between commercial aspirations for innovative growth and social needs for affordable healthcare.

Abinav Sharma (2020) made an attempt, to study the creation, communication, and provision of value to the target market by healthcare professionals is greatly aided by healthcare marketing. Rather than starting with goods or services, modern marketers start with the customer. Establishing a long-lasting connection holds greater significance than completing a single transaction. Creating a high degree of customer satisfaction should be the goal of a healthcare service provider in order to encourage repeat business from satisfied clients. According to the report, hospitals face a number of difficulties when trying to sell their services, but there are also opportunities in the market that healthcare organizations can take advantage of. With a carefully thought-out marketing strategy, hospitals can maintain their competitive edge and build a long-lasting relationship with patients by providing top-notch care and building a solid reputation.

Priyanka Singh (2013) examined a particular facet of rural marketing that these markets have not been utilized in any way. Its sole objective is to draw attention to the rural markets' increasing significance in the rapidly shifting economic landscape. Due to the wide range of courses that must be taken in rural marketing, particular consideration must be given to the product, its quality, packaging, brand, price, advertisement, personal selling, and distribution channel. The rural marketing strategy must be suitable, fully understanding the dispersed nature of rural consumers and the requirement for a distinct communication mix due to the lower educational attainment and environmental variations. All of this necessitates coordinated and coordinated action from the sector and the government. Even while producers may experience early losses due to high promotion and distribution costs, they shouldn't let this stop them from entering the market because the potential in the rural area is enormous. The country's shifting economic landscape combined with the rural population's increased purchasing power means that the recently established rural markets will undoubtedly pay off handsomely.
Luv Saini and P.K. Agarwal (2023) in their study highlighted a pharmaceutical business would be a smart decision because the industry is growing and has a bright future. The process involves several steps, which present the entrepreneur with a variety of challenges. Materials and information must come from trustworthy and credible sources. This study focuses on the various challenges that come with starting a pharmaceutical business in India. The study is qualitatively descriptive and makes use of secondary data. The results show that registration and licensing, resource requirements, financial concerns, business plan formation, raw material availability, skilled labor, and workforce optimization are the primary barriers to starting a pharmaceutical company in India.

Kalyani Rajput and Dr. Rajesh Kumar Pandey (2022) examined product marketing is a standard practice recognized by the worldwide business community as being essential to organizations seeking to achieve their targeted outcomes. The pharmaceutical industry is one of the most important and widespread industries. Its scope is broad, encompassing anything from over-the-counter (OTC) goods to life-saving medications to medical equipment. So much so that pharmaceutical education is given its own area in medical education as a whole, and the foundation for the production of pharmaceutical products is laid by these excellent educational opportunities. It takes a certain set of abilities to get these medications on the market, which is why pharmaceutical marketing is involved. Pharma marketing is more essential than general product marketing because it falls into the category of necessities and useful goods rather than desired goods, as most people don't plan to purchase medications or medical equipment unless they are prescribed or advised by a healthcare professional. This element presents a significant obstacle for the pharmaceutical marketing industry.

III. METHODOLOGY:

This research study aims to assess the association among important marketing challenges components empirically, namely Product challenges, Price challenges, Place challenges, Promotion challenges and how these critical components influence effective performance, which impacts the organizational performance. The present study framed the following objective of the study to enhance the limited literature available on Marketing challenges in the Pharma context: To study the relationship between marketing effectiveness and organizational Performance in Pharmaceutical organizations in India.

The following Hypotheses were framed for the present study
Ha01: There is a significant relationship between Marketing (4P's) challenges and Organizational Performance.
Ha02: There is a significant relationship between Marketing Effectiveness and Organizational Performance.
Data was collected from both Primary and secondary sources. The primary data was collected by administering a structured questionnaire from the employees working in the selected Pharmaceutical organizational in marketing domain. The secondary data was collected from research articles, journals, company records, and manuals. Measures for the research constructs used in the present study were developed by seeking the help from real time professionals who are working in the Pharma organizations with a framework borrowed and adapted by compiling various standard studies from prior literature. Most of the items were measured using a 5-point Likert scale ranging from "very poor" to "excellent". The antecedents in our research model comprise four constructs. "Product Performance of Marketing challenges" was assessed using six items; "Price Performance of Marketing challenges" was assessed using Five items. Nine items used to capture "Place Performance". "Promotion Performance" was assessed using eight items. Finally, "Marketing Effectiveness Performance" and "Organizational Performance" were assessed by using twelve and eight items respectively. A pilot study with a sample size of 50 responses was conducted before arriving at the final questionnaire. Reliability analysis ***(Cronbach's alpha)*** was applied to check the reliability of items used in initial questionnaire which showed that *Cronbach Alpha ranges from 0.7 to 0.9*(which is quite reliable). Based on reliability analysis and feedback from the Marketing representatives working in Pharma organizations, the final questionnaire was prepared.
The population universe consists of the employees working in India's marketing management wing of the pharmaceutical organization. The present study has limited the scope by restricting the universe as a pharmaceutical organization that only deals with marketing mix challenges. A total of 100 questionnaires were distributed and collected from the employees working in marketing management in pharmaceutical organizations in India.

IV. ANALYSIS

The profile of the respondents includes age, gender, designation, and work experience. The distribution of respondents based on their characteristics is shown in table 1. Analytical aspects of these characteristics are worth noting.

Tabel: 1 Profile of the Respondents

Variables	Categories	Frequency	Per cent
Age of the Respondent	Less than 25 years	24	24.0
	25 – 35 years	56	56.0
	Above 35 years	20	20.0
	Total	100	100.0
Education	Certificate Level	23	23.0
	Diploma Level	7	4.0
	Degree	28	28.0
	Masters	42	42.0
	Total	100	100.0
Qualification	Related to Job	58	58.0

	Unrelated to Job	42	42.0
	Total	100	100.0
Place of Work	City	28	28.0
	Town	38	38.0
	Both	34	34.0
	Total	100	100.0
Experience as Medical Representative	0 – 2 years	25	25.0
	2 – 5 years	44	44.0
	> 5 years	31	31.0
	Total	100	100.0

The final sample (N=100) was respondents are in the age group less than 25 is 24(24%), age group of '25 – 35 years is 56 (56%), 20 respondents are in the age group of 'above 20 years' (20%), Designation wise, the majority of the respondents are at 'Team lead level' (N=56). Twenty respondents are at 'Executive level', and 24 respondents are managers. Similarly, majority of the respondents have experienced are 2-5 five years. 25 respondents have experienced '0-2 years', 31 respondents have experience of 'above 5 years' in the marketing department. As the present study is based on the employees' perception towards marketing challenges practices, having more respondents from team lead level and good experience in marketing departments will make the data collected more authenticate in this survey. Table 2 is designed to exhibit the mean distribution of marketing effectiveness and marketing variables along with organizational performance scale. From the table, it can be noted that the highest mean was observed to the scale 'Product challenges' (M=3.68) and 'Organizational Performance' (M=3.65), whereas low mean was observed to the scales 'Pricing Challenges' (M=3.61) and 'Marketing effectiveness'(M=3.63).

Table:2 MARKETING CHALLENGES AND ORGANIZATIONAL PERFORMANCE

S. No	**Variable**	**Mean**	**S.D.**
1	Product Challenges	3.68	0.676
2	Pricing Challenges	3.61	0.564
3	Place Challenges	3.64	0.689
4	Promotion Challenges	3.67	0.560
5	Marketing Effectiveness	3.63	0.647
6	Organizational Performance	3.65	0.624

The present paper attempts to examine the relationship between marketing effectiveness and organizational performance with two hypotheses. The following deals with hypotheses testing by applying suitable statistical tools. Ha1: There is no significant relationship between selected variables on marketing challenges and Organizational Performance H01: There is a significant relationship between selected variables on marketing challenges and Organizational Performance. The hypothesis is framed to test the statistically significant relationship between marketing effectiveness and organizational performance. To test this hypothesis, linear regression is employed by considering organizational performance as dependent variables and variable of the marketing challenges such as Product challenges, Price challenges, Place (Distribution) challenges, and Plance challenges as independent variables. Table 3a portrays the regression test results, giving that marketing effectiveness variables can explain 71.1% of organizational performance.

Ha01: There is a significant relationship between Marketing (4P's) challenges and Organizational Performance.

Table: 3a **Model Summary**

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.843[a]	**.711**	.699	.35513

Table: 3b **ANOVA[a]**

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	29.455	4	7.364	58.387	**0.000[b]**
	Residual	11.981	95	0.126		
	Total	41.436	99			

Table: 3c **Coefficients[a]**

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-0.196	0.266		0-.738	.463
	Product Challenges	0.406	0.079	0.424	5.170	**0.000**
	Pricing Challenges	0.520	0.078	0.453	6.705	**0.000**
	Distribution Challenges	0.095	0.079	0.101	1.202	0.232
	Promotion Challenges	0.030	0.119	0.026	0.248	0.804

From table 3b, it can be inferred from the ANOVA test result that the overall model is significant. Table 3c shows that all the marketing challenges variables significantly influence organizational performance except two variables: product challenges and price challenges. Thus, the null hypothesis (H01) is rejected from the regression analysis test results, and the alternate hypothesis (Ha1) is accepted. H02: There is no significant relationship between marketing effectiveness and Organizational Performance Ha1: There is a significant relationship between Marketing Effectiveness and Organizational Performance. This hypothesis is framed to examine the relationship between marketing challenges and organizational performance. The earlier hypothesis has considered the variables of marketing challenges as independent variables. In this hypothesis, the marketing challenges is regarded as an independent variable and organizational performance as a dependent variable. Linear regression is applied to examine the relationship between the two selected variables. Table 4a shows that 64.1% of organizational performance can be explained by Marketing Effectiveness, which found to be consistent with the previous finding of the present study.

Ha02: There is a significant relationship between Marketing Effectiveness and Organizational Performance.

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	0.783[a]	**0.614**	0.610	.38980

ANOVA[a]

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	23.637	1	23.637	155.564	**0.000[b]**
	Residual	14.890	98	0.152		
	Total	38.527	99			

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	0.913	0.223		4.089	**0.000**
	MARKETING EFFECTIVENESS	0.755	0.061	0.783	12.473	**0.000**

Table 4b and 4c have given a p-value less than 0.05, which means that there is a statistically significant relationship between marketing effectiveness and organizational performance. Hence, the null hypothesis (H02) is rejected, and an alternative hypothesis (Ha2) is accepted

V. LIMITATIONS

- Any study based on a survey through a predesigned questionnaire suffers from the basic limitation.
- The study is confined to Ten Pharma organisations in India which becomes a limitation in generalizing the facts.
- Non-Probabilistic Sample used in for the survey stands as another limitation of the present study.

VI. CONCLUSION

The study found that organizational performance can be attained by effective marketing management. Marketing challenges can be effective only if designed to meet the various product, price, place and promotion. The study found that product and price are the key issues that significantly impact organizational purpose. The researcher found that the place and promotion are the key issues to address while studying marketing challenges, especially in the pharmaceutical market.

As the study selected marketing segment, product and stock-out situations are unavoidable. But still, efforts should be made to reduce the occurrence of these situations in the future. There are many issues to focus on detail like the product design, accessibility, return policy etc. Hence, further study is recommended to the researchers who shown interest in marketing management.

ABSTRACT

In the contemporary and dynamic landscape of business, the retention of skilled and experienced software professionals is a critical challenge faced by organizations. High turnover within the software industry not only results in substantial costs but also leads to a loss of productivity and knowledge. To address this challenge, organizations must adopt effective strategies to attract and retain talented software professionals. This research study aims to assess the various employee retention strategies implemented by organizations within the software industry. The study will delve into factors influencing employee retention and evaluate the effectiveness of diverse strategies employed to retain software professionals. Specifically, the research will investigate the impact of organizational culture, work-life balance initiatives, career development opportunities, compensation packages, and employee engagement practices on employee retention. Through a comprehensive analysis, the study seeks to contribute valuable insights that can inform organizations in developing and enhancing their strategies to retain skilled software professionals in the competitive business environment.

Keywords: Employee retention, Productivity, Organizational strategies, Compensation packages, Employee engagement, Human resources.

1. INTRODUCTION

In the contemporary global business arena, the retention of top-tier talent has emerged as a critical concern for organizations, particularly within the fiercely competitive software industry. With India solidifying its position as a major hub for software development and technology services, companies in this sector face unique challenges in retaining skilled professionals amidst high demand and intense competition [1]. Effective employee retention is pivotal for organizational success, contributing to stability, enhanced productivity, and reduced recruitment and training costs. This study seeks to explore the diverse strategies employed by software companies in India to retain their professionals and evaluate the effectiveness of these strategies in fostering long-term commitment. Given the high demand and competition for skilled professionals in the software industry, organizations deploy a variety of retention strategies to maintain a stable workforce, minimize turnover costs, and cultivate a positive work environment conducive to employee satisfaction and loyalty [2][3]. This paper examines several commonly implemented employee retention strategies in the Indian software industry. It includes many factors such as Competitive Compensation Packages, Career Development Opportunities, Work-Life Balance Initiatives, Recognition and Rewards, Employee Engagement Programs, Transparent Communication, Employee Well-being Initiatives and Strong Leadership and Management [4]. Generally, to attract and retain top talent, companies strive to offer competitive salaries and benefits that align with industry standards, reflecting the value of employees' skills and expertise. Recognizing the motivation driven by growth, organizations invest in employee development, providing clear career paths through training programs, mentorship initiatives, and challenging project opportunities. Acknowledging the importance of balancing work and personal life, software companies often implement flexible schedules, remote work options, and paid time off policies to support work-life integration, reducing burnout and increasing employee loyalty. Fostering a positive work culture involves acknowledging and appreciating contributions through rewards, bonuses, and public appreciation programs, boosting morale and creating a sense of loyalty among employees. Recognizing the link between engagement and retention, software firms implement team-building activities, social events, and employee resource groups to create a supportive work environment that fosters a sense of belonging and camaraderie [5][6]. Open and transparent communication channels build trust and loyalty. Ensuring access to organizational information, regular feedback sessions, and performance reviews provide opportunities for employees to voice concerns and receive constructive feedback. Prioritizing employee well-being involves offering wellness programs, mental health support, and access to fitness facilities, demonstrating a genuine concern for employees' health and building trust and loyalty. Effective leadership and management practices significantly influence retention. Investments in training managers to be supportive, empathetic, and skilled in employee development foster positive relationships, reducing turnover [7]. By examining these strategies, this research paper aims to contribute valuable insights for organizations seeking to enhance their employee retention approaches in the dynamic and competitive landscape of the Indian software industry. The key factors that helps to assess the strategies implemented by Indian software industries for investigating the employee retention strategies in the Indian software industry and the benefits of the employee retention is shown in the following fig.1.

Fig 1: Employee retention in IT industry

II. LITERATURE REVIEW

Employee retention strategies play a crucial role in the contemporary business landscape, particularly within the Information Technology (IT) sector, where attracting and retaining skilled professionals is paramount. This literature review seeks to explore and synthesize existing research on the impact of employee retention strategies on the job satisfaction of IT professionals. Understanding the intricate relationship between retention strategies and job satisfaction is essential for organizations striving to create a positive work environment and retain their valuable IT workforce. Through investigation on the research papers available in the literature reveals the following observations and conclusions.

Rahman, M., Islam, M. A. presented a paper on "Effective Strategies for Employee Retention in the IT Industry"[8]. The presented research work explores, in the ever-evolving landscape of the Information Technology (IT) industry, the retention of skilled professionals stands as a critical imperative for organizational success. This literature review examines several key studies that delve into effective strategies for employee retention within the IT sector. The insights provided by these studies contribute to a comprehensive understanding of the multifaceted approaches organizations employ to reduce turnover, enhance employee satisfaction, and elevate overall organizational performance

Madhavan, A., & Mahadevan, N, presented a paper on “The Impact of Compensation and Benefits on Employee Retention in the IT Sector"[9]. Their research scrutinizes the intricate relationship between compensation and benefits and employee retention within the IT sector. The study underscores the pivotal role of competitive salaries, incentives, and comprehensive benefits packages in attracting and retaining IT professionals. Additionally, it explores the significance of non-monetary rewards, such as flexible work arrangements and career growth opportunities, in bolstering employee retention.

Mehta, P presented a paper on "Employee Retention Strategies and Organizational Performance: A Comprehensive Review with Special Reference to IT Industry"[10]. Mehta's comprehensive review delves into the nexus between employee retention strategies and organizational performance, with a specific focus on the IT industry. The study explores strategies encompassing career development, work-life balance, employee recognition, and leadership development. It provides valuable insights into the positive impact of these strategies on employee commitment, satisfaction, and overall organizational success.

Jain, A., & Kaur, P submitted study on "A Study of Employee Retention Practices and its Effectiveness in IT Sector"[11]. Jain and Kaur's study systematically explores employee retention practices within the IT sector, evaluating their effectiveness. The research meticulously examines factors such as compensation, career growth opportunities, work environment, and employee engagement. It identifies the pivotal role of a positive work culture, supportive leadership, and effective communication in retaining IT professionals.

Singh, A., & Verma, N. presented a paper on “Impact of Work-Life Balance on Employee Retention: A Study in Indian IT Industry"[12]. Singh and Verma's research focuses on the critical impact of work-life balance initiatives on employee retention within the Indian IT industry. The study accentuates the role of flexible work arrangements, family-friendly policies, and employee well-being programs in not only reducing turnover but also enhancing job satisfaction.

Altogether, these studies provide comprehensive understanding of the diverse strategies and practices employed within the IT industry to retain skilled professionals. The insights gathered from these works offer a valuable resource for organizations seeking to refine and implement effective employee retention strategies, thereby fostering a resilient and satisfied IT workforce.

III. RESEARCH METHODOLOGY

To assess the employee retention strategies of software professionals in India, a mixed-methods research approach will be employed. The study will commence with a comprehensive literature review to establish a theoretical foundation and identify existing frameworks and models relevant to employee retention in the software industry. Subsequently, qualitative data will be gathered through semi-structured interviews with HR professionals and software experts to gain insights into the industry's specific context and nuances. The interview data will be thematically analyzed to identify recurring patterns and themes related to effective retention strategies. Additionally, a quantitative survey will be administered to a representative sample of software professionals across different organizations in India. The survey will encompass standardized measures of job satisfaction, perceptions of organizational culture, and the perceived effectiveness of various retention strategies. Statistical analyses, including regression analysis and correlation assessments, will be conducted to determine the relationship between retention strategies and job satisfaction. The combined findings from qualitative and quantitative data will contribute to a holistic understanding of the efficacy of employee retention strategies in the Indian software industry [13] [14] [15].

The survey comprises two sections: The initial part delves into respondents' demographic details, while the subsequent section focuses on gathering insights into their perspectives on the correlation between strategic impact elements and customer perceptions and purchasing behaviors. Using a Likert scale ranging from 1 (strong agreement) to 5 (strong disagreement), respondents rated the claims. Disagreement is denoted by scores of 4 or 5 [16] [17]. Regarding the sample design, a convenience sample was employed, distributing a total of 300 questionnaires, with 240 being fully completed. Upon thorough examination, an impressive 80 percent response rate was achieved. Descriptive statistics indicated a final sample size of 241, comprising both males and females.

IV. CONCEPTUAL FRAMEWORK

The conceptual framework for assessing employee retention strategies among software professionals in India is structured around key dimensions: organizational context, individual factors, and retention strategy effectiveness. The organizational context involves analyzing industry dynamics, examining organizational culture, and evaluating leadership effectiveness. Individual factors encompass demographic variables, job satisfaction, and professional

development needs [18]. The retention strategy effectiveness dimension involves assessing the impact of compensation, career development programs, work-life balance initiatives, and recognition programs on employee retention. The interactions between these dimensions will be explored through qualitative interviews and quantitative surveys.

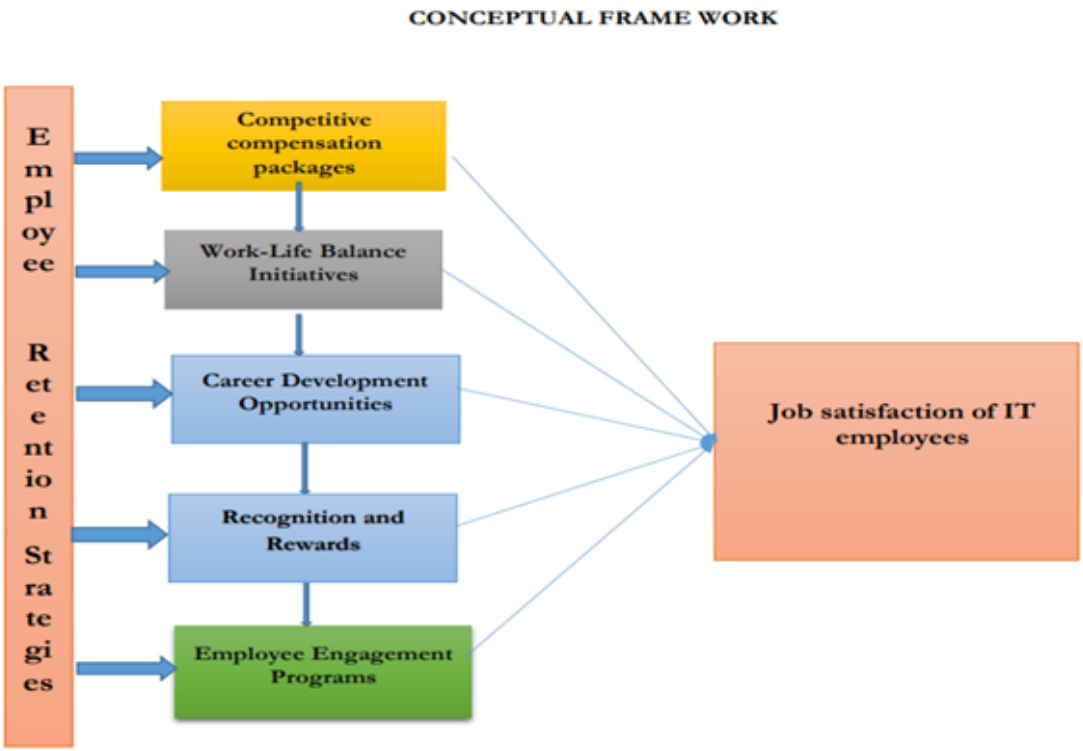

Fig 2: Conceptual frame work

The study aims to delineate the interplay of these factors in the Indian software industry, providing a nuanced understanding of effective retention strategies and their alignment with the unique needs and expectations of software professionals in this dynamic context [19]. The figure 2 revels the concept of the conceptual frame work.

V. OBJECTIVES

The main objective of this paper is to understand the influence of strategies on the job satisfaction of IT employees. The specific objectives of this research study are outlined as follows:

- Evaluate the impact of competitive compensation packages on the job satisfaction of IT employees.
- Analyze the influence of work-life balance initiatives on the job satisfaction of IT employees.
- Assess the impact of career development opportunities on the job satisfaction of IT employees.
- Examine the influence of recognition and rewards on the job satisfaction of IT employees.
- Evaluate the impact of employee engagement programs on the job satisfaction of IT employees.

VI. HYPOTHESIS

Competitive Compensation Packages:

- H0: The impact of Competitive Compensation Packages on Job satisfaction of IT employees is statistically significant.
- H1: There is no statistically significant impact of Competitive Compensation Packages on Job satisfaction of IT employees.
- Work-Life Balance Initiatives:
- H0: The impact of Work-Life Balance Initiatives on Job satisfaction of IT employees is statistically significant.
- H1: There is no statistically significant impact of Work-Life Balance Initiatives on Job satisfaction of IT employees.
- Career Development Opportunities:
- H0: The impact of Career Development Opportunities on Job satisfaction of IT employees is statistically significant.
- H1: There is no statistically significant impact of Career Development Opportunities on Job satisfaction of IT employees.
- Recognition and Rewards:
- H0: The impact of Recognition and Rewards on Job satisfaction of IT employees is statistically significant.
- H1: There is no statistically significant impact of Recognition and Rewards on Job satisfaction of IT employees.
- Employee Engagement Programs:
- H0: The impact of Employee Engagement Programs on Job satisfaction of IT employees is statistically significant.
- H1: There is no statistically significant impact of Employee Engagement Programs on Job satisfaction of IT employees.

VII. RESULTS & DISCUSSION

To attain the desired outcome of this research work, a systematic research methodology is implemented and the respective outputs were described in this section to conclude the impact of employee retention strategies on job satisfaction of it professionals. In this proposed work, Statistical Package for the Social Sciences SPSS is a software package widely used for statistical analysis in various fields, including management and social sciences. In management, SPSS is often used for tasks such as data analysis, statistical modelling, and reporting. SPSS 22 is a statistical software tool that can be utilized in management for analysing and interpreting data, making informed decisions, and gaining insights into various aspects of organizational processes and behaviour. In this research work SPSS 22 is used to analyse the data. The study under consideration employs exploratory factor analysis to illustrate concept validity and assesses internal consistency using Cronbach's alpha. To identify potential relationships between variables, the study utilizes the regression method. Principal Component Analysis (PCA) is employed in the Exploratory Factor Analysis (EFA) to validate constructs. Referring to Hair et al.'s research in 1998, a factor loading equal to or greater than 0.30 is considered to meet the minimum criterion, followed by factor loadings of 0.40 and 0.50, which are deemed progressively more crucial. This study establishes a termination point at a factor loading of 0.50. The outcomes of the factor analysis are presented in the accompanying table. KMO is a statistic used in management research, particularly in the context of factor analysis, to assess

the adequacy of the data for identifying underlying factors or constructs. The value of KMO, when it is between 0.5 and 1.0, a component analysis is advantageous for the data.

The extent of interdependence among variables is assessed through Bartlett's sphericity test, with researchers measuring the outcome by computing the test's significance level. If the resulting values are significantly small, typically below 0.05, it indicates substantial correlations between the variables. Conversely, a p-value exceeding 0.10 suggests that the data may not be well-suited for factor analysis. The findings affirm the appropriateness of employing factor analysis for the given dataset, as all twenty-one items were validated for the final analysis, with none exhibiting a loading value below 0.5.

Table 1: Results of Exploratory Factor Analysis

Table 1: Results of Exploratory Factor Analysis								
Macro Variable	**Micro Variable**	**Factor loadings**	**KMO Measureof Sample Adequacy (>0.5)**	**Bartlett's Test of Sphericity**		**Items confirmed**	**Items dropped**	**Cum % of loading**
				Chi Square	**Sig. (<.10)**			
Impact of strategies	Competitive compensation packages -1	.907	.574	211.429	.000	3	0	65.843
	Competitive compensation packages - 2	.843						
	Competitive compensation packages -3	.665						
	Work-Life Balance Initiatives-1	.878	.705	355.625	.000	3	0	78.536
	Work-Life Balance Initiatives-2	.857						
	Work-Life Balance Initiatives-3	.922						
	Career Development Opportunities: - 1	.737	.642	309.165	.000	3	0	72.860
	Career Development Opportunities: -2	.901						

Reliability Assessment:

The researchers utilized Cronbach's Alpha calculation to assess the internal consistency and reliability of the questionnaire. Nunally and Bernstein (1994) recommend an alpha value as low as 0.60 for new scales, with acceptability extending to lower values. However, common practice often dictates a requirement for an internally consistent established scale with an alpha value of 0.70 or higher. In this study, the predefined threshold for Cronbach's alpha is established at 0.7.

Table 2: Results of the Reliability Examination

	Independent Variable	Cronbach Alpha
1	Competitive compensation packages	.722
2	Building trust and credibility	.861
3	Career Development Opportunities:	.808
4	Recognition and Rewards	.669
5	Employee Engagement Programs	.946
Over all Reliability of the Questionnaire		.801

Table 2 reveals, the presents Cronbach's alpha values for various independent variables, indicating their internal consistency or reliability within a questionnaire.

1. **Independent Variable:** This column lists the different factors or constructs that were assessed in the questionnaire.
2. **Cronbach Alpha**: Cronbach's alpha is a measure of internal consistency, which assesses how closely related a set of items are as a group. It ranges from 0 to 1, where higher values indicate greater reliability. Competitive compensation packages have a Cronbach alpha of 0.722, suggesting moderate internal consistency. Building trust and credibility has a Cronbach alpha of 0.861, indicating high internal consistency. Career Development Opportunities have a Cronbach alpha of 0.808, indicating a high level of internal consistency. Recognition and Rewards have a Cronbach alpha of 0.669, suggesting moderate internal consistency. Employee Engagement Programs have a Cronbach alpha of 0.946, indicating high internal consistency. The overall reliability of the questionnaire, including all items, has a Cronbach alpha of 0.801, suggesting a good level of internal consistency.

These values provide insights into the reliability of the questionnaire items related to each independent variable, with higher Cronbach alpha values indicating greater reliability.

Table 3: Correlations

	CCP	CDO	R&R	EEP	WLB
Competitive compensation packages(CCP)	1				
Career Development Opportunities: (CDO)	.806**	1			
Recognition and Rewards(R&R))	.755**	.798**	1		
Employee Engagement Programs(EEP)	.757**	.768**	.723**	1	
Work-Life Balance Initiatives(WLB)	.308**	.348**	.343**	.367**	1

Table 3 reveals that the Cronbach's alpha values surpass the acceptable cutoff of 0.7, indicating satisfactory reliability. Specifically, the questionnaire exhibits an overall reliability demonstrated by a Cronbach's alpha value of 0.801.

Moving on to the correlation analysis, the study on independent variables indicates a robust connection among all of them. Each variable demonstrates a significant correlation with the five variables under examination in the "impact of strategies" framework. Notably, all five independent variables within the "impact of strategies" framework exhibit substantial associations with one another (refer to Table 4). The correlation between "Career Development Opportunities" and "Competitive Compensation Packages" is the highest at 0.806, while the least significant relationships are observed between "Building Trust and Credibility" and "Competitive Compensation Packages" at 0.308.

Regression Analysis:

The study utilizes stepwise regression analysis to discern the predictor-criterion relationship between dependent and independent variables. Specifically, the correlation between the impact of retention strategies on job satisfaction was explored.

Results of Hypotheses Testing for Job Satisfaction of IT Employees as Dependent Variable:

Multiple regression models were developed and tested to assess the job satisfaction of IT employees as the dependent variable. The study considered five factors related to the impact of strategies—Competitive Compensation Packages (CCP), Career Development Opportunities (CDO), Recognition and Rewards (R&R), Employee Engagement Programs (EEP), and Work-Life Balance Initiatives (WLB)—as independent variables in the regression models.

Table (4a): Model summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.863[a]	.744	.743	.355
2	.911[b]	.830	.829	.290
3	.936[c]	.876	.874	.248
4	.955[d]	.912	.910	.210
5	.962[e]	.926	.925	.192

The results of the stepwise regression analysis indicate that, according to Table 4(a), five factors (Competitive Compensation Packages, Career Development Opportunities, Recognition and Rewards, Building Trust and Credibility, Employee Engagement Programs) emerged as significant predictors of "Job satisfaction of IT employees." With an R-square value of 0.934, these five variables collectively explain job satisfaction to the extent of 93.4 percent in the dataset.

a. Dependent Variable: Job satisfaction of IT employees
b. Predictors: (Constant), Career Development Opportunities:
c. Predictors: (Constant), Career Development Opportunities: Employee Engagement Programs
d. Predictors: (Constant), Career Development Opportunities: Employee Engagement Programs,
e. Predictors: (Constant), Career Development Opportunities: Employee Engagement Programs, Recognition and Rewards

Table (4b). ANOVA

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	87.776	1	87.776	696.150	.000[b]
	Residual	30.135	239	.126		
	Total	117.911	240			
2	Regression	97.885	2	48.943	581.674	.000[c]
	Residual	20.026	238	.084		
	Total	117.911	240			
3	Regression	103.276	3	34.425	557.490	.000[d]
	Residual	14.635	237	.062		
	Total	117.911	240			
4	Regression	107.488	4	26.872	608.429	.000[e]
	Residual	10.423	236	.044		
	Total	117.911	240			
5	Regression	109.232	5	21.846	591.557	.000[f]
	Residual	8.679	235	.037		
	Total	117.911	240			

Moreover, Table 4(b) showcases the ANOVA outcomes for the regression model, affirming validity with a 95 percent confidence level.

Table (4c): Coefficients

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
	(Constant)	.498	.087		5.752	.000
1	Career Development Opportunities:	.800	.030	.863	26.385	.000
2	(Constant)	.517	.071		7.310	.000
	Career Development Opportunities:	.475	.039	.512	12.280	.000
	Employee Engagement Programs	.325	.030	.457	10.961	.000
3	(Constant)	.215	.069		3.124	.002
	Career Development Opportunities:	.440	.033	.475	13.217	.000
	Employee Engagement Programs	.284	.026	.400	11.055	.000
	Building trust and credibility	.183	.020	.231	9.343	.000

	Career Development Opportunities:	.262	.034	.283	7.811	.000
	Employee Engagement Programs	.224	.023	.316	9.928	.000
	Building trust and credibility	.171	.017	.216	10.310	.000
	Recognition and Rewards	.271	.028	.328	9.765	.000
5	(Constant)	.074	.055		1.358	.176
	Career Development Opportunities:	.185	.033	.199	5.655	.000
	Employee Engagement Programs	.191	.021	.268	8.965	.000
	Building trust and credibility	.168	.015	.212	11.045	.000
	Recognition and Rewards	.250	.026	.302	9.758	.000
	Competitive compensation packages	.173	.025	.191	6.873	.000

a. Dependent Variable: Job satisfaction of IT employees

A brief scrutiny of the corresponding coefficients in Table 4(c) discloses beta values for the factors— "Competitive Compensation Packages (CCP), Career Development Opportunities (CDO), Recognition and Rewards (R&R), Employee Engagement Programs (EEP), Work-Life Balance Initiatives (WLB)"—as 0.129, 0.221, 0.215, 0.265, and 0.195, respectively. These findings strongly underscore the significance of these factors in influencing job satisfaction among employees.

Table 5: Test Results for Hypotheses

Hypothesis	Independent Variables	Dependent Variables	R-Square	Beta Coefficient	t-value	Sig Value
H1	Competitive compensation packages (CCP)	Job satisfaction of IT employees	0.129	3.593	0.076	Accepted
H2	Career Development Opportunities (CDO)	Job satisfaction of IT employees	0.221	7.437	0.000	Accepted
H3	Recognition and Rewards (R&R)	Job satisfaction of IT employees	0.215	11.793	0.003	Accepted
H4	Employee Engagement Programs (EEP)	Job satisfaction of IT employees	0.265	8.771	0.012	Accepted
H5	Work-Life Balance Initiatives (WLB)	Job satisfaction of IT employees	0.195	7.379	0.017	Accepted

The table 5 presents the findings of a research study examining the relationship between various factors and the job satisfaction of IT employees. The study hypothesized that factors such as competitive compensation packages, career development opportunities, recognition and rewards, employee engagement programs, and work-life balance initiatives influence job satisfaction in the IT sector. The results indicate that all hypotheses were supported, as evidenced by the statistically significant relationships between the independent variables and job satisfaction. Specifically, career development opportunities, recognition and rewards, employee engagement programs, and work-life balance initiatives showed particularly strong associations with job satisfaction, as indicated by their higher beta coefficients, t-values, and lower significance values. These findings suggest that organizations seeking to enhance job satisfaction among IT employees should prioritize initiatives related to career development, recognition, engagement, and work-life balance. Overall, the study highlights the importance of considering various organizational factors in understanding and promoting job satisfaction within the IT industry. The research findings support the hypotheses with numerical evidence and are summarized as follows. Competitive compensation packages (CCP): The relationship with job satisfaction has a beta coefficient of 0.129, a t-value of 3.593, and a significance value of 0.076.Career Development Opportunities (CDO): The association with job satisfaction is stronger with a beta coefficient of 0.221, a t-value of 7.437, and a significance value of 0.000.Recognition and Rewards (R&R): This factor has a beta coefficient of 0.215, a t-value of

11.793, and a significance value of 0.003, indicating a significant impact on job satisfaction. Employee Engagement Programs (EEP): The relationship with job satisfaction is notable, with a beta coefficient of 0.265, a t-value of 8.771, and a significance value of 0. 012.Work-Life Balance Initiatives (WLB): This factor shows a beta coefficient of 0.195, a t-value of 7.379, and a significance value of 0.017, indicating a statistically significant relationship with job satisfaction.

These numerical values provide quantitative evidence supporting the conclusion that career development opportunities, recognition and rewards, employee engagement programs, and work-life balance initiatives have significant associations with job satisfaction among IT employees.

VIII. RECOMMENDATIONS & SUGGESTIONS

Based on the extensive research conducted on employee retention strategies and their impact on job satisfaction of IT professionals, the primary recommendations and suggestions are listed below.

1. **Tailor Compensation Packages**: Customize compensation packages to align with industry standards and the unique skills and expertise of IT professionals.
2. **Invest in Career Development**: Prioritize investments in training programs, mentorship initiatives, and challenging project opportunities to support career growth and advancement.
3. **Promote Work-Life Balance**: Implement flexible work arrangements, remote work options, and paid time off policies to support work-life integration and reduce burnout.
4. **Enhance Recognition and Rewards**: Recognize and reward outstanding performance through bonuses, incentives, and public appreciation programs to boost morale and loyalty.
5. **Strengthen Employee Engagement**: Foster a supportive work environment through team-building activities, social events, and employee resource groups to promote engagement and camaraderie.
6. **Facilitate Transparent Communication**: Establish open channels of communication between management and employees to address concerns and provide feedback effectively.
7. **Prioritize Employee Well-being**: Offer wellness programs, mental health support, and access to fitness facilities to demonstrate genuine concern for employee health and well-being.
8. **Develop Leadership Skills**: Invest in training managers to be supportive, empathetic, and skilled in employee development to foster positive relationships and reduce turnover.
9. **Promote Diversity and Inclusion**: Create a diverse and inclusive workplace culture where all employees feel valued and respected.
10. **Regularly Review HR Policies**: Continuously review and update HR policies to ensure they meet the evolving needs and expectations of IT professionals and the organization.
11. **Encourage Cross-Functional Collaboration**: Facilitate collaboration between IT teams and other departments to promote innovation and problem-solving.
12. **Implement Mentorship Programs**: Pair junior IT professionals with experienced mentors to facilitate knowledge transfer and career development.
13. **Offer Performance-Based Incentives**: Tie rewards and incentives directly to individual and team performance to motivate IT professionals and drive results.

14. **Provide Leadership Opportunities**: Identify and groom future leaders within the IT department by offering leadership training and opportunities for advancement.
15. **Support Continuous Learning**: Encourage IT professionals to attend workshops, conferences, and training programs to stay updated with the latest technologies and trends.
16. **Create a Positive Work Culture**: Foster a culture of trust, collaboration, and appreciation to enhance job satisfaction and employee retention.
17. **Promote Flexibility**: Allow IT professionals to have autonomy over their work schedules and environments to accommodate personal preferences and obligations.
18. **Encourage Innovation:** Create avenues for IT professionals to contribute ideas and solutions to drive innovation within the organization.
19. **Provide Clear Expectations**: Communicate clear goals, expectations, and performance metrics to ensure alignment and accountability.
20. **Seek Feedback and Iterate**: Regularly solicit feedback from IT professionals and adapt retention strategies based on their input and changing needs.

These recommendations aim to help organizations in the IT industry develop and enhance their employee retention strategies to foster job satisfaction and create a conducive work environment for their valuable IT workforce.

Altogether, the recommendations and suggestions outlined provide a comprehensive framework for organizations within the IT industry to enhance their employee retention strategies and promote job satisfaction among their workforce. By implementing tailored compensation packages, investing in career development, promoting work-life balance, and fostering a supportive work culture, organizations can create an environment where IT professionals feel valued, motivated, and engaged. Additionally, prioritizing transparent communication, recognizing and rewarding performance, and supporting employee well-being are essential components of effective retention strategies. By continuously reviewing and updating HR policies, promoting diversity and inclusion, and encouraging innovation, organizations can adapt to the evolving needs and expectations of their workforce while staying competitive in the dynamic IT landscape.

Ultimately, by incorporating these recommendations into their retention strategies, organizations can cultivate a dedicated and loyal IT workforce, driving organizational success, growth, and innovation. As the IT industry continues to evolve, organizations must prioritize employee satisfaction and retention to remain competitive and thrive in the ever-changing market.

IX. CONCLUSION

Research on employee retention strategies within the software industry consistently emphasizes the robust correlation between these strategies and job satisfaction. The software industry, renowned for its competitiveness and high demand for skilled professionals, grapples with substantial challenges in retaining its workforce. Nevertheless, organizations can overcome these challenges by deploying effective retention strategies, thereby establishing a positive work environment conducive to job satisfaction, heightened employee commitment, and increased loyalty. Numerous studies have pinpointed key employee retention strategies integral to fostering job satisfaction in the software industry. These encompass competitive compensation packages, career development opportunities, work-life balance initiatives, recognition and rewards, employee engagement programs, transparent communication, employee well-being initiatives, and robust leadership and management practices. Research findings underscore the critical importance of offering competitive salaries and benefits in

attracting and retaining software professionals. Furthermore, providing avenues for career development, such as training programs and clear career paths, proves instrumental in promoting job satisfaction by enabling skill enhancement and career progression within the organization. In the demanding landscape of the software industry, work-life balance initiatives, including flexible work schedules and remote work options, emerge as pivotal contributors to job satisfaction, facilitating a healthy integration of work and personal life. Recognition and rewards programs significantly contribute to job satisfaction by acknowledging employee contributions and nurturing a positive work culture. Engagement programs, transparent communication channels, and employee well-being initiatives collectively play a substantial role in cultivating a supportive and fulfilling work environment, thereby enhancing job satisfaction. Finally, strong leadership and management practices that prioritize employee development and support further contribute to job satisfaction and employee retention. In summation, the literature review unequivocally supports the conclusion that the implementation of effective employee retention strategies in the software industry leads to heightened job satisfaction among software professionals. By addressing key influencers of job satisfaction, organizations can cultivate a dedicated and loyal workforce, ultimately bolstering the company's success and growth.

ABSTRACT

The Digital India Programme represents a transformative vision aimed at reshaping India's digital landscape to promote widespread digital inclusion and socio-economic development. Despite significant advancements in digital banking, e-governance, and rural development, the programme faces numerous challenges, especially in rural areas. These challenges include inadequate digital literacy, poor infrastructure, socio-economic disparities, and cybersecurity threats, which hinder the effective adoption of digital financial services. Studies highlight these impediments and underscore the need for interventions to ensure equitable distribution of digital benefits. This comprehensive evaluation identifies pain points associated with the programme's implementation and suggests measures to enhance its efficacy. This study discusses key issues such as network and infrastructure limitations, digital literacy gaps, socio-cultural resistance, economic barriers, insufficient customer support, and slow regulatory responses. The findings emphasize the importance of strategic investments, regulatory support, and community engagement to overcome these challenges and achieve the programme's full potential.

Keywords: Digital India, digital literacy, rural development, e-governance, cybersecurity.

1. INTRODUCTION

The Digital India Programme represents a transformative vision to fundamentally reshape India's digital landscape, promoting widespread digital inclusion and enhancing socio-economic development. However, the programme's implementation has encountered significant challenges, especially in rural areas where barriers such as inadequate digital literacy, poor infrastructure, and socio-economic disparities persist. Literature reviews, including studies from the Thane District, reveal that these challenges hinder the effective adoption of digital financial services, underscoring the need for interventions to ensure equitable distribution of digitalization benefits. Despite notable advancements in digital banking and e-governance, cybersecurity threats and the need for regulatory frameworks remain pressing issues. The programme's impact on rural development is evident through improved access to information, education, healthcare, and government schemes, yet

obstacles like unreliable internet connectivity and resistance to change within governmental bodies persist. Furthermore, digital initiatives in education and healthcare, such as telemedicine and mobile health applications, highlight both the potential and the hurdles of digital transformation, with infrastructural deficiencies and digital illiteracy posing significant barriers. The role of the Digital India Programme in fostering entrepreneurship and growth in MSMEs is also notable, though limited digital skills, access to finance, and infrastructural constraints need to be addressed through supportive policies and capacity-building initiatives. This comprehensive evaluation aims to identify the pain points associated with the Digital India Programme's implementation and suggests measures to enhance its efficacy. The study employs a descriptive research design, drawing on secondary data from journal articles, books, and electronic sources. Key issues discussed include network and infrastructure limitations, digital literacy gaps, socio-cultural resistance, economic barriers, insufficient customer support, and slow regulatory responses.

2. LITERATURE REVIEW:

The Digital India Programme has made significant strides in fostering digital inclusion and enhancing financial literacy among marginalized communities, yet it faces considerable challenges, particularly in rural areas. Studies, such as the one conducted in Thane District, highlight several barriers to the effective adoption of digital financial services, including a lack of digital literacy, inadequate infrastructure, and socio-economic challenges. These impediments hinder the programme's goal of creating a digitally empowered society. While the initiative has made headway in promoting digital inclusion, there is a clear need for interventions to address these challenges and ensure the equitable distribution of digitalization benefits. Furthermore, the transformative impact on the Indian banking sector through the Digital India Programme has been profound, with digital banking services like mobile and internet banking reshaping traditional models. This transformation has enhanced efficiency, customer experience, and broadened financial inclusion, especially in rural areas, though cybersecurity threats and the need for regulatory frameworks remain pertinent challenges.

The role of the Digital India Programme in enhancing e-governance and its socio-economic impact on rural communities underscores its broad influence across various sectors. The integration of digital technologies into government-led operations has improved transparency, efficiency, and citizen engagement, as evidenced by successful initiatives like the Digital Locker system and online grievance redressal mechanisms. However, persistent hurdles such as the digital divide and resistance to change within governmental bodies need addressing. In rural India, digital initiatives have facilitated access to information, education, healthcare, and government schemes, contributing significantly to rural development. Despite these positive outcomes, challenges such as inadequate internet connectivity and lack of awareness about digital services continue to pose obstacles. Sustained efforts are required to bridge these gaps and ensure inclusive digital growth, highlighting the importance of strategic investments in infrastructure and comprehensive digital literacy campaigns.

The Digital India Programme's impact on education, healthcare, and entrepreneurship further illustrates its transformative potential and the accompanying challenges. Digital education initiatives hold promise for transforming education by making learning more accessible and interactive, though infrastructural deficiencies

and digital illiteracy among students and teachers pose significant barriers. Similarly, digital health initiatives like telemedicine and mobile health applications have improved healthcare access, particularly in underserved areas, but issues related to data privacy and the digital divide persist. The programme has also spurred entrepreneurship and growth in MSMEs by creating new business opportunities and expanding market access. However, limited digital skills, access to finance, and infrastructural constraints remain challenges that need to be addressed through supportive policies and capacity-building initiatives. Overall, the Digital India Programme has made commendable progress, but achieving its full potential requires addressing these challenges through strategic investments, regulatory support, and community engagement.

3. OBJECTIVES AND RESEARCH METHODOLOGY:

Objectives:

1. To study the pain points associated with the implementation of Digital India Programme.
2. To suggest, based on the findings, various measures to the Government of India to advance the Digital India Programme.

Research Design: Used a descriptive research design.

Data Sources:

The researcher collected secondary data from journal articles, write-ups from books and electronic sources.

Discussion:

Network and infrastructure issues result in fewer digital payments, as unreliable connectivity disrupts transactions and undermines trust in digital financial systems. The limited digital infrastructure in these regions exacerbates the problem, with many rural areas lacking essential facilities like reliable internet and digital devices, thus hindering access to digital services. Poor internet connectivity further restricts the use of online platforms for education, healthcare, and government services, isolating rural populations from digital advancements. Additionally, the dependence on an unreliable power supply for digital devices poses a major challenge. Frequent power outages and unstable electricity supply disrupt the functioning of digital services, making it difficult for rural communities to maintain consistent digital connectivity.

Many rural individuals lack the basic skills to navigate and utilize digital platforms, which limits their ability to benefit from digital initiatives. The limited outreach of digital literacy campaigns exacerbates this issue, as many such efforts fail to reach remote and underserved communities, leaving a substantial portion of the rural population without essential digital knowledge. Furthermore, a lack of awareness about digital financial services leads to underutilization of digital payment systems, online banking, and other financial technologies that could enhance economic efficiency and inclusivity. Additionally, insufficient training and capacity-building programs for rural users mean that even those who have access to digital technologies struggle to keep pace with rapidly evolving digital environments.

Resistance to adopting new digital technologies in rural areas where traditional methods are preferred. This reluctance is compounded by a lack of trust in digital financial transactions, with fears of security breaches and

digital fraud discouraging engagement with online financial services. Cybersecurity concerns and the fear of fraud further deter users, as potential risks associated with cyber threats and scams create apprehension about the safety of digital transactions. Socio-cultural barriers also play a crucial role, as deeply entrenched norms and practices in rural communities foster suspicion and skepticism towards digital adoption. These socio-cultural attitudes, along with a lack of digital literacy, reinforce distrust and resistance.

High costs of digital devices and internet access create significant barriers for rural and economically disadvantaged populations, preventing them from fully participating in the digital economy. Many individuals and families in these areas cannot afford the initial investment in smartphones, computers, or consistent internet connectivity, which are essential for accessing digital services. Furthermore, limited access to financial resources for digital investments exacerbates this problem. Without sufficient financial support or affordable financing options, rural users are unable to invest in the necessary infrastructure to benefit from digital advancements.

Insufficient customer support for digital services significantly in rural and remote areas where users often require assistance to navigate new technologies. The limited availability of localized digital content and services further exacerbates this issue, as many digital platforms fail to cater to the specific needs and preferences of diverse regional populations. This gap in service availability prevents users from fully benefiting from digital initiatives designed to improve their daily lives. Additionally, the lack of multilingual support on digital platforms creates a barrier for non-English speaking users, making it difficult for them to access and utilize digital services effectively. This language barrier particularly affects rural users, who may be more comfortable with regional languages.

Many rural populations remain excluded from formal financial systems. This exclusion is exacerbated by ineffective digital payment systems in rural areas, where poor connectivity and inadequate infrastructure hinder seamless transactions. Consequently, the slow adoption of digital payment systems by small businesses further restricts the economic benefits of digitalization, as these enterprises struggle to transition from cash-based operations to digital platforms. Moreover, there is a dependency on intermediaries for digital transactions, which increases costs and reduces trust among users. These intermediaries often charge fees for facilitating transactions, making digital payments less attractive for both consumers and small businesses.

Slow regulatory responses to emerging digital challenges hinder the program's ability to adapt and evolve in a rapidly changing technological landscape, leaving gaps in legal and operational frameworks necessary for effective digital governance. Limited collaboration between the private and public sectors further exacerbates these issues, as the lack of coordinated efforts and shared goals between these entities stifles innovation and the effective implementation of digital initiatives. Additionally, limited financial incentives for digital adoption discourage businesses and individuals from transitioning to digital platforms, slowing the overall progress of the programme.

Verification challenges often stem from inconsistencies and inaccuracies in digital identity databases, leading to difficulties in authenticating users and accessing services. This undermines trust in digital systems and discourages their use. Additionally, the lack of seamless integration between digital services and existing government schemes hampers the efficiency and effectiveness of digital initiatives. Without cohesive integration, beneficiaries face obstacles in leveraging digital platforms to access various welfare and support programs.

The Digital India Programme faces significant challenges in achieving its goals due to the digital exclusion of elderly and less-educated populations. These groups often lack the necessary digital skills and familiarity with technology, which prevents them from fully participating in and benefiting from digital initiatives. The elderly, in particular, may find it difficult to adapt to new digital tools and platforms, leading to their marginalization in an increasingly digital society. Individuals with lower levels of education may struggle to understand and use digital services, further exacerbating the digital divide.

To address the challenges faced by the Digital India Programme, the Indian government needs to implement a comprehensive and integrated approach that leverages existing capacities while fostering innovation and collaboration. Enhancing network and infrastructure is paramount; thus, investments in expanding reliable internet connectivity and robust digital infrastructure, particularly in rural areas, must be prioritized. This could include initiatives such as deploying satellite internet services and strengthening the power supply to ensure consistent digital connectivity. Simultaneously, expanding digital literacy campaigns is essential to equip rural populations with the skills needed to navigate digital platforms. Tailored training programs, supported by localized and multilingual content, can bridge the knowledge gap and foster greater digital inclusion. To build trust and overcome resistance to digital adoption, the government should enhance cybersecurity measures, provide extensive awareness campaigns about the safety and benefits of digital transactions, and establish customer support networks. Encouragingly, subsidies and financial incentives for purchasing digital devices and internet access can alleviate economic barriers, enabling wider participation in the digital economy. Additionally, fostering public-private partnerships can drive innovation and resource-sharing, expediting the development and deployment of digital solutions tailored to diverse regional needs. Improving the regulatory framework to adapt swiftly to emerging digital challenges will ensure legal and operational coherence, enhancing the program's effectiveness. Furthermore, streamlining digital identity verification processes and integrating digital services with existing government schemes can bolster trust and efficiency in accessing welfare programs. To specifically address the needs of elderly and less-educated populations, targeted outreach and simplified digital interfaces can make digital services more accessible and user-friendly.

4. CONCLUSION

The Digital India Programme faces significant challenges that hinder its effectiveness, particularly in rural areas where network and infrastructure issues disrupt digital payments, education, healthcare, and government services. Limited digital literacy, resistance to adopting new technologies, and cybersecurity concerns further exacerbate these issues, creating a significant digital divide. High costs of digital devices and internet access, insufficient customer support, and verification challenges add to the complexity, preventing

many from fully benefiting from digital initiatives. To address these challenges, a comprehensive and integrated approach is essential. Prioritizing investments in reliable internet connectivity, expanding digital literacy campaigns, enhancing cybersecurity measures, and providing financial incentives can foster greater digital inclusion. Public-private partnerships and improved regulatory frameworks can drive innovation and adaptability, while tailored outreach programs can make digital services more accessible to elderly and less-educated populations. By adopting this holistic strategy, the Indian government can advance the Digital India Programme, ensuring inclusive participation in the digital revolution.

Allure of the 'Indo-Pacific' and dynamics of regional cooperation after COVID-19

Dr. M. Prayaga, Ph.D.
Director
Centre for Southeast Asian and Pacific Studies
Sri Venkateswara University, Tirupati-517502, A.P.

Abstract

The security relations have changed globally in reaction to the ongoing political developments on the world stage, particularly in the light of China's rapid economic development and military modernization. The exceptional growth of China and its claims of entire South China Sea is an alarming development for the US, Japan, Australia and India as well as regional actors in the Indo-Pacific region. The broad geopolitical changes brought about by China's rise prodded the US, India, Japan and Australia to devote their time and precious few resources to boost Indo-Pacific alliances. Major Powers have reached a new level of collaboration and have strengthened their contacts in the areas of security, business, humanitarian aid and public health as a result of the swift geoeconomic and geostrategic changes in the Indo-Pacific. In order to help the region's nations recover from the Covid-19 pandemic faster and to promote environmentally sustainable development and a better future, this paper focuses on the Quad and India's cooperative posture in the Indo-Pacific.

Keywords: Indo-Pacific, Quad, India and Quad, Humanitarian assistance, HADR and AUKUS

Indo-Pacific Initiation

In the post-Cold War era, new robust economic states have emerged in the world. In the current situation, Asian nations are growing, and the Indian Ocean is quickly emerging as a region with enormous economic and human resource potential. The massive oil and gas reserves in the Middle East and North Africa are transported through this vital route. The surge of China started attempting to alter the status quo and started to displace the leading developed countries in the Indo-Pacific region. In the beginning of 21st century the major powers evinced keen

ABSTRACT

Multilateral regional organisations were founded all over the world in the decades that followed the Second World War and the Cold War. Building confidence mechanisms, regional economic integration, trade, and multilateral agreements are all activities that regional organisations are getting more and more involved in. Furthermore, they are paying more attention to matters like general notions of security, terrorism, drug trafficking, human trafficking, and more human rights, and energy and environmental concerns. The precarious conditions erupted after the disintegration of the USSR, encouraged Russia, China and the newly formed Central Asian countries to join hands for a strong regional cooperation. Thus, the Shanghai Cooperation Organisation (SCO) was founded in 2001 with an aim to enhance political, economic cooperation and evolve strategy to fight against terrorism in the Eurasian region. This paper will focus on the evolution of SCO's multilateral cooperation and engagement of member countries in economic, political, energy security and strategic areas under the regional governance.

INDIA-ASEAN NAVAL COOPERATION: AN IMPORTANT STRATEGY

Dr.G.Vijay Kumar Reddy Associate Professor Centre for Studies on Southeast Asia & Pacific Studies College of Arts S.V.University Tirupati

KEYWORDS :

India holds a primary interest in the Freedom of Navigation through the South China Sea. It also has an economic interest in exploring hydrocarbon resources in the area. But how effective are India's role as the balancing actor that the ASEAN nations seek?

Maritime cooperation is one of the important aspects of the India-ASEAN strategic partnership. The ongoing territorial disputes among some of the ASEAN nations and China in the South China Sea is challenging the regions peace and tranquillity. India holds a primary interest in the Freedom of Navigation (FON) through the South China Sea. It also has an economic interest in exploring hydrocarbon resources in the area with ONGC Videsh Ltd. (OVL) the global arm of the Indian petroleum company, Oil and Natural Gas Ltd. (ONGC) operating in two oil blocks in Vietnam. China's increasingly assertive navy make it necessary for New Delhi to maintain its stakes and safeguard its interests in the region. This in turn will require continued naval engagement with the littorals. India can be a key player in maintaining peace and security in the region and for that New Delhi must further strengthen its maritime cooperation with the Association for the South East Asian Nations, despite China's disapproval. As India looks to strengthening its ties with members of the Association for Southeast Asian nations (ASEAN), this article looks at India's naval cooperation with ASEAN countries and evaluates India's role as the balancing actor that the ASEAN nations seek.

China's growing assertiveness

The SCS is an important trade route and a major Sea Lane of Communication (SLOC)with six nations (China, Taiwan, the Philippines, Vietnam, Brunei and Malaysia) competing over territorial rights in the region. China, the most assertive in its claims, considers the entire SCS in a U shaped line as its territory.

Beijing's claims go well into the Exclusive Economic Zone (EEZ) of the other disputing nations. China's vigorous pursuance of its territorial claims concern the international community as this affects a major SLOC. China even protests India's oil exploration with Vietnam in Block 128 despite the block falling within Vietnam's EEZ. Beijing nevertheless went ahead and put the block up for bidding to international companies ignoring the fact that it is already being operated by India. The China Philippines row in 2012 over the Scarborough Shoal incident is another instance where China displayed its assertive behaviour.

While Beijing strongly opposes internationalisation of the issue and suggests that the disputes be resolved bilaterally, countries like Vietnam and the Philippines do not want to be seated alone against Beijing at the negotiating table. Hence, the countries seek extra regional powers to balance the situation.

India-ASEAN naval cooperation

India's naval cooperation with the Southeast Asian nations is an important dimension of the "Look East Policy", launched in the early 1990's. India ASEAN relations have improved incrementally in recent years with India becoming the ASEAN Sectoral Dialogue Partner in 1992, and a full Dialogue Partner as well as a member of the ASEAN Regional Forum (ARF) in 1996. In December 2012, India and ASEAN celebrated 20 years of dialogue partnership and 10 years of Summit level partnership. Today India ASEAN relations stand at an elevated echelon of a strategic partnership.

The Indian Navy has been carrying out joint exercises and military drills with the navies of the Southeast Asian nations for a long period of time. India has enhanced its naval cooperation with the ASEAN nations and seek to further strengthen its defence cooperation with the countries. However, China is wary of New Delhi's growing closeness to its ASEAN neighbours and perceives this as a strategy to counter balance a rising China. Such concerns are fuelled due to countries such as Vietnam and the Philippines, who are seeking extra regional powers to maintain their presence and encourage their engagements in the region.

It must be noted that India's naval cooperation with the ASEAN nations date back to the early 1990's. Although India and its ASEAN counterparts may not have yet realised the full potential of their naval cooperation, there has been incremental progress on this front over the years. The table below lists out the current exercises between the Indian Navy and the navies of the ASEAN nations.

The need for Indian presence is set to shoot up.

Indian presence in the region has not been fuelled solely by the recent ongoing maritime disputes. Indian presence in the South China Sea dates back to early 2000 with India's overseas naval deployment to the area as well as in the form of SIMBEX.

India has regularly deployed its vessels from its Eastern Fleet to Southeast Asia and the SCS. New Delhi has deployed its vessels for Presence-cum-Surveillance missions in the Malacca Strait, Sunda Strait and the South China Sea during May 2003 .

India also sent its aircraft carrier INS Viraat on Southeast Asia deployments to mark its presence and build its ties with the ASEAN navies complemented with high level visits on the defence front between India and the ASEAN nations. In 2003 Singapore's Defence Minister, visited India and signed an agreement on defence cooperationII . A bilateral agreement for the conduct of joint military training and exercises between the two countries was signed in 2007. New Delhi held its first India Vietnam security dialogue in 2003 and signed a Memorandum of Understanding (MoU) on defence cooperation in 2009. India also participated in a security dialogue with the Philippines in 2003III and institutionalized the Joint Defence Cooperation Committee in 2012.

Additionally, the Indian Navy frequently visits major ports in Singapore, Thailand, Vietnam, the Philippines, Cambodia and Indonesia while deployed to the SCS and Southeast Asia. The 2012 Commemorative Summit also saw the Indian Naval Ship Sudarshini embarking on a commemorative ship expedition to ASEAN countries from 15 September 2012 to 25 March 2013. The expedition retraced the sea routes linking India with South East Asia, covering most of the modern and ancient ports in the ASEAN countries. The expedition was conceptualized to demonstrate India's historical proximity with its ASEAN neighbours and to commemorate the longstanding ASEAN-India maritime and trade relationship.

Defence diplomacy

Naval goodwill visits are an important element of defence diplomacy. Defence engagements are crucial to build and maintain trust and contribute toward conflict prevention and resolution. In this, India and ASEAN share common ground wherein both parties seek to maintain peace and security in the region. This was reflected by the Vision statement adopted at the India-ASEAN commemorative Summit 2012, which underlines the importance of maritime security. "We are committed to strengthening cooperation to ensure maritime security and freedom of navigation, and safety of sea lanes of communication for unfettered movement of trade in accordance with international law,

including UNCLOS" stated the Vision Statement, highlighting the main concerns in the SCS namely freedom of navigation and the need to adhere to international rules and norms.

ASEAN nations have welcomed Indian presence in the region and wish to see India pursue its engagements. Both sides have realised the importance of India ASEAN cooperation. Indian Prime Minister Manmohan Singh underlining the need to further strengthen ties remarked in May 2013 that "...ASEAN countries are our strategic partners and there are enormous opportunities of expanding trade ties, expanding investment relations, expanding maritime cooperation, expanding the scope of trade and investment. And now we have reached a stage where large-scale flow of trade and investment is becoming a reality..." When Beijing put up Block 128 for bidding to international companies, Vietnam was enraged and protested vigorously. Vietnam then requested OVL to stay put in the block and promised more data and help to successfully drill the oil block. India had earlier decided that it may vacate the oil block due to unsuccessful drilling but reconsidered its decision. In January 2013, Vietnamese Deputy Prime Minister Mr. Vu Van Ninh invited "Indian companies to continue to invest and enter into Vietnam".

The stabilising factor

The ongoing maritime disputes in the SCS are a major concern for the ASEAN nations. It has created a rift within ASEAN as the nations are divided on how to resolve the disputes. Countries like Singapore and Vietnam believe that India can play a positive role in the regions peace and stability. India is concerned over the maritime disputes and their implications. The maritime disputes and the safety of sea lanes are discussed in all major forums between India and ASEAN for whether it is the India ASEAN Summit, or the Delhi Dialogue. What is yet to be seen if India can be the balancing actor that the region seeks.

New Delhi's presence in the area is not a strategy to counter China but rather a necessity to safeguard its interests from an increasingly assertive Beijing. India looks to increase its engagements with ASEAN nations and in turn, the Southeast Asian nations seek its presence in stabilising the region. Although there is a concerted effort for an increased cooperation on maritime security, New Delhi must be careful not to let China intimidate this collaboration. Keeping in mind the rapidly changing geo political dynamics in Asia, and India's vision of enhanced cooperation, it would be beneficial for India to remain in the area and protect its interests. New Delhi must continue to engage and cooperate with the ASEAN countries to realise its desired level of strategic partnership. This in turn would involve deepening naval cooperation with the key countries of ASEAN and major powers sharing India's interest in defending the principle of Freedom of Navigation and maintaining peace and stability. New Delhi must find the political will to be the stabilising factor that its ASEAN friends seek.

INDIA-ASEAN DEFENCE COOPERATION

Dr.V.Ramesh Babu Associate Professor, Centre for Southeast Asian & Pacific Studies, S.V.University, Tirupathi

Dr.G.Vijay Kumar Reddy* Associate Professor, Centre for Southeast Asian & Pacific Studies, S.V.University, Tirupathi*Corresponding Author

KEYWORDS :

India's defence strategy towards Southeast Asia can be understood in terms of two broad sets of strategic objectives that together drive India's relationships in the region. These include its ambitions to be the predominant power in the Ocean and a broader objective to assume a greater strategic role in Southeast Asia and the Pacific. India's aspirations to increase its defence presence in the region are broadly consistent with the perspectives of many ASEAN states, which mostly see India as a positive factor in the Southeast Asian balance of power. But India is yet to demonstrate itself as a useful and consistent security partner for much of the region. India is hindered by a lack of strategic focus and planning that is consistent with many of its strategic relationships

New Delhi sees several strategic imperatives to be the predominant power in the Indian Ocean, which includes the huge bay comprised of the Bay of Bengal and Andaman Sea. For India, the northeast represents a key defensive space against potential threats that may emanate from or through the Southeast Asian archipelago. The ability to control the sea lines of communication that cross the Bay of Bengal and Andaman Sea and enter the Pacific Ocean through the Malacca Strait would also pro-vide India with considerable strategic leverage in dealing with rival powers. The area also has numerous immediate security issues that may either directly threaten India's interests or otherwise require it to act as a regional maritime security provider, including piracy and smuggling, maritime terrorism, the activities of separatist movements in Sri Lanka, Myanmar, Thailand, and India, and territorial disputes over offshore energy resources.India's second set of strategic objectives in Southeast Asia stems from its desire to expand its strategic role in Southeast Asia and further into the Pacific. India is driven by an imperative to balance China's growing influence in Southeast Asia as well as its aspirations to expand its own strategic space. India has been relatively successful in recent years in expanding its influence in Southeast Asia in a cooperative and relatively benign manner. It has little choice but to proceed in that way. India's lack of strength compared with other major powers, particularly China, means it must remain flexible and discreet in its engagement with Southeast Asia with the expectation that its relative power will grow in coming decades.

Despite these imperatives, India does not yet have a clearly articulated strategy for its defense engagement with Southeast Asia. New Delhi has made it clear that closer defence relations with Southeast Asia is a key part of its Look East policy through which India has sought to develop a comprehensive economic, political, and security relationship with the region. At a diplomatic level, India has engaged in regional security groupings such as the ASEAN Regional Forum, the Shangri-La Dialogue and the ASEAN Defence Ministers + 8 meetings, as well as establishing regular bilateral dialogues at Defence Minister level with key states such as Singapore, Vietnam, Indonesia, Malaysia, and Thailand. New Delhi has frequently allowed the Indian Navy to lead the way in building military-to-military relationships. This has involved developing a naval presence where it could through regular exercises, coordinated patrols and ship visits. The Indian Navy has also sought to emphasize its role as a leading provider of public goods to the region, including in areas such as piracy, smuggling, maritime terrorism, and humanitarian and disaster relief. Through these means, India is seeking its gradual acceptance over time as a benign power and a preferred security partner to ASEAN, if one having a somewhat undefined role.

Although India is a strong supporter of ASEAN as a regional organization, the lack of a regional defence policy among ASEAN states means that most engagement takes place at a bilateral level. India's initial focus in expanding its influence into Southeast Asia has been on Singapore, which historically recognized India as being a natural security provider to the region. India has also had a political alliance with Vietnam stemming from the Cold War era, but which has been revived in recent years. But India will need to make considerable investments of resources and political will to develop other partners in the region, some of which have been more hesitant in recognizing India's regional security role.

India's Leading Maritime Security Role in the Indian Ocean The starting point in any discussion of India's defence strategy in Southeast Asia is India's leading maritime security role in the Indian Ocean. Key ASEAN states such as Indonesia, Malaysia, Thailand, Singapore, and Myanmar lie on or near these waters. India's role in this area is a function of its geographic advantages, its relative capabilities and its perceived strategic imperatives. India has dominated the northeast Indian Ocean since at least 1971, when the separation of Bangladesh from Pakistan removed any challenge to its position from any potential rival. India's successful naval blockade of Bangladesh severely inhibited Pakistan's ability to defend the territory and was an important reminder of the strategic consequences of control over the Bay of Bengal/Andaman Sea.

In recent years, India has been reinforcing its capabilities in the Indian Ocean. Much of India's naval modernization program over the last decade has focused on improving its capabilities. There has been an effective "rebalancing" of the proportion of defence resources committed to the India's eastern waters, reflecting relatively reduced conventional maritime threat perceptions in relation to Pakistan and relatively increased threat perceptions in relation to China. This rebalancing includes the planned construction of a major new base for the Eastern Fleet south of Visakhapatnam on India's east coast, with capacity for two aircraft carriers and nuclear submarines, among other things.

India dominant strategic position in the Indian Ocean is underpinned by its possession of the Andaman and Nicobar islands, which run north-south through the Andaman Sea near the western end of the Malacca Strait. As K. M. Panikkar once commented, the Andaman and Nicobar Islands potentially give India strategic bases "which if fully utilised in coordination with air power can convert the Bay of Bengal into a secure area."2 These islands also form a natural base for India to project power into the Malacca Strait and beyond into the South China Sea. They also have the poten-tial to dominate the Malacca Strait and have been described by a Chinese naval writer as constituting a "metal chain" that could lock the western end of the Malacca Strait tight.

Beginning in the mid-1990s, India developed extensive military facilities in the Andaman and Nicobar Islands, including port facilities to service elements of the Eastern Fleet and air bases for surveillance and strike aircraft. The operational radius of aircraft based in, or staging through, the Andaman's encompasses the Malacca Strait and large portions of the South China Sea. Under a plan announced in 2010, there will be a major development of military infrastructure, including runway upgrades and the development of port infrastructure for use by major vessels. In addition, there will be a permanent deployment of UAVs and an expansion of the 3,500-strong army brigade to divisional strength.5 In July 2012, the Indian Navy opened a new forward air base on Great Nicobar, at the northern end of the Malacca Strait, which will be used primarily for maritime surveillance. However, the Indian Air Force has not yet permanently deployed frontline strike aircraft in the islands.

Over the last two decades, the Indian Navy has played a leading role in developing cooperative security relationships with several ASEAN states bordering the Bay of Bengal/Andaman Sea, including through conducting joint naval patrols, bilateral exercises, and hosting the biennial MILAN "gathering" of regional navies at Port Blair in the Andaman Islands. The absence of the United States and China from the MILAN meetings is a none-too-subtle reminder of India's assertion of regional leadership. As the same time, the Indian Navy has made considerable efforts to prove itself the leading provider of public goods to the region, providing maritime security in areas such as piracy, smuggling, refugees, terrorism and separatism. The Indian Navy has also demonstrated its capabilities to provide humanitarian assistance and disaster relief to several ASEAN states, including following the 2004 Tsunami, which affected much of the northeast Indian Ocean, the 2007 Cyclone Sidr in Bangladesh, and 2008 Cyclone Nargis in Myanmar. All of these initiatives help legitimize India's naval presence in the region.

India's Maritime Security Ambitions in the Malacca Strait

A focal point of India's maritime security ambitions in the northeast Indian Ocean is its ambitions in the Malacca Strait, which is identified by the Indian Navy as part of its "primary area of interest." The Malacca Strait is the primary route for sea traffic between the Indian and Pacific Oceans and one of the world's busiest waterways, including a projected 140,000 ship movements per annum by 2020. Around one third of global trade and the bulk of energy supplies from the Middle East to East Asia transit it. An ability to exert negative control over the Strait would be significant for India's strategic role in Southeast Asia, and indeed the entire Indian Ocean. Some claim that for India the Strait represents a rough counterpart to the strategic importance of the Panama Canal to the United States.8 Kaplan describes the Strait as being as strategically significant in coming decades as was the Fulda Gap during the Cold War.

India's defense facilities in the Andaman and Nicobar Islands provide it with considerable measure of potential control over the western approaches to the Malacca Strait. Over the last decade India has also sought to develop an active security role—either direct or indirect—inside the Strait. At the turn of this century there were considerable concerns about piracy and the potential for maritime ter-rorists to block use of the Strait. In 2002, following an unsolicited request from the United States, India provided naval escorts for high-value commercial traffic through the Strait as part of the US-led Operation Enduring Freedom. India's participation in the operation was supported by Singapore (which hosted Indian naval vessels), and India is believed to have consulted Malaysia and Indonesia as well as the Philippines and Australia on the initiative. As the Chairman of the U.S. Joint Chiefs of Staff, General Pace, commented in 2006, the United States was "very comfortable with the fact that India has offered its assistance" in providing security in the Strait.

Most ASEAN states now see India's defence presence in the Indian Ocean in relatively benign terms and regard India as a net security provider. This contrasts with a degree of unease felt in the region during the 1980s about India's ambitious naval modernization plans and what was seen to be its opaque intentions. Regional perspectives about India also contrast sharply with perspectives on China's naval build up in the South China Sea, which is now seen as a major destabilizing factor in the region. But India's ambitions in the Malacca Strait are seen somewhat differently from its presence in the Bay of Bengal/Andaman Sea and there seems little prospect at the moment that all the littoral states will agree to giving India a direct security role in the Strait. Among other things, there are few immediate security threats (such as piracy and maritime terrorism) to be addressed and any Indian naval presence in the Strait would likely be regarded as highly provocative by China. But if the security environ-ment changes and littoral states come under increased pressure to take action on Strait security they may allow India to participate in Strait security on their terms. Any secu-rity role for India would be a significant, not only with respect to the Malacca Strait, but also in legitimizing India's claims to be a benign security provider to the region as a whole.

India's Defence Engagement with Southeast Asia

India's second set of strategic objectives in Southeast Asia relate to its broader ambitions to expand its political and security role in the region. India is driven not only by an imperative to balance China's growing influence in Southeast Asia but also by its aspirations to expand its own strategic space into the region as part of its own growing economic and military power. Several Southeast Asian states are encouraging India to play a greater role in the region as a useful balance to China.

The United States is also encouraging India to assume a greater role in the Southeast Asian balance of power, including through developing its defence relationships with U.S. allies and friends in the region. Washington is also actively promoting the idea of the "Indo-Pacific" as a single security region, which justifies India playing a greater political and defence role in East Asia/Pacific. In the longer term this includes poten-tially assuming a direct security role in the Malacca Strait and the South China Sea. The United States hopes that India might become an important political partner in East Asia, which can help bolster its efforts to temper China's strategic ambitions.

The majority of ASEAN states have, to a greater or lesser degree, welcomed an increased regional role for India, including in maritime security. Many now see India as potentially playing an important role in the regional balance of power through helping to ensure a balanced distribution of power in the region, alongside other key extra-regional

powers such as the United States, China, Japan and Australia. Singapore, in particular, has consistently welcomed and encouraged a balanced role for external security providers on the basis that competition between major regional powers "must be squarely confronted and cannot be wished away."Singapore's conception of a "balance of power" involves a multipolar balance that provides freedom to smaller states. As the Prime Minister Lee Hsien Loong has argued, Singapore's concept of a balance of power "depends on the competing interests of several big powers in the region, rather than on linking the nation's fortunes to one overbearing power. The big powers can keep one another in check, and will prevent any one of them from dominating the entire region, and so allow small states to survive in the interstices between them."

HOW BALOCHISTAN BECAME A PART OF PAKISTAN – A HISTORICAL PERSPECTIVE

***DR. G. VIJAY KUMAR REDDY**

**Associate Professor, Centre for Southeast Asian & Pacific Studies College of Arts S.V. University Tirupati*
Correspondence E-mail: vijaykumar67g@gmail.com

INTRODUCTION:

Baluchistan consists of the south west of Pakistan. In the west it borders with Afghanistan and Iran and in the south, it has the Arabian Sea. It accounts for nearly half the land mass of Pakistan and only 3.6% of its total population. The province is immensely rich in natural resources, including oil, gas, copper and gold. Despite these huge deposits of mineral wealth, the area is one of the poorest regions of Pakistan. A vast majority of its population lives in deplorable housing conditions where they don't have access to electricity or clean drinking water. Before the partition of India and Pakistan, Balochistan consisted of four princely states under the British Raj. These were Kalat, Lasbela, Kharan and Makran. Two of these provinces, Lasbela and Kharan, were fiduciary states placed under Khan of Kalat's rule by the British, as was Makran which was a district of Kalat. Three months before the formation of Pakistan, Muhammed Ali Jinnah had negotiated the freedom of Baluchistan under Kalat from the British. Discussions were made about Kalat's relationship with Pakistan as it was formed. This ensued a series of meetings between the Viceroy, as the Crown's Representative, Jinnah and the Khan of Kalat. This resulted in a communique on August 11, 1947, which stated that: a. The Government of Pakistan recognizes Kalat as an independent sovereign state in treaty relations with the British Government with a status different from that of Indian States. b. Legal opinion will be sought as to whether or not agreements of leases will be inherited by the Pakistan Government. c. Meanwhile, a Standstill Agreement has been made between Pakistan and Kalat. d.

Role of Women in Tourism Sector

Dr.G.Vijay Kumar Reddy
Associate Professor
Centre for Studies on Southeast Asia & Pacific Studies
College of Arts
S.V.University
Tirupati

There is no denying the fact that women in India have made a considerable progress in almost seven decades of Independence, but they still have to struggle against many handicaps and social evils in the male-dominated society. Many evil and masculine forces still prevail in the modern Indian society that resists the forward march of its women folk. It is ironical that a country, which has recently acclaimed the status of the first Asian country to accomplish its Mars mission in the maiden attempt, is positioned at the 29th rank among 146 countries across the globe on the basis of Gender Inequality Index. There has been amelioration in the position of women, but their true empowerment is still awaited.

Swami Vivekananda, one of the greatest sons of India, quoted that, “There is no chance for the welfare of the world unless the condition of women is improved, It is not possible for a bird to fly on only one wing.” Therefore, the inclusion of ‘Women Empowerment’ as one of the prime goals in the eight Millennium Development Goals underscores the relevance of this fact. Thus, in order to achieve the status of a developed country, India needs to transform its colossal women force into an effective human resource and this is possible only through the empowerment of women.

Causes for the conflict in Baluchistan

Dr.G.Vijay kumar Reddy
Associate Professor
Centre for Studies on Southeast Asia & Pacific Studies
College of Arts
S.V.University
Tirupati

Background:

The landscape of Baluchistan is comprised of an area over half a million square kilometers in the southeastern part of the Iran plateau, south of the central deserts and the Helmand river. The Baluchs are the main ethnic group in the province, followed by Pashtuns. The majority of the inhabitants are Sunni Muslims. A small number of Shia's and Hindus also reside in the province. The province is divided between three countries: Afghanistan, Pakistan and Iran. The largest part of Baluchistan belongs to Pakistan. In spite of the natural resources in the Baluchistan province including chromites, fluorite, marble, gold, gas, iron and petroleum which are of prominent importance , it has remained one of the poorest provinces in Pakistan. The province has been marginalized throughout history. The history of the conflict in the province goes back to the independence of Pakistan in 1947. The first conflict arose in 1948, when Kalat, a part of the current Baluchistan, chose independence. This was followed by further conflict in 1958-59 and 1963-69. These conflicts were about the One Unit policy and military bases in Baluchistan. In 1973-79 President Bhutto dismissed the provincial government of Baluchistan, which led to an armed insurgency and revolt. From 2005 to now, there have been several issues driving the protracted conflict in the province such as the attack on General Shujaat Zamir, Inspector of the Frontier Corps of Pakistan and his deputy in Baluchistan Province in 2005, killing of the 79 year old Baluch political leader Nawab Akbar Khan Bugti in 2006, detention of the two leaders of the Baluch movement in 2009, and the announcement of the Council for Independent Baluchistan by Mir Suliman Dawood the Khan of Kalat in late 2009. The Islamic Republic of Pakistan has accused the army of Baluchistan of engaging in violent incidents.

Tourism Sector:

The hospitality sector is linked to the tourism sector. The sector that employs millions of Indians started bouncing back after the first wave, but the second wave of covid was back for the devastation! The tourism sector contributes nearly 7% to India's annual GDP. It comprises hotels, homestays, motels and more. The restrictions due to the second wave have crippled the tourism sector, which was already struggling to recover from the initial loss suffered by the businesses in 2020.

Aviation and Travel sector:

Aviation and other sector establishments faced a massive struggle during the second wave of the pandemic. The larger travel sector is also taking a hit as people are scared to step out of their homes. For airlines and the broader travel sector, its recovery will depend on whether people in future will opt for such services. At present, the outlook for the aviation and broader travel sector does not look good.

Automobile sector:

The automobile sector is expected to remain under pressure in the near term due to the covid-19 situation in India.

Real Estate and Construction sector:

The real estate and construction activities have started facing a disruption during the second wave as a large number of migrant workers have left the urban areas. The situation has not been grave as of 2020 for this sector.

Fiscal Deficit:

The Covid-19 pandemic has not affected our fiscal deficit and disinvestment target much. In this year's union budget, Finance minister Nirmala Sitharaman announced a fiscal deficit target of 6.8% for 2021 to 2022. India's fiscal deficit for 2020-21 zoomed to 9.5% of GDP as against 3.5% projected earlier. Our finance minister has promised to achieve a fiscal deficit of 4.5% of GDP by 2025-26 by increasing the steaming tax revenues through increased tax compliance as well as asset monetization over the years. According to the medium-term fiscal policy statement that the government had presented in February 2020, the fiscal deficit for 2021-22 and 2022-23 was at 3.3% and 3.1% respectively.

The impact of the lockdowns and restrictions:

The extents to which localised lockdowns and restrictions have been imposed in the past have impacted the economic recovery timeliness. There is a scope for sustained fiscal stimulus going throughout the year. To some extent, if credit is made available to businesses at low-interest rates, then monetary stimulus is also possible. The second wave has pushed back India's fragile economic recovery. Rising inequality and strained household balance sheets have constrained the recovery. From growing only 4% in 2019-20 to contracting 7-8% in 2020-21 to staring at another low economic growth recovery in 2021, India has been virtually stopped in all its tracks. Therefore, fiscal policy must lend a generous helping hand to lead vulnerable businesses and households towards economic recovery.

What is the path to recovery?

If the outbreak worsens over time, or if the case numbers are very high, this would elevate the risk to India's economic and fiscal recovery. The Indian economy should resume its recovery once the covid waves recede and the Indian economy will continue to grow at a faster pace than its peers at similar levels of per capita income around the world. On the downside, there will be less vigorous recoveries in the government revenues and severe downside scenarios may entail additional fiscal spending. Commodities and the automobile sector are severely affected by the initial stream of infections and associated lockdown measures. It recovered strongly in the second half of 2021.

The recovery in the global economy has made it unlikely that a sharp price decline like 2020 will happen again. The pent up demand in the automobile sector will likely drive a strong recovery when curbs are relaxed as was seen in 2020. The second wave of covid-19 has challenged an otherwise strong recovery for Indian Infrastructure. As consumers strive to maximize their utility, they will maintain earning due to regulated returns, fixed tariffs and quick recovery in demand. Airports are most at risk with international traffic recovery likely delayed by another year. This may impede a strong domestic recovery if the government increases the severity and scope of restrictions on mobility. A strong recovery is needed after a crushing 2020. As the outbreak grew worse the state governments have applied re-

strictive lockdown measures that halted the budding economic recovery in tracks.

Downgrades are a warning not to take economic recovery for granted. The slow pace of vaccinations is likely to be a burden on India's economic recovery. The Indian recovery has been vigorous across many sectors particularly in the last quarter of fiscal 2021. Halts to domestic air traffic and subdued international travel have dismantled recovery for airports. The covid wave has hit small and medium-size enterprises particularly hard. It has delayed recovery in banks' asset quality. Mobility has been down to 50-60% of the normal levels. Therefore, people are staying home more and spending less. Recovery will take hold later this year. India's budding economic recovery throughout March solidified government revenues.

Power Sector: The Indian power sector will generate huge revenues and it would track the recovery of the GDP of India.

Airports: The second wave has threatened India's air recovery traffic. The domestic passenger traffic has decreased by 75% of the pre-covid levels. The traffic recovery in the worst-case scenario could be 10% lower than what is predicted. Weaker traffic hits the cash flows of the airports. There will be a sharp recovery in road traffic after a short disruption. The commercial vehicle traffic will see better resilience as it supports logistics and essential services.

Ports: A modest recovery will be witnessed by import volumes. Fertilizers and containers will increase at a greater pace than crude and coal segments.

Operating cash flows will recover most infrastructure and utilities such as water, sewage, dams and natural gas segments. Credit loss will remain high in the fiscal year 2022 at 2.2% of the total loans before it recovers to 1.8% in 2023. India's strong economic recovery and the steps taken by the central governments and the state government to mitigate the effects of the economic crisis have lessened the burden on the banks. Additionally, banks have raised capitals to strengthen their balance sheets. This will smoothen the hit from covid related losses. The weak consumption accompanied by large scale job losses and the salary cuts in the formal sector may hit the banking sector's loans and 'credit card' loans. This is accompanied by lower recovery rates in the bank's non-performing assets. That could lead to a rise in weaker loans.

If we have to move towards sustained and real economic growth against v-shaped, k-shaped or w-shaped paths, the states and the centre need to work towards a cooperative strategy through their "cooperative federalism" scheme to increase the vaccination drive.

In 2020, the government chose life over livelihoods. By choosing to protect the former, the covid 1.0 was delayed in September and its intensity was much lower than predicted. By January 2021, the government had declared victory over covid-19. The first threat to economic recovery is the regional cases which are resulting in further extension of lockdowns and hence they are limiting the pace of economic recovery. The second threat is the vaccination rates arising from the vaccine supply. Without inoculating a major portion of our labour force, there is a threat that viruses will disrupt our real economy. It is apparent from the worldwide cases of Covid-19.

Indians in Indonesia: A Study

Dr. G. Vijay Kumar Reddy

It must be a touch of magic that has drawn Indians to Indonesia for two millennia. Indians have historically made the journey to Indonesia - a name derived from the Latin Indus, meaning "India", and the Greek Nesos, meaning "island", in search of economic opportunities, to find sources of livelihood and success for themselves and their families.

The abundant friendly faces and easy smiles have captivated Indian migrants for centuries and even today, ask any Indian expatriate: they would like to grow roots in Indonesia. If they move to any other part of the world, they yearn to come back. It is like coming home, because after all, Indonesia is a cultural Godchild of India. The underlying philosophical concepts introduced since the 5th century by the Brahman priests have had a profound effect in shaping every facet of Indonesian society.

At present, individuals of Indian descent are found in nearly all sizeable towns of the Indonesian archipelago, from Banda Aceh at the northern end of the island of Sumatra to Jayapura in Irian Jaya, near the eastern boundary of the republic. However the Indian population is concentrated in Medan, Jakarta, Bandung and Surabaya. The Indians here form a continuum between two extremes. Between short term visitors with their homes in India at one extreme; and Indonesians of Indian descent who do not identify themselves as being Indian in any way, at the other extreme.

The Indian community of Indonesia is generally well-to-do. They have assimilated well, have cordial relationship with the local community as well as close connections with government officials and politicians. In the 20th century, Indian enterprise was characterized by the traders of Sindhi and Punjabi origin, who migrated and settled in Indonesia. They setup prominent businesses in textiles, garments, entertainment, sports goods, chemicals and general trading. The garment trade is still largely controlled by them in Indonesia.

The first Indian migrants came primarily from Gujarat in India during the first Christian era. This followed the introduction of the Sanskrit language which led to the development of the Kawi language and script. Early trade relations were established between India and the islands of Sumatra, called 'Swarna Dwipa' or "the island of gold," and 'Java Dwipa' or "the rice island". The influx of Indian settlers continued till the 16th century and this period is historically referred to as the Hindu-Indonesian period.

Indian culture and customs were introduced and soon colored the entire fabric of Indonesian society from government, military, literature, music and dances, architecture, and religious practices and rituals. The Hindu literary works known as Vedas and the "Mahabharata" and "Ramayana" epics gained popularity and continue to be an integral part of present day Indonesia.

The modern aspect of the relationship between the two countries grew out of their respective struggles for independence and through personal friendship between the leaders of the new nations - Sukarno, Mohammad Hatta, Sutan Sjahrir and Jawaharlal Nehru. "Today, India and Indonesia share a common commitment to democracy, pluralism and unity in diversity and at the same time face similar challenges and opportunities" said Indian President Pratibha Patil, during her last visit to Indonesia.

The recent global financial crisis has further put a spotlight on the tremendous inherent potential of the two nations. These growing economic powerhouses are being variously clubbed together. New areas of cooperation are being discussed and there is a renewed entrepreneurial effort by businessmen of both countries to capitalize on the burgeoning opportunities. The new Indian migrant to Indonesia is no longer ethno-centric but opportunistic and individualistic, investing in the shared bilateral dream. The sense of the local ethnic Indian Indonesian too has changed from a rigid network to a more flexible and social community due to increased acceptance and points of interaction. There is also a focus on community development and philanthropy, with a genuine feeling of oneness.

It is now that Indians in Indonesia, people who belong to many different regional and linguistic groups, castes, religions, and traditions are developing, with greater confidence, a sense of Indian identity, unity and sense of pride. They are indeed

"Associate Professor "Centre for Southeast Asia and Pacific Studies, "Sri Vekateswara University, Tirupati. -517502,AP

living up to their host country's official national motto Bhinneka Tunggal Ika - a unity that draws strength from diversity.

Although a predominantly Muslim region now, Java, home of Jakarta and the most densely populated of Indonesia's islands, has a long Hindu history. Figures from Hindu mythology continue to have a popular resonance here. Garishly painted advertisements on public buses, for example, market an energy drink called Kuku Bima Ener-G. The name is a reference to the mighty Pandava, Bhima (in fact the father of Gatotkatcha) also of Mahabharata fame. Kuku Bima Energ-G is, however, not to be confused with Kuku Bima, a traditional medicinal potion with benefits for "men's health." It transpires that in one of the Javanese versions of the Mahabharata, Bhima draws the irrigation lines of Java's rice fields with his fingernail. This is the allusion in the name Kuku Bima: a vitality drink!

Java's classical Hindu history means that living in Jakarta can feel like having wandered onto the set of a Mahabharata TV serial. People pepper ordinary conversation with words like "manushya" (man) and "karena" (because). The explanation lies in the fact that Sanskrit forms the basis for a substantial part of the vocabulary of Bahasa Indonesia, the national language.

Indians have been living in Indonesia for centuries, from the time of the Sri Vijaya and Majaphit Empire, both of which were Hindu and heavily influenced by the subcontinent. Indians were later brought to Indonesia by the Dutch in the 19th century as indentured labourers to work on plantations located around Medan in Sumatra. While the majority of these came from South India, a significant number also came from the north. The Medan Indians included Hindus, Muslims and Sikhs. They have now been in Indonesia for over four generations, and hold Indonesian passports. While local statistics continue to suggest that there are some 400 PIOs in Sumatra, the vast majority are now completely assimilated in Indonesian society, though some elements of the Tamil, Sikh and Bihari Communities still maintain their cultural traditions.

The Indian Diaspora also includes several thousand Sindhi families who constitute the second wave of Indian immigrants who made Indonesia their home in the first half of the 20th century. The Sindhi community is mainly engaged in trading and commerce. Among these communities, Tamils and to a lesser extent Sikhs were primarily engaged in agriculture, while Sindhis and Punjabis mainly established themselves in the textile trade and the sports business.

Tamils have lived in Indonesia since the 1930s; though predominantly in Medan, Tamil business men have set up various enterprises. Waves of expatriates speaking Tamil language have set up home in Indonesia. Indonesia Tamil Manram, a social organisation is very active In Jakarta. The organisation is also involved in welfare activities. Indonesian Tamil Manram also teaches the Tamil language to children with Tamil as their mother tongue, conducts interesting programs involving Tamil language and culture, distributes Tamil literature and books to children, organizes Tamil debates, dramas, dance and music programs for local talent, and brings reputable artists from India in the fields of dance, music, drama, and other cultural fields.

Many feel that India is becoming culturally individualistic and aggressive which stands in contrast to Indonesia. The latter is more collaborative in nature. "In Indonesia, the collaborative attitude actually flows from Hindu-Buddhist tradition, but the fear is that two may collide one day because of Make in India campaign," says Amol.

Life for an expat or person of an Indian origin is almost like a rhythm. "We follow every festival. We celebrate them together. Outside India, we are Indians first," says Shanti, an expat who lives in Jakarta. The religious festivals for Indians outside become cultural festivals, a glue which binds them over parochial difference of caste, language and religion. The other side, the majority too is religious and religious space is being contested between conservatives and people who want tolerant Islam.

The evolution of Islamic Terrorism

Dr.G.Vijay Kumar Reddy

Definition of Terrorism

"The unlawful use of — or threatened use of — force or violence against individuals or property to coerce or intimidate governments or societies, often to achieve political, religious, or ideological objectives."

— U.S. Department of Defense publication

In the wake of the Sept. 11, 2001 terrorist attacks on the U.S., the threat of militant Islamic terrorism -- rooted in the Middle East and South Asia -- has taken center stage. While these extremely violent religious extremists represent a minority view, their threat is real. As pointed out by RAND's Bruce Hoffman, in 1980 two out of 64 groups were categorized as largely religious in motivation; in 1995 almost half of the identified groups, 26 out of 56, were classified as religiously motivated; the majority of these espoused Islam as their guiding force.

To better understand the roots and threat of militant Islam, here's a closer look at how modern terrorism has evolved in the Middle East and South Asia.

The Dawn of modern International Terrorism

The colonial era, failed post-colonial attempts at state formation, and the creation of Israel engendered a series of Marxist and anti-Western transformations and movements throughout the Arab and Islamic world. The growth of these nationalist and revolutionary movements, along with their view that terrorism could be effective in reaching political goals, generated the first phase of modern international terrorism.

In the late 1960s Palestinian secular movements such as Al Fatah and the Popular Front for the Liberation of Palestine (PFLP) began to target civilians outside the immediate arena of conflict. Following Israel's 1967 defeat of Arab forces, Palestinian leaders realized that the Arab world was unable to militarily confront Israel. At the same time, lessons drawn from revolutionary movements in Latin America, North Africa, Southeast Asia as well as during the Jewish struggle against Britain in Palestine, saw the Palestinians move away from classic guerrilla, typically rural-based, warfare toward urban terrorism. Radical Palestinians took advantage of modern communication and transportation systems to internationalize their struggle. They launched a series of hijackings, kidnappings, bombings, and shootings, culminating in the kidnapping and subsequent deaths of Israeli athletes during the 1972 Munich Olympic games.

These Palestinian groups became a model for numerous secular militants, and offered lessons for subsequent ethnic and religious movements. Palestinians created an extensive transnational extremist network -- tied into which were various state sponsors such as the Soviet Union, certain Arab states, as well as traditional criminal organizations. By the end of the 1970s, the Palestinian secular network was a major channel for the spread of terrorist techniques worldwide.

Key Radical Palestinian Groups

Popular Front for the Liberation of Palestine (PFLP): The PFLP, one of the original members of the PLO, [1] is a Marxist-Leninist group founded in 1967 by George Habash. The group was against the 1993 Declaration of Principles; participation in the PLO was also suspended. Participated in meetings with Arafat's Fatah party and PLO representatives in 1999 to discuss national unity but continues to oppose negotiations with Israel. Committed numerous international terrorist attacks during the 1970s, has allegedly been involved in attacks against Israel since the beginning of the second intifadah in September 2000. Syria has been a key source of safe haven and limited logistical support.

Front for the Liberation of Palestine-General Command (PFLP-GC): This group, led by Ahmed Jibril, split from the PFLP in 1968, wanting to focus more on terrorist than political action; violently opposed to the PLO and is closely tied to Syria and Iran. The PFLP-GC conducted multiple attacks in Europe and the Middle East during the 1970s and

Associate Professor
Centre for Southeast Asian & Pacific Studies
S.V.University, Tirupati

1980s. Unique in that it conducted cross-border operations against Israel using unusual means, including hot-air balloons and motorized hang gliders. Currently focused on small-scale attacks in Israel, the West Bank, and Gaza Strip.

Abu Nidal Organization (ANO): Anti-Western and anti-Israel international terrorist organization led by Sabri al-Banna; left the PLO in 1974. Organizational structure composed of various functional committees, including political, military, and financial. The ANO has carried out terrorist attacks in 20 countries, killing or injuring almost 900 persons. Targets have included the United States, the United Kingdom, France, Israel, moderate Palestinians, the PLO, and various Arab countries. Major attacks included the Rome and Vienna airports in December 1985, the Neve Shalom synagogue in Istanbul and the Pan Am flight 73 hijacking in Karachi in September 1986, and the City of Poros day-excursion ship attack in Greece in July 1988. Suspected of assassinating PLO deputy chief Abu Iyad and PLO security chief Abu Hul in Tunis in January 1991. ANO assassinated a Jordanian diplomat in Lebanon in January 1994. Has not attacked Western targets since the late 1980s. Al-Banna relocated to Iraq in December 1998, where the group maintains a presence. Financial problems and internal disorganization have reduced the group's capabilities; activities shut down in Libya and Egypt in 1999.

While these secular Palestinians dominated the scene during the 1970s, religious movements also grew. The failure of Arab nationalism in the 1967 war resulted in the strengthening of both progressive and extremist Islamic movements. In the Middle East, Islamic movements increasingly came into opposition with secular nationalism, providing an alternative source of social welfare and education in the vacuum left by the lack of government-led development -- a key example is The Muslim Brotherhood. Islamic groups were supported by anti-nationalist conservative regimes, such as Saudi Arabia, to counter the expansion of nationalist ideology. Yet political Islam, [2] more open to progressive change, was seen as a threat to conservative Arab regimes and thus support for more fundamentalist -- and extremist -- groups occurred to combat both nationalist and political Islamist movements.

Meanwhile, in Iran, a turn to revolutionary Shia Islam under the leadership of Ayatollah Khomeini further eroded the power and legitimacy of the U.S.-backed authoritarian Pahlevi regime, setting the stage for the Shah's downfall.

1979 - 1991: The Afghan Jihad and State Sponsors of Terrorism

The year 1979 was a turning point in international terrorism. Throughout the Arab world and the West, the Iranian Islamic revolution sparked fears of a wave of revolutionary Shia Islam. Meanwhile, the Soviet invasion of Afghanistan and the subsequent anti-Soviet mujahedeen war, lasting from 1979 to 1989, stimulated the rise and expansion of terrorist groups. Indeed, the growth of a post-jihad pool of well-trained, battle-hardened militants is a key trend in contemporary international terrorism and insurgency-related violence. Volunteers from various parts of the Islamic world fought in Afghanistan, supported by conservative countries such as Saudi Arabia. In Yemen, for instance, the Riyadh-backed Islamic Front was established to provide financial, logistical, and training support for Yemeni volunteers. So called "Arab-Afghans" have -- and are -- using their experience to support local insurgencies in North Africa, Kashmir, Chechnya, China, Bosnia, and the Philippines.

In the West, attention was focused on state sponsorship, specifically the Iranian-backed and Syrian-supported Hezbollah; state sponsors' use of secular Palestinian groups was also of concern. [3] Hezbollah pioneered the use of suicide bombers in the Middle East, and was linked to the 1983 bombing and subsequent deaths of 241 U.S. marines in Beirut, Lebanon, as well as multiple kidnappings of U.S. and Western civilians and government officials. Hezbollah remains a key trainer of secular, Shia, and Sunni movements. As revealed during the investigation into the 1988 bombing of Pan Am Flight 103, Libyan intelligence officers were allegedly involved with the Palestinian Front for the Liberation of Palestine -- General Command (PFLP-GC). Iraq and Syria were heavily involved in supporting various terrorist groups, with Baghdad using the Abu Nidal Organization on several occasions. State sponsors used terrorist groups to attack Israeli as well as Western interests, in addition to domestic and regional opponents. It should be noted that the American policy of listing state sponsors was heavily politicized, and did not include several countries -- both allies and opponents of Washington -- that, under U.S. government definitions, were guilty of supporting or using terrorism.

Key Radical Religious Groups

Hezbollah: Radical Shia group formed in 1982 in Lebanon. Strongly anti-Western and anti-Israeli. Closely allied with, and often directed by, Iran but may have conducted operations that were not approved by Tehran. Known or suspected to have been involved in numerous anti-U.S. terrorist attacks, including the suicide truck bombing of the U.S. Embassy and U.S. Marine barracks in Beirut in October 1983 and the U.S. Embassy annex in Beirut in September 1984. Elements of the group were responsible for the kidnapping and detention of U.S. and other Western hostages in Lebanon. The group also attacked the Israeli Embassy in Argentina in 1992 and is a suspect in the 1994 bombing of the Israeli cultural center in Buenos Aires. Operates in the Bekaa Valley, the southern suburbs of Beirut, and southern Lebanon. Has established cells in Europe, Africa, South America, North America, and Asia. Receives substantial amounts of financial, training, weapons, explosives, political, diplomatic, and organizational aid from Iran and Syria.

Egyptian Islamic Jihad (EIJ - Al-Jihad, Jihad Group, Islamic Jihad): Egyptian group active since the late 1970s. The EIJ is apparently split into two factions: one led by Ayman al-Zawahiri - who currently is in Afghanistan and is a key leader in the Usama bin Laden (UBL) network - and the Vanguards of Conquest (Talaa' al-Fateh) led by Ahmad Husayn Agiza. Abbud al-Zumar, leader of the original Jihad, is imprisoned in Egypt and recently joined the group's jailed spiritual leader, Shaykh Umar Abd al-Rahman, in a call for a "peaceful front." The group's traditional goal is the overthrow of the Egyptian Government and creation of an Islamic state. Given its involvement with UBL, EIJ is likely increasingly willing to target U.S. interests. The group has threatened to strike the U.S. for its jailing of Shaykh al-Rahman and the arrests of EIJ cadres in Albania, Azerbaijan, and the United Kingdom..

Palestinian Islamic Jihad (PIJ): The PIJ, emerging from radical Gazan Palestinians in the 1970s, is apparently a series of loosely affiliated factions rather than a cohesive group. The PIJ focus is the destruction of Israel and the creation of a Palestinian Islamic state. Due to Washington's support of Israel, the PIJ has threatened to strike American targets; the PIJ has not "specifically" conducted attacks against U.S. interests; Arab regimes deemed as un-Islamic are also threatened. The group has stated its willingness to hit American targets in Jordan. PIJ cadres reportedly receive funding from Tehran and logistical support from Syria.

Islamic Resistance Movement (HAMAS): Emerging from the Muslim Brotherhood during the first Palestinian intifadah (1987), HAMAS has become the primary anti-Israeli religious opposition in the occupied territories. The group is mainly known for its use of suicide bombers and is loosely organized, with centers of strength in Gaza and certain areas in the West Bank. HAMAS, while condemning American policies favoring Israel, has not targeted the U.S. directly.

Al-Gamaat Al-Islamiyya (IG - the Islamic Group, al-Gama'at, Islamic Gama'at, Egyptian al-Gama'at al-Islamiyya, GI): The IG, begun in the 1970s, is the largest of the Egyptian militant groups. Its core goal is the overthrow of the Cairo regime and creation of an Islamic state. The IG appears to be a more loosely organized entity than the EIJ, and maintains a globally present external wing. IG leadership signed Usama Bin Ladin's February 1998 anti-U.S. fatwa but has denied supporting UBL. Shaykh Umar Abd al-Rahman is al-Gama'at's spiritual leader, and thus the U.S. has been threatened with attack. From 1993 until the cease-fire, al-Gama'a launched attacks on tourists in Egypt, most notably the attack in November 1997 at Luxor that killed 58 foreign tourists. Also claimed responsibility for the attempt in June 1995 to assassinate Egyptian President Hosni Mubarak in Addis Ababa, Ethiopia. Has a worldwide presence, including Sudan, the United Kingdom, Afghanistan, Austria, and Yemen. The Egyptian Government believes that Iran, Bin Ladin, and Afghan militant groups support the organization.

1990 - 2001: The Globalization of Terror

The disintegration of post-Cold War states, and the Cold War legacy of a world awash in advanced conventional weapons and know-how, has assisted the proliferation of terrorism worldwide. Vacuums of stability created by conflict and absence of governance in areas such as the Balkans, Afghanistan, Colombia, and certain African countries offer ready made areas for terrorist training and recruitment activity, while smuggling and drug trafficking routes are often exploited by terrorists to support operations worldwide. With the increasing ease of transnational transportation and communication, the continued willingness of states such as Iran and Iraq to provide support, and dehumanizing ideologies that

enable mass casualty attacks, the lethal potential of terrorist violence has reached new heights.

The region of Afghanistan -- it is not a country in the conventional sense -- has, particularly since the 1989 Soviet withdrawal, emerged as a terrorist training ground. Pakistan, struggling to balance its needs for political-economic reform with a domestic religious agenda, provides assistance to terrorist groups both in Afghanistan and Kashmir while acting as a further transit area between the Middle East and South Asia.

Since their emergence in 1994, the Pakistani-supported Taliban militia in Afghanistan has assumed several characteristics traditionally associated with state-sponsors of terrorism, providing logistical support, travel documentation, and training facilities. Although radical groups such as the Egyptian Islamic Jihad, Osama bin Laden's Al Qaeda, and Kashmiri militants were in Afghanistan prior to the Taliban, the spread of Taliban control has seen Afghan-based terrorism evolve into a relatively coordinated, widespread activity focused on sustaining and developing terrorist capabilities. Since the mid-1990s, Pakistani-backed terrorist groups fighting in Kashmir have increasingly used training camps inside Taliban-controlled areas. At the same time, members of these groups, as well as thousands of youths from Pakistan's Northwest Frontier Province (NWFP), have fought with the Taliban against opposition forces. This activity has seen the rise of extremism in parts of Pakistan neighboring Afghanistan, further complicating the ability of Islamabad to exert control over militants. Moreover, the intermixing of Pakistani movements with the Taliban and their Arab-Afghan allies has seen ties between these groups strengthen.

Since 1989 the increasing willingness of religious extremists to strike targets outside immediate country or regional areas underscores the global nature of contemporary terrorism. The 1993 bombing of the World Trade Center, and the Sept. 11, 2001, attacks on the World Trade Center and Pentagon, are representative of this trend.

Key Groups in the New Phase of Militant Islamic Terrorism

Al-Qaeda (The Base): Established by Usama Bin Ladin (UBL) circa 1990, Al Qaeda aims to coordinate a transnational mujahideen network; stated goal is to "reestablish the Muslim State" throughout the world via the overthrow of corrupt regimes in the Islamic world and the removal of foreign presence - primarily American and Israeli - from the Middle East. UBL has issued three anti-U.S. fatwas encouraging Muslims to take up arms against Washington's "imperialism." Al Qaeda provides financial, manpower, transportation, and training support to extremists worldwide. In February 1998 bin Ladin issued a statement under the banner of "The World Islamic Front for Jihad Against The Jews and Crusaders," saying it was the duty of all Muslims to kill U.S. citizens, civilian or military, and their allies. Allegedly orchestrated the bombings of the U.S. Embassies in Nairobi, Kenya and Dar Es Salaam, Tanzania, on August 7, 1998. Claims to have been involved in the 1993 killing of U.S. servicemen in Somalia and the December 1992 bombings against U.S. troops in Aden, Yemen. Al Qaeda serves as the core of a loose umbrella organization that includes members of many Sunni Islamic extremist groups, including factions of the Egyptian Islamic Jihad (EIJ), the Gama'at al-Islamiyya (IG), and the Harakat ul-Mujahidin (HUM). The group is a prime suspect in the Sept. 11 attacks as well as the U.S.S Cole bombing.

Armed Islamic Group (GIA): Having initiated terrorist activities in 1992 following Algiers refusal to accept a democratically elected Islamist government, the GIA has conducted multiple mass killings of civilians and assassinations of Algerian leaders. While present in areas such as Yemen, the GIA reportedly does not target the U.S. directly. However, it is possible that GIA splinter movements or personnel may become involved in anti-U.S. action.

Aden-Abyan Islamic Army (AAIA): The Aden-Abyan Islamic Army is allegedly affiliated to the Yemeni Islamic Jihad and has been implicated in acts of violence with the stated goal to "hoist the banner of al-Jihad, and fight secularism in Yemen and the Arab countries." Aden-Abyan Islamic Army leader Zein al-Abideen al-Mehdar was executed for participating in the December 1998 kidnapping of 16 Western tourists. Four of the hostages were killed and another 13 hostages were freed when Yemeni security forces attacked the place where the hostages were being held. In March 1999 the group warned the U.S. and British ambassadors in Yemen to leave immediately.

Harakat ul-Mujahidin (HUM): Formerly part of the Harakat al-Ansar (HUA), the Pakistani-based HUM operates primarily in Kashmir. Long-time leader of the group, Fazlur Rehman Khalil, in mid-February stepped down; the popular Kashmiri commander

and second-in-command, Farooq Kashmiri, assumed the reigns. Khalil, who has been linked to Bin Ladin and signed his fatwa in February 1998 calling for attacks on U.S. and Western interests, assumed the position of HUM Secretary General. The HUM is linked to the militant group al-Faran that kidnapped five Western tourists in Kashmir in July 1995; one was killed in August 1995 and the other four reportedly were killed in December of the same year. Supporters are mostly Pakistanis and Kashmiris and also include Afghans and Arab veterans of the Afghan war. The HUM trains its militants in Afghanistan and Pakistan.

Jaish-e-Mohammed (Army of Mohammed): The Pakistan-based Jaish-e-Mohammed (JEM) has greatly expanded since Maulana Masood Azhar, a former ultra-fundamentalist Harakat ul-Ansar (HUA) leader, formed the group in February 2000. The group's aim is to unite Kashmir with Pakistan. It is politically aligned with the radical, pro-Taliban, political party, Jamiat-i Ulema-i Islam (JUI-F). The JEM maintains training camps in Afghanistan. Most of the JEM's cadre and material resources have been drawn from the militant groups Harakat ul-Jihad al-Islami (HUJI) and the Harakat ul-Mujahedin (HUM). The JEM has close ties to Afghan Arabs and the Taliban. Usama Bin Ladin is suspected of giving funding to the JEM. Group by this name claimed responsibility for the USS Cole attack.

Lashkar-i-Taiba (LT) (Army of the Righteous): The LT is the armed wing of the Pakistan-based religious organization, Markaz-ud-Dawa-wal-Irshad (MDI)--a Sunni anti-U.S. missionary organization formed in 1989. One of the three largest and best-trained groups fighting in Kashmir against India, it is not connected to a political party. The LT leader is MDI chief, Professor Hafiz Mohammed Saeed. Almost all LT cadres are foreigners--mostly Pakistanis from seminaries across the country and Afghan veterans of the Afghan wars. The LT trains its militants in mobile training camps across Pakistan-administered Kashmir and Afghanistan.

What produces terrorists and what conditions allow them to multiply in number and power in the Muslim world? While many studies point to the important role public opinion plays in creating an environment in which terrorist groups can flourish, relatively few works have explored survey data to measure support for terrorism among general publics.

ABSTRACT

The economic relations and international trade have assumed a considerable significance because of the key role they play in accelerating the pace of development and growth. The subject has since occupied Centre stage in the wake of recent worldwide economic development and growth. The successful conclusion of the prolonged GATT (General Agreement on Tariffs and Trade) at WTO (World Trade Organization) in 1995, multilateral trade negotiations and the thrust on globalization in the Third World has created unprecedented developments, which have exercised a profound impact on international trade. The Globalization, economic liberalization, structural reforms, and global integration have become a common phenomenon in the developing countries in recent years. In their efforts to activate international competitiveness in exports and to integrate their economies in the global economy, developing nations have started liberalizing their trade regimes and opening their markets for foreign competition. India's total trade with China in 2021 was worth $125.7 billion. The sharp uptick in imports on a large base has pushed India's trade deficit with China to a record high $69.4 billion in 2021, up from $45.9 billion in 2020 and $56.8 billion in 2019. Some of India's key imports from China include smartphones, components for smartphones and automobiles, telecom equipment, plastic and metallic goods, active pharmaceutical ingredients (APIs), and other chemicals. Experts have noted that players in the Indian electronic goods space are still largely focused on the assembly of products and did not have much discretion in sourcing of components. India's exports to China grew to $28.1 billion in calendar year 2021, up 34.9 per cent from exports worth $20.9 billion in 2020, which was impacted by Covid-19 related restrictions, according to Chinese government data. India's exports to China in 20201 were 56.5 per cent higher than exports in 2019, which was not impacted by the pandemic. Raw material exports constitute a significant portion of India's outbound trade with China with iron ore, organic

The Impact of Covid-19 on Indian Economy

Dr.V.Ramesh Babu

As per the official data released by the ministry of statistics and program implementation, the Indian economy contracted by 7.3% in the April-June of 2021 year. This is the worst decline ever observed since the ministry had started compiling GDP stats quarterly in 1996. In 2020, an estimated 10 million migrant workers returned to their native places after the imposition of the lockdown. But what was surprising was the fact that neither the state government nor the central government had any data regarding the migrant workers who lost their jobs and their lives during the lockdown.

The government extended their help to migrant workers who returned to their native places during the second wave of the corona, apart from just setting up a digital-centralized database system. The second wave of Covid-19 has brutally exposed and worsened existing vulnerabilities in the Indian economy. India's $2.9 trillion economy remains shuttered during the lockdown period, except for some essential services and activities. As shops, eateries, factories, transport services, business establishments were shuttered, the lockdown had a devastating impact on slowing down the economy. The informal sectors of the economy have been worst hit by the global epidemic. India's GDP contraction during April-June could well be above 8% if the informal sectors are considered. Private consumption and investments are the two biggest engines of India's economic growth. All the major sectors of the economy were badly hit except agriculture. The Indian economy was facing headwinds much before the arrival of the second wave. Coupled with the humanitarian crisis and silent treatment of the government, the covid-19 has exposed and worsened existing inequalities in the Indian economy. The contraction of the economy would continue in the next 4 quarters and a recession is inevitable. Everyone agrees that the Indian economy is heading for its full-year contraction. The surveys conducted by the Centre for Monitoring Indian Economy shows a steep rise in unemployment rates, in the range of 7.9% to 12% during the April-June quarter of 2021. The economy is having a knock-on effect with MSMEs shutting their businesses. Millions of jobs have been lost permanently and have dampened consumption. The government should be ready to spend billions of dollars to fight the health crisis and fast-track the economic recovery from the covid-19 instigated recession. The most effective way out of this emergency is that the government should inject billions of dollars into the economy.

The GDP growth had crashed 23.9% in response to the centre's no notice lockdown. India's GDP shrank 7.3% in 2020-21. This was the worst performance of the Indian economy in any year since independence. As of now, India's GDP growth rate is likely to be below 10 per cent.

The Controller General of Accounts Data for the centre's fiscal collection indicates a gross-tax revenue (GTR) of rupees 20 lakh crore and the net tax revenue of rupees 14 lakh crore for 2020-21. The tax revenue growth will be 12 per cent, which would mean the projected gross and the net tax revenues for 2020-21 would be rupees 22.7 lakh crore and 15.8 lakh crore respectively.

This suggests some additional net tax revenues to the centre amounting to rupees 0.35 lakh crores as compared to the budget magnitudes. The main expected shortfall may still be in the non-tax revenues and the non-debt capital receipts. If we look down in the past, the growth rate for the non-tax revenues and non-debt capital receipts have been volatile, but if we add them together, they average to a little lower than 15% during the five years preceding 2020-21.

How have different sectors been affected due to Covid-19?

Hospitality Sector:

As many states have imposed localised lockdowns, the hospitality sector is facing a repeat of 2020. The hospitality sector includes many businesses like restaurants, beds and breakfast, pubs, bars, nightclubs and more. The sector that has contributed to a large portion of India's annual GDP has been hit hard by restrictions and curfews imposed by the states.

ECONOMIC CO-OPERETION BETWEEN INDIA AND JAPAN

*DR. V. RAMESH BABU

*Associate Professor Centre for Southeast Asian and Pacific Studies S. V. U. College of Arts S.V. University Tirupati-517502.

ABSTRACT

The economic relations between India and Japan have vast potential for growth given the obvious complementarities that exist between the two Asian economies. Japan's interest in India is increasing due to variety of reasons including India's huge and growing market and its resources, especially the human resources. The signing of the historic India-Japan comprehensive economic partnership agreement (CEPA) and its implementation from august 2011 is expected to further accelerate growth of trade, economic and commercial relation between the two countries. India-Japan economic cooperation has also grown over the past few years Japan currently holds the position of India's 4th largest investor. In the financial year 2015-16 India and Japan bilateral trade stood at US$14513 millions along with a cumulative figure of US$ 19.43 billion of Japanese foreign investment into India over the time period from 2000 to December 2015. The two countries can also be seen engaging in crucial economic initiative figure including 2011 joint CE+PA. Which seeks to eliminate around 94% of the tariff between Japan and India within 10 years Japan and India committed to working together to promote peace stability and prosperity through economic growth and development in the Indo Pacific including Africa enhancing connectivity through quality infrastructure and capacity building of our partner.

Abstract

While on one hand, the Japanese open market has not seen growing in the product zones of India's interest, Indian business bits and pieces are opposite problems in market place right to use. Indian business would, consequently, have the option of taking part in this process of investment generated trade. The other route of admittance of India's export sectors into Japan will require language proficiency, transferring a simplified framework for market access and continuous trade elevation efforts on the part of businesses and the Government. The Government will, therefore, run exceptional programmes for trade promotion in Japan in identified segments such as textiles, garments, information technology services, pharmaceuticals, leather products and agro handled products. India and Japan was bilateral trade in 2018-19 was neighbouring to US$ 18 billion. Exports from Japan to India throughout this old-fashioned be situated US$ 12.77 billion and imports be located US$ 4.86 billion. Japan's exports to India stood 2.48 per cent of India's entire imports and India's exports to Japan be situated 1.47 per cent of India's total exports. India's primary transport crossways to Japan are petroleum foodstuffs, chemicals, fundamentals, complexes, non-metallic mineral squander, fish and fish arrangements, metalliferous ores and disagreement, sartorial and equipment, iron and steel products, textile yarn, materials and equipment . India's top three imports from Japan in 2010-11 had been sustained the same in 2018-19. These be made up of nuclear-powered reactors, boilers, equipment and mechanical utilisations electrical machinery, iron and steel. In 2010-11 these three import groups reported for from place to place 55 per cent of India's imports their share in 2018-19 fell to 48 per cent. A noteworthy strengthening in the imports of copper and its apprenticeships from Japan was experimental in 2018-19 - from 0.3 per cent in 2010-11 to 2.87 per cent in 2018-19.

India-China Political and Economic Relations: An Overview

Abstract

India and China are not mere societies they are civilizations. We do not know exactly when and how they started exchanging their cultural elements, but we do know that they grew in parallel and shared their cultural traits since the beginning of human history and this tradition of sharing has continued ever since. Even before the advent of Buddhism, the Shang-Zhou civilization and the ancient Vedic civilization in 1500-1000 B.C. showed some evidence of conceptual and linguistic exchanges. For instance,"wumingzhi" (nameless finger) in Chinese is called "anamika" (nameless) in Sanskrit and in Pali. Similarly, some ancient Indian literature mentions "chinas" referring to the Chinese people. Higher political level contacts were revived by the visit of the then External Affairs Minister, A.B. Vajpayee in February 1979. The Chinese Foreign Minister Huang Hua paid a return visit to India in June, 1981. Prime Minister Rajiv Gandhi visited China in December 1988. During this visit, both sides agreed to develop and expand bilateral relations in all fields. It was also agreed to establish a Joint Working Group (JWG) - to seek fair, reasonable and mutually acceptable solutions on the boundary question - and a Joint Economic Group (JEG). From the Chinese side, Premier Li Peng visited India in December 1991. Prime Minister Narasimha Rao visited China in September 1993. India and China shared deep cultural norms, primarily through Buddhism, which shaped both societies. India's famous Nobel Laureate, Rabindranath Tagore, took a leading role in the modern cultural exchange between India and China. Chinese philosopher Hu Shih once said that India conquered China culturally for 20 centuries without ever sending a soldier across its border, which symbolizes the rich history of cultural ties between the two civilizations.China was one of the co-sponsors of the UN resolution designating June 21 as the International Day of Yoga.The two countries have established pairs of sister cities and provinces. Examples are Fujian Province, Tamil Nadu State, Quanzhou City, and Chennai City.India-China bilateral trade which was as low as US$ 2.92 billion in 2000 reached US$ 41.85 billion in 2008, making China India's largest trading partner in goods. By 2015, as per DGC&IS provisional data India-China bilateral trade stood

AN OVERVIEW OF DIGITAL BANKING SYSTEM IN INDIA

ABSTRACT

Digital India Program was launched by Prime Minister Narendra Modi on July1, 2015. In the opening speech of this program he has been mentioned his dream from digital India i.e. for driving innovation, knowledge is strength and empowers the people, access of information knows no barrier, government is open and governance is transparent, technology ensures the citizen government interface is morally upright, governmental services are easy and efficiently available to citizens on mobile devices, government productivity engaged with people through social media, superiority education reaches the most inaccessible corners driven by digital learning, excellence health care percolates right up to remotest region powered by e health care, formers are empowered with real-time information to the connected with global market, mobile enable emergency services ensures personal security, cyber security is integral part of national security, mobile and E-banking ensures financial exclusion, ecommerce drive entrepreneurship , world looks to India for next big idea. Digital India attracted more than 4 lakh crore investments and generated more than eighteen lakh job opportunists at its launch. Second highest import category in India is electronics goods in country. This truth is hard to understand because India has largest number of IT professional and very large MSME (Micro, small and Medium) scoter still it has not developed its capabilities to manufacture in this sector. The Government has been made the strategy with a vision to make net zero import of this category. "The digital India and making in India programme is a flagship programme of the government of India with a hallucination to transform India into a digitally empowered society and knowledge economy" The ATM is the most well-known device in India, Automatic Teller Machine (ATM) the ATM is the most famous device in India, which enables customers to pull back their money 24 hours every day, 7 days per week.

KEYWORDS :

India's defence strategy towards Southeast Asia can be understood in terms of two broad sets of strategic objectives that together drive India's relationships in the region. These include its ambitions to be the predominant power in the Ocean and a broader objective to assume a greater strategic role in Southeast Asia and the Pacific. India's aspirations to increase its defence presence in the region are broadly consistent with the perspectives of many ASEAN states, which mostly see India as a positive factor in the Southeast Asian balance of power. But India is yet to demonstrate itself as a useful and consistent security partner for much of the region. India is hindered by a lack of strategic focus and planning that is consistent with many of its strategic relationships

New Delhi sees several strategic imperatives to be the predominant power in the Indian Ocean, which includes the huge bay comprised of the Bay of Bengal and Andaman Sea. For India, the northeast represents a key defensive space against potential threats that may emanate from or through the Southeast Asian archipelago. The ability to control the sea lines of communication that cross the Bay of Bengal and Andaman Sea and enter the Pacific Ocean through the Malacca Strait would also pro-vide India with considerable strategic leverage in dealing with rival powers. The area also has numerous immediate security issues that may either directly threaten India's interests or otherwise require it to act as a regional maritime security provider, including piracy and smuggling, maritime terrorism, the activities of separatist movements in Sri Lanka, Myanmar, Thailand, and India, and territorial disputes over offshore energy resources.India's second set of strategic objectives in Southeast Asia stems from its desire to expand its strategic role in Southeast Asia and further into the Pacific. India is driven by an imperative to balance China's growing influence in Southeast Asia as well as its aspirations to expand its own strategic space. India has been relatively successful in recent years in expanding its influence in Southeast Asia in a cooperative and relatively benign manner. It has little choice but to proceed in that way. India's lack of strength compared with other major powers, particularly China, means it must remain flexible and discreet in its engagement with Southeast Asia with the expectation that its relative power will grow in coming decades.

Despite these imperatives, India does not yet have a clearly articulated strategy for its defense engagement with Southeast Asia. New Delhi has made it clear that closer defence relations with Southeast Asia is a key part of its Look East policy through which India has sought to develop a comprehensive economic, political, and security relationship with the region. At a diplomatic level, India has engaged in regional security groupings such as the ASEAN Regional Forum, the Shangri-La Dialogue and the ASEAN Defence Ministers + 8 meetings, as well as establishing regular bilateral dialogues at Defence Minister level with key states such as Singapore, Vietnam, Indonesia, Malaysia, and Thailand. New Delhi has frequently allowed the Indian Navy to lead the way in building military-to-military relationships. This has involved developing a naval presence where it could through regular exercises, coordinated patrols and ship visits. The Indian Navy has also sought to emphasize its role as a leading provider of public goods to the region, including in areas such as piracy, smuggling, maritime terrorism, and humanitarian and disaster relief. Through these means, India is seeking its gradual acceptance over time as a benign power and a preferred security partner to ASEAN, if one having a somewhat undefined role.

Although India is a strong supporter of ASEAN as a regional organization, the lack of a regional defence policy among ASEAN states means that most engagement takes place at a bilateral level. India's initial focus in expanding its influence into Southeast Asia has been on Singapore, which historically recognized India as being a natural security provider to the region. India has also had a political alliance with Vietnam stemming from the Cold War era, but which has been revived in recent years. But India will need to make considerable investments of resources and political will to develop other partners in the region, some of which have been more hesitant in recognizing India's regional security role.

India's Leading Maritime Security Role in the Indian Ocean The starting point in any discussion of India's defence strategy in Southeast Asia is India's leading maritime security role in the Indian Ocean. Key ASEAN states such as Indonesia, Malaysia, Thailand, Singapore, and Myanmar lie on or near these waters. India's role in this area is a function of its geographic advantages, its relative capabilities and its perceived strategic imperatives. India has dominated the northeast Indian Ocean since at least 1971, when the separation of Bangladesh from Pakistan removed any challenge to its position from any potential rival. India's successful naval blockade of Bangladesh severely inhibited Pakistan's ability to defend the territory and was an important reminder of the strategic consequences of control over the Bay of Bengal/Andaman Sea.

In recent years, India has been reinforcing its capabilities in the Indian Ocean. Much of India's naval modernization program over the last decade has focused on improving its capabilities. There has been an effective "rebalancing" of the proportion of defence resources committed to the India's eastern waters, reflecting relatively reduced conventional maritime threat perceptions in relation to Pakistan and relatively increased threat perceptions in relation to China. This rebalancing includes the planned construction of a major new base for the Eastern Fleet south of Visakhapatnam on India's east coast, with capacity for two aircraft carriers and nuclear submarines, among other things.

CAMBODIA-FLOATING VILLAGE KAMPONG SEAM REAP

Dr. M. Padmaja Associate Professor, CSEAPS, S.V.University, Tirupati.

KEYWORDS :

Lord Venkateswara is known has Kaliyugavaryukuntam situated in TirumalaTirupatiAndhraPradesh India. It was constructed and developed by Krishna devarayalu andSalvanarasimharayalu. Lord Vishnu temple at Angkor watSiem reap is the largest temple, with area 500 akers in Cambodia. I went to Cambodia on December 2022 and visited Angkor wat at that time I visited Kampong floating Village. As an Anthropologist I surprised a lot how people are living in this village in the floating water.

The village consist houses, schools, temples, health centers what not it consists of each and everything else. The flora and fauna covered with greenary and the trees remain in the floating water with their fixed roots the areas is abundant with dogs and pigs few birdsand aquatic creatures.

The people come from the various countries visit the floating village. Watch Sun rise and Sun set. The sun set which we see can feel the excitement because the Sun is sinking into the sky . I asked people who live there how they constructed wooden houses remain safely in the water. They answered isthat isthe pine wood they used for construction of houses. Stay secure and this is the Characteristic of pine wood of Sieam Reap. At first when we want enter into big boat they pay 60 dollars and after reaching the point there is a wooden hotel later a small boat intelugu we know it as theppa, and we should pay 15 dollars each person.

The larger boat is moved by 12 years age boy persons and smaller boat is moved by Kampong women and they singing a song "Row row a boat" and their names are similar to Indian culture like Savithrie, Sakunthalai.

This is anexcellent examples this how Indian culture is diffusedsocial, culturally and religiously. First we have to remember Suryvarma and Jayavarma. who constructed Angkor wat at Cambodia and diffused Indian culture in Cambodian Khmers life.

Fishing:

The people livelihood is fishing in kampong village. with making fishing nets and catching fish and trading it. They live 15 feets space for wood pillars at base and then they construct houses in the first floor. The ground base is used for boat parking as we used for vehicles parking such as cars, two wheelers and bicycles . Tonal Sop is 16,000 square kilometers and nine meters deep during rainy season. In the dry season, that shrinks to 2,700 sq km and between 1 - 2 meters deep.

Because the water levels differ so drastically in dry and rainy season, fishing families who make their living on the lake began living in floating villages which move with the changing water levels Tonal Sop is one of the world's biggest inland fisheries. The annual income of households on the lake is under $500.A few years ago, in New York Times published a sad outlook for Tonal Sop lake, reciting the issues the floating villages of Tonal Sop face due to climate change and longer periods of droughts.

The ecosystem in the lake is changing, the catch of the fishermen is declining, and it is likely that the floating villages won't be able to sustain themselves in the future.

Sun Rise And Sun Set

Life in Kampong:

Row a boat is hard task and women row a boat to the lake and as we read in tale and moral stories. After reaching the point they pick lotus flowers from the running boat and present the flowers to us. This is an excitement feeling for us running in the boat in water and keeping stick in a hand into water. With all these emotional feelings one side with fear and other side with daring the excitement experiences and Pleasure. What a beautifully trip kampong floating village and experiencing the peoples livelihood in the floating village those who planning to Cambodia don't miss it. The floating markets of Bangkok with their colorful produce on adorable wooden boats floating through the city's canals. Most of Cambodia's floating villages are based on Lake Tonal Sop. Though this is the largest freshwater lake in South East Asia, this unique body of water changes drastically in size throughout the year. In the rainy season between June and October, the lake is massive, flooded with water from the Mekong River. In the dry season, from November to May, the lake shrinks to such a degree that its flow reverses to deposit water back into the Mekong

Participation In Field Work At Kampong Villlage In Cambodia

Abstract: Self Help Groups (SHGs). Its participation has been tremendous changes in women livelihood and style of poor women and has empowered them at various levels not only as individuals but also as members of the family members of the community and the society as whole. They come together for the purpose of solving their common problems through self-help and mutual help. The more attractive scheme with less effort is "Self Help Group" (SHGs). It is a tool to remove poverty and improve the women entrepreneurship and financial support in India. The main objective of this paper Impact of Self Help Groups on Women Livelihood and Empowerment in Nellore, Gudur, Sydapuram, Nayudupeta, and Sullurpeta Mandals/villeges in Nellore District of Andhra Pradesh. In the present study, an attempt has been made to analyze the structure, conduct and performance of Pulla Yerukula descriptive tribal women by administering research design. STs, especially the Pulla Yerukula are the major population living in the project area.in collaboration with line departments Community development aimed at uplifting the downtrodden tribal community by undertaking various livelihood and empowerment activities through bank linkage. The main objective of this paper is the randomly collected basic data from 150 members of self-help groups who make a living from baskets weaving (Buttalu, Thattalu, Gampalu) products and seasonal business, from five Mandals/villages in the Nellore district of Andhra Pradesh. The study used primary data and secondary data for analysis according to the research paper set out in the result and findings of the study.

Keywords: Self Help Groups (SHGs), SHG Participation, Changing livelihood, Empowerment, Pulla Yerukula.

1. INTRODUCTION

When we think about tribal women, they are more backward and their social and economic empowerment issues are even more complicated. Microfinance alone cannot alleviate poverty. It needs a holistic approach to improve their employability status. This includes improved skill levels, attention to entrepreneurial aspect, market availability, problems, new technology etc. In this regard, the role of the Self-Help Group (SHG) is very important. The Government of India

MYNAMAR-MILITARY POWER- VIOLENCE

Dr. M. Padmaja

Associate Professor, Southeast Asian & Pacific Studies, S.V.University, Tirupati.

KEYWORDS :

The old Burma is named as Myanmar and the capital city is Rangoon now replaced by the name Yagoon. Mynamar is peopled predominantly by Mongoloid groups composed of at least three major ethnic strains. These are : (1) the Tibeto-Burman people, Burmans, Kachins, Chins and sub-groups who speak the same basic language with variation and who form the great majority of the total population: (2) the Shan-Tai peoples, Shans, Karens, and their sub-groups who speak related languages and dialects-these two strains represent about eight percent each of the population, or sixteen who speak a as single group; (3) The Mons and sub-groups above men-common language with variations. The sub-groups above mentioned represent triable and other groupings who have acquired names as a result of tribal distinctions, dialect varoations, and identification in terms of hill or plains location. **(Helen G Trager)**

The present paper is based on secondary data . the paper focus its attention on Violence against women, Children, Rohingyas and the power of military in Myanmar. United states and some states at global level rising their hands for uplipment Burma peace and security.

Women and Gender Issues

There is no discrimination against the girl-child in Myanmar. The Myanmar National committee for Women's Affairs (MNCWA) held the First and Second National Women's Conference, in November, 1988 and June 2001 respectively. At the First Conference, the National plan of Action for Advancement of Women was discussed and adopted. At he second conference, the works implemented by the state/ Division Working Committees for Women's Affairs, at the grass-roots levels were reviewed, the constrains encountered were discussed and the future Plan of Actions recommended. In Myanmar 50.3% of the total population are women. Thus the women outnumber the men. The status of Myanmar women has alweys been high since the days of the Myanmar Kings. They enjoy equal rights as men. The legal system of Myanmar provides equal rights to women and men in the area of business and commerce. With regard to women in the profession, women outnumber men in the field of education and nursing, while 50% of women are doctors. There is a Myanmar saying: When a daughter is born parents usally say, "Assurance of an additional dish on the dining table". In Myanmar family, the husband and wife share equal household responsibilities. (Dr. M.Padmaja)

When the United Nations began its annual campaign to end violence against women 30 years ago, no one had Myanmar on their radar. But in recent years, Myanmar's military has escalated its use of sexual and gender-based violence to terrorize women and girls — most infamously against ethnic minorities, notably the Rohingya. Confronted by these atrocities, the international community has issued widespread demands for accountability and justice that have yet to come to fruition.

With reports of sexual and gender-based violence piling up in the [illegible] violence should pay particular attention to Myanmar — and the United States is in the perfect position to lead the way.

Since Myanmar's military seized control in a coup last February, women have emerged as symbols of defiance and as key leaders of resistance efforts. Generation Z women in particular have assumed prominent roles on the front lines of the civil disobedience movement. However, this has also put them at great risk. Since the coup, the junta has arrested more than a thousand women, many of whom have been held in interrogation camps in unknown locations and subjected to severe abuse.

Within months of the coup, evidence of this abuse began to pour in, as more and more women reported experiences of sexual assault at the hands of the military. Khin Lay, director of the Triangle Women Organization in Myanmar, says that women are most vulnerable when held alone during interrogation, enabling the police and military to act without wilnesses. **(Kathleen kuehnast Ph.D; Gabriela sagun)**

Violence against Children

Myanmar's military, known as the Tatmadaw, remains locked in an armed struggle with its own people, but the crisis barely reached the surface at last week's United Nations General Assembly meetings in New York. Officials from the United States and Malaysia met on the sidelines with representatives from Myanmar's National Unity Government, a cabinet formed by elected lawmakers ousted when the military seized power in February 2021. The United Nations has delayed responding to the junta's request for a seat; Myanmar's current representative at the United Nations, Kyaw Moe Tun, remains loyal to the overthrown government.

As diplomacy sputters, violence in Myanmar is spiraling. At least 11 children were killed on Sept. 16 when military helicopters fired on a school in Sagaing region, a resistance stronghold. The killing of students was shocking, but extreme violence has come to characterize the junta. The military allegedly rampaged through a village in Kachin State, burning down homes and killing civilians. These attacks followed a trend: The monitoring group Data for Myanmar said the military has torched more than 28,000 civilian homes since the coup, and August was the worst month on record.

Junta leader Min Aung Hlaing has had ample opportunity to make minor concessions to the international community, such as allowing a meeting with detained civilian leader Aung San Suu Kyi, that would have allowed him to reenter the fold without fundamentally threatening the military's power. At every turn, the regime has instead chosen the path least conducive to compromise. The July executions took place against a backdrop of global outcry, including from authoritarian Cambodian Prime Minister Hun Sen, who currently chaired the Association of Southeast Asian Nations. But like most of the junta's decisions since the coup, the killings were intended for a [illegible]

Damaraju Pundarikakshudu's Dramas and its Impact on Freedom Movement in Andhra

- *Dr. V. Thimmappa,* Academic Consultant, Centre for Southeast Asia and Pacific Studies, Sri Venkateswara University- Tirupati.

Introduction :

Even a stony heart should melt if you see his play! After hearing his songs we have to jump in the freedom struggle with heroism! Damaraju Pundarikakshudu, a rare Telugu writer, who made the letters as a weapon, The English government, which was unable to restrain him despite banning his writings. In the days when the independence movement was in full swing, The British rulers considered writing and performing movement plays as an act of treason. Pundarikaksha was the warrior who put those threats under the palm of his hand. Pundarikaksha was jailed twice for creating opposition to the government with political dramas. The main reason why he became known as the first writer of national dramas in the country was *'Swarajya Sopanam'*.

The patriotic songs, anecdotes, burrakathas written by Pundarikakshu were not only appreciated by celebrities and scholars, but also penetrated the mouths of the average Indians and fostered nationalism in them. The drama 'Panchala Parabhavam' written by Pundarikakshu was a sensation at that time, incorporating the atrocity of Jallianwala Bagh in the story of Mahabharata'. The main objective of this paper is to understand how his Plays were played an important role to mobilize the common people into the main stream of freedom struggle. Through this article an analysis is made to highlight the core concept of the selected plays of Damaraju Pundarikashudu.

About the Author :

Damaraju was born on 6th July 1896 in Patibandla village of Pedkurapadu Mandal of Guntur (present Palnadu) district. His mother Rangamamba and Father Gopalakishnaiah, he studied schooling in Nuzivedu, later Damaraju went Guntur for Intermediate and completed BA and BL (Law) in Madras[1]. While studying on the one hand, on the other hand he sharpened his literature by criticizing the British tyranny and awakening people towards the national movement. Damaraju inspired from great National leaders like Gandhi, Tilak, Dadbai Nouroji and others. He started writings against the British atrocities. He wrote 9 Plays and 6 stories in 1921 he wrote a Drama i.e., *"Swarajya Sopanam"*[2] that was banned by the British Government.

The government not only banned the plays written by him but seized the copies and burnt them. During the national movement, he suffered from long-term illness as his lungs were damaged due to police baton charge[3]. Pundarikaksha was jailed twice for creating opposition to the government with political dramas. The main reason why he became known as the first writer of national dramas in the country was 'Swarajya Sopanam'. It is remarkable that the play was banned by the British government and published in 1961 after independence. As a Lawyer he fought for the rights of victims. Damaraju was died in 1975[4].

Let us start our analysis with some of the

వ్యాససంగ్రహం:

సంస్కృతి, సంప్రదాయాలకు, ఆచారవ్యవహారాలకు పుట్టినిల్లు మన భారతదేశం. సంస్కృతి సంప్రదాయాలను మన పండగలు ఉత్సవాలు తిరునాళ్లు తెలియజేస్తాయి. ఈ వ్యాసంలో విషయాలు క్షేత్రపర్యటన చేసి సేకరించివి, పూర్వపరిశోధనల్లోని పాందుపరిచినవి. జానపదవిజ్ఞానాన్ని ఐదు భాగాలుగా విభజించగా, అందులోని సాంఘికజానపద ఆచారాలు, జానపదవస్తుసంస్కృతి కిందకు ప్రస్తుత పరిశోధనాంశం చేరుతుంది. శ్రీరామనవమి పండుగకు తిరుపతిలోని శ్రీకోదండరామస్వామి ఆలయంలో జరిగే రథోత్సవాన్ని తిరుపతిలో నివసించే వారు భక్తిశ్రద్ధలతో ఏ విధంగా జరుపుకుంటారనే విషయాలను క్షేత్రపర్యటనలో సేకరించిన అంశాలపై పరిశోధనాత్మక విశ్లేషణలు ఈ వ్యాసంలో ఉన్నాయి. ఉత్సవంనాడు అమ్మబడే ప్రత్యేకమైన మట్టిపాత్రలు, వాటితోపాటు పిల్లలు ఆడుకునే బుడిగీలకు సంబంధించిన విషయాలు, ప్రయోజనాలు మొదలైన అంశాలను చర్చించడం ఈ వ్యాసం ప్రధాన ఉద్దేశం. మన సంస్కృతిసంప్రదాయాలు, ఆచారవ్యవహారాలు మరుగున పడిపోకుండా,వారసత్వంగా భావితరాలకు అందించాలనే ఆశయంతో ఈ పరిశోధనవ్యాసం రూపుదిద్దుకుంది.

Keywords: సంస్కృతి, సంప్రదాయం, వారసత్వం, ఆచార వ్యవహారాలు, రథోత్సవం, భక్తిశ్రద్ధలు మట్టి బుడిగీలు, ఉత్సాహం, పానకం, విసనకర్రలు. మానసిక పరిపక్వత.

1.ఉపోద్ఘాతం:

సంస్కృతి సంప్రదాయాలకు నిలువెత్తు నిదర్శనం పండుగలు. పండుగ అంటేనే ఆనందం, సంతోషం, ఉత్సాహం, భక్తి భావం, శ్రద్ధా అన్నీ కలగలిపి ఉంటాయి.పూర్వ పరిశోధకులు జానపద విజ్ఞానాన్ని ఐదు భాగాలు విభజించారు. అవి జానపదసాహిత్యం, సాంఘిక జానపద ఆచారాలు, వస్తు సంస్కృతి, జానపద కళలు, జానపదుల భాష .అందులో సాంఘిక జానపద ఆచారాలలో జానపద సాంఘిక ఆచారాలు ఒక భాగం. ఈ భాగంలో మనిషి పుట్టుక నుంచి చావు వరకు జరిగే కార్యక్రమాలు,నమ్మకాలు మూఢ విశ్వాసాలు,పండుగలు జాతరలు రాగా ఆటలు, వినోదాలు మరో భాగంగా ఉన్నాయి.

(క్షేత్ర పర్యటనలో భాగంగా కోదండ రామాలయం ముందు వ్యాసకర్త)

"తరతరాలుగా జన సమూహంలో నిలిచి ఉన్న నమ్మకాలు సంప్రదాయాలు క్రియ రూపాన్ని దాల్చగా పండగలు ఏర్పడ్డాయి." (ఆంధ్రుల జానపద విజ్ఞానం, పుట: 296)

పండుగకు పర్యాయపదాలుగా ఉత్సవాలు, తిరునాళ్లు, జాతరలను చెప్పుకోవచ్చు.

హిందువుల పండుగలలో శ్రీరామనవమి పండుగ ఒకటి. హిందువులు పూజించే వైష్ణవ దేవుళ్లలో శ్రీరామచంద్రుడు ఒకరు. చైత్ర శుద్ధ నవమి నాడు వచ్చే ఈ పండుగకు ముందుగా తిరుపతిలోని శ్రీ కోదండ రామస్వామి ఆలయంలో స్వామివారికి బ్రహ్మోత్సవాలు జరుగుతాయి. బ్రహ్మోత్సవాలలో రథోత్సవం అతి ముఖ్యమైనది. ఈ రథోత్సవాన్ని తిరుపతి వాసులంతా చాలా పవిత్రంగా, ముఖ్యంగా జరుపుకుంటారు.

"తెలుగు వారి పండుగలను ఒక్కొక్కసారి ప్రత్యేకంగా వివరించడం కష్టం ఉత్సవాలు, ఊరేగింపులు, జాతరలు కూడా ఒక విధంగా పండుగలే. నోములు వ్రతాలు పండుగలు కావని ఎవరనగలరు? అయినా మనం వాడుకునే పదాలను బట్టి వీటిలోనే కొన్నింటిని పండుగలని, కొన్నింటిని ఉత్సవాలని పిలవడం జరుగుతున్నది".

(ఆంధ్రుల జానపద విజ్ఞానం, పుట: 299).

కోదండ రామస్వామి తేరు అంటే ఒక పెద్ద పండగలాగా ఉంటుంది. అంగరంగ వైభవంగా రథోత్సవం జరుగుతుంది.

(కోదండరాముని రథోత్సవం)

2. ప్రాంతవిధానం:

రాముల వారి రథోత్సవం రోజున అందరూ నిద్రలేచి తల స్నానాలు గావించుకుని పరమ పవిత్రంగా రాముల వారిని రథం పైన దర్శించుకోవడానికి ఎంతో ఉత్సాహంగా ఆలయానికి వెళ్తారు. రాములవారి రథాన్ని లాగడానికి ఎంతో ఉత్సాహపడుతారు. ఒకరికొకరు సహాయ సహకారాలతో అందరు కలిసి రాముల వారి రథాన్ని మాడ వీధుల్లో ఊరేగింపుగా లాగుతారు. ఇసుక వేస్తే రాలనంత జనం స్వామివారిని దర్శించుకుంటారు. రథం లాగడానికి అడా మగా చిన్న పెద్ద అని తేడా లేకుండా ప్రతిఒక్కరూ రథాన్ని లాగుతారు.రథం లాగడం వారి పూర్వ జన్మ సుకృతంగా భావిస్తారు. రథం లాగేటప్పుడు రథంపైన ఉప్పు మిరియాలను భక్తులు చల్లుతారు. మిరియాలు చల్లడం వల్ల శరీరంపై వచ్చే "పులిపిర్లు పోతాయని నమ్ముతారు. అలాగే రథంపై చల్లిన మిరియాలను ఏరుకొని తింటే రోగాలు పోతాయని నమ్ముతారు". (జి. సరస్వతి,(70), కేశవయాని గుంట, తిరుపతి).

భక్తి పారవశ్యంతో గోవిందా! గోవిందా! అని నామ స్మరణ చేస్తూ అలాగే జై శ్రీ రామా, జై శ్రీరామా అని అంటూ భక్తులు రథాన్ని ఉత్సాహంగా లాగడం చేస్తారు. రథం లాగడం కూడా భక్తిలో ఒక భాగమే. రథం లాగే భక్తులు సంతోషంతో పులకించి పోతారు. ఏదో ఒక విధంగా స్వామివారికి సేవ చేసుకోవడం భక్తులు వారి భాగ్యంగా భావిస్తారు.రథం లాగి పూర్తయి యదాస్థానానికి రథం చేరిన తర్వాత భక్తులు హారతులు ఇచ్చి కొబ్బరికాయలు కొడతారు.యథాస్థానానికి చేరిన తర్వాత ప్రజల సందర్శనార్థం సీతా లక్ష్మణ సమేత రాముల వారిని రథం పైనే చాలా సేపు ఉంచడం జరుగుతుంది.

రథంపై స్వామి వారిని దర్శించుకోడానికి స్నేహితులతో చుట్టాలతో కలిసి వెళ్ళడం జరుగుతుంది.

3. దానధర్మాలు చేయడం:

ఏదో ఒక విధంగా స్వామివారి సేవకు పాత్రులు కావాలని భక్తులకు కోరికగా ఉంటుంది. అందులో భాగంగానే అనేక రకాలైన దానధర్మాలు చేస్తారు రాముల వారి రథోత్సవం నాడు కూడా కింది విధంగా దానధర్మాలు చేస్తారు.

3.1. పానకం:

శ్రీరాముడి రథోత్సవం రోజున మాడ వీధుల్లో వచ్చిన భక్తులకు పానకం పంచుతారు.పానకం పంచడం కూడా స్వామివారి సేవలో ఒక భాగంగా భావిస్తారు. వేసవికాలం అప్పుడే ప్రారంభం అవుతూ ఉంటుంది. కాబట్టి చలువ చేయడానికి, దాహార్తిని తీర్చడానికి అక్కడి స్థానికులు ఉత్సవానికి వచ్చే భక్తులకు పానకం పంచే ఆచారం ఉంది. భక్తులందరూ పానకాన్ని దేవుడి ప్రసాదంగా భావించి భక్తి పూర్వకంగా స్వీకరిస్తారు.

> **"పానకం పంచే ఆచారం పూర్వ కాలం నుంచి వస్తున్నది.నీటిలో బెల్లాన్ని వేసి కరిగించి అందులో నిమ్మకాయ రసం, యాలుకల పొడి కలిపి పానకం తయారు చేస్తారు"** (వీరమ్మ. డి. (67), అనంత వీధి, తిరుపతి).

3.2 విసనకర్రలు పంచడం:

"రథోత్సవం నాడు కొంతమంది భక్తులు విసనకర్రలు పంచేవారు. వేసవి కాలంలో వేడికి విసురు కోవడానికి విసనకర్రలను పంచేవారు" (కే. రాజయ్య (65), పరసాలపీఠి, తిరుపతి).

వెదురుతో చేసిన విసన కర్రలను పంచేవారు. ఇప్పుడు విసనకర్రతో విసురుకునేవారు చాలా తక్కువ. కరెంట్ పోతే బయట గాలికి కూర్చొనే వారే తక్కువ. అప్పటి కాలంలో బయట చల్ల గాలికి సాయం వేళల్లో మధ్యాహ్న వేళలో చెట్ల కింద కూర్చొని మాట్లాడుకుంటూ గాలికోసం విసన కర్రలతో విసురుకునే వాళ్ళు. ఇప్పుడు విసనకర్రలు కనబడటమే చాలా అరుదుగా ఉంది. కొంతమంది పిల్లలకు విసనకర్ర అంటే ఏమిటో కూడా తెలియని పరిస్థితి. వెదురుతో కాకుండా తర్వాత ప్లాస్టిక్ విసనకర్రలు వచ్చాయి. పూర్వ కాలం సీలింగ్ ఫ్యాన్స్ లేని కాలంలో ప్రతి ఇంట్లో నూ విసన కర్రలు ఉండేవి. ఈ విసనకర్రలు పూర్వం శుభకార్యాలలో కూడా విసురుకోవడానికి ఇచ్చేవారు.

3.3 అంగళ్లు పెట్టడం:

ఉత్సవాలు, తిరునాళ్లు, జాతరలకు అంగళ్లు పెట్టడం ఒక ఆనవాయితీగా వస్తోంది.

"ఇంతకు ముందు ప్రసిద్ధ పుణ్యక్షేత్రాలలో జాతరలు జరిగేవి. లక్షలాది ప్రజలు ఒక్క చోట చేరేవారు తర్వాత తర్వాత ఇవి ఒక్కొక్క పల్లెకు ప్రత్యేకమైన పండుగలుగా మారిపోయాయి. దేవుడు కొంత ప్రభావశాలి అనుకుంటే ఒక్క దినం జాతర రెండు దినాలకు మూడు దినాలకు వ్యాపిస్తుంది. దీనితోబాటు కేవలం ధార్మిక వాతావరణం కాక జన సమూహానికి తగ్గట్టుగా వ్యాపార కార్యకలాపాలు కూడా ప్రారంభమవుతాయి. జాతర ఉత్సవాలు అనగానే బొమ్మలు అమ్మేవాళ్లు, తిండి దినుసులు అమ్మేవాళ్లు, వినోద కార్య కలాపాలతో డబ్బు చేసుకునేవారు, బొమ్మలు ఆడించేవారు, రంకుల రాట్నాల వారు అందరూ తయారవుతారు" (ఆంధ్రుల జానపద విజ్ఞానం, పుట:316)

ఉత్సవాలకు వచ్చిన ప్రతి ఒక్కరూ వారికి కావాల్సిన వస్తువులను అక్కడ తీసుకోవడం జరుగుతుంది. తినుబండారాలు ఇంటికి కావాల్సిన వస్తువులు, ఆట వస్తువులు వంటివి కనబడతాయి. రోడ్డుకి ఇరు వైపులా కళ్లు మిరుమిట్లు గొలిపేలాగా తాత్కాలిక అంగళ్లను పెడతారు.ప్రతి ఒక్కరూ ఏదో ఒక వస్తువును కొనడం ఒక ఆచారంగా సంప్రదాయంగా వస్తోంది.

(మట్టి పాత్రల అమ్మకం)

3.4 తినుబండారాలు:

రాముల వారి ఉత్సవంలో అనేక రకాలైన తిరు బండారాలు దర్శనమిస్తాయి. అందులో పీచు మిఠాయిలు, కమర కట్ట, ఢిల్లీ పాకు, తీపి బూందీ, కారా బూందీ, తీపి మురుకులు, బొరుగులు, నిమ్మకాయ సోడా, అల్లం బర్ఫీ, కొబ్బరి బర్ఫీలు, లడ్డులు వంటి తినుబండారాలు దర్శనమిస్తాయి. వచ్చిన భక్తులు సరదాగా వాటిని కనుక్కొని తింటారు.

3.4 ఇంటికి కావాల్సిన వస్తువులు:

ఇంటికి కావాల్సిన వస్తువులన్నీ జానపద వస్తు సంస్కృతి కిందకు వస్తాయి. ఉత్సవాలు తిరునాళ్లలో ఇంటికి కావాల్సిన వస్తువులు అనేకం కనిపిస్తాయి ఎందుకంటే భక్తులు ఆ చోటకు వచ్చినప్పుడు వాటిని చూసి కొనుక్కోవడానికి అవకాశం ఉంటుంది.ఇంటికి కావాల్సిన వస్తువుల్లో గరిటెలు, పాత్రలు. గిన్నెలు,తట్టలు రకరకాల బుట్టలు చీపుర, చేట వంటివి కొనుక్కుంటారు.

3.5 మట్టి పాత్రలు కొనడం:

రాముల వారి రథోత్సవం సమయంలో ఎక్కువగా కుండలు అమ్ముతారు. ఇప్పుడు అది చాలా తక్కువగా కనిపిస్తోంది. ఒకప్పుడు రాముల వారి రథోత్సవానికి వచ్చి కుండలను కొనుక్కోవడం తప్పనిసరిగా ఉండేది.

> **"మాకు రాముల వారి రథోత్సవం అంటే చాలా సరదాగా ఉండేది. ఎందుకంటే ప్రతి సంవత్సరం రథోత్సవం నాడు ఇప్పుడు రామకృష్ణ పుష్కరిణి ఉన్న ప్రాంతంలో అప్పుడు మట్టి పాత్రలను అమ్మేవారు. మేము కుండలు కొనుక్కోవడానికి వెళ్ళేవాళ్ళం.ఎందుకంటే పుష్కరిణికి దగ్గర లో కుమ్మర వీధి ఉంది. దీన్నే కుమ్మరతోపు అని అంటారు. అక్కడ తయారు చేసే మట్టి పాత్రలను రథోత్సవం నాడు తీసుకొని వచ్చి విశేషంగా అమ్మేవారు.**

వేసవి కాలం కనుక అప్పటి కాలంలోఆ ప్రాంతమంతా మట్టికుండలు కొనుక్కోవడానికి జనం కిటకిటలాడేవారు.మట్టికుండలతో పాటు మట్టి పాత్రలు, కూజాలు మూకుళ్లు వంటివాటితో పాటుగా పిల్లలు ఆడుకునేందుకు మట్టి బుడిగీలు అమ్మేవారు. రామకృష్ణ పుష్కరిణి ప్రాంతం కాస్త ఎత్తుగా ఉంటుంది. అప్పట్లో పుష్కరిణి చుట్టుపక్కలంతా మట్టితోనే దారి ఉండేది. ఎత్తుగా ఉన్న ఆ ప్రాంతానికి నడుచుకుంటూ వెళ్లడానికి చాలా ఉత్సాహాన్ని కనబరిచేవాళ్ళం." (జి. ఎల్లమ్మ (72), నెహ్రూ వీధి, తిరుపతి).

ప్రస్తుతం ఆ ప్రాంతమంతా పుష్కరిణి ఉద్యానవనంతో చుట్టుపక్కల రవాణా సౌకర్యంతో ప్రజలకు ఉపయోగపడుతోంది. ఆధునిక కాలం లో కుండల వినియోగం చాలా తగ్గింది. ఎందుకంటే ఫ్రిజ్‌లు ఆ స్థానంలో చోటు చేసుకున్నాయి. అందువల్ల కుండలను వాడడం తగ్గింది. కానీ ఆరోగ్యానికి కుండ నీళ్లు మంచిది. ప్రస్తుతం మళ్లీ చల్ల నీటికోసం కుండలను, వాడుకోవడానికి మట్టి పాత్రలను ఉపయోగించడం క్రమక్రమంగా పెరుగుతూ ఉంది.

(క్షేత్ర పర్యటనలో విషయ సేకరణ చేస్తున్న వ్యాసకర్త)

3.6. ఆట వస్తువులు:

ఉత్సవాలు, తిరునాళ్ళు, జాతరలు అలాంటి సమయాల్లో పిల్లల ఆట వస్తువులు ఎక్కువగా కనబడతాయి. అలాగే కోదండ రామస్వామి రథోత్సవం రోజున కూడా పిల్లల ఆట వస్తువులు అనేకం అమ్మడం జరుగుతుంది. ఈ ఉత్సవాలకు పెద్దలతో పాటు పిల్లలు కూడా వస్తారు. కాబట్టి ఆట వస్తువులను విరివిగా కొంటారు. బుడగలు, గోళీకాయలు వామన గుంటలాడే పెట్టే, పాచికలు, పరమపదసోపాన పటం,కోలాటం కర్రలు, రింగు బాలు, అనేక రకాల బంతులు చెక్కతోనూ, ప్లాస్టిక్ తో చేసిన అనేక బొమ్మలు, చెక్క బుడిగీలు మట్టి బుడిగీలు ఒకటేంటి అనేక రకాలు కనబడతాయి. వీటినన్నింటిని పిల్లలు సంతోషంగా కొనుక్కుంటారు. రాముల వారి రథోత్సవం నాడు మట్టి బుడిగీలు ప్రత్యేకంగా కనబడతాయి. మట్టి బుడిగీలలో చిన్న చిన్న కుండలు, అన్నం చేసుకునే పాత్రలు, చిన్న నీళ్లు తాగే లోటాలు, వాటి పైకి మూతలు వండుకోడానికి పొయ్యి, రోలు,

చిన్నారులు, సానరాయి వంటి పాత్రలన్నీ దర్శనమిస్తాయి. ఆడపిల్లలు మట్టి బుడిగీలు కొనుక్కోవడానికి చాలా ఉత్సాహపడుతారు. వాటితో ఆడుకోవడానికి చాలా ఇష్టపడతారు. ఆడపిల్లలు మట్టి బుడిగీలతో కింది విధంగా ఆడుకుంటారు.

4. బుడిగీలతో ఆటలు:

ఆడపిల్లలు వంట పనుల్లో తల్లిని అనుకరిస్తారు. తల్లి చేసే పనులను చూసి వారు వంట నేర్చుకుంటారు చిన్న వయసులోనే సరదాగా వంట చేయాలనే ఉత్సాహం పిల్లలో ఉంటుంది. పిల్లలు ఆడుకునే బుడిగిలాటలో ముందుగా బుడిగీలన్నింటిని కడిగి ఆరబెట్టుకుంటారు. పిల్లలు అందరూ ఒకచోట చేరి ఇంటి ఇంటి చుట్టూ ఉన్న చెట్ల నుంచి రాలిన పుల్లలను ఏరు కొంటారు. ఒక చోట తెచ్చుకున్న మట్టి పొయ్యిని పెట్టి వెలిగించి అన్నప్రసాదం వండుతారు. ముందుగా. ఇంటిలో నుంచి కాస్త బియ్యం,కొంచెం బెల్లం తీసుకుని వస్తారు. తెచ్చిన కుండలో బియ్యాన్ని నానబెట్టి మరొక కుండని పొయ్యిపై పెట్టి అందులో కాస్త నీటిని పోసి ఎసరు పెట్టి అది కాగిన తర్వాత బియ్యం కడిగి యసర్లో వేస్తారు. బియ్యం ఉడికిన తర్వాత బెల్లం వేసి కలుపుతారు. బియ్యం ఉడికిందా లేదా అని చూడటానికి అందరం పోటీ పడతారు. బెల్లం వేసి బాగా కలిపి అందులో కాస్త నెయ్యి వేస్తారు. బియ్యం ఉడికే వరకు మంట ఆరిపోకుండా చూసుకుంటూ పొయ్యి లో సన్నని పుల్లలను వేస్తూ ఉంటారు. అందర పొయ్యి చుట్టూ కూర్చుని సరదాగా మాట్లాడుకుంటూ పని చేసుకుంటారు. అందరు పొయ్యి చుట్టూ కూర్చొని ప్రసాదం వండడం పిల్లలకు చాలా ఉత్సాహంగా ఉంటుంది .ప్రసాదం తయారైన తర్వాత దాన్ని అందరూ కూర్చొని పంచుకొని తింటారు. ఇంటిలో ఉన్న పెద్ద వాళ్ళకు కూడా ప్రసాదాన్ని పెడతారు. వాళ్ళు పిల్లలు వండిన ప్రసాదాన్ని తిని చాలా బాగుంది అని అంటారు. ఆ మాటకు పిల్లలు చాలా పొంగిపోతారు. తెచ్చుకున్న చిన్నచిన్న కుండల్లో నీళ్లు పోసి కాసేపు ఉంచి అవి చల్లబడ్డాక సరదాగా వాటిని తాగి ఆ చల్లదనానికి సంతోషపడతారు. అలాగే నిమ్మకాయలు తెచ్చుకొని వాటిలోని రసాన్ని పిండి చల్లని నీటిలో కలిపి అందులో కాస్త చక్కెరను వేసి నిమ్మరసాన్ని తయారు చేసి తాగుతారు.ఇలాంటి చిన్న చిన్న ఆనందాలే పిల్లలకి చాలా సంతోషాన్ని కలుగజేస్తాయి. విధంగా పిల్లలు మట్టి బుడిగీలతో ఆటలను ఆడుకుంటారు.

5. ప్రయోజనాలు:

మన సంస్కృతిలో అనేక రకాలైన సాంఘిక సాంస్కృతిక అంశాలు చోటుచేసుకొని ఉన్నాయి. వీటి వల్ల మనకు అనేక ప్రయోజనాలు కలుగుతాయి. రామువారి గుడికి వెళ్ళడంఅక్కడ భక్తులు చేసే సేవ చేసే దానాలు వంటివాటితో పాటు అక్కడ మట్టి బుడిగీలు కొనుక్కోవడం వంటి విషయాలు మనకు కనబడుతున్నాయి. ఈ విషయాలను గనుక పరిశీలిస్తే అనేక రకాలైన ప్రయోజనాలు మనకు మన భావితరాలకు ఉపయోగపడతాయి.

5.1 భక్తి భావం పెరుగుతుంది:

ఉత్సవాలు, తిరునాళ్లు మన సంస్కృతిలో ఒక భాగం. ఉత్స వాలకు, తిరునాళ్లకు వెళ్లడం వల్ల మనలో భక్తిభావం పెరుగుతుంది. ఆ ప్రదేశాలకు తీసుకుని వెళ్లడం వల్ల పిల్లలకు సంస్కృతి వారసత్వం తెలుసుకునే అవకాశం కలుగుతుంది.

5.2 ఐకమత్యం:

ఐకమత్యమే మహాభాగ్యం. కలిసి కట్టుగా ఉంటే ఏ పనైనా చేయవచ్చు. అందరూ కలిసి ఆనందంగా ఒక చోటకు వెళ్లడం అక్కడ స్వామివారి సేవ చేసుకోవడం వంటి పనుల వల్ల అది చూసి పిల్లలు కూడా నేర్చుకుంటారు. అదే విధంగా పిల్లలు అందరూ కలిసి ఆడుకోవడం వల్ల ఐకమత్యం పెరుగుతుంది ఒకరి ఆలోచనలు ఒకరు పంచుకోవడానికి అవకాశం కలుగుతుంది. పిల్లలు అందరూ కలిసి ఆడుకోవడం వల్ల ఐకమత్యం కలుగుతుంది. వారి మధ్య స్నేహ భావం పెరగడానికి అవకాశం కలుగుతుంది.

5.3. మానసిక పరిపక్వత:

పిల్లలందరూ కలిసి ఆడుకోవడం వల్ల మానసికంగా వారిలో ఎదుగుదల బాగా ఉంటుంది. ఒకరినొకరు అర్థం చేసుకునే స్వభావాన్ని కలిగి ఉంటారు. ఇప్పటి కాలంలో వేసవి సెలవులు వచ్చినా పిల్లలు ఆడుకోవడానికి అంతగా ఆసక్తి చూపడం లేదు. ఆధునిక సాంకేతిక పరిజ్ఞానం మన అరచేతిలో వైకుంఠంలాఉంది. సెల్‌ఫోన్లు లాప్ టాప్‌లో ఇంటర్నెట్ వల్ల పిల్లల్లో ఎదుటి వారితో కలిసే మాట్లాడే విధానంపోతోంది వాటికి పిల్లలు అలవాటు పడిపోయి బయటకు వచ్చి ఆడుకునే పరిస్థితి ప్రస్తుతం చాలా తక్కువనే చెప్పవచ్చు. ఆడుకోవడానికి పిల్లలకు తల్లిదండ్రులే ఉత్సాహం కల్పించాలి. శారీరక శ్రమతో మానసిక పరిపక్వత బాగా పెరుగుతుంది. ఆధునిక సాంకేతిక పరిజ్ఞానం అవసరమే కానీ విపరీతమైన సాంకేతిక పరిజ్ఞానం ముప్పు కి దారితీస్తుంది.

5.4 ఆలోచన శక్తి పెరగడం:

ఆడుకోవడం వల్ల పిల్లల్లో ఆలోచనాశక్తి పెరుగుతుంది. అంటే వంటకు కావాల్సిన వస్తువులు ఏమి కావాలి వంట ఎలా చేయాలి, ఎలా చేస్తే వంట రుచిగా వస్తుంది అనే ఆలోచనలు పిల్లలు చేసినట్లు అన్ని ఆలోచనలు చేసే శక్తి పిల్లలకు కలుగుతుంది.

5.5 ఉత్సాహం కల్పించడం:

చేసిన పనిని మెచ్చుకోవడం వల్ల పిల్లల్లో మంచి ఉత్సాహం కలుగుతుంది. ఇక్కడ ప్రసాదం చేసి పెద్దలకు పెట్టడంతో వారు మెచ్చుకోవడంతో పిల్లల్లో ఎంతో సంతోషం కలిగింది. అలాగే పెద్దలతో పాటు పిల్లలు కూడా అనేక ప్రదేశాలకు తీసుకుని వెళ్లి వారిలో భక్తిభావాన్ని పెంపొందించి అటువైపుగా వెళ్లడానికి వారిలో

అవకాశాన్ని కల్పించాలి. అలా చేయడం వల్ల పిల్లలు ఇంకా మంచి మంచి పనులు చేయడానికి అవకాశం కలుగుతుంది.

5.6 సాంత ప్రణాళిక:

ఆటలు ఆడుకొనేటప్పుడు వేసుకునే ప్రణాళిక వారి జీవితంలో కూడా ఉపయోగపడుతుంది. చదువుకొనేటప్పుడు, చదువు తర్వాత జీవితాన్ని ఎలా మలచుకోవాలో కూడా ఆటలు నేర్పుతాయి.

5.7 ఓపిక, సహనం:

అమ్మానాన్నలే సహన వంతులు, ఓపికస్తులు అనే ఒక నానుడి. ఈ ఓపిక సహనం పిల్లలు చిన్నప్పటి నుంచే వారి ఆటలు ద్వారా నేర్చుకుంటారు. ఓపికగా వారి ఆటలో వంట చేసేటప్పుడు పుల్లలు ఏరుకోవడం, అంచనా కూర్చొని గుంపుగా మంట ఆరిపోకుండా వంట చేయడం అన్నం ఉడికేంత వరకు ఓపికగా ఉండటం వంటివన్నీ అవి వారే చేయగలరు.

5.8. వ్యాయామం కలగటం:

బుడిగేలాటలో పిల్లలు రక రకాలైన పనులు చేస్తూ ఉంటారు. వంగటం, లేవటం, కూర్చోవటం, నడవడం వంటి పనులను చేస్తుంటారు. దీనివల్ల వారికి తెలియకుండానే మంచి వ్యాయామం కలుగుతుంది.

6. ముగింపు:

- మన సంస్కృతి సంప్రదాయాల పట్ల పిల్లలకు అవగాహన కలిగేటట్లు చేయాలి.
- భక్తి భావం పెంపొందుతుంది
- విషయ పరిజ్ఞానం కలుగుతుంది.
- పిల్లల ఆటలకు పాఠశాలల్లో అలాగే ఇంట్లోనూ సమయాన్ని కేటాయించాలి.
- పిల్లల్లో ఆలోచనా శక్తి, సృజనాత్మక శక్తి పెరుగుతుంది. చురుకుగా ఉంటారు.

21वीं शती की भारतीय दलित कहानियों में वैषम्य

Dr. Narayana, Associate Professor, Dept. of Hindi, S.V. University- Tirupati-517502, Andhra Pradesh

हिन्दी साहित्य में कई दलित कहानियाँ लिखी जा चुकी हैं। इनमें वैषम्य की जाँच पड़ताल करना पूर्ण, न्यायसंगत न होगा फिर भी 21वीं शती की भारतीयकहानियों में जिन बिन्दुओं पर भिन्नता स्पष्ट नजर आती है उनकी चर्चा करने का प्रयास किया है ।

1. अभिव्यक्तिगत वैषम्य
2. दलित महिला के दो अभिशाप
3. स्त्री शोषण व अपमान

अभिव्यक्ति वैषम्य

दलित कहानियों में अभिव्यक्ति की सहजता को अपनाया गया है। अपने सुख–दुःख आदि को बहुत ही हृदयस्पर्शी तरीके से बहुत ही सादगी से, किसी भी प्रकार की कलात्मकता के वगैर जस का तस अभिव्यक्त किया है । कहानीकारों के सभी क्रियाकलाप 'स्व' से शुरू होकर 'हम' अर्थात् कि समष्टि भाव में बदल जाते हैं। 'स्वयं' की वेदना से प्रारंभ हुआ, दलित रुदन धीरे–धीरे 'हम' के रुदन में अर्थात् कि दलित समाज के रुदन में बदल जाता है। यदि पुरुष व महिला दलित कहानीकारों के अभिव्यक्तिगत वैषम्य की बात करें तो, दोनों में कुछ भिन्नतायें जरूर नजर आती है । पुरुष दलित कहानियाँ स्वयं एवं दलित समाज केन्द्रित है जबकि महिला दलित कहानियाँ स्वयं एवं अपने परिवार केन्द्रित अधिक रही है । जहाँ दलित कहानीकार खुद को और अपने समाज को अधिक अभिव्यक्त करता हैवहीं महिला कहानीकार खुद के महिला जीवन को और अपने परिवार को प्रमुखतादेती है ।

दलित कहानीकारों ने अपने भावों को सशक्त बनाने के लिए जैसा जिया और अनुभव किया वैसा ही सशब्द अपनी कहानियों में चित्रित किया है। जिसके लिए उन्होंने कई स्थानों पर गाली–गलौच व अश्लील शब्दों का भी प्रयोग किया है। ऐसे अनेक उदाहरण पुरुष कहानीकारों की कहानियों में देने को मिलते हैं। जबकि दलित महिला कहानीकार अपनी कहानियाँ में ऐसे अश्लील शब्दों का प्रयोग नही करती है। ऐसा नहीं है कि पति द्वारा दी गई यातनाओं, प्रताड़नाओं, मारपीट को झेलते समय पति के मुँह से गाली–गलौच न हुआ हो किन्तु, महिला कहानीकारों ने उन गाली–गलौच के शब्दों का प्रयोग अपनी कहानियाँ में नहीं किया है। "कहा था और अब कह रहा हूँ नहीं मिलेगी। ये पैसे शहर में जाके दिखाना। दो पैसे हो गये जेब में तो सारी दुनिया को सिर पे बिठाया लिया है। ये शहर नहीं गाँव है यहाँ चूहड़े चमारों को मेरी दुकान पर तो दाय नहीं मिलने वाली कहीं और जाते पियो।" यहां पर दलित जाति के लोगों को उनकी जाति पर गाली दी जाती है। चमार और चूहड़े जैसे खराब शब्दों से अपमानित किया जाता है। 'बैल की खाल' कहानी में जब काले और भूरे समय पर नहीं पहुँचते तो बिरिज मोहन उन्हें गाली देने लगता है– "कहाँ मर गये थे.... तड़के में ढूंढ–ढूंढ के गोड्डे टूट गए हैं और अब आ रहे हो। इसे बैल को कौन उठावेगा तुम्हारा बाप।'

ओमप्रकाश वाल्मीकि की कहानी 'यह अंत नहीं' में भी दलितों को अपमानित होते देखा जा सकता है "भंगी चमारों की यह हिम्मत ..... क्यूं बे बसना मुझे प्रधान इसलिए बनाया था। और इतना उन सभी को बता देना दरोगा से लेकर एस. पी. तक सभी अपनी जात के हैं ।"

दलितों के साथ गाली–गलौच के शब्दों का प्रयोग जिस तरह कहानियों में देखा गया है वैसे ही हिन्दी दलित आत्मकथाकारों की आत्मकथा में भी देखा जा सकता है। 'जूठन' आत्मकथा में ओमप्रकाश वाल्मीकि ने बताया है कि स्कूल में बालक ओमप्रकाश से हैडमास्टर कालीराम दो दिनों तक स्कूल का मैदान साफ करवाता है। तीसरे दिन ओमप्रकाश चुपचाप क्लासरूम में जाकर बैठ जाता है। उसी समय हैडमास्टर कालीराम की दहाड़ सुनाई पड़ती है "अबे ओ चूहड़े के मादरचोद कहाँ घुस गया.... अपनी माँ..... ?" लेखक सूरजपाल अपनी पत्नी के साथ पैदल चलकर अपने गाँव जा रहे थे। रास्ते में पत्नी विमला को प्यास लगने पर सवर्ण के कुएँ पर जाते हैं। पत्नी विमला ओक बनाकर जैसे ही पानी पीने के लिए एक कदम आगे बढ़ती है उसी समय दाँत पीसते हुए बूढ़ा जमींदार बोला "अरे भंगनिया नेक पीछे के हट के पानी पी, यह शहर ना है गाँव है। मारे लठिया के कमर तोड़ दई जाएगी । मैंचो भंगिया और चमट्टा के शहर में जा के नये नये लत्ता (कपड़े) पहर (पहन) के गाँव में आ जात है, कुछ पता न चलतु कि जे भंगिया के हैं कि नाय ।" 'शिकंजे का दर्द' आत्मकथा में सुशीला टाकभौरे अपने पति के द्वारा की जानेवाली मारपीट के संदर्भ में लिखती हैं– "घर में झगड़ा होता, मारने–पीटने की और मेरे रोने चिल्लाने की आवाज ऊँची सुनाई देती। पड़ोसियों को ये बातें सुनाई न दें, इसके लिए वे रेडियो की आवाजऊँची कर देते थे।" इस प्रकार भारतीय दलित कहानियों में ही नहीं बल्कि अन्य विधाओं में भी दलितों के साथ गाली–गलौच जैसी भाषा का उपयोग किया जाता है।

मराठी दलित कहानियों के संदर्भ में यह कहा जा सकता है कि ये सारी कहानियाँ आम दलित जनता की भाषा में कहीं गयी है। इसमें ज्यादातर पात्र अशिक्षित मजबूर और दबे हुए वर्ग के प्रतिनिधि होने के कारण इनकी भाषा में औपचारिकता कम है। दलितों की भाषा तो अपने जीवन संग्राम की भाषा है, उनके साहित्य में यही भाषा तो अभिव्यक्त होती है। उसमें अधिक रूप से बोली के शब्दों का प्रयोग होता है । यह आश्चर्य की बात नहीं है क्योंकि ये कहानियाँ

21वीं शती की भारतीय दलित कहानियों में वैषम्य

Dr. Narayana, Associate Professor, Dept. of Hindi, S.V. University- Tirupati-517502, Andhra Pradesh

हिन्दी साहित्य में कई दलित कहानियाँ लिखी जा चुकी हैं। इनमें वैषम्य की जाँच पड़ताल करना पूर्ण, न्यायसंगत न होगा फिर भी 21वीं शती की भारतीयकहानियों में जिन बिन्दुओं पर भिन्नता स्पष्ट नजर आती है उनकी चर्चा करने का प्रयास किया है ।

1. अभिव्यक्तिगत वैषम्य
2. दलित महिला के दो अभिशाप
3. स्त्री शोषण व अपमान

अभिव्यक्ति वैषम्य

दलित कहानियों में अभिव्यक्ति की सहजता को अपनाया गया है। अपने सुख–दुःख आदि को बहुत ही हृदयस्पर्शी तरीके से बहुत ही सादगी से, किसी भी प्रकार की कलात्मकता के वगैर जस का तस अभिव्यक्त किया है । कहानीकारों के सभी क्रियाकलाप 'स्व' से शुरू होकर 'हम' अर्थात् कि समष्टि भाव में बदल जाते हैं। 'स्वयं' की वेदना से प्रारंभ हुआ, दलित रुदन धीरे–धीरे 'हम' के रुदन में अर्थात् कि दलित समाज के रुदन में बदल जाता है। यदि पुरुष व महिला दलित कहानीकारों के अभिव्यक्तिगत वैषम्य की बात करें तो, दोनों में कुछ भिन्नतायें जरूर नजर आती है । पुरुष दलित कहानियाँ स्वयं एवं दलित समाज केन्द्रित है जबकि महिला दलित कहानियाँ स्वयं एवं अपने परिवार केन्द्रित अधिक रही है । जहाँ दलित कहानीकार खुद को और अपने समाज को अधिक अभिव्यक्त करता हैवहीं महिला कहानीकार खुद के महिला जीवन को और अपने परिवार को प्रमुखतादेती है ।

दलित कहानीकारों ने अपने भावों को सशक्त बनाने के लिए जैसा जिया और अनुभव किया वैसा ही सशब्द अपनी कहानियों में चित्रित किया है। जिसके लिए उन्होंने कई स्थानों पर गाली–गलौच व अश्लील शब्दों का भी प्रयोग किया है। ऐसे अनेक उदाहरण पुरुष कहानीकारों की कहानियों में देने को मिलते हैं। जबकि दलित महिला कहानीकार अपनी कहानियाँ में ऐसे अश्लील शब्दों का प्रयोग नहीं करती है। ऐसा नहीं है कि पति द्वारा दी गई यातनाओं, प्रताड़नाओं, मारपीट को झेलते समय पति के मुँह से गाली–गलौच न हुआ हो किन्तु, महिला कहानीकारों ने उन गाली–गलौच के शब्दों का प्रयोग अपनी कहानियाँ में नहीं किया है। "कहा था और अब कह रहा हूँ नहीं मिलेगी। ये पैसे शहर में जाके दिखाना। दो पैसे हो गये जेब में तो सारी दुनिया को सिर पे बिठाया लिया है। ये शहर नहीं गाँव है यहाँ चूहड़े चमारों को मेरी दुकान पर तो दाय नहीं मिलने वाली कहीं और जाते पियो।" यहां पर दलित जाति के लोगों को उनकी जाति पर गाली दी जाती है। चमार और चूहड़े जैसे खराब शब्दों से अपमानित किया जाता है। 'बैल की खाल' कहानी में जब काले और भूरे समय पर नहीं पहुँचते तो बिरिज मोहन उन्हें गाली देने लगता है– "कहाँ मर गये थे.... तड़के में ढूंढ–ढूंढ के गोड्डे टूट गए हैं और अब आ रहे हो। इसे बैल को कौन उठावेगा तुम्हारा बाप।' ओमप्रकाश वाल्मीकि की कहानी 'यह अंत नहीं' में भी दलितों को अपमानित होते देखा जा सकता है "भंगी चमारों की यह हिम्मत ..... क्यूं बे बसना मुझे प्रधान इसलिए बनाया था। और इतना उन सभी को बता देना दरोगा से लेकर एस. पी. तक सभी अपनी जात के हैं ।"

दलितों के साथ गाली–गलौच के शब्दों का प्रयोग जिस तरह कहानियों में देखा गया है वैसे ही हिन्दी दलित आत्मकथाकारों की आत्मकथा में भी देखा जा सकता है। 'जूठन' आत्मकथा में ओमप्रकाश वाल्मीकि ने बताया है कि स्कूल में बालक ओमप्रकाश से हैडमास्टर कालीराम दो दिनों तक स्कूल का मैदान साफ करवाता है। तीसरे दिन ओमप्रकाश चुपचाप क्लासरूम में जाकर बैठ जाता है। उसी समय हैडमास्टर कालीराम की दहाड़ सुनाई पड़ती है "अबे ओ चूहड़े के मादरचोद कहाँ घुस गया.... अपनी माँ..... ?" लेखक सूरजपाल अपनी पत्नी के साथ पैदल चलकर अपने गाँव जा रहे थे। रास्ते में पत्नी विमला को प्यास लगने पर सवर्ण के कुएँ पर जाते हैं। पत्नी विमला ओक बनाकर जैसे ही पानी पीने के लिए एक कदम आगे बढ़ती है उसी समय दाँत पीसते हुए बूढ़ा जमींदार बोला "अरे भंगनिया नेक पीछे के हट के पानी पी, यह शहर ना है गाँव है। मारे लठिया के कमर तोड़ दई जाएगी । मैंचो भंगिया और चमट्टा के शहर में जा के नये नये लत्ता (कपड़े) पहर (पहन) के गाँव में आ जात है, कुछ पता न चलतु कि जे भंगिया के हैं कि नाय ।" 'शिकंजे का दर्द' आत्मकथा में सुशीला टाकभौरे अपने पति के द्वारा की जानेवाली मारपीट के संदर्भ में लिखती हैं– "घर में झगड़ा होता, मारने–पीटने की और मेरे रोने चिल्लाने की आवाज ऊँची सुनाई देती। पड़ोसियों को ये बातें सुनाई न दें, इसके लिए वे रेडियो की आवाजऊँची कर देते थे।" इस प्रकार भारतीय दलित कहानियों में ही नहीं बल्कि अन्य विधाओं में भी दलितों के साथ गाली–गलौच जैसी भाषा का उपयोग किया जाता है।

मराठी दलित कहानियों के संदर्भ में यह कहा जा सकता है कि ये सारी कहानियाँ आम दलित जनता की भाषा में कहीं गयी है। इसमें ज्यादातर पात्र अशिक्षित मजबूर और दबे हुए वर्ग के प्रतिनिधि होने के कारण इनकी भाषा में औपचारिकता कम है। दलितों की भाषा तो अपने जीवन संग्राम की भाषा है, उनके साहित्य में यही भाषा तो अभिव्यक्त होती है। उसमें अधिक रूप से बोली के शब्दों का प्रयोग होता है । यह आश्चर्य की बात नहीं है क्योंकि ये कहानियाँ

FARMER'S SUICIDES IN RAYALASEEMA REGION, ANDHRA PRADESH, INDIA

Dr.P.Venu
Academic Consultant, Department of History
S.V.University, Tirupati – 517 502
Andhra Pradesh, India

ABSTRACT

Rayalaseema is a geographic region in the Indian state of Andhra Pradesh. It comprises four southern districts of the State, from prior to the districts reorganization in 2022, namely Kurnool, Anantapur, YSR Kadapa and Chittoor. The wide variations in agricultural output that have occurred throughout human history testify to the fact that farming is an economic activity dependent on the vagaries of weather. As a sequel, climatic variations significantly impact the livelihood of millions and particularly poor and vulnerable people. The performance of agricultural sector in Rayalaseema region has great impact on people living on dry land agriculture. Owing to vagaries of monsoon, cost of fertilizers, low yield, low prices for output are making the farmers to go for suicide. The present paper elicits the number of people made suicide in Rayalaseema and their causes thereof.

INTRODUCTION

Rayalaseema is a geographic region in the Indian state of Andhra Pradesh. The Rayalaseema region is the land once ruled by the 'Rayas' of the famous Vijayanagara Empire. The name has become popular after Sri Krishnadevaraya, the great king who ruled Rayalaseema as part of his kingdom from 1509 to 1530 AD. It was also poetically called as 'Rayalaseema is Rathanalaseema' (area of precious stones)[1]. Also, it is an economically backward region of Andhra Pradesh when compared to coastal Andhra. This is a typically dry tract of AP, situated in an unfavourable zone and has been declared as famine zone of south India[2]. Rayalaseema region lies between 12° 30' N and 16° 30' N latitudes and 76° 30' E to 79° 55' E longitudes. It includes the four southern districts of Anantapur, Chittoor, YSR Kadapa and Kurnool (covering an area of 67, 298 Sq kms (42 % of state area)). Anantapur revenue district is the largest district with an area of (19130) square kms, followed by Chittoor (15151), YSR Kadapa (15359) and Kurnool (17658), the total numbers of Mandals of all the four districts are 234. The particulars of the district wise, area wise population, density and sex ration of Rayalaseema districts are furnished (Table 1) and location map of the area indicate Figure 1.

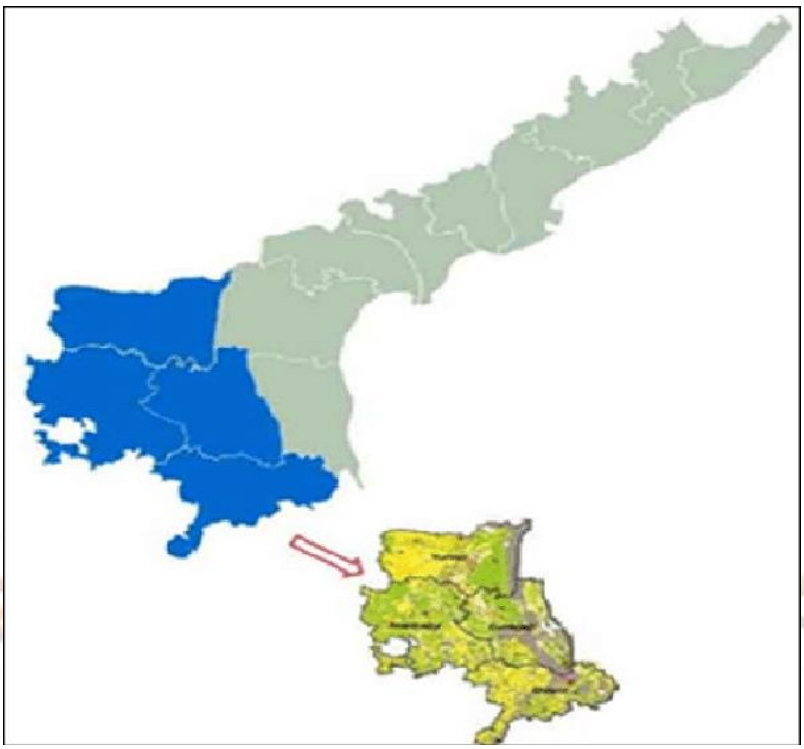

Fig.1 Map of Rayalaseema

GENERAL LAND USE PATTERN

The land use pattern is significant not only just in agricultural dominated and over populated developing regions, but also throughout the globe because of its relationship with different human phenomena. Its importance also increased during the population pressure and decreasing human and land ratio, increasing demand for food and raw materials they require for optimal use of land in an integrated manner has assumed greater relevance. Land use is any kind of stable or cyclic human being intervention on the environment to satisfy human needs and the land use capability or land suitability is the potential capability of giving tract and to support different types of land utilization under given cultural and socioeconomic conditions (**Vink A.P.A., 1975**).[4]

Classification of Land use pattern

Land use classifications are the systematic arrangement of land on the basis of certain related characteristics, mainly to identify and understand their basic utilities intelligently and effectively. The land use pattern indicates the spatio-temporal sequence of field under different uses. It too indicates that net

available land for cultivation, which is an significant factor since it is the foundation for agricultural planning (Arsud, 2000).[5]

The classification and major categories of Land use pattern is as follows:

1. Forest land
2. Barren and uncultivable land
3. Land put to non-agricultural uses
4. Cultivable waste land
5. Permanent pastures and other grazing Land
6. Land under miscellaneous tree crops and groves not 'included in net sown'
7. Current fallow land
8. Other fallow land
9. Net area sown
10. Total cropped area
11. Area sown more than once
12. Land under fish and prawn culture.

The above land use classifications have been taken on all the provinces leading to comparability in land use pattern (Veerannachari, 2015).[6] Some land is for a particular use depending mostly on the physical characteristics of land to its suitability for a particular usage is concerned.

Land utilisation Pattern in Rayalaseema region

The total geographical area of Rayalaseema region is about 4484200 (in hectares) and forests occupied 1108968 (in hec) in the year 2013-2014. Out of these the total area under Barren and uncultivable land is 519441 (in hec), followed by the area under Land put to non- agricultural uses is 532789 (in hec), Cultivable waste 146181 (in hec), Permanent pastures and other grazing is 48196 (in hec), Land under miscellaneous tree crops & groves not 'included in net sown' is 52370 (in hec), Current fallows is 386349 (in hec), Other fallow lands is 453359 (in hec), Net area sown is 2604981 (in hec), Total cropped area is 2894749 (in hec), Area sown more than once is 292494 (in hec) and Fish & Prawn culture is 1184 (in hec). There is change in photographic, soil types, rainfall and geology all these factors played important part in setting the agricultural practices. The categories include any land classified as a forest legal enactment. The land use of the Rayalaseema region (in hectares) for various aspects is furnished in the Table 2.

Table 2
Land Utilisation Pattern in Rayalaseema region 2013-14 (Area in Hectares)

Sl. No.	Land use Category	Name of the District				Total
		Anantapur	Chittoor	YSR Kadapa	Kurnool	
1	Total geographical area	1913000	151500	653900	1765800	4484200
2	Forests	196978	452018	119303	340669	1108968
3	Barren & Uncultivable land	166425	152700	73003	127313	519441
4	Land put to non-agricultural uses	150140	157312	77678	147659	532789
5	Cultivable waste	48533	46097	4243	47308	146181

6	Permanent pastures & other grazing	5848	33540	5231	3577	48196
7	Land under miscellaneous tree crops & groves not 'included in net sown	9416	30561	10535	1858	52370
8	Current fallows	86502	120944	64058	114845	386349

Source: Chief Planning Officer, Anantapur, Chittoor, YSR Kadapa and Kurnool (2013-14)[7]

Out of the entire area of Rayalaseema region, in Anantapur district the total geographical area is 1913000 lakh hectares and followed by the Chittoor total area is 1515100 lakh hectares, YSR Kadapa total geographical area is 653900 lakh hectares and the total geographical area covered by Kurnool is 1765800 lakh hectares. In Anantapur district 196978 he of the total land area is covered by the Forest. Chittoor district has 452018 (hec) of Forests. YSR Kadapa district has 119303 (hec) of the Forests in the total land area. In Kurnool district 340669 (hec) is under Forest area.

Barren and uncultivable lands are rocky outcrops of hills, plateaus, mountains etc., and this land put up under no conceivable circumstances be brought under farming. Merely a very high cost a little proportion may be classified as unproductive waste. This area occupies in Anantapur district is 166425 (hec), Chittoor district has 452018 (hec), YSR Kadapa district has 73003 (hec) and Kurnool district has 127313 (hec). The concentration of land under land put to non-agricultural uses is high in Chittoor which amounts to 157312 (hec). In Anantapur district about 150140 (hec) and Kurnool districts about 147659 (hec) lands under this category of land use, about 77678 (hec) of the total lands put to non-agricultural use of the YSR Kadapa district. The cultivable waste land is high in Anantapur district that is 48533 (hec), then Kurnool district has 47308. Chittoor district has 46097 (hec) and Kadapa district has 4243(hec) under cultivable waste. The entire acres under permanent pastures and other grazing land in Anantapur district is 5848 (hec), high in Chittoor district is approximately 33540 (hec). In YSR Kadapa district it is about 5231 (hec) of the total land. In Kurnool district, an area of about 3577 (hec) of land is found under permanent pastures and other grazing lands.

The land under miscellaneous tree crops & groves (not included in net sown), the Anantapur district posses 9416 (hec), the Chittoor district has 30561(hec), the YSR Kadapa district posses 10535 (hec) and the Kurnool district has 1858 (hec) of the land under miscellaneous tree crops and groves. The current fallow land is high in Chittoor district followed by Kurnool, Anantapur and YSR Kadapa. The absorption of other fallow land is high in Anantapur that is 209067 (hec) and Chittoor district has 150207 (hec), followed by Kurnool and Kadapa districts. The total land under net area sown high in Anantapur is about 1038980 (hec), then Kurnool district has 917654 (hec), followed by Chittoor and Kadapa districts. The total land under

cropped area high in Anantapur district is about 1106371 (hec), followed by the Kurnool, Chittoor and Kadapa districts. The land under sown more than once is high in Kadapa district. The concentration of Fish & Prawn culture is high in Anantapur district, normal in YSR Kadapa district, fewer amounts in Chittoor and Kurnool districts.

The land competence of the Rayalaseema region has been turned out taking positive variables like cropped area, total irrigated area and net area sown. In the Rayalaseema region, out of the total geographical area, majority of the land is under total cropped area followed by net area sown, forest cover, area sown more than once, land under non-agricultural use, other fallow lands, fallow land and under cultivable waste land etc. The maximum land use is found in Anantapur and Kurnool districts. The dispersion of soil under forest is uneven in the Rayalaseema region. The land under Fish and Prawn culture is very minuscule amount. For any regional improvement, the planners must learn the spatial form of land use pattern for forthcoming developmental activities to be held at local stage and regional level. Expansion of agricultural land with the assistance of technology may cause considerable changes in land use.

HISTORICAL STUDY OF FARMER'S SUICIDES INRAYALASEEMA

India is an agrarian country with around 60% of its people directly or indirectly depends upon agriculture. Agriculture in India is often attributed as gambling with monsoons because of its almost exclusive dependency on precipitation from monsoons. The failure of these monsoons leading to a series of droughts, lack of remunerative prices, exploitation by middlemen, all of which have led to a series of suicides committed by farmers across India**.** Farmers in India became the centre of considerable concern in the 1990s. Official reports initially denied the farmer suicides but as more and more information came to light, the government began to accept that farmers in India were under considerable stress. On suicide figures, there was much debate since the issue was so emotive.

More than 17,500 farmers a year killed themselves between 2002 and 2006, according to experts who have analyzed government statistics. Others traced the increase in farmer suicides to the early 1990s. It was said that a comprehensive all India study is still awaited, that most suicides occurred in states of Andhra Pradesh, Maharashtra, Karnataka, Kerala and Punjab. The situation was grim enough to force at least the Maharashtra government to set up a dedicated office to deal with farmers' distress. The agrarian crisis has its roots in the collapse of the rural economy. The centrality of basic livelihood security concerns is missing in most government policies. A systems approach is missing in dealing with the problems of farmers' distress. There is no coordination among various government departments dealing with the different components of the agrarian crisis. Unemployment is on the rise. The minimum support price mechanism is not operating for most commodities. At every level of the livelihood security system, there is a tendency to make profit out of poverty.

CAUSES OF FARMERS SUICIDE

Farmer's suicide is a major issue and it should be dealt with seriousness. Many farmers' lives are at stake because of this. The reasons why farmers commit suicide are varied and the methods they use to end their lives are different. Various reasons that could make the farmers in India take this ghastly step of ending their lives. The main reasons behind farmer's suicide could be lack of money, financial problems, carrying the burden of debt, extreme crop failure due to natural calamities etc.

Increased Costs

From seeds to fertilizers, from tools to big equipment, everything has become extremely expensive for the farmers to buy and grow crops. On top of it the livestock industry also needs a good amount of expense to look after the animals, their health, their food, their hygiene and so much more. All these increased costs may affect the purchasing value for the farmers which could lead in low production or low output.

The Debt

When the costs for equipment and other facilities increase, farmers may not have a choice but get a loan. Again, when the income is low due to the low production, then naturally paying off the interest and the loan amount is going to be challenge. The burden of increasing interest and low income to pay it off can be a lot to bear. Suicides due to inability to pay off the loans are high in farmers and the biggest cause that leads then to this path of taking their own life.

Loss of Family's Support

Loss of support from peers or family members could also be one of the major reasons for farmers' suicide. When we say 'support' it is not just financial support, but also emotional and mental support, which is equally important. When families of farmers go one step ahead and create an empathetic support for them, then the feeling of being understood or knowing that they aren't alone or they can fight and find ways out of the problem can help them to take a step back from think about suicide.

Lack of Awareness

If farmers are educated frequently about the loan facilities, subsidies, new ways of farming and much more than their problem-solving skills may develop and they may think of different ways to look at a problem and find different solution other than suicide. The main reasons include monsoon failure, climate change, high debt burdens, government policies, mental health, personal issues and family problems among the reasons of farmers' suicides.

The surge in input costs

A major cause of the farmers' suicides in India has been the increasing burden on the farmers due to inflated prices of agricultural inputs. The culmination of these factors is seen in the **overall increase in the cost of cultivation**, for wheat, the cost at present is three times than it was in 2005.

Cost of chemicals and seeds

Be it the fertilizers, crop protection chemicals or even the seeds for cultivation, farming has become expensive for the already indebted farmers.

Costs of Agricultural equipment

The input costs, moreover, aren't limited to the basic raw materials. Using agricultural equipment and machinery like tractors, submersible pumps etc adds to the already surging costs. Besides, these secondary inputs have themselves become less affordable for the small and marginal farmers.

Labour costs

Likewise, hiring labourers and animals is getting costlier too. While this may reflect an improvement in the socio-economic status of the labourers, driven primarily by MGNERGA and hike in minimum basic income, this has not gone too well with boosting the agriculture sector.

Distressed due to loans

The NCRB data points out that in 2474 suicides out of the studied 3000 farmer suicides in 2015 the victims had unpaid loans from local banks. This is clear enough an indication for drawing correlations between the two. Whether or not the banks had been harassing them, however, is a long-drawn debate and needs more specific empirical evidence. Moreover, a shift away from usual trend also revealed that of the loans taken by these farmers, only 9.8% were loans from money-lenders. Thus the pressure or muscle-power of money-lenders could be far from being a major driving force, as is otherwise perceived. Another source of strong linkages between farmer suicides and indebtedness is reflected from the spread of the two. While Maharashtra had 1293 suicides for indebtedness, Karnataka had 946. Note that both these states saw one of the highest incidences of farmer suicides as well as indebtedness.

Lack of direct integration with the market

Although initiatives like the National Agricultural Market and contract farming are helping integrate the farmers' produce directly with the market, cutting the role of intermediaries, the reality is still lagging behind.

Lack of awareness

The digital divide, as well as the literacy gap, has made the marginal and small farmers particularly vulnerable due to their inability to utilise the positives of government policies. This is reflected in the continued unsustainable cropping practices – like cultivating sugarcane in water-deficit regions.

Water crisis

The concentration of these suicides in the water-deficit regions of states like Maharashtra, Karnataka is a manifestation of how the water crisis and thereby failure to meet production demands have intensified the menace. This is particularly true in the backdrop of continued failed monsoons.

Interstate water disputes

What has added to the already prevalent crisis is the unwillingness to cater to each other's water needs amongst the states. A case in point is the recently resurfaced Kaveri dispute that saw Karnataka and Tamil Nadu battle out water shortage both in and outside the tribunal even to the extent of non-compliance with the tribunal award.

Climate change

The climate change has acted as the last nail in the coffin by resulting in furthering of the uncertainties associated with the already uncertain monsoon system and hence agricultural production. While incidents like flash floods have led to crop losses, deferred monsoons have seen production shortfall year-in and year-out.

Loan waivers instead of restructuring, re-investment measures

Our approach of handling farmer indebtedness and hence farmer suicides has been appeasement politics like the recent move by the UP government to waive off Rs 36000 crore worth of loans. Surprisingly this comes at a time when agricultural yield is expected to be better in the wake of a good monsoon. In essence, the factors sum up to crop failure, unsustainable production and subsequent farmer indebtedness leading to failure of strengthening the economic state of the farmer as the driving force behind these suicides.

FARMERS'S SUICIDES IN RAYALASEEMA REGION

The district wise and year wise number of suicides by farmers in Rayalaseema during 2004 - 2014 are presented in Table 3.

Table 3
Year-wise Farmers' Suicides in Rayalaseema

Sl. No.	Name of the District	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	Total
1	Ananthapur	72	70	69	90	86	47	45	67	40	31	41	51	908

As per the data collected from newspapers and from the list prepared by Andhra Pradesh Rythu Sangam (before bifurcation) during the five year period i.e. October 1997 to September 2002, a total of 877 suicides by farmers were reported in the state. In 1998 a maximum of 353 farmers committed suicide. During 1990-99, 59 farmers and in 2000, 82 farmers committed suicide. Again in 2001 there was a steep rise in suicides, the number reaching 200. The year 2012 also saw a spate of suicides. By the end of August 2002, 112 cases were reported. Later the figure rose to 218 by the end of November (**Prajasakthi, November 21st, 2002**)[9]. Of the total of 877 suicides, Coastal Andhra and Rayalaseema Regions accounted for around 13 percent each. Moreover in Ananthapur district 70 cases and 59 cases in Guntur district were reported.

Intensity of Farmers' Suicides in the Rayalaseema

District-wise Details of Farmers

The district-wise details of farmers' suicides in the state (2015-16) are presented in table 4.

Table 4

District-wise details of farmers' suicide in the state (July, 2015 to June, 2016) – AP[9]

Sl. No.	Name of the district	No. of farmers' suicide	% to state total	No. of farmers' suicide per lakh hectare of Net Sown Area = (no. of farmers' suicides x 100,000) / net sown area in ha)	No. of farmers' suicide per lakh hectare of Gross cropped area = (no. of farmers' suicides x 100,000) / gross cropped area in ha)	No. of farmers' suicide per lakh farming farmers = (no. of farmers' suicides x 100,000) / no. of farmers)
1	Ananthapur	27	34.18	3.18	2.93	3.71
2	Chittoor	2	2.53	0.54	0.47	0.30

4	Kurnool	1	1.27	0.12	0.11	0.16
	Total	39	100	1.30	1.05	1.04

Source:Commissionerate of Agriculture, Govt. of Andhra Pradesh[9]

During 2015-16 the cases of suicides reported are 39. Of them 34.18 percent are reported from Ananthapur district. Moreover the number of Farmers' suicides per lakh hectare of net sown area is reported as 1.30, and the number of farmers' suicides per lakh hectare of gross cropped area is reported as 1.05 in the state. On the other hand the numbers of farmers' suicides per lakh farming families are reported as 1.04 in the state. Observing across the districts the number of farmers' suicides per lakh hectare of net sown area are reported to be 3.18 in Ananthapur district. Similarly the numbers of farmers' suicides per lakh hectare of gross cropped area are estimated to be 2.93 in Ananthapur district. Moreover the numbers of farmers suicides per lakh farming farmers are observed to be 3.71 in Ananthapur. Observing across the districts of the state the suicides per lakh farming farmers varied from 0.16 is Kurnool district to 3.71 in Ananthapur district.

Month-wise Farmers' Suicides

The details of month-wise farmers' suicides in the state (2015-16) are presented in table 5.

Table 5
Month-wise farmers' suicide in Rayalaseema

Sl. No.	Month	No. of Farmers' Suicides	Percent to total number of farmers' suicides
1	July 15	8	10.13
2	August 15	9	11.39
3	September 15	11	13.92
4	October 15	15	18.99
5	November 15	9	11.39
6	December 15	9	11.39
7	January 16	3	3.80
8	February 16	8	10.13
9	March 16	2	2.53
10	April 16	5	6.33
11	May 16	0	0.00
12	June 16	0	0.00
Total		79	100.00

Source: Commissionerate of Agriculture, Govt. of Andhra Pradesh[10]

It can be observed from the table that comparatively higher percentage of suicides was taken place in September and October months of 2015. Similar percentage of suicides was reported in August, November and December months of 2015. Moreover 10.13 percent of suicides are reported in both July 2015 and February, 2016. No suicide cases were reported in May and June months of 2016. Observing across the months the percentage of suicide cases varied from 18.99 percent in October 2015 to 2.53 percent in March 2016.

CONCLUSION

Rayalaseema is a landlocked region with an expanse of 67,298 Sq Km accounting for 42% of the total geographical area of Andhra Pradesh. Rayalaseema region is the still neglected and economically backward region. The cropping pattern also varies with the effect of temperature, soil and other irrigation facilities. In the Rayalaseema region, out of the total geographical area, majority of the land is under total cropped area followed by net area sown, forest cover, area sown more than once, land under non-agricultural use, other fallow lands, fallow land and under cultivable waste land etc. The maximum land use is found in Anantapur and Kurnool districts. There is change in photographic, soil types, rainfall and geology all these factors played important part in setting the agricultural practices. Agriculture is often attributed as gambling with monsoons because of its almost exclusive dependency on precipitation from monsoons. The failure of these monsoons leading to a series of droughts, lack of remunerative prices, exploitation by middlemen, all of which have led to a series of suicides. The suicides per lakh farming farmers varied from 0.16 is Kurnool district to 3.71 in Ananthapur district. The percentage of suicide cases varied from 18.99 per cent in October 2015 to 2.53 per cent in March 2016. In long-term preventive policies, the main cause of drought is inadequacy of irrigation, a plan for development of scarcity prone areas should ensure maximum increase and in addition, following tube well and lift irrigation schemes to enhance the farmers to sustain.

Farmers Suicides in Andhra Pradesh, India

Dr. P. Venu

Academic Consultant, Department of History, S. V. University, Tirupati – 517 502, Andhra Pradesh, India

ABSTRACT

Andhra Pradesh is called as rice bowl of India. The deltas formed by the most important rivers of the Godavari and the Krishna make up the central part of the plains, an area of fertile alluvial soil. Thus, agriculture plays an immensely important role not only in the economy but also for achieving the food security for the state and also for the country. Andhra Pradesh is one of the leading rice-growing states in the country and is a major producer of India's tobacco. The main challenges of agriculture are, growing water scarcity, degrading natural resources like land and decreasing per capita availability of land and water resources. The large number of suicides by farmers is perhaps the most distressing phenomenon observed in Andhra Pradesh over the last decade. The main reasons behind farmer's suicide could be lack of money, financial problems, carrying the burden of debt, extreme crop failure due to natural calamities etc. The paper presents the number of farmer's suicides, distribution in different districts and reasons thereof in Andhra Pradesh.

Keywords: Farmers, Suicides, Reasons, Andhra Pradesh

INTRODUCTION

Andhra Pradesh State is "the bejewelled rice bowl of India". Agriculture plays an important role in the livelihoods of people as 63 per cent of the population in Andhra Pradesh lives in rural areas and depends on agriculture and related livelihood opportunities. Agriculture sector contributes 27 per cent share in State GDP. The agriculture plays an important role not only in the economy but also for achieving the food security for the state and also for the country. Our main challenges are, growing water scarcity, degrading natural resources like land and decreasing per capita availability of land and water resources. Andhra Pradesh is located in the southeastern part of the subcontinent ad bounded by Tamil Nadu to the south, Karnataka to the southwest and west, Telangana to the northwest and north and Odisha to the northeast. The eastern boundary is a 600-mile (970-km) coastline along the Bay of Bengal.

Land

The state has three main physiographic regions: the coastal plain to the east, extending from the Bay of Bengal to the mountain ranges; the mountain ranges themselves, the Eastern Ghats, which form the western flank of the coastal plain; and, in the southwest, the plateau to the west of the Ghats. The coastal plain, also known as the Andhra region, runs almost the entire length of the state and is watered by several rivers, flowing from west to east through the hills into the bay. The deltas formed by the most important of those rivers—the Godavari and the Krishna—make up the central part of the plains, an area of fertile alluvial soil. The Eastern Ghats are part of a larger mountain system extending from central India to the far south and running parallel to the east coast. Interrupted by the great river valleys, the mountains do not form a continuous range. The Penneru River forms the main drainage system. As the

result of erosion, the plateau is a region of graded valleys, with red sandy soil and isolated hills. Black soil is also found in certain parts of the area.

Climate

A summer that lasts from March to June, a season of tropical rains that runs from July to September, and a winter that lasts from October to February constitute the three seasons of Andhra Pradesh. Summers are extraordinarily hot and humid, with maximum daily temperatures exceeding 95 °F (35 °C) and even surpassing 104 °F (40 °C) in the central portion of the state. Summer nightly minimums drop to below about 70 °F (20 °C) only in the far southwest. Winters are somewhat cooler, with January maximum temperatures between 86 and 95 °F (30 and 35 °C) in all but the north-eastern portion of the state. Winter lows drop below about 60 °F (15 °C) only in the extreme northeast. Annual precipitation, which derives largely from the southwest monsoon rains, generally decreases toward the south-western plateau area. Coastal areas receive about 40 to 47 inches (1,000 to 1,200 mm) per year, while the westernmost part of the plateau may receive only half that much. Rainfall totals in portions of the north-eastern mountains exceed 47 inches and can be as high as 55 inches (1,400 mm).

Economy

Agriculture, forestry, and fishing

Agriculture, dominated by the production of food grains, is a major, although declining, sector of the state's economy, in terms of value. Andhra Pradesh is one of the leading rice-growing states in the country and is a major producer of India's tobacco. The state's rivers—particularly the Godavari and the Krishna, but also the Penneru—account for its agricultural importance. For a long time the rivers' benefits were restricted to the coastal districts of the Andhra region, which had the best irrigation facilities. Beginning in the mid-20th century, however, great efforts were made to tap the waters of the Godavari, Krishna, Penneru, and other rivers by constructing dams and reservoirs that benefit both coastal and drier upland regions. Canal irrigation in the Rayalaseema region of the plateau has given rise to agro-industrial complexes rivalling those of coastal Andhra Pradesh. The Nagarjuna Sagar multipurpose project, diverting the waters of the Krishna for irrigation, has substantially increased the production of rice and sugarcane. Rice flour, rice-bran oil, paints and varnishes, soaps and detergents, cardboard and other packaging materials, and cattle feed are all produced from local paddy rice. Other agricultural commodities grown state-wide include other cereal grains, pulses (peas, beans, and lentils), peanuts (groundnuts), corn (maize) and cotton—all of which are processed locally as well—and a variety of fruits and vegetables. Animal husbandry has increased significantly in Andhra Pradesh, especially since the start of the 21st century. Livestock rising contributes roughly half as much in overall value as crop production. Animals raised include cattle, water buffalo, sheep, goats, pigs, and poultry. Dairy and egg production have grown dramatically. The woodlands of Andhra Pradesh annually yield high-quality timber, such as teak and eucalyptus. Non-timber forest products—including sal seeds (from which an edible oil is extracted), tendu leaves (for rolling cigarettes), gum karaya (a type of emulsifier), and bamboo—are also important. With its long coastline and many rivers, the state has a significant and expanding fishing industry.

Resources and power

The state's principal mineral resources are asbestos, mica, manganese, barite and high-grade coal. Low-grade iron ore is found in the southern parts of the state. Andhra Pradesh produces a major share of the country's barite. It is the only state in southern India that possesses significant coal reserves. In the

early 21st century, large deposits of natural gas were discovered onshore and offshore in the basins of the Godavari and Krishna rivers. The diamond mines of Golconda were once renowned worldwide for producing the Koh-i-noor diamond and other famous stones; efforts have been made to revive production in the area. Quartz, limestone, and graphite also occur. The state has established a mining and metal-trading corporation to lead the exploitation of its mineral resources. Most of Andhra Pradesh's energy is produced by thermal generators in the public sector. Hydroelectric power stations—notably those on the Krishna River along the Telangana border at Srisailam and Nagarjuna Sagar—provide an important secondary source of energy. In addition, the government has established several wind farms. A number of private companies operate generators powered by natural gas; they also have worked to develop wind, biomass, and other nonconventional power sources.

Manufacturing

Andhra Pradesh since the mid-20th century has become one of the most highly industrialized states in India. Industry—including mining, utilities, and construction as well as manufacturing—contributes roughly the same value to the state income as does agriculture, although manufacturing itself accounts for only a small proportion of the overall income. Industries such as shipbuilding, aeronautics, and the manufacture of electrical equipment, machine tools, and drugs have been established in the Visakhapatnam area. Private enterprises, many of them located in and around the urban agglomeration of Vijayawada and Guntur in the east-central region, produce chemicals, textiles, cement, fertilizers, processed foods, petroleum derivatives, and cigarettes. A number of important enterprises of moderate size, such as sugar factories, are scattered across the medium-size and smaller urban areas. There is a mammoth steel plant at Visakhapatnam, where raw materials and port facilities are easily accessible; an oil refinery also is located there, as is a large shipbuilding yard. The increase in power generated by hydroelectric and thermoelectric projects since the late 20th century has benefited industrialization and irrigation.

CAUSES OF FARMERS SUICIDES

The large number of suicides by farmers in various parts of the country is perhaps the most distressing phenomenon observed in India over the last decade. These suicides, which reached almost epidemic proportions in certain pockets of the country, were first recognised and reported by an alert press around the late 1990s. The public concern that these press reports created forced some State governments, such as those of Karnataka, Andhra Pradesh, and Maharashtra, to set up Commissions to enquire into the phenomenon. The databases on which the press and the Commissions of Enquiry depended were somewhat uncoordinated and sporadic: they were either impressionistic, or based on information collated by activist sources and organisations such as Kisan Sabhas or small-scale surveys conducted by the Commissions of Enquiry. While the extremely useful role that the press and the Commissions of Enquiry played in informing the public about this distressing situation has to be recognised, these efforts could be — and often were — dismissed as the products of the fevered imaginations of some journalists and social activists (**Bhagwati and Panagariya, 2013[1]; Jadhav 2008[2]** and **Kapoor 2013[3]).**

Increased Costs

From seeds to fertilizers, from tools to big equipment, everything has become extremely expensive for the farmers to buy and grow crops. On top of it the livestock industry also needs a good amount of expense to look after the animals, their health, their food, their hygiene and so much more. All these

increased costs may affect the purchasing value for the farmers which could lead in low production or low output.

The Debt

When the costs for equipment and other facilities increase, farmers may not have a choice but get a loan. Again, when the income is low due to the low production, then naturally paying off the interest and the loan amount is going to be challenge. The burden of increasing interest and low income to pay it off can be a lot to bear. Suicides due to inability to pay off the loans are high in farmers and the biggest cause that leads then to this path of taking their own life.

Loss of Family's Support

Loss of support from peers or family members could also be one of the major reasons for farmers' suicide. When we say 'support' it is not just financial support, but also emotional and mental support, which is equally important. When families of farmers go one step ahead and create an empathetic support for them, then the feeling of being understood or knowing that they aren't alone or they can fight and find ways out of the problem can help them to take a step back from think about suicide.

Lack of Awareness

If farmers are educated frequently about the loan facilities, subsidies, new ways of farming and much more than their problem-solving skills may develop and they may think of different ways to look at a problem and find different solution other than suicide. The various reasons include monsoon failure, climate change, high debt burdens, government policies, mental health, personal issues and family problems among the reasons of farmers' suicides in Andhra Pradesh.

The surge in input costs

A major cause of the farmers' suicides in India has been the increasing burden on the farmers due to inflated prices of agricultural inputs. The culmination of these factors is seen in the overall increase in the cost of cultivation**,** for wheat, the cost at present is three times than it was in 2005.

Cost of chemicals and seeds

Be it the fertilisers, crop protection chemicals or even the seeds for cultivation, farming has become expensive for the already indebted farmers.

Costs of Agricultural equipment

The input costs, moreover, aren't limited to the basic raw materials. Using agricultural equipment and machinery like tractors, submersible pumps etc adds to the already surging costs. Besides, these secondary inputs have themselves become less affordable for the small and marginal farmers.

Labour costs

Likewise, hiring labourers and animals is getting costlier too. While this may reflect an improvement in the socio-economic status of the labourers, driven primarily by MGNERGA and hike in minimum basic income, this has not gone too well with boosting agriculture.

Distressed due to loans

The NCRB data points out that in 2474 suicides out of the studied 3000 farmer suicides in 2015 the victims had unpaid loans from local banks. This is clear enough an indication for drawing correlations between the two. Whether or not the banks had been harassing them, however, is a long-drawn debate and needs more specific empirical evidence. Moreover, a shift away from usual trend also revealed that of the loans taken by these farmers, only 9.8% were loans from money-lenders. Thus the pressure or muscle-power of money-lenders could be far from being a major driving force, as is otherwise perceived. Another source of strong linkages between farmer suicides and indebtedness is reflected from

the spread of the two. While Maharashtra had 1293 suicides for indebtedness, Karnataka had 946. Note that both these states saw one of the highest incidences of farmer suicides as well as indebtedness.

Lack of direct integration with the market

Although initiatives like the National Agricultural Market and contract farming are helping integrate the farmers' produce directly with the market, cutting the role of intermediaries, the reality is still lagging behind.

Lack of awareness

The digital divide, as well as the literacy gap, has made the marginal and small farmers particularly vulnerable due to their inability to utilise the positives of government policies. This is reflected in the continued unsustainable cropping practices – like cultivating sugarcane in water-deficit regions.

Water crisis

The concentration of these suicides in the water-deficit regions of states like Maharashtra, Karnataka is a manifestation of how the water crisis and thereby failure to meet production demands have intensified the menace. This is particularly true in the backdrop of continued failed monsoons.

Interstate water disputes

What has added to the already prevalent crisis is the unwillingness to cater to each other's water needs amongst the states. A case in point is the recently resurfaced Kaveri dispute that saw Karnataka and Tamil Nadu battle out water shortage both in and outside the tribunal even to the extent of non-compliance with the tribunal award.

Climate change

The climate change has acted as the last nail in the coffin by resulting in furthering of the uncertainties associated with the already uncertain monsoon system and hence agricultural production. While incidents like flash floods have led to crop losses, deferred monsoons have seen production shortfall year-in and year-out.

India's urban consumer driven economic policies

The political economy of India is driven more by the urban consumers than the rural producers. This is reflected in the *urgency to impose price controls* in case of price rise (imposing Minimum Export Prices, bringing items under Essential Commodities etc) and a *lacklustre withdrawal* once the price is under control. Contrast this with how we have been imposing minimum import price to secure our steel sector. This differential treatment to primary sector also limits profit margin and thereby hinders farmers' chances of breaking free from the cycle of indebtedness.

Loan waivers instead of restructuring, re-investment measures

Our approach of handling farmer indebtedness and hence farmer suicides has been appeasement politics like the recent move by the UP government to waive off Rs 36000 crore worth of loans. Surprisingly this comes at a time when agricultural yield is expected to be better in the wake of a good monsoon. In essence, the factors sum up to crop failure, unsustainable production and subsequent farmer indebtedness leading to failure of strengthening the economic state of the farmer as the driving force behind these suicides.

The economy of Andhra Pradesh is mainly dependent on agriculture. Two important rivers of India, the Godavari and Krishna, flow through the state, providing irrigation. Paddy, Sugarcane, Cotton and Tobacco are the local crops. Recently, crops used for vegetable oil production such as sunflower and peanuts have gained favour. There are many multi-state irrigation projects in development, including Godavari River Basin Irrigation Projects and Nagarjuna Sagar Dam, the world's highest masonry dam.

Agriculture is the main occupation of 60 per cent of population and related activities. Rice is the major food crop and staple food of the state. Other important crops are Jowar, Bajra, Maize and Ragi. The state has 23 per cent area covered with forest. Agriculture has been the chief source of income for the state's economy. Four important rivers of India, the Godavari, Krishna, Penna, and Thungabhadra flow through the state, providing irrigation.

FARMERS SUICIDES IN ANDHRA PRADESH

The district wise and year wise number of suicides by farmers for bifurcated Andhra Pradesh are presented in Table 1.

Table 1

Year-wise Farmers Suicides in Andhra Pradesh

Sl. No.	Name of the District	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	Total
1	Srikakulam	4	1	0	0	1	1	2	2	1	0	0	1	14

CV: Andhra Pradesh 2.04

Source: Commissionerate of Agriculture, Govt. of Andhra Pradesh, Amaravathi[4]

As per the data collected from newspapers and from the list prepared by Andhra Pradesh Rythu Sangam (before bifurcation) during the five year period i.e. October 1997 to September 2002, a total of 877 suicides by farmers were reported in the state. In 1998 a maximum of 353 farmers committed suicide. During 1990-99, 59 farmers and in 2000, 82 farmers committed suicide. Again in 2001 there was a steep rise in suicides, the number reaching 200. The year 2012 also saw a spate of suicides. By the end of August 2002, 112 cases were reported. Later the figure rose to 218 by the end of November (**Prajasakthi, November 21, 2002**).[5] Of the total of 877 suicides, Coastal Andhra and Rayalaseema

Regions accounted for around 13 percent each. Moreover in Ananthapur district 70 cases and 59 cases in Guntur district were reported.

It can be observed from the table that the number of suicides which was 381 in 2004 gradually reduced to 48 by 2014 in Andhra Pradesh. But in 2015 the suicides were reported to be 101, the reason may be attributed to the unexpected seasonal conditions and drought affects. During 2016, the suicides were reported as 79. This inferences that inspite of supplementary improvement programmes implemented in the state, the suicides are still continuing in the state. The reason may be attributed to the drought conditions and irrecoverable indebtedness. The coefficient of variation for number of suicides for the period 1998 to 2015 is estimated to be 144.22%. The log linear growth rates of number of suicides in the bifurcated Andhra Pradesh for the period 1998-2015 are found to be 0.97 percent for Guntur, 2.71 percent for Ananthapur and 2.04 percent for the state.

INTENSITY OF FARMERS' SUICIDES IN THE STATE

District-wise Details of Farmers

The district-wise details of farmers' suicides in the state (2015-16) are presented in table 2.

Table 2

District-wise details of farmers' suicide in Andhra Pradesh (July 2015 to June 2016)

Sl. No.	Name of the district	No. of farmers' suicide	% to state total	No. of farmers' suicide per lakh hectare of Net Sown Area = (no. of farmers' suicides x 100,000) / net sown area in ha)	No. of farmers' suicide per lakh hectare of Gross cropped area = (no. of farmers' suicides x 100,000) / gross cropped area in ha)	No. of farmers' suicide per lakh farming farmers = (no. of farmers' suicides x 100,000) / no. of armers)
1	Srikakulam	0	0.00	0.00	0.00	0.00
2	Vizianagaram	0	0.00	0.00	0.00	0.00

Suicide case of suicides reported in the state: During 2015-16 the cases of suicides reported in the state are 79. Of them 25.32 percent of the cases are reported from Guntur district and 34.18 percent are reported from Ananthapur district. Moreover the number of Farmers' suicides per lakh hectare of net

sown area is reported as 1.30, and the number of farmers' suicides per lakh hectare of gross cropped area is reported as 1.05 in the state. On the other hand the numbers of farmers' suicides per lakh farming families are reported as 1.04 in the state. Observing across the districts the number of farmers' suicides per lakh hectare of net sown area are reported to be 3.76 in Guntur district and 3.18 in Ananthapur district. Similarly the numbers of farmers' suicides per lakh hectare of gross cropped area are estimated to be 2.95 in Guntur district and 2.93 in Ananthapur district. Moreover the numbers of farmers suicides per lakh farming farmers are observed to be 2.63 in Guntur and 3.71 in Ananthapur. Observing across the districts of the state the suicides per lakh farming farmers varied from 0.16 is Kurnool district to 3.71 in Ananthapur district. No suicide cases are reported from Srikakulam, Vizianagaram and Krishna districts.

Month wise Farmers' Suicides

The details of month-wise farmers' suicides in the state (2015-16) are presented in table 3.

Table 3

Month-wise farmers' suicide in Andhra Pradesh

Sl. No.	Months	No. of Farmers' Suicides	Percent to total number of farmers' suicides
1	July 15	8	10.13
2	August 15	9	11.39
3	September 15	11	13.92
4	October 15	15	18.99
5	November 15	9	11.39
6	December 15	9	11.39
7	January 16	3	3.80
8	February 16	8	10.13
9	March 16	2	2.53
10	April 16	5	6.33
11	May 16	0	0.00
12	June 16	0	0.00
Total		79	100.00

Source: Commissionerate of Agriculture, Govt. of Andhra Pradesh

The table portrays that comparatively higher percentage of suicides was taken place in September and October months of 2015. Similar percentage of suicides was reported in August, November and December months of 2015. Moreover 10.13 per cent of suicides are reported in both July 2015 and February, 2016. No suicide cases were reported in May and June months of 2016. Observing across the months the percentage of suicide cases varied from 18.99 per cent in October 2015 to 2.53 per cent in March 2016.

CONCLUSION

Andhra Pradesh is called as rice bowl of India and 63 per cent of its population lives in rural areas and depends primarily on agriculture. The main reasons behind farmer's suicide could be lack of money, financial problems, carrying the burden of debt, extreme crop failure due to natural calamities etc. The reasons why farmers commit suicide are varied and the methods they use to end their lives are also

different. The number of suicides which was 381 in 2004 gradually reduced to 48 by 2014 in new Andhra Pradesh Observing across the districts of the state the suicides per lakh farming farmers varied from 0.16 is Kurnool district to 3.71 in Ananthapur district. No suicide cases are reported from Srikakulam, Vizianagaram and Krishna districts. The percentage of suicide cases varied from 18.99 per cent in October 2015 to 2.53 per cent in March 2016.Farmer's suicide in Andhra Pradesh is a major issue and it should be dealt with seriousness.

FINE ARTS IN TAMIL SANGAM AGE

Dr. GADDAM VENKATA RAMANA
Faculty, Academic Consultant,
Dept. of History, Sri Venkateswara University, Tirupati-517 502,

Dr. T. GIRIJA SESHAMAMBA, M.A., Ph.D. Music, LLB, LLM.
Recipient of Limca book & India Book of World Records Holder,
Faculty, Academic Consultant Department of performing Arts,
S.V. University, Tirupati.

Abstract- **The historic period of Tamil Nadu started with the sangam age. Education in the arts is an integral part of the development of each human being. This study mainly will give importance to the origin and development of the fine arts in the history of Sangam period. Sangam age to fine arts had its progress in various fields and inspired the coming generations. The fine arts like music, dance, drama and painting were all developed in a conspicuous measure. Tamils embraced, there from not only literature but also music and drama. The concept of Muttamil comprising Iyal, Is I and Natakam had attained currency as early as the Sangam age.**

Keywords: **Music, fine arts, sangam age, sangampeople, art forms, instruments.**

INTRODUCTION:

The sangam period as the classical age of the Tamils analogues. The Sangam age in Indian history witnessed the rapid development of Arts and literary works in the southern reasons. Various fine arts were very popular in the sangam age. Poetry, music and dance were quite popular among the sangam people. Various fine arts were very popular in the sangam age. During the sangam period music and dance were highly developed and popular. Musical instruments of various types are described and included many kinds of yal and varieties of drums.

Music

Music is the subtlest and finest of all fine arts and it develops the faculty of human imagination and appeals to the soul and conscience of the people. Through its melody or harmony it gives infinite pleasure to the mind and the heart. Tamils of the Sangam age possessed a highly developed system of music. The **Purananuru** shows that the Tamils had acquired a remarkable skill in music from an early time. They took a great delight in assembling in large numbers for the purpose of enjoying music, vocal and instrumental as well as dance performances. From **Pattinappalai** we come to know that the people of **Kavirippumpattinam** often resorted to the common place of the city in order to witness dances and enjoy music recitals. A class of bards known as Vairiyar used to provide music in the public assemblies of the village. It is learnt that when the guardian tree of a hostile ruler was felled the **Vairiyar** used to sing songs in merriment. The bards used to sing in praise of kings in their palaces early in the morning. There were the ubiquitous panar, the roving musicians and dancers. The groups of Panar proceeded from place to place. Their womenfolk **Viraliar** also sang the glories of Kings and Chieftains. The Porunars were the bards who accompanied kings to battlefields in order to cheer up the soldiers by their war songs and music.

Porunar

The Porunar were well known for their resourcefulness ready wit and conspicuous skill in conversation also. Rich presents were given to the Porunar and their womenfolk by the Kings munificently. When the king or chieftain Won a victory, golden flowers were given to the Porunar and jewels and ornaments were presented to the Viraliar, Among the Porunar and Panar, though they belonged to the same class, the former were more esteemed and more gitted poets and musicians than the Panar, However the Panar themselves were men or notable skill in music and Ldance. The artistic performances of the Panar and their women were immensely relished by the common people too.

Usal vari

From time immemorial there was in vogue the practice of women singing lullabies in order to lull babies in the cradle' to sleep. This variety of song was known as "Usal Vari". The girls used to sing songs when they were swinging in the Unchal i.e, swings from branches of trees or other hangers Women pounding rice resorted to a particular variety of song during the ourse of their work was described as Vallaippattu, Kurava women are said to have sung songs in order to miti~ato the pain and agony of their husbands when they were writhin with pain.

Asunam

A bird known as Asunam, mentioned in Ahananuru and Narrinai (it is said to be an animal) is said to have had a remarkably sensitive ear for music was called the '**Isai Art Paravai Paravai**. The cc mmon belief was that those who

wanted trap the bird sang suitable songs in order to entice it. from the Aliananuru it is learnt that even wild animals were stunned -by' the spell of sweet 'music. The application –'Isai' given to music, is itself significant; it denotes that which- moves or meets. According to Parimelalagar tbe verses of Paripadal were attuned to music.

High Degree

Tamils claimed the highest degree of musical perfection though they were much indebted to folk music in the evolutionary stages. They excelled in soft melodies through the gamut that consisted of seven notes or svaras. They were known as kural, tuttam, Kaikkilai, Ulai, ili vilari and taram. These were identical with the swarams or symbols, sa, ri, ga,ma, pa, da and ni, Their Sanskrit equivalents are Shadjam, Rishabham, Gandaram, Madhimam, Panchamam, Daivatam, Nishadam respectively. The seven tones were divided into 22 quarter tones or rutis or matras. In Puram 152, Venbaranar mentions the twentyone'Musical Stages'. The commentator explains this as the twentyone stages obtained by playing the seven svaras at the three places viz Tharam, Madhiyamam , Uchcham, His alternative explanation is that number twenty one refers to the number of 21 strings on a yal.

Patumalai

Pan was raga or tune. Sevvali, Marudam, Palai etc. were 'Pans'; it was prescribed that Sevvali was appropriate to the afternoon" and Marudam to the dawn. There were seven kinds of palai, viz Cempalai, Padumalalppa lai, Cevvalippalai, Ammpalai, Kotippalai, Vilarippalai, Mercempalai that were in practie. But, K. Kothandapani Pillai in his rook Pazhan tamil' mentions that seven palais are entirely different from 'Palai Nurperum Pannum Elu Perum Palaiyum' of Perunkatai. It is for musicologists to think *it* over and decide whether all tunes were the sub-divisions or offshoots of main tune palai or not. It may be surmised that the term palai was used in a broad se n-,e ~ignifyillg seven different main tunes since some names Cevvali, Patumalai and Vilari are associated with the wow -patai' , In the- initial stages the-principal -runes or airs were four in number Palai, Kurinchl Marudam and Cevvali. When the knowledge of music developed there were many variations for each time based on emotions such as war, marriage or ceremony.

Musical Instruments

"Instrumental music has played a prominent part in the evolution of music of both the Orienl and the accident Man became very conscious of the fundametntal principles of musical science, through musical instruments. The rnonophonous voice was not much help to him in practically working out and understanding the various musical laws and phenomena" says Prof. P. Sambamurthy, tbe musicologist. Tamilagam of the Sangam age has evolved different kinds of musical instruments suitable for chamber music, open air music aod marital music. The musical instruments were termed in Tarnil works as Turiyam, Iyam and Kalam.

They were carefully preserved in covers called 'Kalap pais'. On the basis of note technique, the musical instruments may be clasified into two kinds, the monophonnus in-trurnents that can produce only one note at a time like the horn, and the polyphonous instruments that can produce rn vr e than one note at a tim- like the Yal, Generally the musical instrurnenre are classified into four kind, as follows. (1) Torkaruvi, (2) Tulaikkaruvi, (3) Narampukkaruvi and (4) Kanchakkaruvi.

The Tamils of different tinais or regions had their separate parais and musical instruments. Parai, the percussion instru- ment, and Yal, the stringed instrument denote the distinctive features of Tamils. They find place in the list of Karupporul as follows. Local festivals and Individual ceremonies offered ample scope apd O,pportunities for the musicians to have splendid display or their musical talents. However, music played an important part as a unifying force of different strata of society in many ways.

Torkaruvi or Percussion Instruments

Percussion instruments are generally based on the principles of talam or layarn or rhythm. They vary in size,structure, sound and manipulation. They are also differentiated according to the different occasions such as 'festival, marriage, worship etc. The names of percussion instruments found in the ancient Sangam works are as follows : Muracu or panai, mulavu, tannumal, kinai, tatari, patalai, parai, tattam, tontakam, Pampai tuti, akuli, paoripparai, manror sirnparai, mattari etc.

Morasu

Murasu was a big drum which had unique honour in royal "lnalaces. During village festivals also murasu was used. The urasu was considered an important feature of war, camp and he battlefield This gave encouraging sensation to soldiers in heir progressive expeditions. Generally-the murasu sign.fied be honour of kings and chieftains in T amilagarn. The unique place it had in royal palace is already mentioned. It's sound was compared with the rainfalls and the roar or he sea, and it was used as a simile for the sound of Waterfalls rid thunder bolt. There are references to the high pitched, odaimurasu for announcing chat ities. This drum was used, Dot only for the mass feeding of gallant soldiers but also for the poor people. In Paripada l the sound of manamurasu (marriage drum) produced at Madurai was like the roaring sound of the sea and that of lndras thunderbolt. Its echo was beard in Tirupparankuodram, the temple of Murugan.

Mulavu

Mulavu can be identified with the modern mattalarn in shape only. From Malaipadukadam and Ahananuru it is known

that a stick (mulavin ta laik k.rl or rnulaviu errkurnil) was used for playing on mulavu; this stick was helpful for 'travelling artists on slippery path. Mulavu might have been - played on one side of it With fingers and on the other side with . stick. The Mulavu appears to be a big 'Udakkai' or Pampai. played with' stick and hand in local temp- les. The identification of it with Mattalam appears to be improbable. Mulavu is. given a central and important place to draw the minor muslcaj , defects of other instruments. This is evident from Madurark- kanchi, When the devotees of Lord Muruga holding in their bands their offering to tne Deity, the choicest offering among them was Mulavu,

Tannumai

As regards Tannumai there is no clear definition or shape about it. The term Tanuumai was used by the Sangam Tamils, in different meanings. It is referred to in Padirruppattu as makkattannumai (Tannumai with black spot, i.e., the black substance (Man) applied on the face of it, In that context there is also reference or note that it was played on by hand (Kaiyalai aluka). According to the commentaries of Padirrup pattu tannumai is interpreted as murasarn in this contexts.' orppuratannumai arppelunto muvala'. In Narrinai it is noted as 'palavai tannum d' In Ahananuru and Kuruntogai it is mentioned that tannumai was used by the Vcttakkavalar of Vetar clan especially whilst lifting cattle. In Purananuru here is an imagery about the honey bees alarmed by the sound of this drum (tannumai) flyaway from their honey combs bamboo tree. From MulJaikkali we infer that tannumai was considered as a marriage drum during the Sanga m age There is a reference to 'pookkoleya tannumai' in Ahananuru, and Purananuru. They speak of this instrument played for gallant warriors to select the flowers or symbols suitable to the situations of warfare.

Kinai and Tatari

The Kinai and tatari are different kinds of drums that give the sound syllabus-'kin kin' and 'tata tata' respectively. Kinai is a double faced drum since the old commentary Oil Purananuru identifies this as Udukkai. The movement Kinai is compared with that of turtle. This was also play with both sticks and hands. A Ceylonese scholar S.Vidyananthan identifies this Kinai with tatari. There are al references to show that kioai and tatari are one and the sum It may be said that kinai, tatari and udukkai are synonyms.

Patalai

Patalai is identified with single faced large drum called! 'Orukan Makkinair, fhere are references to 'Orukan Makkinai'' and 'PlItatai Orukan' in Purananuru. The musical souad *or* patalai was belpful to note the time measure. So it was called 'Dotitaru paniya patalai' in Malaipadukadam. Mayilai Seeni Venkatasami suggests that the modern term ‘tabla' (tapalai) is only the word patalai suffering metathesis.

Tattai

Nachinarkkiniyar says that tattai is an instrument made of bamboos and adds that it is called Tattai since it resembles the clapping of hands. It was used to scare away the birds coming towards the corn fields. Tattai is identified with Karadikai having the sound of bear.

Tontakam

Tontakam is a small drum played by the people of the hilly tracts to scare away the birds coming to eat millet in the fields. Ahananuru speaks of a folkdance participated by both males and females to tbe musical accompaniment or tontakam in the hilly streets. The Tirumurukarruppadai describes kuravaikkuttu performed by drunken jungle people with their relatives to the musical beat of tontakam *Manror Siruparai* mentioned in Malaipadugadam may be identified with tontakam since the description are alike.

Akuli and ElIari

Akuli is described in Maduraikkanchi as 'Nunnirakuli' Malaipadukadam says that the sound of owls was just like the sound of Akuli. Ellari is also a small drum mentioned in Malaipadukadam, According to Nachinarkkiniyar it is called 'Calli' since it has the sound of - Cal', Purananuru speaks of ellari' in the sense of ‘Calli’.

Tudi or Udukkai

In Porunararrupp::tdai, the side of rudi when beaten is compared with the circular foot of an young elephant. Tudiyan was one who played on Tudi. Tudi was played when offerings were made to the deities like ‘nadukal'. Paripadal mentions the use of tudi during the dance perfor- mances. It was useful to give caution to the agriculturists against sudden floods. Tolkappiyam explains a situation Tudinilai,

Pampai

Narrinai mentions about Pampai a, kind of drum which IS still in use in village festivals. Makuli and Mattarai are mentioned in Paripadal,

Parai

The term parai was used in a broad sense in the Sangam period. Kalittogai mentions about the sound of parai as a caution for the people to guard themselves from the ruttish elephants coming along the streets. The ancient poets speak about a peculiar animal called a cunama which could not tolerate the harsh sound of parai.

TULAIKKARUVI OR WIND INSTRUMENTS

Wind instruments are considered by the scholars as the earliest musical instruments of Tamils. In these instrumens sound is produced by setting in vibration a column of air inside th'e tube-like middle part. They are either mouth

blown or bellows blown. The antiquity of the wind instruments is explained by Captain Day in his book" The Musical instruments of Southern India and eccan." The following are the wind instruments mentioned ill the 'Saogam works: Flute, conch, Neduvankiyam or tumpu and Horn or trumpet.

Flute

Flute is the most universally common wind instrument amongst all musical instruments. The commentary on Paripadal speaks of 'Pakarkular' as a keynote instrument. The standard tonic note was set by the flute according to 'which the Yal was tuned. Kalittogai speaks of flute as coni . rolling the musical timbre of 'Yal.' In Perumpauarruppadal and its commentary some points regarding the process of making a flute are mentioned. In Paripadal there is a reference to flutes with seven and five holes. Ba-roboo. ampal stem konrai fruit were used for making flutes, The musical sound produced by the shepherds and cowherds during the evening hours was considered inducing pathos in the minds of' sepa rated 'lovers is picturised in Kurinchippattu, In' Pattinappala there is a detailed-description ofYelan Veriyadal, a kind of dance in which mention is made of flute as being one of the musical instruments to that dance. There is ample' reason to believe that it is a divine musical instrument as it is associated with Lord Muruga in Tirumurukarruppadai.

Tumpu or Neduvankiyam

In the world of music instruments, flute and turnpu are interpreted as Vankiyam and Neduvankiyam by the commentators of the Sangam works. The Tumpu should also be a flute of larger size with sligbt difference. As the term tumpu is also meant for the trunk of an elephant, and the sound of the tumpu or the appearance of an elephant is noted as resembling elephants sighting it seems that tumpu might have been a vertically blown pipe .

Horn or Udu Kompu

It should have been made of animal horn, whereas might have been made of the cone of strong wood •

Valai

The Valai or conch was also another musical instrument used during the festivals and war times. The conch was regarded as a sacred instrument. Its blowing indicated specially a success in the battle field; it might be a precursor of the trumpet.

NARAMPUKKARUVI OR STRINGED INSTRUMENTS

Yal (Yazh) is considered the oldest Tarnil musical instrument which paved the way for the emergence of a number of stringed instruments-plucked, bowed and struck varieties, Regarding the origin of this instrument Prof. P. Sambamurthy says, “When the primitive man shot an arrow he heard the fascinating sound emanating from the string of the bow. The bow string or Vil Yazh is the earliest stringed instrument in the history of human culture.”

The TamiIs had for every Tinai special instruments Vil, Yal and Parai suited to these tinais. In this connection there were Kurunchi Yal, Mnllai Yal, Marudbam Yal, Neydal Yal and Palai Yal. In Paripadal the term -Kuttam' is used for Yal in general. Four of the Pattuppattu works, Porunararruppadai, Sirupanarruppadai, Perumpanarruppadai and Ma la ipadukadam or Kootharar ruppadai have fine descriptions of Yal (Yazh). While describing, the shape and other observation of things and imagination. In the midst of differences of opinion regarding the real shape of the 'Yal' Swami Vipulanandar has thrown some light on this in his -Yalnul', ,

In Porunararruppadai there is a hyperbole that even the highway robbers of desert region are renouncing their robbery when they hear the charming music of the Palaiyal. Kalittogai has got a reference to point out that even wild elephant was brought under control by the music of YaL In Narrinai tltil sound of Yal is used as a simile for the sweet voice of Kuruku, (a kind of bird). The comparison that the sweet voice of a woman is like the music of Yal indicates that the Yal should have been very popular musical instrument among the highly. artistic minded people. The Panars were called Yalppanar.

KANCHAKKARUVI OR BELL METAL INSTRUMENTS

In the Sangam age, tala or rhythm held an important place in music -Iogy. In the opening stanza of Malaipadu kadarn there is a list of various musical instruments that were used by ancient musicians. In that list, there are two kinds of Cymbals, viz Pantil, and ElIari mentioned vividly. Pantil was made of well melted bronze and was circular in shape as to produce a ringing sound. While describing elari, the large cymbal, Per un Kaucikanar author of Ma1aipadukadam uses the attributed attributive words (that which is being bright and loud) signifying subtly the features of Cymbals i.e. sound and shining. In. Ahananuru, the cymbal 'is-mentioned. The large cymbal was made of gold. Though it is mentioned here so gold should be taken -a ,broad .rerm for-metals in general, since it is not possible to get the ringing or musical sound from genuine gold.

Bells

.Tbe sound of bells also was required as one of the musical accompaniments for the dance performances for the dance performances. In Ahananuru the dancer Attanatti has been described as wearing a belt of small bells around his hip in order to have the musical sound keeping time measure with his dance. In Kuruntogai it is described that the musical sound produced from the small bright bells was like the Vilarippan. In Purananuru it is mentioned that -Iraimanl' was

during the sentimental offerings to the deity in the hope of healing a hero's wounds and scaring way the ghosts. God Muruga is described as bolding a bell in one of his twelve hands in Tirumurukarruppadai,

Musicians

In the Sangam age musicians of high repute were patronised and gifts were given to them by Kings and other affluent persons. Lotus flowers made of gold as well as flowers knitted together with a silver string were presented to them. Occasionally lands and entire villages; too, were bestowed on them as gifts. Among the rulers of Tamilagam Pari, Nalankilli, 'Palai Padia Perunkadungo and the Pandian Nambi were some of the well known patrons of poets and musicians.

DANCE

Dancing was. developed with great enthusiasm during the Sangarn age. It attained a high degree of excellence in the peried of tbe post Sangam. The kings and Chieftains patronised "-dancing no less than music. Verses sung in praise of Kopperuncholan and Pari testify to this. The poet, Uraiyur Mudukannan Sattanar adverts to tbe patronage of dance by Nalam Killi.

Dancing was known by several names like 'Attam', 'Koothu; and Kunippu', Tolkappiyam shows' that dancing was resorted to by all classes of people. Tolkappiyam mentions Vallikkoothu and Kalanilaikkoothu. Vallikkoothu was the representation of the supposed dance of Valli the consort of Lord Muruga. The second one was held in honour of those soldiers who firmly stuck to their posts, relentlessly fighting the enemy even after many of their compatriots had retrated. Another pattern of dance is described in the section on the Puratrinai Iyalof Tolkappiyam. It was dance held by the fellow kings in honour of a ruler who was killed in the battle. The references to ritual dance was found in Kuruntogai and Maduraikkanchi, There is an interesting dance description in Kuruntogai held' in honour of Murugan.

Dance could be performed by men as well as women. Adi Mandi, the daughter of Karikalan's husband Attan Athi was a dancer. Madurai Tamila Kuttanar was a dancer from Madurai who bad specialised in the kind of dance peculiar to Tamilagam. A koothan or a porunan was a male dancer or actor and a Kootti, a femall dancer. The male dancer was called attan, the dance was attam and the stage aderkalarn. Anion the Sangam works, the Malaipadukadam and Porunararruppadai in particular describe the skill of these professional dancers.

Kuravai and Tunangai were group dances. The Kuravai though common *in* the Marudam region was also adopted the Kurinchi and Mullai. A ferocious type of Kuravai was the Verikkuravai, commonly resorted to by Kuravar when in a wild temper. This dance was common among the kurava soldiers. Adorning themselves with palmyra garlands these Kurava used to do dance in a frency. Tunangai generally to place in the open theatre of the village. In was a dance which men women participated. The women used to embraced each other in the course of the dance.

Apart from this associated with the battlefield there another type of' Tunangai ' when the victory was won, the or the leader of the triumphant army used to lead this dance in the midst of the corpses lying all around. On festive occasion groups of women performed the Tunangai dance. The Malaipadukadam shows that there was dancing at festivals and that, at other times, too, hillmen and their wives danced in order to amuse themselves. Kalittogai describes the attention devoted to pose and facial expression during dance.

How far the Tamilian technique of dance was influenced by the North Indian pattern has become a matter of controversy. "Whether the Tamil system of dance was indebted to. Bharatha or not one thing is clear, that is, that Bharata himself acknowledges the highly developed nature of South Indian music and dance."

"Chitra Dakshina Vrtte tu saptarupe prakirtita Sopohane sanirgite devastutyabhinandite Naradadyais tu gandharvaih sabhayam Devadanavah

Nirgitam sravitah samyag Iayatalasemanitam". (Natyasastra, v.31-2)

"Now when songs in seven forms and in Chitra and Dakshina Margas together with the Upohana and Nirgita were started by musical experts like Narada in praise of Gods, all the Gods and Danavas in the assembly were made to hear the Nirgita performed with proper tempo and time beat." The above, translation is given by Manmohan Ghosh(Bib. Indi, 1951, p. 81). This shows that the Dakshina Marga of the southern pattern of music had attained a high position when Bharata wrote his work. There is another reference in chapter XIV of Bharatha's Natya Sastra shows that the South Indian dance too bad attained high measure of development.

The host of pure Tamil terms occurring in the early literature of the Tamils indicates the indigenous origin and development of music, dance and other fine arts. Such are words like Isai, Koothu, Tunangai, Kuravai, TalaikkoI, Porunan, Yal,' Pan, Kannul, Ulai, Ili and Oviyam. During the post Sa ngam period due to Aryan influence there seems to have occurred a combination of Sou rh with North. The division of 'Ariyakkootu' (Northern Dance) and 'TamiI Koothu' (Southern Dance) is an indication of the distinction between the exotic and indigenous form. In certain cases the Tarnil patterns seem to bave been adopted by the Northern system and Sanskrit names. Ahakkoothu and Purakkoothu became "Nritya" and Nritta' in the aspects of Bharatha dance. These varieties of dance mentioned in Silappadikararn might have developed from certain types of Sangam age. It is agreeable to accept that basically the dance was that of the Tamils but it seems to have had some influence in details at the hands of the Arvan settlers.

DRAMA

Reference to Natakam are found in the Tolkappiyam and other early works. 'Nataka Valakkilum, Ulakiyal Valakkilum' (Tol. Porul, 53) Though the interpretation in' this contex had varied with writers, it seems to denote drama.

The Maduraikkanchi states that dramas were enacted night during festive occasions. It is unfortunate that no early dramatic composition has survived barring no doubt the Silampu which is as much a work of drama as of literature. Even with regard to Silappadikararn a scholar Madurai University Tamil Department points out that Silappadikararn was only a Therukkoothu or street drama. The various aspects like Kattiyankaran etc made him to come to the above conclusion.

The section of the Tolkappiyam which is immediately striking as concerns the dramatic arts is the meypattiyal. Even though it appears that nurpa 251 which enumerates eight *meypadukal* would seem to contain the most relevant information in this section, nurpa 249 is of vital importance this discussion here in that it gives us Tolkappiyar's idea of how these meypattu originates Nurpa 251 of this same section of the Tolkappiyam is giving us a list of the **meypadukal** makes the level of development of dramatic performances during the Sangarn period. '

“Nakaiye alukai I1ivaral marutkai accam perumitam Vekuli uvakaiyenru appal ettam meypadenba".

(They say laughter, weeping. desnisedness, wonder. Rear fortitude, anger and delight are the eight meipadukal)

Richard A. Frasca says that the primary importance of this nurpa is that it indicates the sophistication of the Tamils' concept of the theatre during this period. The fact that they nalysed and classified these varied emotional manifestations is ample proof that dramatic performance had a very important place in this society. The eight meypadukal clearly had to be the central concept around which ancient Dravidian theatrical traditions developed.

Professor George L. Hart of the U.S.A. in his detailed study of Sangam literature has given a discussion of the various performers of this ancient period but has certainly missed the point in describing them only as poets or musician). Many of the Sangarn poems are 'dramatic utterances'. The dancing girls were called ‘nataka makalir’ and the performance conducted by them was spoken of as Natakam, Drama was definitely an important aspect of the Sangtrn culture. But Tolkappiyam does not specifically mention Koothu or Nada , Kam in its list of compositions (Yappu), Prof. V. R. R. Dikshitar in his valuable translation with notes of the Silappadikaram makes a direct equivalence between the pattu of the Aham and Puram and drama.

PAINTING

Painting was known by the pure Tarnil word 'Oviyam'. the class of painters was called "Oviyar ' or "Oviya Makkal. painters were also described by the significant expression .Kannul Vinainar, Nachinarkkiniyar explains this term by stating that skillful painters had the gift of captivating the onlooks by their art.

It is learnt from Maduraikkanchi that figures of god as well as scences of Nature were painted-on walls as well as on Canvas, Tamil works like the Paripadal reveal that there existed some treatises on painting. Nedunalvadai calls the outline drawing : which was not painted as Punaiya Oviyam. The pictures on the walls of the temple at Kavirippumpattina are referred in the Pattinappalai. Palai Padia Perunkadunko stated to have compared the brush employed for painting with a kind of soft flower called' Padiri' in Narrinai.

The reference to the Pandyan King**, 'Chittira Madattuttunjiya Seranmaran'** indicates that the royal palace had a hall or a picture galIery containing art exhibits. The temple of Lord Murugan on the hill of Tirupparankundram contain painted pictures on the walls. We learn from the Madurail kanchi about the existence. of painting probably on the wall of Jain monasteries in Madurai, It is learnt that the canopi of the royal cot on which the Pandyan ...ing Nedunchelia usedto sleep as welI as the walls and- ceilings of the room halS~, drawings of astronomical drawings representing the positiel of planets. We are not able to get any archaeological evidences old painting to estimate the quality of paintings. The litera references, however tend to show that paintings of high m ..were found. The poet andarattanar compares a handso damsel to the painting of a girl executed by a skillful painte As far as the available information goes the sculpture the early Tamils does not seem to have attained high stag development.

CONCLUSION:

The age of the sangam in the extreme South India was one of cultural transformation. At the turn of the first century B.C. South India moved from pre-historic period. That South India was absorbed into the cultural development of the sub-continent, which was taking place at the time. Thus the sangam age constituted a glorious era in the history of South India.

Abstract

After the withdrawal of Non-Co-operation Movement in February 1922 there was a lull in the political activities in India. The Lahore Session of the Indian National Congress in 1929 is an important landmark in the History of the Indian Freedom Movement. Jawaharlal Nehru, representative of younger elements in the congress was elected as the President. Congress declared attainment of Purna Swaraj (complete Independence) to India as its objective. To achieve this goal it also decided to start Civil Disobedience Movement and if necessary no-tax campaign against the British Government. It was at this session the congress has adopted to observe 26th January 1930 as the day of Indian Independence.

Keywords: Women. Civil, Disobedience, Movement, Rayalaseema

Introduction

The great enthusiasm shown by the people in celebrating the 26th January 1930 and taking the pledge given by Gandhiji, has indicated the mood of the people and their willingness to participate in the Civil Disobedience Movement. Before taking a final decision on Civil Disobedience he gave another opportunity to British to prevent Civil Disobedience Movement. He addressed a letter to the Viceroy in which he has mentioned eleven demands, which if acceded by the Government he would not start Civil Disobedience Movement. Gandhi considered these eleven demands as the substance of Independence. His eleven demands are:

1. Total Prohibition
2. Lowering of the Rupee-Sterling Exchange ratio to 1s 4D
3. 50% reduction in land revenue.
4. Abolition of Salt Tax, and Govt. monopoly on Salt
5. Reduction of Military expenditure by atleast 50%
6. Reduction of salaries of the Higher level services.

7. Protection to Indian Textiles
8. Reservation of Coastal shipping for Indians
9. Release of all Political prisoners
10. Reform of C.I.D. or its popular control, and\
11. Liberal issue of licences for the use of Fire-Arms for self defence and the permission to all Indian exiles to return home.

Gandhi felt that the acceptance of these demands would have announced to the achievement of most of the objective for which Indians had been agitating. Their non- acceptance revealed the exploitative nature of the British Rule. The Viceroy made no response. On the country, the Government started arresting the prominent leaders as a preventive step. Subhas Chandra Bose was the first Congress Leader arrested by the Government and was sentenced to one year imprisonment. So, Gandhiji decided to launch the Civil Disobedience Movement by breaking the Salt Law first by himself at Dandi. On 11th March Gandhi declared wholesale illegal manufacture and auctioning of salt should begin, after he had himself violated the law at Dandi. On 12th March Gandhi started his march from Sabarmathi Ashram to the Sea at Dandi through the heartland of Gujarath with 71 Ashram Members. This is popularly known as Dandi March.

It attracted the attention of the entire country and the world. Enormous publicity was given to this event all over the world. The March reached Dandi on 5th April. The very next day Gandhi started Civil Disobedience Movement by picking a handful of salt lying on the shore. This was the signal for starting Salt Satyagraha throughout the country by manufacturing salt flouting the law. It was a deliberate act of defiance to the mighty British Government and a signal to the nation that another stage in the fight for freedom has begun. Where facilities for flouting salt law do not exist, i.e., interior areas far away from the sea shore, Tripple Boycott, of Liquor shops, Foreign Cloth, Educational Institutions and services has to be followed.

Civil Disobedience Movement, 1930

On 10th April 1930, Dhurgabayamma, Headmistress of Girl's High School at Kakinada, addressed a meeting at Gandhi Chowk in Chittoor. Audiences of about 100 persons were present. One Krishnaswami, who accompanied Dhurgabayamma, also addressed the meeting. They exhorted the audience to join the Civil Disobedience Movement and enrol themselves as national volunteers. On 11th April, Dhurgabayamma had an informal meeting at Chittoor with the women of the Brahmin Street in the house of M. Ananthashayanam Ayyangar. She requested the women to induce their husbands to join the movement. Another meeting was held in the Varadappa Nayudu Girl's High School, mostly for women. In the evening, a public meeting was held at Gandhi Chowk with M. Ananthashayanam Ayyangar as the President. Dhurgabayamma spoke on the occasion. She repeated what she said the previous day. About 150 to 200 people attended. They included also a dozen women. On 13th April, there was a meeting of about 50 persons, mostly students at Gandhi Chowk, in Chittoor, to celebrate the Jallianwala Bagh Day and the National Week. M. Ananthashayanam Ayyangar who presided over the meeting spoke on the Khaddhar and temperance movements and the salt campaign. In April 1930, K. Subramanyam of Pennaperur village in Kadapa District wanted to take advantage of the Brahmotsavam at Vontimitta and

convened a political conference. He invited V.L. Sastri, President, Madras Andhra District Congress Committee to address the conference. He also endeavoured to organise a no- tax campaign in Badvel Taluk when the Taluk Board attempted to secure volunteers at Chittoor. On 22nd June 1930, three agitations from Vellore in North Arcot District were invited to address the meeting at Chittoor. As the meeting was prohibited under Section 144 Cr.P.C., the three Congress emissaries from Vellore reached Tirupati. On 24th June 1930, they wanted to hold a meeting. They were served with an order under Section 144 Cr. P.C. and one of them disobeyed the same. He was arrested and put up before the Joint Magistrate, Chandragiri, who convicted him and sentenced him to six months rigorous imprisonment. On 9th July, 1930, another Congress emissary from Kadapa District arrived at Kuntrapakam a small village near Tirupati to organize meetings.

On 2nd October 1930, a procession consisting of a few students went through the streets of Madanapalle with a photo of Gandhi. A meeting was held in the evening and the President of the meeting had been warned. The pamphlets advertising the meeting were printed by a local press and its proprietor was warned. One Mahadheva Sastry who had been imprisoned for violation of Salt Laws and who was released from the jail arrived at Madanapalle on 31st October 1930 on his way to Tirupati. He lectured to the people urging them to join the movement and to boycott foreign cloth. An attempt was made by him to take out a procession. He was prosecuted under Sections 153 and 290 I.P.C. and was sentenced to six months R.I. and a fine of Rs.50/-. In November 1930, some young men of Korlakunta, a village in Pulivendula Taluk tried to organise a procession with the photos of Gandhi and Tilak.

Gandhi-Cap and Ceded District's College Incident

On 4th August 1930, a hartal was observed in Anantapur in connection with the arrest of Pandit Madan Mohan Malaviya and shops were closed. A number of students of the Ceded Districts College, Anantapur and also of the Municipal High School stayed away from their classes and went in a procession through the streets of the town. The next day, finding that two of the boys in the college were wearing Gandhi caps, the Principal sent them out and put up a notice prohibiting the wearing of Gandhi caps inside the college. This was exploited by the local Congressmen like Y.Ramamurthy and Lakshmana Pillai who exhorted the students to disobey the orders of the Principal. An order for a large number of Gandhi caps was placed with a local tailor. The situation was, however, tactfully managed and on the students assuring the Principal that the wearing of Gandhi caps did not show that they were associated with any political party and that they did not intend to join any political propaganda while at college, the Principal withdrew his prohibition order.

Civil Disobedience Movement in 1931

In Chittoor, the conditions saluting to the National Flag was prohibited. Holding meetings were also banned. On 31st July 1931, A. Kaleswara Rao, General Secretary of the APCC visited Chittoor and made a very stirring speech abusing the Government. On 23rd August 1931, two Congress volunteers defied the D.S.P's order and went in a procession through the streets of Kuppam carrying Congress flag. The Sub-Magistrate of Kuppam issued an order under Section 144 Cr. P.C. prohibiting meetings, processions and carrying of national flags.

In August, 1931, the police prosecuted under Section 108 Cr. P.C. the Congress Secretary of

Kadapa for publicly approving political assassination. At Rajampeta, the police dispersed a public meeting.

Achanta Rukmini Lakshmipathi's Tour, 1931

In August 1931, Achanta Rukmini Lakshmipathi of Tamil Nadu Congress Committee and A. Kaleswara Rao toured Anantapur District on the invitation of Kalluru Subba Rao. On the morning of 29th August 1931, there was a public meeting in the Church Compound at Gooty (Gutthy). Rukmini Lakshmipathi spoke in English. Her speech was translated into Telugu by A. Kaleswara Rao. At 11:00 AM., there was another meeting at Peddhavaduguru on the invitation of Chinna Narayana Reddy. C.P. Obi Reddy presided over the meeting.

At Anantapur, Rukmini Lakshmipathi and A. Kaleswara Rao addressed a women's meeting at Sharadha Samajam and urged the women to join the Civil Disobedience Movement. From there, they proceeded to Gandhi Chowk. She said that the country was passing through a difficult period. Tracing the history of the struggle launched by the Congress in 1885, she appealed to the people to fight unitedly for Swaraj. On 30th August 1931, Rukmini Lakshmipathi hoisted the national flag at Dharmavaram. On behalf of the Mahila Samaj, Smt. Ambamma garlanded her. At Penugonda, both Smt. Rukmini Lakshmipathi and A. Kaleswara Rao were taken in a procession from the railway station to the residence of T.Sivashankaram Pillai. At the meeting held at Ramaswamy Temple, Venguswami Ayyar garlanded the guests. Agali Narayana Rao proposed a vote of thanks. On 31st August 1931, Rukmini Lakshmipathi and A. Kaleswara Rao addressed a meeting at Hindupur. P. Ramacharlu and Kalluru Subba Rao also spoke.

A.P.C.C. Meeting at Chittoor, 1931

The Andhra Provincial Congress Working Committee met at Chittoor on 29th and 30th September 1931, under the presidentship of the Kumara raja of Gampalagudem. Among those present were Messrs. T. Prakasam, K. Nageswara Rao,

A. Kaleswara Ro, B. Gopal Reddy and Narayanamurthi. The Committee passed resolutions condemning the prosecutions of Messrs. Lingaraju and Subramanyam. The Committee adopted the Secretary's report to the AICC regarding breaches of Gandhi- Irwin pact by officials in Andhra.

The Sub-Magistrates of Chandragiri and Puttur issued orders not only prohibiting the hoisting of the flag but also prohibiting the holding or attending of any meeting in support of the Congress Party or creed. At Madanapalle, cases were lodged by the police against V.V. Vedhanthacharyulu and Nagarathnam Mudhaliar for trying to extend monetary help to some volunteers. Proceedings were instituted under Section

109 Cr.P.C. against four young strangers who came apparently from Madras to Rompicherla.

In Kurnool District, the Civil Disobedience Movement was led by Swamy Narayananda Saraswathi, D. Sesha Reddy and K. Chenchu Reddy. D. Sesha Reddy, invited Kalluru Subba Rao toured Athmakuru Taluk for one week and explained to the people about the evils of the British rule in India.

Repressive Measures

The Government struck heavily against the people by resorting to severe methods of repression. By a Gazette Extraordinary, the Madras Government declared the APCC, the District Congress Committee of Anantapur and Bellary Satyagraha Shibiram as unlawful associations.

Resignation of teachers and other Government servants

During the Civil Disobedience Movement, teachers and other government servants in Rayalaseema resigned in protest against the repressive measures of the government. Those who resigned were C.R. Reddy, the Vice-Chancellor of Andhra University, T.K.T. Veeraraghavacharya and R.Venkata Reddy (Chittoor District), Nivarthi Venkata Subbaiah, D.H. Krishna Rao and D.Govinda Doss (Kurnool District),

D. Rama Reddy, M. Rangaiah Naidu and K. Subramanyam (Kadapa District).

Boycott of Educational Institutions

The students who gave up their studies during the Civil Disobedience Movement in Rayalaseema were: A. Chidhambara Reddy, N. Sanjeeva Reddy and H. Narasinga Rao (Anantapur District), M. Durvasulu Naidu, K. Mal Reddy,

V. Ramachandra Reddy, P. Thimma Reddy, A.P. Vajravelu Chetty, K. Venkatesayya (Chittoor District), M. Shamsheer Baig and A. Venkatasubbayya (Kurnool District). **Action against Local Bodies**

The Anantapur District Board which met on 31st May 1930 and passed a resolution condemning the action of the government for arresting national leaders like Jawaharlal Nehru, Sardar Patel, Abul Kalam Azad and others, was superceded on its refusal to cancel that resolution.

Action against the Press

The Telugu newspapers in Rayalaseema did their best to cover the movement and sent the messages to the nook and corner of the region. Therefore, the government's censor fell upon them to restrict their freedom. The Government had included a list of printing presses and newspapers in its blacklist. Warnings were issued or security was demanded from them. Among them were the Kowmodaki and Aindravathi published from Nandyal and Pattikonda respectively in Kurnool District. Kypa Subramanya Sarma, Editor and Publisher of Kowmodaki and P. Kondaiah Chetty, Keeper of Vani Nikethan Press were warned for publishing three articles, "Boycott of foreign cloth", "Prohibition" and "Mr.Gandhi's March" in their paper dated 27th June 1930. Vanam Sankara Sarma, Editor of Aindravathi was warned for publishing an article "The Gandhi Cap" in his paper dated 4th July 1930. P. Ramacharlu, Editor and publisher was warned for publishing two articles, "The Round Table Conference" and "The Cease of toddy shops and Kapus and Reddis" inhis paper Sri Sadhana published from Anantapur. In 1930, Rayalaseema Ugadhi Kaanuka, a Telugu annual was published from Tadipathri by K. Venkatarangachar. It contained a seditious article, "Wash thy feet in warm blood". It was a prayer to the Goddess of Freedom written by K. Venkataramanacharyulu, a partner of Deshabhandhu press where the journal was published. The government warned the printer and publisher for publishing the objectionable article.

Gandhi's Harijan Tour, 1933-1934

Gandhi, as part of the 'Harijan' uplift campaign, once again, visited Rayalaseema from 31st December 1933 to 4th January 1934 and covered places like Kalahasthi, Renigunta, Tirupati, Kadapa, Gooty, Peddhavaduguru, Ramarajupalle, Thimmancherla, Guntakal, Penugonda, Konakondla, Uravakonda, Vajrakaruru, Anantapur, Hindupur and Alur. He was accompanied by M.Bapineedu, Secretary, Andhra Harijan Sevak Sangh. Prof. Malkani, Meerabehan, Chandra Shankar Shukla, Uma Bajaj, Krishna Behan, Viswanatha Pandya, Dhamodhar Dhass, Ramanarayana Choudhary and one Mr.Sarma.

Gandhi Jayanthi Celebrations in Rayalaseema

In this conection, activities such as the portrayal of the life tof Gandhi importance of Khaddhar feeding of poor people, public meetings and processions were organized at Jammalamadugu, Kurnool, Kuppam, Nandyal, Proddatur, Palamaneru (Pallavan Eri means Pallavas Tank), Madanapalle and Narayanavanam. Prayers were also held in the Mahanandiswara Swamy temple.

Rajendra Prasad's visit, 1935

A notable event of 1935 was the visit of Rajendra Prasad, the President of the INC to Rayalaseema. From 23rd to 26th November 1935, he toured places like Nandyal, Panyam, Kurnool, Adoni, Nemakal, Guntakal, Vajrakaruru, Uravakonda, Kuderu, Tadipathri, Jalalpuram, Anantapur, Dharmavaram, Kuntimaddhi, Penugonda, Hindupur, Parigi, Lepakshi, Chilamatthuru, Kodikonda, Pathapalyam, Palasamudrum, Gorantla, Obuladhevara Cheruvu, Kadiri, Thanakal and Madanapalle. During his tour, he was accompanied by Acharya Kripalani, Hukkerikar, Chakradhara Saran, T. Prakasham, P. Ramacharlu and Kalluru Subba Rao.

Keshava Vidyanilayam

On the evening of 25th November 1935, Rajendra Prasad opened Keshava Vidyanilayam (behind District Board office at Anantapur), built for Harijans in memory of P. Keshava Pillai. Yerramala Kondappa donated two acres of land for the said school during Gandhi's Harijan tour of Rayalaseema in 1933-1934.

I. Sadhashivan was kept in charge of the school. Addressing the students, he appealed to them to sacrifice their lives for the service of the motherland.

N. G. Ranga's Election Tour, 1937

On 6th January 1937, a meeting was held at Thimmancherla near Guntakal in Anantapur District. N.G. Ranga addressed public meetings at Madanapalle, Anantapur, Dharmavaram, Pamidi organized the public meetings. At Pamidi, N.G. Ranga asked the people to defeat the Justice Party and vote for Congress. From Pamidi, N.G. Ranga left for Adoni.

Dhuvvuru Subbamma's Speech, 1937

In 18th April 1937, Desabhandhavi Dhuvvuru Subbamma from Nellore also addressed a public meeting at Gooty. She spoke about the political situation in the country. She criticised the Justice Party Government headed by K.V.Reddy Nayudu. She appealed to the voters to elect the Congress Party in the coming elections. She also addressed a women's meeting separately and asked the women to join

the freedom struggle. On 20th April 1937, Subbamma addressed a meeting at Pamidi. It was presided over by M. Sethu Rao.

C. Rajagopalachari's visit to Rayalaseema, 1938

In 1938, Gandhi Jayanthi was celebrated at Kadapa with the introduction of prohibition by C. Rajagopalachari, Premier of the Madras Government. At Rayachoti,

C. Rajagopalachari asked the people to give up drinking. At Chittoor, the prohibition was inaugurated by Yakub Hussain, Minister for Public Works of the Madras Government. Later Yakub Hussain, C.R. Parthasaradhi Ayyangar, R. Venkata Reddy, District Congress Secretary, L.Sundhararaja Ayyangar, Secretary, Prohibition Committee, Andhra region visited Murukkambhat, Kalavakunta, Penumury, Kothapeta, Poothalapattu, Venganapalli and asked the people to vacate the toddy and arrack shops. C. Rajagopalachari accompanied by Yakub Hussain, Muniswamy Pillai and S. Ramanatham visited Chittoor and expressed happiness as the toddy and arrack shops were closed. In the evening, they addressed a meeting near the police grounds.

Peasant Movement in Rayalaseema

A notable feature of 1930's in Rayalaseema was the organisation of Summer Schools of Economics and Politics for peasant activities. A Rayalaseema Peasants' School of Politics and Economics was opened at Giddhaluru in Kurnool District on 22nd December 1937 under the direction of N.G. Ranga in which about 25 students were enrolled.

N. G. Ranga also started in 1938 a Political and Economic Summer School at Madhanapalle in Chittoor District. It had 75 students on its rolls and it was an organ of socialistic propaganda. The lectures dealt with the evils of Imperialism and Capitalism and were intended to direct the energies of the students towards active participation in movements aiming at the abolition of these forms of domination.

A Summer School of Economics and Politics was organised during 20th May to 20th June 1939 at Kalwabugga in Kurnool District. G. Harisarvothama Rao was its Principal and it had strength of 64 students.

In Andhra all the Prominent Leaders of the Congress like Tanguturi Prakasham Pantulu, Pattabhi Seetharamaiah, Mutnuri Krishna Rao, Bulusu Sambamurthi and Pyda Bapayya were arrested. In spite of these arrests, the Congress volunteers continued the boycott and the swadeshi.

The prominent leaders of Rayalaseema and their followers in various districts participated in the second phase of the Civil Disobedience Movement. They had organized hartals in several places like Guntakal, Adoni, Kuppam and Nandyal. Gooty Kesava Pillai condemned the arrests of the Gandhiji and other leaders. The popular leaders like Kalluri Subbarao, Pappuri Ramacharyulu and Idhukallu Sadhasivan raised the revolt in Rayalaseema, but were arrested and sent to Jail. Several individuals sacrificed a great deal by participating in this Movement.

Participation of Women

Thousands of women participated in the second phase of the Civil Disobedience Movement in 1932. The participants like Vallabhaneni Sithalakshmamma, Digomerti Janakamma, Chukkamma, Duggirala Kanakamba, Kanagarthi Nagarathnamma, Vasireddy Hanumayamma, Dasari Krishnavenamma, Harikapudi Manikyamma, Suguna, Mahalakshmamma, Cherukuri Sowbhagyamma, Kotamarthi Kanakamma, Tripuraneni Kausalyamma, Vedhantham Kamala Devi, Kambampati Manikyamma were very prominent in the propagation of defying salt laws, picketing of liquor shops and boycott of foreign cloth. All the women were awarded one year imprisonment. Smt. Manikyamma had to go to prison with six months old baby in her arms. The women detenues were treated very badly. At this juncture, the Rayalaseema women were inspired by the leadership of Bharathi Devi Ranga wife of N.G.Ranga who led a campaign in Guntur district. She came to Rayalaseema Districts to propagate the movement among the women of Rayalaseema. She was arrested and sentenced to one year imprisonment and a fine of Rs.500/-.

During the Civil Disobedience Movement, number of Teachers serving in Municipal Schools, District Boards and Government Schools in Rayalaseema resigned to their jobs in protesting against the attitude of the Government. C.R.Reddy, Chittoor; Nivarthi Venkata Subbaiah, Kurnool,; M. Rangaiah Naidu from Kadapa District. Many of the students of Rayalaseema gave up their studies during the Second phase of the Civil Disobedience Movement.

Anantapur District

Lakshmi Devi D/o Narasayya

She was born in 1896, daughter of Seshamma and Narasayya. She was very much interested in studies but her parents got her married early and soon she became a widow. Even then she did not give up her hopes about studies. It was her uncle (mother's brother) who supported her in her studies. By 1925, she became the first Doctor in the Anantapur District. While studying Medicine in Bombay, she had observed social and political leaders and developed independent views. She got married in 1929 with Nivarthi Mrutyunjaya Sastri, a Junior Lawyer under her Uncle. She started her medical practice for common people. She was interested in maintaining not only a healthy body but also a healthy society.

By 1930 she was driven towards the Salt Satyagraha Movement. She met Gurgabayamma under whose influence she started addressing the people in large gatherings and picketing foreign goods. The police arrested her and brought her before the Sub-Magistrate Court. After heated arguments she was sentenced to six months Rigorous Imprisonment and a fine of Rs.200/- or in default of which further two months imprisonment. She was lodged in Vellore Jail in 1932.

Lakshmi Devi, worked for Harijan upliftment. She encouraged and followed inter-dinning and collected Harijan Fund when Gandhiji visited Bellary in 1934.

She was also served as Vice-President of the D.C.C. and worked for involving more women in the Congress and its movements. In 1935, she was elected as a member of composite Madras State Assembly for Two and half years and worked hard for her constituency. She was a representative from Bellary to the All India Women's Conference. The Sastri couple suggested change of the name of Ceded Districts as Rayalaseema they also suggested Tungabhadra project for improving irrigation

facilities in that region. She worked for the cause of unity and integrity. She died in February 1976.

Kadapa District

Kadapa Rama Subbamma

She was born in 1902 in Kadapa district, daughter of Ramachandra Reddy and Atchamamba. Her father was a great Sanskrit Scholar. She was married to Kadapa Koti Reddy in 1917. He was a Barrister Law in London and Oxford University, but turned a nationalist and inspired Rama subbamma. As a result of this atmosphere she joined the Congress in 1921 and started her political activities. She was highly inspired by T. Prakasam activities during the boycott of Simon Commission at Madras. She participated in the Salt Satyagraha of 1930 along with Durgabayamma, Dronam Raju Lakshmi Bayamma, Ponaka Kanakamma and other great leaders.

During the Individual Satyagraha in 1941 she participated along with her husband but was not arrested. When her husband was arrested, she organized the movement from 1918, and served as its Vice-President. She served as the Municipal Councilor for 40 years and did great service. She worked for women upliftment. She was the President of District Congress Committee from 1938-43. She left it during the Quit India Movement.

She was the President of All India Women's Conference State Wing. She toured extensively throughout the State. She was a great social worker and worked for the establishment of a Women's College in Kadapa. She donated One Lakh rupees for this purpose. She served as a Member of All India Social Welfare Board. State Social Welfare Board and President of Guild of Services. She worked in the relief programme of Rayalaseema famine. She was a member of All India Congress Executive Committee. She visited foreign countries. While addressing a meeting of Andhra Yuvathi Mandali. Hyderabad in 1940 she inspired the women of Hyderabad to come out of the seclusion. Though she was not arrested. She took an active part in the freedom struggle and social field.

Dr. Muthulakshmi Reddy

Dr. Muthulakshmi Reddy was one of the great women leaders of this period. Though her work was confined to Madras Women of Andhra derived benefit of her services as a Member of the Legislative Assembly. She was responsible for the enactment of laws concerning education and Health of Women, the abolition of Devadasi System and the suppression of prostitution. All her reforms had their impact on women in Andhra as there was already awakening in these matters dawned by the social reformers. Prominent person's likeYamini Purnatilakam, her daughter Rama Tilakam and the famous cinema star of the day Bezawada Ranla Tilakam had carried a movement for abolition of the Devadasi System. Dr. Muthulakshmi Reddy started a number of institutions for women. She did not participate in the Salt Satyagraha or in picketings and boycotting like other women of Andhra. But as a staunch follower of Gandhiji as an educated lady, she tried to awakening the women through meetings, discussions and organizations. As a follower of Gandhiji she resigned her membership in the Legislature in 1930. She represented Women's Indian Association and attended the Round Table Conference at England. When Gandhiji visited Madras in 1933, she was the President of Women's Indian Association and organized a large women meeting with Gandhiji. These women took a pledge that they would carry on the campaign against untouchability. She had already established Avvai Home, in which she

sheltered women of all castes. She took up the task of constructing a Cancer Hospital through the Women's Indian Association and collected huge donations. Though her eyesight was deteriorating due to age she convinced Gandhi and carried on the work.

Dr. Muthulakshmi Reddy was the first lady Doctor in the composite Madras Province. She was highly influenced by the Brahmo Samaj and its founder and leaders. **Conclusion**

Thus, Mahatma Gandhi's call of Civil Disobedience Movement has enormous effect which spread to the nook and corner of the country symbolizing that irrespective of age, education, profession, religion all joined together for the cause of freedom for the country. It is important to note here that because of the sacrifices made by the lakhs of people who suffered in the hands of the British by serving jail sentences, hangings, firings and Lathi charges. We are enjoying freedom. In this context the role played by Rayalaseema Women freedom fighters who involved in this movement played a key role in arousing national sentiment among the people for the cause of national independence.

Editor-In Chief

With the disintegration of the Soviet Union and the end of the Cold War, India reoriented its foreign policy priorities. The intense historical ties and the presence of a vast Indian diaspora in the region made it easy for India to unveil the "Look East Policy" (LEP) in the 1990s. The increasing harmony between India and ASEAN led to the acceptance of India as ASEAN's sectoral partner in 1992, full dialogue partner in 1996 and Summit-level partner in 2002.

FROM LOOK EAST TO ACT EAST

Prime Minister Narendra Modi, who came to power in 2014, rephrased India's Look East Policy to "Act East Policy" (AEP) at the 12th ASEAN-India Summit in 2014 held in Nay Pyi Taw in Myanmar. The amended message was that India was keen to act on its promises. More emphasis was given to connectivity, with the Cambodia, Laos, Myanmar and Vietnam (CLMV), which had not had priority attention in the LEP. AEP is a comprehensive policy that looks beyond ASEAN to include countries in East Asia and the West that is, the Indo-Pacific region. At the 16th India-ASEAN Summit, Prime Minister Modi declared that, "India's Act East policy is an important part of our Indo-Pacific vision and ASEAN lies at the core of it. India-ASEAN share a principle of regional architecture that is open, inclusive, sustainable, transparent and rules based".

In August 2015, under the ASEAN-India Plan of Action for the period 2016–2020, security, economic and socio-cultural aspects were identified as three priority areas for cooperation. Enhancing strategic ties with the vibrant ASEAN, India's fourth largest trading partner, through trade, investment, education and culture is considered a critical aspect of India's AEP. Bilateral trade between India and ASEAN grew from US$ 12 billion in 2003 to US$ 142 billion in 2018. India hosted the leaders of all ten member states of ASEAN at India's Republic Day parade on 26 January 2018 to mark 25 years of the ASEAN-India Dialogue Partnership. It also hosted a two-day Summit in New Delhi in January 2018 to commemorate the 25th Anniversary of the ASEAN-India Dialogue Relations, under the theme of "Shared Values, Common Destiny".

SOFT POWER APPROACH TO INDIA-ASEAN RELATIONS

The soft power of a country essentially rests on three resources, namely, culture, political values and foreign policy. Soft power-building tools include cultural and academic exchange programmes, media, international products, development assistance programmes, disaster relief programmes, etc.

India carries the image of a civilisation with no history of military and colonial interventions abroad. It has an immense reputation in the UN peacekeeping and religious. The diverse heritage and resources of India in sciences, medicine, arts, architecture, culture, festivals, cuisine, languages, literature, music, dance, movies and worship yoga is attractive to many people across the world, and the International Yoga Day is celebrated on 21st June in all ASEAN member states. The messages of peace and non-violence of Indian historical figures such as the Buddha and Gandhi are famous. India has nearly 400 million people in the middle class who play a key role in stabilising the political and economy. India has a large English-speaking population and is the largest publishing centre for books in English. India ranks third in the world in terms of scientific base. Many graduates of educational institutions like Indian Institutes of Technology (IIT) and the Indian Institutes of Management (IIM) have made it to top positions in global business corporations.

The soft power approach is about cooperation on the basis of respecting the interests of the parties involved, preserving indigenous cultures, and the acquisition and adoption of cultures from external sources. Gandhi had asserted that power based on love is a thousand times more effective and permanent than the one derived from the fear of force. Southeast Asia is crucial to India's vision of the Indo-Pacific region as well as in its Act East Policy. The Indian government supports the ASEAN Outlook on the Indo-Pacific (AOIP).

Since 2014, Prime Minister Narendra Modi has successfully attracted, engaged and connected with the overseas Indians. India's diplomats at the Annual

Bilateral trade between India and ASEAN grew from US$ 12 billion in 2003 to US$ 142 billion in 2018. India hosted the leaders of all ten member states of ASEAN at India's Republic Day parade on 26 January 2018 to mark 25 years of the ASEAN-India Dialogue Partnership.

Moreover, syncretism is apparent in Indian symbols found in Southeast Asia. The statue of Indonesia is nestled after Garuda, a statue of Indian origin associated with the Ramayana. The image of Indian attire in Malaysian Muslim weddings, the Buddhist temple practiced in the Hindu temples of Cambodia are major examples of Indian influence in Southeast Asia.

The influence of India is also evident in the food and flavours of Southeast Asia. There are many spices in common between Indian and Southeast Asian foods. Most of the people of the Southeast Asian region eat rice and curry like the people of Eastern India with many common ingredients. Indian herbal remedies also reached Southeast Asia from ancient times and are used even today in many countries.

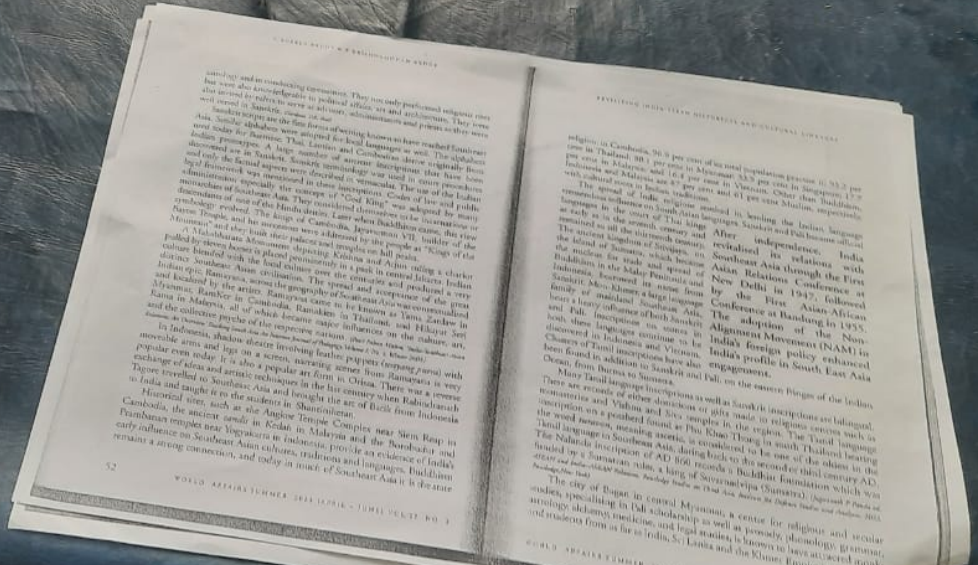
SHARED CULTURAL HERITAGE

In the context of India-ASEAN relations, cultural heritage played a significant role in the exchange of religions, scientific and philosophical values and concepts, artefacts, oral or folk heritage, languages and literature, traditional arts and crafts, architecture, performing arts, games, indigenous knowledge systems and practices, myths, customs and beliefs, rituals and other living traditions.

The process of acculturation of India and Southeast Asia began in ancient times. The exchanges via trade, the influence of Sanskrit and the Indian epics in Southeast Asia and technological innovations shared between the two regions are well documented. The commonalities between India and Southeast Asia provide a platform for building synergies with the countries of the region. Therefore, culture is the key to the India-ASEAN partnership.

The increased interactions resulted in exchanges of various features of practises ranging from religion to food and customs with the settling of Indians in the region and intermarriages with indigenous populations. This resulted in a process of hybridisation in cultural practices and localisation of Indian culture in Southeast Asian countries visible even today.

DECONSTRUCTING COLONIAL PARADIGMS



The interactions between India and Southeast Asia were viewed from colonial perspectives in the early part of the twentieth century. There was a need to

deconstruct and deconstruct the colonial paradigms and intellectual structures to understand the interactions from a closer and more objective perspective.

After independence, India articulated its relations with Southeast Asia through the First Asian Relations Conference at New Delhi in 1947, followed by the First Asian-African Conference at Bandung in 1955. These conferences were significant landmarks in shaping post-independence India's relations with Southeast Asia or the ASEAN countries. The adoption of the Non-Aligned Movement (NAM) in India's foreign policy enhanced India's profile in South East Asia engagement. India extended support to the Indonesian struggle for independence in the 1950s as well as in the Indochina crises in the 1960s. The signing of friendship treaties with Indonesia, Myanmar and the Philippines aided India in consolidating its bilateral diplomatic relations with the regional bilaterals. However, the Cold War politics affected the relations between India and Southeast Asia. Some of the countries became members of the newly-formed Southeast Asia Treaty Organization (SEATO), forging an alliance with the United States to address their security needs. India distanced itself from such treaties and instead moved close ties with the Soviet Union.

The formation of ASEAN (Association of Southeast Asian) on 8 August 1967 in Bangkok, Thailand, was a significant landmark. The ASEAN Declaration (Bangkok Declaration) was signed by Indonesia, Malaysia, Philippines, Singapore and Thailand, while India focused on its bilateral problems with Pakistan and China. India signed the Indo-Soviet Treaty of Friendship and Cooperation, in August 1971. The pro-American countries of ASEAN like Thailand, Malaysia and Singapore were apprehensive of India's drift towards the Soviet Union, as they felt this would aid Moscow in advancing its interests beyond South Asia. They were also worried about communist Vietnam and its potential threat to the region. As a result, India and Southeast Asia navigated in different directions with diverging strategic interests.

Prime Minister Narendra Modi, who came to power in 2014, rephrased India's Look East Policy (LEP) as the "Act East Policy" (AEP) at the 12th ASEAN-India Summit in Nay Pyi Taw in Myanmar. More emphasis was given to improving ties with the Cambodia, Laos, Myanmar and Vietnam (CLMV), which had not had priority attention in the LEP.

Revisiting India-ASEAN Historical and Cultural Linkages

The relationship between India and Southeast Asia dates back many millennia. Historically and culturally Southeast Asia, now known as the ASEAN region, was comprising Myanmar, Thailand, Malaysia, Singapore, Laos, Cambodia, Vietnam, Indonesia, the Philippines and Brunei, has been one hub of Indian cultural outreach for more than 2,000 years. The historical and cultural links ranging from particularly excellent exchanges in the expansion of Buddhism, Hinduism and Islam across the Bay of Bengal and impact, collaboration in the early twentieth century by Indian intellectual and political leaders like Nobelprize winner Tagore. This article explores the political and civilizational linkages between India and the ASEAN states to facilitate and substantiate those links for mutual economic and geopolitical benefits.

C Sheela Reddy & P Krishnamohan Reddy

Historical Backdrop

Southeast Asia was particularly attractive to the Indian mercantile class and they named the faraway lands Suvarnabhumi (land of gold), Suvarnadvipa (island of gold), Narikeladvipa (island of coconuts), Karpuradvipa (island of camphor), and Yavadvipa (island of barley).

Hindu priests and Buddhist monks accompanied the merchants and seafarers and assumed a leading role in spreading the message of Indian thought and culture in the entire Southeast Asian region. The local people welcomed them since they had no political ambitions and lived in harmony and tolerance. India's culture, religion and civilization spread to different parts of Southeast Asia as monks and Hindu Brahmins priests travelled to faraway kingdoms like Cambodia and Indonesia. The kings of the region wore Indian-made silk during

commercial settlements and donated jewels imported from India. The interaction people performed religious and cultural activities.

Hinduism and Buddhism, and to an extent Islam, which spread into countries from India to Southeast Asia, serve as an important cultural linkage. Buddhism came to Southeast Asia from India in the third century BCE when Buddhist missionaries were sent by King Ashoka. Mahendra, a son of Indian Buddhist minister of the Dharmasastra of Buddhist monasteries and communities. However, some of the elements of Hinduism and Ramayana, across the geography of these religions with pre-existing conventional with the Hindus in a Southeast Asia for the Asian countries for the past.

Buddhism entered from the Southeast Asian region also impacted on Indian monuments in the eastern Indian caves of Nalanda, Sarnath and Sanchi (Varanasi) and the continues even today. The multifaceted society of Khasis in Meghalaya, India, is one the matrilineal matrimonial society of Sumatra (Minangkabau) in Indonesia, where women head the family and inherit property through the daughters.

India never established colonies in Southeast Asia, and the movement was more of ideas rather than peoples. The Indians who went there did not go to rule but had only interest in exercising political control from the Indian religion, political thought, literature, mythology, arts, morals and style, were absorbed deeply into local culture as greater interaction with Indians who settled in the courts of Southeast Asia took place.

In medieval times, from the sixth to fourteenth century, many Indian artisans from Kalinga (modern day Orissa) came to work temporarily in the courts of the great maritime empire based in the Indonesian islands of Java and Sumatra. They helped in building great temples and monuments. Many of the murals on the walls of Borobudur and Angkor Wat resemble carvings of Konarak and other medieval temples of eastern India. Brahmins also played an important role in the Sukhone (Thai), Cambodian, Lisonian and Annamese courts as experts in

cultural exchange programme between India and ASEAN. The first-ever delegation of State Ramayana ballet performances was conducted in the Prambanan temple complex of Yogyakarta, Indonesia, in 2011.

Under the aegis of the Archaeological Survey of India (ASI), initiatives for restoring temples and cultural monuments across ASEAN promote the close cultural links that India has ordinarily, periodically. ASI undertook restoration of the Ta Prohm temple in Cambodia in 2011, the restoration of Cham monuments in 2015 of Vietnam and the conservation project of Vat Phou temple in Champasak province of the Lao PDR in 2014. The ASEAN-India Film Festival organized in 2018 by the Indian Ministry of External Affairs in cooperation with the Ministry of Information and Broadcasting showcased films of different genres from India and ASEAN member states, [illegible]

The similarities in lifestyle and culture together with the low-cost tourism offered by Thailand and Malaysia attract Indians. According to statistics, by 2020, six million are expected to visit Thailand, while the percentage of Indian tourists expected to go up from 4 per cent to 15 per cent. The Thailand Tourism Authority reports that Indians spend 11 per cent more than foreign visitors. Equally, the number of tourists from ASEAN countries to India is growing yearly, from seven lakh (seven hundred thousand) in 2016 to 8.8 lakh in 2018. Most sought-after tourist destinations for Indians are in Thailand, Singapore, Malaysia, Cambodia and Indonesia, given the low-cost affordable packages, presence of Indian diaspora and similarity of culture and cuisine. The cities often visited by Indians visit more in ASEAN countries are Bangkok, Pattaya, Kuala Lumpur, Singapore, Phnom Penh, Jakarta and Manila.

In the education sector, India and ASEAN developed different mechanisms to promote more exchange of students among them. ICCR, as the coordinating body from the Indian side that provides scholarships and exchange programmes to students from ASEAN countries. Annually, ICCR provides more than 100 scholarships for studying Indian heritage, culture, music, dance and yoga in India. In addition, the Ministry of Ayush (traditional and holistic medicine) in connection with ICCR provides 29 scholarships yearly to Southeast Asian nationals to study Ayurveda, Unani, Siddha and Homeopathy medicine in India. India also accepts ASEAN students under the aegis of the Cultural Exchange Programme (CEP). The year 2022 marked thirty years of ASEAN-India relations

and a new designation as ASEAN-India Friendship Year by the leaders in October 2021. [illegible]

CONCLUSION

India and the Association of Southeast Asian Nations (ASEAN) are home to more than 1.8 billion people and have an economic GDP of US$ 6.8 trillion and a substantial share. The other programmes of world economic, economic and aimed at boosting people-to-others. They share land and maritime boundaries. ASEAN remains the main people ties between India and focus for India's cultural diplomacy as ASEAN are students exchange the centuriesold cultural linkages are programmes, a special training among with a major thrust on people course for ASEAN diplomats, to-people relations. The plurilateral parliamentarians exchange ethos in all the member-states shared through the ASEAN Inter-cultural, civilizational ties, religious Parliamentary Assembly (AIPA) affinity, maritime incidents and historical linkages can help them since 2010, the participation of to move towards a comprehensive ASEAN students in National strategic partnership. The Indian Children's Science Congress, government is trying to secure and the ASEAN-India Network of remain various kinds of cultural ties Think Tanks et al.

by establishing and funding a large number of local organizations. The interactions and exchange of ideas that took place in the past can offer models for future cultural interactions and the free flow of people. Historical research can help in rediscovering or regenerating old bonds to suit the modern context and the evolving geo-political situation. ■

[illegible]

Non-Alignment Or Veiled Alignment?

The author highlights the pro-socialistic bent of the Non-Aligned Movement (NAM), inspired by the desire to resist the influence of the former colonial powers and their capitalistic hegemony. The article points out that the co-founder of NAM, Pandit Nehru, even before Independence, leaned towards USSR and other communist policies, despite Stalin's will to bring the communists to power in independent India. Nehru's ideological tendencies led him to ignore Soviet and later Chinese hostility to India's political system and to support Maoist China in various ways while accommodating the Indian Communist Parties.

P KRISHNA MOHAN REDDY

While analysing whether Jawaharlal Nehru's Non-Alignment Movement (NAM) is Veiled Alignment, we should study his anti-West, pro-Socialist leanings as the core of NAM. As we can see, in the name of the fight against imperialism and for democracy and freedom, he consistently attacked the Capitalist West. Nehru admired the Soviet Union ever since he had visited it way back in 1927. From the time of his speech as Vice President of the Interim Government in 1946, he struck and maintained a friendly approach towards the Union of Soviet Socialist Republics (USSR). *(Bipan Chandra, Mridula Mukherji, Aditya Mukherji, India Since Independence, Penguin, New Delhi, 2008, p201)* He continued to keep silent about the totalitarian regimes of Communist Eastern Europe, Soviet Union and China. He never criticised the horrors committed on the domestic populations in USSR under Stalin or in China under Mao. Nehru expressed his regard for Socialism and the USSR despite the fact that Stalin personally supervised the Communist Party of India's (CPI) activities, some of which were detrimental to India's interests. Nehru refused to interpret the communist insurgency in India as proof of Soviet unfriendliness. Even before independence, as a special gesture, he offered diplomatic relations, and sent his sister Vijayalakshmi Pandit as ambassador

to the Soviet Union. *(Ibid)* The CPI, under Soviet guidance, declared in December 1947 that "India's independence was fake, 15th August was a day of national betrayal, Congress had gone over to imperialism and feudalism, Nehru had become a stooge of imperialism, the government was ruling in a fascist manner, and the constitution that was being framed was a charter of slavery. The communists had, therefore, to take up the anti-imperialist and anti-feudal tasks, fight for freedom and democracy and initiate an armed struggle". *(Bipan Chandra, Mridula Mukherji, Aditya Mukherji, India Since Independence , Penguin, New Delhi, 2008, p258)* The CPI gave a call for an immediate armed uprising. It decided to continue the armed peasant struggle in Telangana which had been going on against the Nizam of Hyderabad since 1946, but now directed it against the Indian government. *(Ibid)* During the national railway strike launched by the CPI in March 1949, although a complete flop, the Party indulged in several terrorist acts. As a consequence it was banned in several states. *(Op.cit, pp258-259)*

The CPI, under Soviet guidance, declared in December 1947 that "India's independence was fake, 15th August was a day of national betrayal, Congress had gone over to imperialism and feudalism, Nehru had become a stooge of imperialism, the government was ruling in a fascist manner, and the constitution that was being framed was a charter of slavery. The communists had, therefore, to take up the anti-imperialist and anti-feudal tasks, fight for freedom and democracy and initiate an armed struggle".

Even as a late as the end of 1951, under the direct guidance of Stalin, the CPI still considered India essentially a colony, the transfer of power in 1947 as "betrayal", the Indian government as subservient to imperialism, and the Indian political system as basically undemocratic and authoritarian with the government having established a police state. The political task of the CPI remained the eventual overthrow of the Indian state through armed struggle. However, the new element in its policy was that the overthrow of the state was to be postponed and left for a future agenda because the people were not yet ready for the task. The Party was, therefore, immediately to turn away from revolution-making, withdraw from the armed struggle in Telangana, and participate in the approaching general elections. Nehru was in full command of the government by then. He cleared the way for the CPI by legalising the party

Currently every African country (except South Sudan and the Western Sahara) is a member of the Non-Aligned Movement.

The list of the member-nations of the Non-Aligned Movement during the final years of Nehru's government clearly indicates that most of the members were in the socialist camp. While campaigning for NAM it appears as if Nehru was building up a group of nations which were pro-Soviet to support the USSR and communists in the United Nations. The Marxist historians highlight this fact: "In the UN, for example, whose membership had swollen with their entry, the one country, one vote system enabled the non-aligned bloc, often helped by the Soviets, to check domination by the Western Bloc". *(Bipan Chandra, Mridula Mukherji, Aditya Mukherji, India Since Independence , Penguin, New Delhi, 2008, p. 344)* The character of NAM and

the guiding philosophy of the Soviet model of economy continued till the end of the Cold War, coinciding with the economic reforms introduced by Prime Minister PV Narasimha Rao in 1991.

CONCLUSION

In order to understand whether Jawaharlal Nehru's Non-Aligned Movement (NAM) is a Veiled Alignment, one needs to study his ideology and policies from 1927 onwards, both in foreign and in domestic affairs. He openly advocated his preference for socialism and the Soviet Model of Economic Policy for India. He refused to accept that the communist insurgency in India was sponsored by the Soviets when Stalin was guiding the Communist Movement in India personally. Nehru's policies towards China were no different. The list of countries in NAM welcomed by Nehru clearly demonstrates NAM's anti-Capitalist Stand. The analysis of Nehru's domestic policies/ideologies, together with his foreign policy, leaves no doubt that the Non-Alignment he advocated and built up amounted to a veiled alignment with the Soviets, Chinese and communist nations.

Heads of ASEAN missions engaged actively with the diaspora to promote Indian and Asean friendly programmes like Make in India, Skill Development, Digital India and Smart Cities. The government has also merged two capital award to People of Indian Origin and Overseas Citizen of India in 2002 and 2005 respectively. It offered dual citizenship among these Southeast Asian, launching the 2015 Indian Diaspora Investment Initiative. Modi's policy towards the diaspora focussed on 3Cs: connect (with India), celebrate (cultural heritage), and contribute (to India's development). [7 Nishant Sahdev and Rahul Sen, 'India–East Asia Cooperation: A New Era?', *East Asia: An International Quarterly*, Vol. 32, No. 3 (2015), September 2015, pp. 193–210, 206, and here.]

CULTURE AND DIPLOMACY

Since 2014, India's foreign policy is markedly characterized by dynamism, initiative and intervention. The commitments of the Indian government to building relationships with both big and small countries reflects the spirit of 'Vasudhaiva Kutumbakkam', which means the whole world is one family.

India has shown agency in engineering reality when defining economy and knowledge as the key attributes of the 'New India Strategy'. The Indian government has shifted from the 'primary neighbour' policy to the 'neighbour is the first priority' policy from an regionally defensive maritime policy to a cohesive policy for the Indian Ocean region. This has resulted in projecting a comprehensive vision for the Indo-Pacific, from a Look East Policy to Act East Policy (AEP), from a "non-interference" to "multi-link" policy. India is keen on projecting herself as a soft power using the "Buddha connects" in both the political and economic diplomacy. [Shiv Poonia, 'Interconnectedness Between Buddhism and India–ASEAN Relations', *Routledge Studies on Think Asia: Buddhism The Highest Dharma and Inception 2015*, Routledge, New York, and others.]

Indian diplomacy also emphasises economic connectivity and education along with the cultural connection and national values. India attaches great importance to infrastructure, institutional and digital connectivity to enhance integration. The construction of 1,360 km of roads connecting India, Myanmar and Thailand will help link the Northeastern region of India with ASEAN. India also proposed extending this road to Cambodia, Laos and Vietnam. The link between culture and education is also very specific and can be clearly seen in the steps taken to promote study and research in India by ASEAN students. In the year 2018, along with the enhancement of the ASEAN-India Strategic

Partnership, India offered 7,000 scholarships for PhDs in Indian IITs. ASEAN regards India as a trusted partner in the region, while India views ASEAN as the main pillar of its AEP. The reciprocity between the two sides are quite apparent in this region. India always supports the central and leading role of ASEAN in the evolving regional structure. The soft power approach in ASEAN-India relations is concentrated on the historical and cultural linkages and is sustainable as well.

Culture and connectivity are the key areas of partnership identified by both India and ASEAN. The first international conference on 'ASEAN-India Cultural Links: Historical and Contemporary Dimensions' that was held in New Delhi from 23 to 24 July 2018 and the subsequent one on 'ASEAN-India Cultural and Civilizational Links' held in Jakarta on 19 January 2017, and later, the ASEAN-India youth awards ceremony in New Delhi on 25 January 2018 and the India-ASEAN youth summits conducted annually are some of the successful initiatives in their domain.

The other programmes aimed at boosting people-to-people ties between India and ASEAN are student exchange programmes, a special training course for ASEAN diplomats, parliamentarians exchange through the ASEAN Inter-Parliamentary Assembly (AIPA) since 2010, the participation of ASEAN students in National Children's Science Congress, the ASEAN-India Network of Think Tanks (to be established in 2001-2010), ASEAN-India Media Exchange Programme, India-ASEAN annual Youth Summits and ASEAN-India Eminent Persons Lecture Series, etc. [Prem Chandrasekaran, 'Beyond India and ASEAN: Partners in Security by Pit Act Contemporary Southeast Asia, Vol. 21, No. 1 (April 2009), pp. 21 – 42. http://www.jstor.org/stable/25798740]

CONTEMPORARY CULTURAL TIES

India promotes cultural diplomacy, through arts, literature and dance, et al, through the Indian Council of Cultural Relations' (ICCR) MoUs (Memoranda of Understanding) with different universities across Southeast Asia. India has

CHILD LABOR, EDUCATION AND CHILDREN'S RIGHTS

Dr.G.Adinarayana
Faculty, Department of Law,Sri Venkateswara University,Tirupati, Andhra Pradesh, India.

Abstract
This paper reviews the international legal framework relating to child labour as well as access to education and provides a statistical portrait of child labour and education participation. Moreover, it looks at why children work from the perspective of household decision making. Various policy options are also considered, including those which can improve the incentives to education relative to labour, remove constraints to schooling and increase education participation through legislation. Conclusions are drawn in the final section.

Introduction

"Nonetheless, if the fundamental rights behind our cause are not sufficient to move people to act, then let it be the economic and social rationale behind it. Either way, we are going to challenge people to act."

Nelson Mandela

Child Labour (Prohibition and Regulation) Act of India, 1986 defined that the child is a person who has not completed the age of fourteen years. A child of such tender age is expected to play, study and be carefree about his life. But, as a fact of nature, expectations seldom meet reality. Children, by willy-nilly or by force, are employed to work in the harsh conditions and uncongenial atmosphere which become a threat to their precious life. Child labour leads to underdevelopment, incomplete mental and physical development, which in turn, result in stunted growth of children.

Child labour is retribution to the child and is widespread around the world. It is a curse for development of both the individual child and society and economy in which she/he lives. If allowed to persist to the current extent, child labour will prevent the achievement of the Millennium Development Goals of halving poverty and achieving education for all. All of the countries in the world have ratified international human rights conventions which call for the elimination of child labour and the provision of universal primary education. Fulfilling these commitments is of immensely importance for development.

Child labour is a violation of fundamental human rights and has been a stumbling block to children's development, potentially leading to life-long physical or psychological damage. The fundamental ILO standards on child labour are the two legal pillars of global action to combat child labour.

Over 200 million children between the ages of 5 and 14 years are working around the world. This figure represents one-fifth of the total population of girls and boys in this age group. About 111 million children are in "hazardous work" which refers to forms of labour which are likely to have adverse effects on the child's safety, health and moral development. Nearly 10 million of these children are engaged in some form of slave labour, armed conflict, prostitution or pornography, or other illicit activities. Some observers believe that these figures understate the real magnitude of child labour. The hazardous and worst forms of child labour are of universal prime concern, given the obvious harm that they inflict on the lives of these children and their possibilities for a hopeful future. Child labour also has important various economic implications. Among them the most notable are the

substantial future income losses that working children will incur because of the negative consequences working will have on their human capital, including their health and education. Since children are more likely to work and not go to school if their parents worked as children, the economic losses associated with child labour and their implications for poverty are often transmitted across generations (ILO, 2020).

Child labour, of course, has already received ample attention. Most countries have long had prescriptive legislation as well as compulsory education laws. At the international level, child labour has been the focus of various conventions and recommendations. Among them the UN Convention on the Rights of the Child (1989) and two ILO conventions, the Minimum Age Convention (No. 138, 1973) and the Worst Forms of Child Labour Convention (No. 182, 1999) are most significant. In promoting children's rights, each of these instruments – in very different ways -- has been motivated by an interest in protecting children from exploitation through their labour and providing for education as a preferable alternative.

Human Rights Instruments

The principal international legal instruments for addressing child labour include the UN Convention on the Rights of the Child (1989) that covers both child labour and the right to education and two ILO conventions, the Minimum Age Convention (No. 138, 1973) and the Worst Forms of Child Labour Convention (No. 182, 1999). The UN Universal Declaration on Human Rights (1948) and the International Covenant on Economic, Social and Cultural Rights also address the right to education but the above-listed instruments provide more detail and are commonly seen as the key international instruments for addressing children's rights (Table 1). The Convention on the Rights of the Child (CRC) and the ILO child labour conventions have received widespread international support, the former being ratified by 192 countries – all U.N. members, in fact, save the United States and Somalia. ILO Convention 182, prioritizing action against the worst forms of child labour, was the first convention adopted unanimously and has been the most rapidly ratified convention.

Table 1, International Human Rights Instruments Related to Education and Child Labour

Global and Regional Overview

Child labour remains unacceptably common in the world today. At the start of 2020, prior to the outbreak of the COVID-19 pandemic, 160 million children – 63 million girls and 97 million boys – were in child labour, or 1 in 10 children worldwide. Seventy-nine million children – nearly half of all those in child labour – were in hazardous work directly endangering their health, safety and moral development.

This global estimate masks large variations across regions. Child labour prevalence stands at 24 per cent in sub-Saharan Africa, three times that of Northern Africa and Western Asia, the region with the second highest prevalence. In absolute terms, the nearly 87 million children in child labour in sub-Saharan Africa are more than in the rest of the world combined.

Recent history provides cause for copious concern. In the last four years, for the first time since 2000, the world did not make any progress in reducing child labour. The absolute number of children in child labour was increased by over 8 million to 160 million while the proportion of children in child labour remained still unchanged. Children in hazardous work mirrored these patterns: The share remained almost unchanged but the number rose by 6.5 million to 79 million.

The pace of progress has varied dramatically across regions. The proportion and number of children in child labour have declined consistently since 2008 in Asia and the Pacific and Latin America and the Caribbean. Similar progress has proved elusive in sub-Saharan Africa, where child labour has actually gone up since 2012, a trend especially pronounced over the last four years when the region accounted for much of the global increase.

At present, the world is not on track to eliminate child labour by 2025. For meeting this target, global progress would need to be almost 18 times faster than the rate observed over the past two decades. According to pre-COVID-19 projections based on the pace of change from 2008 to 2016, close to 140 million children will be in child labour by 2025 without an accelerated action. The COVID-19 crisis is making these scenarios even more worrisome, with many more children at risk of being pushed into child labour. Global progress against child labour has stalled since 2016.

Child Labour across Ages

The results of the global estimates make clear that child labour remains an important concern across the spectrum of children aged 5 to 17. Of the 160 million children in child labour, 89.3 million are young children aged 5 to 11, 35.6 million are children aged 12 to 14, and 35 million are children aged 15 to 17. Child labour among children aged 12 to 14 and 15 to 17 continued to fall in both absolute and percentage terms over the last four years. By contrast, the 2016-2020 period saw a worrying rise in child labour among young children aged 5 to 11. In 2016, there were signs of slowing progress among young children. Today the trend line is moving in the wrong direction. The reason for backtracking is not clear and direly needs to be investigated as a priority. Hazardous work accounted for about two fifths of the total number of additional children aged 5 to 11 in child labour during the four-year period. While children of all ages must be protected from hazardous work, its persistence and now growth among younger children is a particular concern.

Boys and girls in child labour

Involvement in child labour is more common for boys than girls at all ages. For children aged 5 to 17, child labour prevalence is nearly one third higher for boys. The gender gap grows with age, and boys are roughly twice as likely as girls to be in child labour in the 15 to 17 age range. Comparisons of child labour estimates for boys and girls must be accompanied by an important caveat. The definition of child labour upon which the estimates are based does not include involvement in household chores in children's own homes, an area of work for which girls shoulder a disproportionate burden of the responsibility in most societies.

The 2020 global estimates look for the first time at how the inclusion of household chores affects overall child labour estimates as well as estimates of male child labour relative to female child labour. The results are noteworthy. When the definition of child labour is expanded to include involvement in household chores for 21 hours or more per week, child labour prevalence increases for both sexes, but the rise in female child labour is much larger. As a result, the gender gap in child labour prevalence is reduced by almost half, from 2.8 percentage points to 1.6 percentage points. Child labour is more prevalent among boys than girls at every age

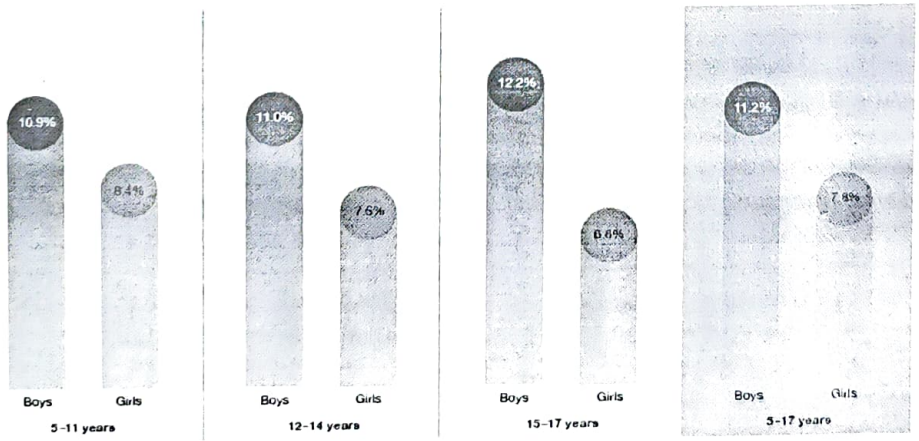

Fig.2. Percentage of children aged 5 to 17 years in child labour, by age and sex

Causes of Child Labour

Major causes of child employment which can be understood keeping in mind the Indian scenario are:

Poverty

In developing countries like India it is quite impossible to control child labour as children have been considered as helping hand to feed their families, to support their families and to feed themselves. Due to poverty, illiteracy and unemployment parents are unable to bear the burden of feeding their children and to run their families. Thus, the poor parents send their children for work in inhuman conditions at lower wages.

Previous Debts

The poor economic conditions of people in India force them to lend money. The illiterate population goes to money lenders and sometimes mortgage their belongings in turn of the debt taken by them. But, due to insufficiency of income, debtors find it quite difficult for paying back the debt and the interest. This vicious circle of poverty drags them towards working day and night for the creditor and then the debtors drag their children too in assisting them so that the debts could be paid off.

Professional Needs

There are some industries such as the 'bangle making' industry, where delicate hands and little fingers are needed to do very minute work with extreme excellence and precision. An adult's hands are usually not so delicate and small, so they require children to work for them and do such a dangerous work with glass. This often resulted in major eye accidents of the children.

Legislation

When in the 20th Century, child labour became so prominent that news of factory hazards and mishappenings taking innocent children's life, flashed all around in the newspapers, then was the time, a need for legislations and statutes were felt to prohibit the malpractice of child labour. Today, there are sufficient statutes condemning and prohibiting child labour such as:

The Factories Act of 1948

The Act prohibits the employment of children below the age of 14 years in any factory. The law also placed rules on whom, when and how long can pre-adults aged 15–18 years be employed in any factory.

The Mines Act of 1952

The Act prohibits the employment of children below 18 years of age in a mine. Mining being one of the most dangerous occupations, which in the past has led to many major accidents taking life of children, is completely banned for them.

The Child Labour (Prohibition and Regulation) Act of 1986

The Act prohibits the employment of children below the age of 14 years in hazardous occupations identified in a list by the law. The list was expanded in 2006, and again in 2008.

The Juvenile Justice (Care and Protection) of Children Act of 2000

This law made it a crime, punishable with a prison term, for anyone to procure or employ a child in any hazardous employment or in bondage. This act provides punishment to those who act in contravention to the previous acts by employing children to work.

The Right of Children to Free and Compulsory Education Act of 2009
The law mandates free and compulsory education to all the children aged 6 to 14 years. This legislation also mandated that 25 per cent of seats in every private school must be allocated for children from disadvantaged groups and physically challenged children.

Conclusion
Child labour is by no means strictly a low income country problem. Three of every five children in child labour live in middle-income countries. For greater national health to translate into reduced child labour, economic growth must be inclusive and its benefits equitably be distributed. The tax revenues it generates must be invested in programmes and services which make a difference for children, above all in education and social protection. The large pockets of child labour persist even in relatively rich countries points to important remaining policy challenges. It is an utmost urgent to put action to end child labour back on track, in line with global commitments and goals.

ENFORCING ENVIRONMENTAL RIGHTS: JUDICIAL RESPONSES TO AIR POLLUTION IN INDIA

Dr.G Adinarayana

ABSTRACT:

Air pollution comes from many sources, depending on location and development. Human actions, like heavy industry, resource overuse, and population growth, are the main culprits. As globalization and industrialization take hold, worsening air quality is a big worry. Protecting the environment from pollution isn't a new idea; it's been crucial for societies forever. Courts, a vital part of our country, play a key role in ensuring environmental justice for those affected by air pollution. They set the rules and hold polluters accountable. This article explores how Indian courts have interpreted laws to control and reduce air pollution, promoting environmental justice in India.

Key words: Air Pollution, resource, globalization, environmental justice, National Green Tribunal.

INTRODUCTION:

When dangerous compounds exist in the Earth's atmosphere and have the potential to negatively impact human health, the environment, and air quality generally, it is referred to as air pollution. These pollutants can come in a variety of forms, such as gases, particles, and chemicals, and they can come from both natural and man-made sources. There are many different effects that air pollution can have, both locally and globally. There have been numerous initiatives in India to address air pollution, such as the adoption of laws, the application of court rulings by the Indian judiciary, the use of cleaner technologies, the promotion of renewable energy sources, the encouragement of sustainable transportation, and the education of the public about the value of clean air. In addition to international agreements and organizations, the judiciary is involved in resolving the problem of transboundary air pollution.

The court, particularly the higher judiciary, has rendered numerous important rulings that have helped to stop the decline in India's air quality. By interpreting and upholding environmental laws, issuing directives, and ensuring that government agencies and businesses take the required steps to lessen the harmful impacts of air pollution, the Indian court plays a critical role in the control of air pollution. The function of the judiciary is especially crucial when environmental rules and regulations are broken.

The enforcement of air pollution control laws, the issuance of guidelines and directives to various governmental agencies and industries, etc., the monitoring and oversight of the implementation of pollution control measures, the provision of compensation and remedies, the dissemination of public awareness and education, and the application of the precautionary principle, which permits preventive action even in the absence of complete scientific certainty about the impacts of air pollution, are just a few of the ways that the Indian judiciary contributes to the mitigation, prevention, or control of air pollution in India. The Supreme Court has rendered several significant rulings in the fight against air pollution, some of which are listed below:

The Bhopal Gas Leak Disaster, a horrific industrial accident, happened in 1984. A poisonous gas called Methyl Isocyanate leaked from a Union Carbide pesticide plant in Bhopal, India. This tragedy caused thousands of deaths and left hundreds of thousands injured, many with permanent disabilities. The case highlights the plight of the numerous victims and criticizes the lengthy court battle for compensation. It emphasizes the severity of the disaster, calling it the worst industrial accident ever, with a leak of nearly 40 tons of toxic gas. For context, the factory belonged to a US company, Union Carbide Corporation.

The Bhopal gas leak caused a huge number of injuries and deaths, raising a complex legal issue how to get fair compensation for so many victims. There was a risk of countless lawsuits, and the severity of harm suffered by each person varied greatly. To avoid this mess of individual cases, the Indian Parliament passed a law in 1985 . This law gave the Indian government the power to sue on behalf of all the victims. This is based on a legal principle called "parens patriae," which allows the government to act as a parent for those who can't represent themselves in court. The Indian government decided to sue in the United States, where the parent company of the factory that caused the disaster was located. They believed the Indian legal system wasn't developed enough to handle such a big case and get the best possible outcome for the victims. However, the company argued that Indian courts were the most appropriate place for the case. Despite the Indian government's objections, the American court agreed with the company and sent the case back to India.

The Bhopal gas leak case started in Indian courts after US courts refused to hear it. Initially, the Madhya Pradesh High Court lowered the compensation amount from 3.5 billion rupees to 2.5 billion rupees. Both the Indian government and Union Carbide appealed to India's Supreme Court. The Supreme Court ordered a final settlement. Union Carbide would pay $470 million to the Indian government to cover all claims from the disaster. This money had to be paid by the end of March 1989. The Supreme Court also used its special authority to end all legal proceedings related to the disaster, including civil lawsuits, criminal cases, and contempt of court charges. These Supreme Court decisions were criticized for being unusually brief and lacking the detailed reasoning typically expected in such a significant case. Some argued the Court based its choices mainly on compassion for the victims.

The Indian Supreme Court took a significant step to protect historical treasures like the Taj Mahal from air and environmental pollution . They ruled that industries in the TTZ must switch to cleaner burning natural gas or relocate outside the zone if they can't use gas. This decision was based on scientific reports and the idea that polluters should be responsible for the damage they cause and that environmental protection should be a priority . The Court actively championed environmental protection through public interest litigation and relied on various parts of the Indian Constitution that guarantee the right to life and a healthy environment. Additionally, they used environmental laws like the Water and Air Pollution Acts to support their judgement. Delhi Vehicular Pollution Case addressed air pollution in Delhi. The Supreme Court ordered several measures to tackle this issue, such as phasing out leaded petrol, replacing old vehicles, building new bus terminals, and improving air quality monitoring. In Vellore Citizen Welfare Forum v. Union of India , the Court emphasized two key environmental principles: the Pre-

cautionary Principle (taking preventive action) and the Polluter Pays Principle (holding polluters accountable). They directed the Indian government to prioritize supplying cleaner-burning natural gas for vehicles nationwide.

Finally, the Oleum Gas Leak case led the Court to recommend a national policy for locating hazardous industries away from populated areas. They also suggested creating a neutral scientific body to advise courts and government, and establishing specialized environmental courts for pollution cases. The Supreme Court took a stand against secondhand smoke, citing the right to life enshrined in the Indian Constitution . They banned smoking in public places and ordered the government to implement this effectively. This is one example of how the Indian courts have championed environmental protection. They've introduced several principles to combat air pollution. The Precautionary Principle was first used in the Vellore Citizens' Welfare Forum case. The Polluter Pays Principle was applied in the Indian Council for Enviro-Legal Action case. And the Public Trust Doctrine was used in the M.C. Mehta v. Kamal Nath case.

PRINCIPLES ADOPTED BY THE COURTS

India's Supreme Court has significantly advanced environmental law by establishing important principles. These principles, developed mainly by the Supreme Court, are like stepping stones that pave the way for cleaner air in India. The Court has incorporated these principles into its decisions, considering international agreements and conferences . This is a major contribution to India's environmental legal system. Some of the principles are;

1. Polluter pays principle
2. Principle of non-discrimination
3. Precautionary principle
4. Principle of intergenerational equity
5. Doctrine of common but differentiated responsibility
6. Public trust doctrine

India's courts have established key principles to fight air pollution. The Precautionary Principle, explained in the Vellore Citizens' Welfare Forum case , states that preventing environmental damage is a government duty, and scientific uncertainty shouldn't delay action. The Polluter Pays Principle, affirmed in the Indian Council for Enviro-Legal Action case, holds polluters responsible for compensating victims and restoring the environment. Finally, the Intergenerational Equity Principle, implies a duty to future generations to leave them a healthy environment. These principles, along with the Public Trust Doctrine, have led to significant court judgements to control air pollution. However, tackling air pollution requires a combined effort. Laws, regulations, technology, public participation, and commitment from everyone are all necessary for clean air.

NGT , established in 2010, is responsible for handling cases related to urban air pollution in India. It aims to fulfill both the constitutional right to a healthy environment (Article 21) and the goals outlined in the NGT Act itself. This Act empowers the NGT to deal with environmental protection, resource conservation, enforce environmental rights, and provide compensation for damages. However, despite significant air pollution problems, there haven't been many cases brought before the NGT regarding this issue.

The National Green Tribunal Act, passed in 2010, reflects India's commitment to international environmental agreements. This is because India participated in major

conferences like Stockholm in the year 1972 and Rio in the year 1992. The NGT is required to consider these international principles, such as sustainable development, the precautionary principle, and the polluter pays principle, when making decisions on environmental protection cases. These international principles are used alongside Indian laws to effectively enforce environmental rights and responsibilities in India. The NGT primarily focuses on protecting environmental legal rights and addressing problems caused by enforcing environmental laws listed in Schedule 1 of the Act.

Vardhaman Kaushik v. Union of India , the first lawsuit under the previously described category 1, was filed in 2014 and concerned harmful air quality in the National Capital Region. The NGT issued numerous directives over the course of four years through judgments and verdicts, including prohibiting polluting companies, controlling traffic, requesting action plans from the government, and demanding certain measures for waste disposal and dust management, among other things. A suo moto case was filed in 2018 in response to the nation's declining urban air quality, based on a Times of India newspaper piece that examined the National Clean Air Programme's timeframes. The NCAP case required 102 'non-attainment cities', or those that had average annual concentration levels of notified criteria, surpassing certain thresholds for five years in a row, to take corrective action regarding air pollution. This lawsuit sought to address the problem of urban air pollution nationwide and mandated that each state and local government prepare action plans under the NCAP, address vehicle pollution, and conduct thorough carrying capacity evaluations for each city.

In both instances, the Tribunal criticized the federal and state administrations and demanded more vigorous action to reduce air pollution by using Right to Life and the three guiding principles of environmental jurisprudence. As a result, the two cases have emerged as the centerpiece of the Tribunal's urban air pollution intervention. Since then, any cases pertaining to urban air quality that are brought before the Tribunal are handled by subsequent benches utilizing the rulings in the two instances as well as the several directions rendered by the Supreme Court in MC Mehta v. Union of India. For instance, the South Zone bench in Vinay Shivanand Naik v. State of Karnataka , a case concerning urban air pollution in Bengaluru associated with vehicle pollution, requested that the State Government adhere to action plans developed under the National Clean Air Plan, as filed in the NCAP Case. In a related case, LG Sahadevan v. Union of India , for Chennai, the Bench requested that an action plan be created taking into account the directives from the NGT regarding the Vardhaman Kaushik issue.

Concerns about air pollution and other environmental issues have been extensively pursued by the NGT. The NGT contributes significantly to the fight against air pollution in the following ways:

1. The NGT has the authority to consider appeals and cases involving environmental infractions, particularly those involving air pollution. It may decide to take up cases on its own initiative or in response to petitions submitted by people, groups, or governmental entities. The tribunal has the authority to penalize and punish polluters as well as individuals who violate environmental standards.

2. The NGT keeps an eye on how environmental laws and rules-including those pertaining to air quality standards-are being applied. It guarantees that businesses and governmental organizations follow established emission guidelines and pollution prevention techniques. The NGT has the authority to make orders to resolve any infractions.

3. The NGT has the authority to enforce the precautionary principle, which stipulates that the burden of proof rests with those promoting an action if it has the potential to harm the environment or the public, even in the absence of conclusive scientific evidence. This approach permits the NGT to regulate air pollution even in the absence of total scientific knowledge by taking preemptive action.

4. The NGT has the authority to mandate routine air quality monitoring and the application of pollution management strategies. In order to evaluate the status of efforts to reduce air pollution and meet established air quality requirements, it may also request periodic reports from the appropriate authorities.

5. The NGT can help spread knowledge about the negative effects of air pollution and the value of environmental preservation. The public is helped to understand the need of addressing air pollution by the frequent media coverage of its rulings and decisions.

6. In order to stop and manage air pollution, the NGT may publish guidelines and recommendations. A broad range of businesses, including waste management, construction, transportation, and industry, may be covered by these guidelines.

It is noteworthy that there may have been changes in the NGT's function and efficacy since my last report. To obtain up-to-date and precise details regarding the NGT's operations and its function in mitigating air pollution, it is advisable to consult official government resources or recent news stories.

Conclusion :

Even with international agreements and laws to fight air pollution, it's still a major health and environmental threat worldwide. This is due to several reasons: a lack of political commitment to enforce existing laws, poor coordination between government agencies, weak institutions, and limited public awareness. To tackle this urgent crisis, we need stricter controls and better technology transfer from developed to developing countries. Additionally, simplifying environmental laws by merging them into one comprehensive piece of legislation would be beneficial. Courts play a crucial role in controlling air pollution in India. They interpret existing environmental laws broadly to fill any gaps and enforce them when the government fails to do so. This "judicial activism" helps protect the environment, which is especially important because environmental damage is often irreversible. However, to be truly effective, the judiciary needs proper resources and qualified judges specializing in environmental cases. Public participation is also essential. The text doesn't continue about public participation, but the idea is that public awareness and action are necessary alongside legal enforcement. Public awareness and participation are key to tackling air pollution. People need to understand their own responsibility for environmental protection. This can be achieved through environmental education programs targeting everyone, especially young people, women, and students. Mass media

also plays a crucial role in spreading awareness. The fight against air pollution requires a multi-pronged approach. The government and NGOs need to work together. The government, in particular, should provide financial aid and annual awards to recognize and encourage environmental activists at various levels (local, regional, national). This will incentivize public participation and help curb air pollution across the country.

FOOD SECURITY IN INDIA- JUDICIAL PROSPECTIVE

Dr. G. Adinarayana

Abstract:

Food security is "an economic and social condition of ready access by all members of a household to nutritionally adequate and safe food". In 1974 at The World Food Conference, Rome, it defines food security as "availability at all times of adequate world food supplies of basic foodstuffs to sustain a steady expansion of food consumption and to offset fluctuations in production and prices. M.S. Swaminathan in 1986 defined food security in terms of "Nutrition Security" as "physical, economic and social access to balanced diet, clean drinking water, environment hygiene, primary health care and nutrition literacy". The activist approach of judiciary through its decisions in various cases gradually paved way for evolving food jurisprudence in India. Some significant verdicts by the Supreme Court of India proclaiming the right to food and allied rights guaranteeing food security of people are discussed hereunder this article. Population explosion, illiteracy, poverty and gender inequality are responsible for food insecurity in India. Effective implementation of the PDS can reduce food insecurity levels and restoration of joint family system to improve food security situation in India. Food security is guaranteed as a statutory right by the enactment of the National Food Security Act, 2013.

Key words: Food security, Nutrition Security, right to food, National Food Security Act, 2013, Judicial activism.

Introduction:

Hunger is not an issue of charity it I an issue of justice. - Jacques Diouf

Since independence India has struggled severely to achieve growth and development. India as a development nation has achieved severely milestones for the promotion of social welfare. In spite of reaching great heights, the nation still faces the basic hurdle of proving the basic necessities of life to its citizens. In spite to its various promises of equality and justice provided under the India constitution either in the form of directive principle of the state policy or the fundamental rights provided to its citizens, the country has failed to take care of the fundamental fights provided to its citizens, the country has failed to take care of the basic right i.e. Right to Food of its millions of citizens even today.

The GHI Report 2019 prepared jointly by Irish aid agency Concern Worldwide and German Organisation Welt Hunger Hilfe termed the level of hunger in India "Serious". India's ranking has dropped from out of 117 countries). India's masses are suffering hunger and malnutrition although there is surplus food grain production and lakhs of tons of food grain stored in FCL godowns. The causes of hunger and malnutrition cannot be attributed to simple natural and manmade disasters but they are enormously complex in nature. The right to food is violated when people suffer hunger and malnutrition. The prominent reasons are discrimination, political economic exclusion and social injustice. 0ften the hungry and malnourished are denied access to sufficient resources as well as adequate incomes such as land, water, livelihoods, etc., which enables them to take care of their families to lead a dignified life.

Associate Professor, P.G. Department of Law, SVU College of Arts, SV University, Tirupati-517502

Food Security Meaning:

The dictionary meaning of the term "Food security" is "an economic and social condition of ready access by all members of a household to nutritionally adequate and safe food". The Merriam webster dictionary defines it as "the ability to consistently access or afford adequate food".

Food security - definition:

The first and foremost definition of "Food security" evolved in 1974 at The World Food Conference, Rome. It defines food security as "availability at all times of adequate world food supplies of basic foodstuffs to sustain a steady expansion of food consumption and to offset fluctuations in production and prices"

After a decade later in 1983 it Was and expanded by the Food and Agriculture Organization as "ensuring that all people at all times have physical and economical access to the basic food that they need".

The World Bank in 1986 defined it as "access of all people at all times to enough food for an active and healthy life".

M.S. Swaminathan in 1986 defined food security in terms of "Nutrition Security" as "physical, economic and social access to balanced diet, clean drinking water, environment hygiene, primary health care and nutrition literacy". This definition of food security not only stresses on nutrition security but also on livelihood security to achieve food security in the long run.

Constitutional and legal prospectives:

The progress of identifying the "Right to Food" as part of the right to life under Article 21 may be attributed to India's wholehearted commitment to implement the provisions of international conventions and declarations such as UDHR, ICESCR, CEDAW, CRC and UDEHM, harmonizing the directive principles of state policy and fundamental rights and adopting human- rights based approach to concept of food security on par with countries like Brazil, South Africa, Colombia, Guatemala, Cuba, Ukraine , Ecuador , Srilanka, ete.

Article 39(a) and (d) directs the state to frame policies to secure adequate means of livelihoods and equal pay for equal work to both men and women equally as they play a key role in the availability, accessibility and affordability of food ensuring food security to people.

India also made significant attempts to ensure food security through enactment of various piece- meal legislations. Some of them are

- The Prevention of Food Adulteration Act, 1954
- The Essential Commodities Act, 1955
- The Food Corporation of India Act, 1964
- The Maternity Benefit Act , 1961
- The Disaster Management Act,2005
- The Food Safety and Standards Act, 2006 etc..

However , with the heave by the decision of Super Court in People's Union for Civil Liberties Vs Union of India & others the National Food Security Act was enacted in 2013.

Judicial Prospectives towards ensuring Food Securities in India:

The activist approach of judiciary through its decisions in various cases gradually paved way for evolving food jurisprudence in India. Some significant verdicts by the Supreme Court of India pro-

claiming the right to food and allied rights guaranteeing food security of people are discussed hereunder.

Azad Rickshaw Puller's Union Vs State of Panjab & Ors

In this case the denial of grant of license to petitioners under the Punjab Cycle Rickshaws (Regulation of license) Act was challenged as violative of Article 14,19 (1) (g) and 21 of the Constitution of India. The Indian Judiciary in this case has showed concern to uphold claims of poor and weaker sections of society rather than fasten strictly to provisions of legislation determining their rights to ensure social justice. It also ordered to provide credit facilities for those people to own rickshaws ensuring food security freeing from poverty, hunger and bondage.

Crown Aluminium Works Vs Their Workmen:

The Supreme Court held that it is quite likely that in under -developed countries, where unemployment prevails on a very large scale, unorganized labour may be available on starvation wages; but the employment of labour on starvation wages cannot be encouraged or favored in a modern democratic welfare state. The employer must at least pay minimum wages guaranteeing to a worker who toil for fulfilling his basic necessities such as adequate food shelter and clothing to avoid starvation and poverty.

Sodan Singh Vs New Delhi Municipal Committee:

In this case the Supreme Court held that street trading is an age-old vocation adopted by human beings to earn living. The court observed that the right to fiid and food security of poor cab be realized only when livelihoods are protected.

Shantistar Builders Vs Narayan Khimalal Totame &Ors:

Justice K Ramaswamy held that the right to life would take within its sweep the right ti food, the right to clothing, the right to decent environment and a reasonable accommodation to live in.

P.G Gupta Vs State of Gujarat & Ors

In this case the government resolution excluding certain categories of employees for allotment of houses converted from rental to hire- purchase scheme was challenged as it violates Article 14, 19, and 21 of Indian Constitution. The Apex Court held that the protection of life assured under Article 21 of Indian Constitution includes the right to food, clothing and shelter.

Delhi Transport Corporation Vs D.T.C Mazdoor Corporation

The supreme court held that " employment is not a bounty from the State nor can its survival be at their mercy. Income is the foundation of many Fundamental Rights when work is the sole source of income, the right to work becomes as much fundamental." Food Security of people can be ensured only when their right to work is protected.

People's Union of Civil Liberties (PUCL) Vs Union of India

It is a landmark case in the history of Indian Judiciary realizing the right to food as an integral part of right to life. A PIL was filed highlighting about people going hungry while food grains stored in FCI go-downs were rotting and excessive food storage was there due to maladministration of food grains in these godowns. The court directed to the government to distribute food grains free of costs to starving poor people who cannot afford to purchase them.

It especially recognized the right to food of aged, infirm, disabled, destitute, pregnant and lactating mothers and children as part of right to life.

Inre Problems and Miseries of Migrant Labourers Vs Union of India

The Supreme Court Suo moto motto took cognizance of problems and miseries of migrant labourers during COVID -19 pandamic. The Apex court held that the ' right to life' confers the right to every human being to live a life of dignity with access to at least the bare necessities of life.

Gulshan Khatun & Ors Vs Delhi Urban Shelter Improvement Board & Ors

The Delhi High Court in this case had observed that it was of utmost importance to see that food is provided to the aged , inform , disabled , destitute women , destitute men who are in danger of starvation, pregnant and lactating women and destitute children, especially incases where they or members of their family do not have sufficient funds to provide food for them.

Conclusion:

Man's survival depends indispensably in food. In a narrow sense food is described as anything to fill hungry stomach. In broadest sense food means sufficient quantity and equality in terms of both calories and nutrients necessary for growth and development as well as health and wellbeing of human being. Initially food insecurity is described as physical unavailability of food at national, regional or household levels.

Indian Judiciary is playing an activist prudent role its various decisions incorporated several Directive Principles of State Policy into Fundamental rights and declared the right to food as an integral part of the right to life under Article 21 guaranteeing food security. Population explosion, illiteracy, poverty and gender inequality are responsible for food insecurity in India. Effective implementation of the PDS can reduce food insecurity levels and restoration of joint family system to improve food security situation in India. Food security is guaranteed as a statutory right by the enactment of the National Food Security Act, 2013. The Constitution of India has no expressed provision directly ensuring right to food security does not hold good as other provisions ensured food security in India.

Apoorva Ragas of Saint Thyagaraja

Dr.T.Girija Seshamamba
Academic Consultant, Teaching Faculty
Dept of Performing Arts
Sri Venkateswara University,Tirupati.

Abstract: Thyagaraja is one of the greatest name in the history of Carnatic Music. Thyagaraja has composed brilliant kritis in number of ragas. Thyagaraja had created new ragas through his compositions. These new ragas are called apoorva (Rare) ragas. Apoorva means there is no vogue. Thyagaraja has created 80 apoorva ragas not handled by any other composers.

Introduction: Carnatic music is based on raga system. The musical compositions are concrete forms of the abstract raga. Raga is pivotal concept of our carnatic music. The term raga means a melodic and intricate combinations of swara phrase which is appealing and pleasing to all.

Apoorva Raga: Apoorva is a word which means uncommon, excellence and exceptional. Many of the apoorva ragas came to known for the first time through Thyagaraja's compositions. These apoorva ragas are janya and also include melakarta ragas in which Thyagaraja composed brilliantly for the first time and showed their melodic possibilities. In these 80 apoorva ragas only one composition is available in one raga.

Few apoorva ragas:

Raga	**Kriti**
Amrita Vahini	Sree Rama Padama
Andolika	Raga sudha rasa
Bindumalini	Enta muddo
Chayanata	Idi samayamura
Jingla	Anathudanu ganu
Jayanta sena	Vinatasuta

In some apoorva ragas there are 2 compositions:

Raga	**Kriti**
Chandra Jyoti	1)Bagaayenayya 2)Sasivadana
Jayamanohari	1) Nee bhakti Bhaya sudha 2) Sree ramya chittalankara
Kalyana Vasantam	1) Nadaloludai 2) Kanulu takanee

ISSN:2582-9513
Pranav Journal of Fine Arts
(A Peer Reviewed Quarterly Online Journal)

In some apoorva ragas there are 3 compositions

Raga	Kriti
Bangala	1) Giri raja suta tanaya 2) Munupe teliyaka 3) sakshi ledanuchu
Janaranjani	1) Vidajaladura 2) Smarane sukhamu 3) Nadaadina mata
Suddha Bangal	1) Rama Bhakti 2) Toli ne jesina 3) Tappakne vachuna

Thyagaraja created distinctive elements in this apoorva raga compositions.

1) Swaraksharas: This is one of the "Kriti Alankarikas". Thyagaraja swami used the swaraksharaas in this composition 'Sree Rana Padama' – Raga: Amrita Vahini. In this kriti the word "padama" appears both in swara and sahitya. This is called "suddha swara". This is one of the rare prayogas used by Thyagaraja.

2) Chitta swaram: The raga 'Chenchu Kamboji' the kriti – vara raga layagnulu Thyagaaja created the beautiful chitta swaram "sa pa ma ga ma da ni sa".

3) Nishadyanta Raga: The raga is Chitta ranjani. in the kriti "Nada tanumanisham" the arohana 'ni sa ri ga ma pa da ni' – avarohana 'nti da pa ma ga ri sa ni'. In this scope the raga is mandrasthayi nishadam to tarasthayi nishadam. Tara thayi shdjamam not occurs in this raga.

4)Vivadi ragas: In carnatic music shat srti rishabha, suddha gandhaara, shat sriti daivta, suddha nishada are four vivadi swaras. Among these if any raga takes one swara is called vivadi raga.

Raga	**Kriti**
Gambhira vani	Sadamadin dalatu gadara
Sruti ranjani	Ee dari sancharintu
Sreemni	Eemandune
Chayanata	Idi samayamura

5) Pratimadhyama ragas:

Raga	Kriti
Mandari	Paraloka Bhayamu
Saraswati	Anuragamu leni

6) Melakarta Ragas:

Raga	**Kriti**
Ganamurti	Ganamurte

Vagadeeswari	Paramatmudu velige

7) Siva keertanas:

It is known that Thyagaraja composed his compositions in the praise of Lord Sri Rama. Some of compositions are composed on Lord Siva also.

Raga	**Kriti**
Gambhira vani	Sada madin dalatu gadara
Chittaranjani	Nadatanu manisham

8) Sapta swara vivarana: Sapta swara vivarana in some apoorva raga compositions. In the kriti Nada tanu manisham sankaram charanam contains 'sarigamapadani vara sapta swara'. The importance of sapta swara mentioned in this kriti.

In the raga jaganmohini the kriti 'Shobillu saptaswara' he mentioned the importance of sapta swara.

9) Social events in the compostions: In the vivardhini raga the kriti 'vinave o manasa, vivarambuga ne telipeda'. In this kriti thyagaraja swami explained the pshycology of human and also explained the way of attainment of sree rama sannidhya.

In the pratapa varali raga the kriti vinanasa goni yunnanura. In this kriti charnam 'Seeta ramani tho vomana guntaladi gelchuta' - denotes one of the game vomanagunta. Also in the charnam 2nd line 'chetanokarikokaru choochi aa bhavamerigi' denotes sringara bhava, It is one of the distinctive nature of kritis.

Conclusion: As explained above Thyagaraja swami mentioned many rare contributions to the Music World.

Abstract

After the withdrawal of Non-Co-operation Movement in February 1922 there was a lull in the political activities in India. The Lahore Session of the Indian National Congress in 1929 is an important landmark in the History of the Indian Freedom Movement. Jawaharlal Nehru, representative of younger elements in the congress was elected as the President. Congress declared attainment of Purna Swaraj (complete Independence) to India as its objective. To achieve this goal it also decided to start Civil Disobedience Movement and if necessary no-tax campaign against the British Government. It was at this session the congress has adopted to observe 26th January 1930 as the day of Indian Independence.

Keywords: Women. Civil, Disobedience, Movement, Rayalaseema

Introduction

The great enthusiasm shown by the people in celebrating the 26th January 1930 and taking the pledge given by Gandhiji, has indicated the mood of the people and their willingness to participate in the Civil Disobedience Movement. Before taking a final decision on Civil Disobedience he gave another opportunity to British to prevent Civil Disobedience Movement. He addressed a letter to the Viceroy in which he has mentioned eleven demands, which if acceded by the Government he would not start Civil Disobedience Movement. Gandhi considered these eleven demands as the substance of Independence. His eleven demands are:

1. Total Prohibition
2. Lowering of the Rupee-Sterling Exchange ratio to 1s 4D
3. 50% reduction in land revenue.
4. Abolition of Salt Tax, and Govt. monopoly on Salt
5. Reduction of Military expenditure by atleast 50%
6. Reduction of salaries of the Higher level services.

7. Protection to Indian Textiles
8. Reservation of Coastal shipping for Indians
9. Release of all Political prisoners
10. Reform of C.I.D. or its popular control, and\
11. Liberal issue of licences for the use of Fire-Arms for self defence and the permission to all Indian exiles to return home.

Gandhi felt that the acceptance of these demands would have announced to the achievement of most of the objective for which Indians had been agitating. Their non- acceptance revealed the exploitative nature of the British Rule. The Viceroy made no response. On the country, the Government started arresting the prominent leaders as a preventive step. Subhas Chandra Bose was the first Congress Leader arrested by the Government and was sentenced to one year imprisonment. So, Gandhiji decided to launch the Civil Disobedience Movement by breaking the Salt Law first by himself at Dandi. On 11th March Gandhi declared wholesale illegal manufacture and auctioning of salt should begin, after he had himself violated the law at Dandi. On 12th March Gandhi started his march from Sabarmathi Ashram to the Sea at Dandi through the heartland of Gujarath with 71 Ashram Members. This is popularly known as Dandi March.

It attracted the attention of the entire country and the world. Enormous publicity was given to this event all over the world. The March reached Dandi on 5th April. The very next day Gandhi started Civil Disobedience Movement by picking a handful of salt lying on the shore. This was the signal for starting Salt Satyagraha throughout the country by manufacturing salt flouting the law. It was a deliberate act of defiance to the mighty British Government and a signal to the nation that another stage in the fight for freedom has begun. Where facilities for flouting salt law do not exist, i.e., interior areas far away from the sea shore, Tripple Boycott, of Liquor shops, Foreign Cloth, Educational Institutions and services has to be followed.

Civil Disobedience Movement, 1930

On 10th April 1930, Dhurgabayamma, Headmistress of Girl's High School at Kakinada, addressed a meeting at Gandhi Chowk in Chittoor. Audiences of about 100 persons were present. One Krishnaswami, who accompanied Dhurgabayamma, also addressed the meeting. They exhorted the audience to join the Civil Disobedience Movement and enrol themselves as national volunteers. On 11th April, Dhurgabayamma had an informal meeting at Chittoor with the women of the Brahmin Street in the house of M. Ananthashayanam Ayyangar. She requested the women to induce their husbands to join the movement. Another meeting was held in the Varadappa Nayudu Girl's High School, mostly for women. In the evening, a public meeting was held at Gandhi Chowk with M. Ananthashayanam Ayyangar as the President. Dhurgabayamma spoke on the occasion. She repeated what she said the previous day. About 150 to 200 people attended. They included also a dozen women. On 13th April, there was a meeting of about 50 persons, mostly students at Gandhi Chowk, in Chittoor, to celebrate the Jallianwala Bagh Day and the National Week. M. Ananthashayanam Ayyangar who presided over the meeting spoke on the Khaddhar and temperance movements and the salt campaign. In April 1930, K. Subramanyam of Pennaperur village in Kadapa District wanted to take advantage of the Brahmotsavam at Vontimitta and

convened a political conference. He invited V.L. Sastri, President, Madras Andhra District Congress Committee to address the conference. He also endeavoured to organise a no- tax campaign in Badvel Taluk when the Taluk Board attempted to secure volunteers at Chittoor. On 22nd June 1930, three agitations from Vellore in North Arcot District were invited to address the meeting at Chittoor. As the meeting was prohibited under Section 144 Cr.P.C., the three Congress emissaries from Vellore reached Tirupati. On 24th June 1930, they wanted to hold a meeting. They were served with an order under Section 144 Cr. P.C. and one of them disobeyed the same. He was arrested and put up before the Joint Magistrate, Chandragiri, who convicted him and sentenced him to six months rigorous imprisonment. On 9th July, 1930, another Congress emissary from Kadapa District arrived at Kuntrapakam a small village near Tirupati to organize meetings.

On 2nd October 1930, a procession consisting of a few students went through the streets of Madanapalle with a photo of Gandhi. A meeting was held in the evening and the President of the meeting had been warned. The pamphlets advertising the meeting were printed by a local press and its proprietor was warned. One Mahadheva Sastry who had been imprisoned for violation of Salt Laws and who was released from the jail arrived at Madanapalle on 31st October 1930 on his way to Tirupati. He lectured to the people urging them to join the movement and to boycott foreign cloth. An attempt was made by him to take out a procession. He was prosecuted under Sections 153 and 290 I.P.C. and was sentenced to six months R.I. and a fine of Rs.50/-. In November 1930, some young men of Korlakunta, a village in Pulivendula Taluk tried to organise a procession with the photos of Gandhi and Tilak.

Gandhi-Cap and Ceded District's College Incident

On 4th August 1930, a hartal was observed in Anantapur in connection with the arrest of Pandit Madan Mohan Malaviya and shops were closed. A number of students of the Ceded Districts College, Anantapur and also of the Municipal High School stayed away from their classes and went in a procession through the streets of the town. The next day, finding that two of the boys in the college were wearing Gandhi caps, the Principal sent them out and put up a notice prohibiting the wearing of Gandhi caps inside the college. This was exploited by the local Congressmen like Y.Ramamurthy and Lakshmana Pillai who exhorted the students to disobey the orders of the Principal. An order for a large number of Gandhi caps was placed with a local tailor. The situation was, however, tactfully managed and on the students assuring the Principal that the wearing of Gandhi caps did not show that they were associated with any political party and that they did not intend to join any political propaganda while at college, the Principal withdrew his prohibition order.

Civil Disobedience Movement in 1931

In Chittoor, the conditions saluting to the National Flag was prohibited. Holding meetings were also banned. On 31st July 1931, A. Kaleswara Rao, General Secretary of the APCC visited Chittoor and made a very stirring speech abusing the Government. On 23rd August 1931, two Congress volunteers defied the D.S.P's order and went in a procession through the streets of Kuppam carrying Congress flag. The Sub-Magistrate of Kuppam issued an order under Section 144 Cr. P.C. prohibiting meetings, processions and carrying of national flags.

In August, 1931, the police prosecuted under Section 108 Cr. P.C. the Congress Secretary of

Kadapa for publicly approving political assassination. At Rajampeta, the police dispersed a public meeting.

Achanta Rukmini Lakshmipathi's Tour, 1931

In August 1931, Achanta Rukmini Lakshmipathi of Tamil Nadu Congress Committee and A. Kaleswara Rao toured Anantapur District on the invitation of Kalluru Subba Rao. On the morning of 29th August 1931, there was a public meeting in the Church Compound at Gooty (Gutthy). Rukmini Lakshmipathi spoke in English. Her speech was translated into Telugu by A. Kaleswara Rao. At 11:00 AM., there was another meeting at Peddhavaduguru on the invitation of Chinna Narayana Reddy. C.P. Obi Reddy presided over the meeting.

At Anantapur, Rukmini Lakshmipathi and A. Kaleswara Rao addressed a women's meeting at Sharadha Samajam and urged the women to join the Civil Disobedience Movement. From there, they proceeded to Gandhi Chowk. She said that the country was passing through a difficult period. Tracing the history of the struggle launched by the Congress in 1885, she appealed to the people to fight unitedly for Swaraj. On 30th August 1931, Rukmini Lakshmipathi hoisted the national flag at Dharmavaram. On behalf of the Mahila Samaj, Smt. Ambamma garlanded her. At Penugonda, both Smt. Rukmini Lakshmipathi and A. Kaleswara Rao were taken in a procession from the railway station to the residence of T.Sivashankaram Pillai. At the meeting held at Ramaswamy Temple, Venguswami Ayyar garlanded the guests. Agali Narayana Rao proposed a vote of thanks. On 31st August 1931, Rukmini Lakshmipathi and A. Kaleswara Rao addressed a meeting at Hindupur. P. Ramacharlu and Kalluru Subba Rao also spoke.

A.P.C.C. Meeting at Chittoor, 1931

The Andhra Provincial Congress Working Committee met at Chittoor on 29th and 30th September 1931, under the presidentship of the Kumara raja of Gampalagudem. Among those present were Messrs. T. Prakasam, K. Nageswara Rao,

A. Kaleswara Ro, B. Gopal Reddy and Narayanamurthi. The Committee passed resolutions condemning the prosecutions of Messrs. Lingaraju and Subramanyam. The Committee adopted the Secretary's report to the AICC regarding breaches of Gandhi- Irwin pact by officials in Andhra.

The Sub-Magistrates of Chandragiri and Puttur issued orders not only prohibiting the hoisting of the flag but also prohibiting the holding or attending of any meeting in support of the Congress Party or creed. At Madanapalle, cases were lodged by the police against V.V. Vedhanthacharyulu and Nagarathnam Mudhaliar for trying to extend monetary help to some volunteers. Proceedings were instituted under Section

109 Cr.P.C. against four young strangers who came apparently from Madras to Rompicherla.

In Kurnool District, the Civil Disobedience Movement was led by Swamy Narayananda Saraswathi, D. Sesha Reddy and K. Chenchu Reddy. D. Sesha Reddy, invited Kalluru Subba Rao toured Athmakuru Taluk for one week and explained to the people about the evils of the British rule in India.

Repressive Measures

The Government struck heavily against the people by resorting to severe methods of repression. By a Gazette Extraordinary, the Madras Government declared the APCC, the District Congress Committee of Anantapur and Bellary Satyagraha Shibiram as unlawful associations.

Resignation of teachers and other Government servants

During the Civil Disobedience Movement, teachers and other government servants in Rayalaseema resigned in protest against the repressive measures of the government. Those who resigned were C.R. Reddy, the Vice-Chancellor of Andhra University, T.K.T. Veeraraghavacharya and R.Venkata Reddy (Chittoor District), Nivarthi Venkata Subbaiah, D.H. Krishna Rao and D.Govinda Doss (Kurnool District),

D. Rama Reddy, M. Rangaiah Naidu and K. Subramanyam (Kadapa District).

Boycott of Educational Institutions

The students who gave up their studies during the Civil Disobedience Movement in Rayalaseema were: A. Chidhambara Reddy, N. Sanjeeva Reddy and H. Narasinga Rao (Anantapur District), M. Durvasulu Naidu, K. Mal Reddy,

V. Ramachandra Reddy, P. Thimma Reddy, A.P. Vajravelu Chetty, K. Venkatesayya (Chittoor District), M. Shamsheer Baig and A. Venkatasubbayya (Kurnool District). **Action against Local Bodies**

The Anantapur District Board which met on 31st May 1930 and passed a resolution condemning the action of the government for arresting national leaders like Jawaharlal Nehru, Sardar Patel, Abul Kalam Azad and others, was superceded on its refusal to cancel that resolution.

Action against the Press

The Telugu newspapers in Rayalaseema did their best to cover the movement and sent the messages to the nook and corner of the region. Therefore, the government's censor fell upon them to restrict their freedom. The Government had included a list of printing presses and newspapers in its blacklist. Warnings were issued or security was demanded from them. Among them were the Kowmodaki and Aindravathi published from Nandyal and Pattikonda respectively in Kurnool District. Kypa Subramanya Sarma, Editor and Publisher of Kowmodaki and P. Kondaiah Chetty, Keeper of Vani Nikethan Press were warned for publishing three articles, "Boycott of foreign cloth", "Prohibition" and "Mr.Gandhi's March" in their paper dated 27th June 1930. Vanam Sankara Sarma, Editor of Aindravathi was warned for publishing an article "The Gandhi Cap" in his paper dated 4th July 1930. P. Ramacharlu, Editor and publisher was warned for publishing two articles, "The Round Table Conference" and "The Cease of toddy shops and Kapus and Reddis" inhis paper Sri Sadhana published from Anantapur. In 1930, Rayalaseema Ugadhi Kaanuka, a Telugu annual was published from Tadipathri by K. Venkatarangachar. It contained a seditious article, "Wash thy feet in warm blood". It was a prayer to the Goddess of Freedom written by K. Venkataramanacharyulu, a partner of Deshabhandhu press where the journal was published. The government warned the printer and publisher for publishing the objectionable article.

Gandhi's Harijan Tour, 1933-1934

Gandhi, as part of the 'Harijan' uplift campaign, once again, visited Rayalaseema from 31st December 1933 to 4th January 1934 and covered places like Kalahasthi, Renigunta, Tirupati, Kadapa, Gooty, Peddhavaduguru, Ramarajupalle, Thimmancherla, Guntakal, Penugonda, Konakondla, Uravakonda, Vajrakaruru, Anantapur, Hindupur and Alur. He was accompanied by M.Bapineedu, Secretary, Andhra Harijan Sevak Sangh. Prof. Malkani, Meerabehan, Chandra Shankar Shukla, Uma Bajaj, Krishna Behan, Viswanatha Pandya, Dhamodhar Dhass, Ramanarayana Choudhary and one Mr.Sarma.

Gandhi Jayanthi Celebrations in Rayalaseema

In this conection, activities such as the portrayal of the life tof Gandhi importance of Khaddhar feeding of poor people, public meetings and processions were organized at Jammalamadugu, Kurnool, Kuppam, Nandyal, Proddatur, Palamaneru (Pallavan Eri means Pallavas Tank), Madanapalle and Narayanavanam. Prayers were also held in the Mahanandiswara Swamy temple.

Rajendra Prasad's visit, 1935

A notable event of 1935 was the visit of Rajendra Prasad, the President of the INC to Rayalaseema. From 23rd to 26th November 1935, he toured places like Nandyal, Panyam, Kurnool, Adoni, Nemakal, Guntakal, Vajrakaruru, Uravakonda, Kuderu, Tadipathri, Jalalpuram, Anantapur, Dharmavaram, Kuntimaddhi, Penugonda, Hindupur, Parigi, Lepakshi, Chilamatthuru, Kodikonda, Pathapalyam, Palasamudrum, Gorantla, Obuladhevara Cheruvu, Kadiri, Thanakal and Madanapalle. During his tour, he was accompanied by Acharya Kripalani, Hukkerikar, Chakradhara Saran, T. Prakasham, P. Ramacharlu and Kalluru Subba Rao.

Keshava Vidyanilayam

On the evening of 25th November 1935, Rajendra Prasad opened Keshava Vidyanilayam (behind District Board office at Anantapur), built for Harijans in memory of P. Keshava Pillai. Yerramala Kondappa donated two acres of land for the said school during Gandhi's Harijan tour of Rayalaseema in 1933-1934.

I. Sadhashivan was kept in charge of the school. Addressing the students, he appealed to them to sacrifice their lives for the service of the motherland.

N. G. Ranga's Election Tour, 1937

On 6th January 1937, a meeting was held at Thimmancherla near Guntakal in Anantapur District. N.G. Ranga addressed public meetings at Madanapalle, Anantapur, Dharmavaram, Pamidi organized the public meetings. At Pamidi, N.G. Ranga asked the people to defeat the Justice Party and vote for Congress. From Pamidi, N.G. Ranga left for Adoni.

Dhuvvuru Subbamma's Speech, 1937

In 18th April 1937, Desabhandhavi Dhuvvuru Subbamma from Nellore also addressed a public meeting at Gooty. She spoke about the political situation in the country. She criticised the Justice Party Government headed by K.V.Reddy Nayudu. She appealed to the voters to elect the Congress Party in the coming elections. She also addressed a women's meeting separately and asked the women to join

the freedom struggle. On 20th April 1937, Subbamma addressed a meeting at Pamidi. It was presided over by M. Sethu Rao.

C. Rajagopalachari's visit to Rayalaseema, 1938

In 1938, Gandhi Jayanthi was celebrated at Kadapa with the introduction of prohibition by C. Rajagopalachari, Premier of the Madras Government. At Rayachoti,

C. Rajagopalachari asked the people to give up drinking. At Chittoor, the prohibition was inaugurated by Yakub Hussain, Minister for Public Works of the Madras Government. Later Yakub Hussain, C.R. Parthasaradhi Ayyangar, R. Venkata Reddy, District Congress Secretary, L.Sundhararaja Ayyangar, Secretary, Prohibition Committee, Andhra region visited Murukkambhat, Kalavakunta, Penumury, Kothapeta, Poothalapattu, Venganapalli and asked the people to vacate the toddy and arrack shops. C. Rajagopalachari accompanied by Yakub Hussain, Muniswamy Pillai and S. Ramanatham visited Chittoor and expressed happiness as the toddy and arrack shops were closed. In the evening, they addressed a meeting near the police grounds.

Peasant Movement in Rayalaseema

A notable feature of 1930's in Rayalaseema was the organisation of Summer Schools of Economics and Politics for peasant activities. A Rayalaseema Peasants' School of Politics and Economics was opened at Giddhaluru in Kurnool District on 22nd December 1937 under the direction of N.G. Ranga in which about 25 students were enrolled.

N. G. Ranga also started in 1938 a Political and Economic Summer School at Madhanapalle in Chittoor District. It had 75 students on its rolls and it was an organ of socialistic propaganda. The lectures dealt with the evils of Imperialism and Capitalism and were intended to direct the energies of the students towards active participation in movements aiming at the abolition of these forms of domination.

A Summer School of Economics and Politics was organised during 20th May to 20th June 1939 at Kalwabugga in Kurnool District. G. Harisarvothama Rao was its Principal and it had strength of 64 students.

In Andhra all the Prominent Leaders of the Congress like Tanguturi Prakasham Pantulu, Pattabhi Seetharamaiah, Mutnuri Krishna Rao, Bulusu Sambamurthi and Pyda Bapayya were arrested. In spite of these arrests, the Congress volunteers continued the boycott and the swadeshi.

The prominent leaders of Rayalaseema and their followers in various districts participated in the second phase of the Civil Disobedience Movement. They had organized hartals in several places like Guntakal, Adoni, Kuppam and Nandyal. Gooty Kesava Pillai condemned the arrests of the Gandhiji and other leaders. The popular leaders like Kalluri Subbarao, Pappuri Ramacharyulu and Idhukallu Sadhasivan raised the revolt in Rayalaseema, but were arrested and sent to Jail. Several individuals sacrificed a great deal by participating in this Movement.

Participation of Women

Thousands of women participated in the second phase of the Civil Disobedience Movement in 1932. The participants like Vallabhaneni Sithalakshmamma, Digomerti Janakamma, Chukkamma, Duggirala Kanakamba, Kanagarthi Nagarathnamma, Vasireddy Hanumayamma, Dasari Krishnavenamma, Harikapudi Manikyamma, Suguna, Mahalakshmamma, Cherukuri Sowbhagyamma, Kotamarthi Kanakamma, Tripuraneni Kausalyamma, Vedhantham Kamala Devi, Kambampati Manikyamma were very prominent in the propagation of defying salt laws, picketing of liquor shops and boycott of foreign cloth. All the women were awarded one year imprisonment. Smt. Manikyamma had to go to prison with six months old baby in her arms. The women detenues were treated very badly. At this juncture, the Rayalaseema women were inspired by the leadership of Bharathi Devi Ranga wife of N.G.Ranga who led a campaign in Guntur district. She came to Rayalaseema Districts to propagate the movement among the women of Rayalaseema. She was arrested and sentenced to one year imprisonment and a fine of Rs.500/-.

During the Civil Disobedience Movement, number of Teachers serving in Municipal Schools, District Boards and Government Schools in Rayalaseema resigned to their jobs in protesting against the attitude of the Government. C.R.Reddy, Chittoor; Nivarthi Venkata Subbaiah, Kurnool,; M. Rangaiah Naidu from Kadapa District. Many of the students of Rayalaseema gave up their studies during the Second phase of the Civil Disobedience Movement.

Anantapur District

Lakshmi Devi D/o Narasayya

She was born in 1896, daughter of Seshamma and Narasayya. She was very much interested in studies but her parents got her married early and soon she became a widow. Even then she did not give up her hopes about studies. It was her uncle (mother's brother) who supported her in her studies. By 1925, she became the first Doctor in the Anantapur District. While studying Medicine in Bombay, she had observed social and political leaders and developed independent views. She got married in 1929 with Nivarthi Mrutyunjaya Sastri, a Junior Lawyer under her Uncle. She started her medical practice for common people. She was interested in maintaining not only a healthy body but also a healthy society.

By 1930 she was driven towards the Salt Satyagraha Movement. She met Gurgabayamma under whose influence she started addressing the people in large gatherings and picketing foreign goods. The police arrested her and brought her before the Sub-Magistrate Court. After heated arguments she was sentenced to six months Rigorous Imprisonment and a fine of Rs.200/- or in default of which further two months imprisonment. She was lodged in Vellore Jail in 1932.

Lakshmi Devi, worked for Harijan upliftment. She encouraged and followed inter-dinning and collected Harijan Fund when Gandhiji visited Bellary in 1934.

She was also served as Vice-President of the D.C.C. and worked for involving more women in the Congress and its movements. In 1935, she was elected as a member of composite Madras State Assembly for Two and half years and worked hard for her constituency. She was a representative from Bellary to the All India Women's Conference. The Sastri couple suggested change of the name of Ceded Districts as Rayalaseema they also suggested Tungabhadra project for improving irrigation

facilities in that region. She worked for the cause of unity and integrity. She died in February 1976.

Kadapa District

Kadapa Rama Subbamma

She was born in 1902 in Kadapa district, daughter of Ramachandra Reddy and Atchamamba. Her father was a great Sanskrit Scholar. She was married to Kadapa Koti Reddy in 1917. He was a Barrister Law in London and Oxford University, but turned a nationalist and inspired Rama subbamma. As a result of this atmosphere she joined the Congress in 1921 and started her political activities. She was highly inspired by T. Prakasam activities during the boycott of Simon Commission at Madras. She participated in the Salt Satyagraha of 1930 along with Durgabayamma, Dronam Raju Lakshmi Bayamma, Ponaka Kanakamma and other great leaders.

During the Individual Satyagraha in 1941 she participated along with her husband but was not arrested. When her husband was arrested, she organized the movement from 1918, and served as its Vice-President. She served as the Municipal Councilor for 40 years and did great service. She worked for women upliftment. She was the President of District Congress Committee from 1938-43. She left it during the Quit India Movement.

She was the President of All India Women's Conference State Wing. She toured extensively throughout the State. She was a great social worker and worked for the establishment of a Women's College in Kadapa. She donated One Lakh rupees for this purpose. She served as a Member of All India Social Welfare Board. State Social Welfare Board and President of Guild of Services. She worked in the relief programme of Rayalaseema famine. She was a member of All India Congress Executive Committee. She visited foreign countries. While addressing a meeting of Andhra Yuvathi Mandali. Hyderabad in 1940 she inspired the women of Hyderabad to come out of the seclusion. Though she was not arrested. She took an active part in the freedom struggle and social field.

Dr. Muthulakshmi Reddy

Dr. Muthulakshmi Reddy was one of the great women leaders of this period. Though her work was confined to Madras Women of Andhra derived benefit of her services as a Member of the Legislative Assembly. She was responsible for the enactment of laws concerning education and Health of Women, the abolition of Devadasi System and the suppression of prostitution. All her reforms had their impact on women in Andhra as there was already awakening in these matters dawned by the social reformers. Prominent person's likeYamini Purnatilakam, her daughter Rama Tilakam and the famous cinema star of the day Bezawada Ranla Tilakam had carried a movement for abolition of the Devadasi System. Dr. Muthulakshmi Reddy started a number of institutions for women. She did not participate in the Salt Satyagraha or in picketings and boycotting like other women of Andhra. But as a staunch follower of Gandhiji as an educated lady, she tried to awakening the women through meetings, discussions and organizations. As a follower of Gandhiji she resigned her membership in the Legislature in 1930. She represented Women's Indian Association and attended the Round Table Conference at England. When Gandhiji visited Madras in 1933, she was the President of Women's Indian Association and organized a large women meeting with Gandhiji. These women took a pledge that they would carry on the campaign against untouchability. She had already established Avvai Home, in which she

sheltered women of all castes. She took up the task of constructing a Cancer Hospital through the Women's Indian Association and collected huge donations. Though her eyesight was deteriorating due to age she convinced Gandhi and carried on the work.

Dr. Muthulakshmi Reddy was the first lady Doctor in the composite Madras Province. She was highly influenced by the Brahmo Samaj and its founder and leaders. **Conclusion**

Thus, Mahatma Gandhi's call of Civil Disobedience Movement has enormous effect which spread to the nook and corner of the country symbolizing that irrespective of age, education, profession, religion all joined together for the cause of freedom for the country. It is important to note here that because of the sacrifices made by the lakhs of people who suffered in the hands of the British by serving jail sentences, hangings, firings and Lathi charges. We are enjoying freedom. In this context the role played by Rayalaseema Women freedom fighters who involved in this movement played a key role in arousing national sentiment among the people for the cause of national independence.

RHYTHMIC DANCE PATTERNS IN COMPOSITIONS OF ŪTUKKĀḌU VENKAṬA KAVI

Dr. C.P.S. Madhuri

Academic Consultant (Teaching Faculty), Department of Performing Arts, Sri Venkateswara University, Tirupati

ABSTRACT

India is a country of many art forms and cultures which are interrelated and inter-dependant in many ways. Especially the fine arts - music and dance are like inseparable twins- bhāva and laya being the most common factors. Music and Dance always complete each other. In South India, Carnatic music compositions are the choice for many classical dancers for their performances. Many South Indian Composers have contributed immensely towards the Dance musical forms like Jatisvaram, Padavarnam, Padam, Tillana etc., which in general figure in a dance recital. Also, there are many compositions that particularly suited for dance with many jati-s, sōlkaṭṭu syllables with svara passages etc., though not intended specifically for dance, that are chosen for classical dance performances as they offer vide scope for the dancers for visual interpretation interspersed with dance specific jati-s and many more dance related aspects. Ūtukkāḍu Venkaṭa Kavi's compositions are one such favourite choice for many dancers belonging to classical dance forms like Bharatanāṭyam and Kūcipūḍi. The present paper aims to bring out the genius of Venkaṭa Kavi's compositions as a choice for dance performances, highlighting various aspects of dance centric rhythmic patterns present in his compositions.

KEY WORDS: *Music, Dance, Rhythm, Jati, Venkaṭa Kavi, Bharatanāṭyam*

INTRODUCTION

Classical Music and Dance have a prominent place in our culture and are the proud treasures of the heritage of our nation. Both Carnatic Music and Dance have prominent place in the Cultural and Fine Arts set up. These have not only swayed the hearts of the ethnic Indian community but also the hearts of the Universe breaking all the barriers. Together they have a great role in the Cultural Diplomacy and make the world a better and befitting place to live. Music is an inseparable part of Dance. They both are incomplete without each other. It is the music- 'Sangīta'- that adds sparkle to the graceful dancing.

In the early Indian context, the term Sangīta meant a composite art-form comprising of Gīta, Vādya and Nṛtta – vocal singing, instrumental accompaniments and the limb movement or dance. The third component of Sangīta, viz., Nṛtta, again involved the use of other two components - Gīta and Vādya.

"Gītam vādyam tathā nṛtyam trayam sangīta muçyatē" (Sangīta Ratnākara)

Thus, the term Sangīta combined in itself all the different phases of music, including dance. For Dance (Nṛtta), just as in the case of vocal (Gīta) and instrumental (Vādya) music, the rhythm (Laya) is very vital. The Dance too was

regarded as a kind of music. This is similar to human body where the different limbs function in harmony with the body's rhythm.

Thus, a dance performance is a feast for both eyes and ears. Music becomes visual in a dance performance. The text (lyrics) of the song is translated to action and through that media, the message is conveyed, the story is narrated, the incident described and the feeling expressed. According to the well-known adage - "There can be music without dance, but there can be no dance without music".

Repertoire

Many dance forms flourished in India, each of these having their own individual style of music. Carnatic music has been playing an important role, particularly in South Indian classical dance forms like Bharatanāṭyam, Kūcipūḍi etc. Several musical forms that are suitable exclusively for dance recital were composed down the centuries. Apart from such regular dance proforma, compositions of many Vaggēyakāra-s, though not particularly intended for dance, have become the choice of many classical dancers, to bring out and expose the vast and varied elements of Abhinaya and various rhythmic patterns contained in them.

Ūtukkāḍu Venkaṭa Kavi's compositions are one such favourite choice featuring in South Indian Classical Dances like Bharatanāṭyam and Kūcipūḍi repertoire.

Ūtukkāḍu Venkaṭa Kavi

Ūtukkāḍu Venkaṭa Kavi (1700-1765) was one of the pioneering composers of South India. His contribution to music, dance and spiritual lore is immense. He was born in the month of Aippāsi, (Saptami – Makham star) at Mannārguḍi to Rāmaçandra and Kamalānārāyaṇi. Venkaṭa Kavi had learnt elementary music from Pūranūr Naṭēśa Bhāgavatār alias Rāja Bhāgavatār and could find none to teach him further and ultimately found his 'Mānaśīka' Guru in the Lord Kṛṣṇa Himself.

Composer Par Excellence

Venkaṭa Kavi's compositions consist of various aspects like Melody, Rhythm, Lyrics, Opera, Dance, Indian Culture, Historic luminaries and various other themes. His compositions have been the outpouring of his divine spiritual experiences glittering with lyrical feat and musical feast replete with rāga-bhāva-rasa-anubhava. He has followed the kṛti pattern of the earlier composers (like Annamāçārya and Purandaradāsa), and the kannigaḷ pattern (number of stanzas sung to the same tune) of the Divya Prabandham of the earlier Āḻvar-s and sollukaṭṭu-s and sāhitya-s for them comparable to Aruṇagirināthar are in abundance in his compositions.

Venkaṭa Kavi had a deep devotion for the presiding deity of the Ūtukkāḍu temple, Kāḷinganartana Perumāḷ. His works express the closeness he felt towards the Lord and his deep devotion which is reflected in every verse he wrote. His compositions – especially those on Lord Kṛṣṇa have a reference to Kṛṣṇa's Kāḷinga Nartana.

Dance Compositions

Most of his compositions are dance-oriented, and contain plenty of *sōlkaṭṭu jati*-s, and madhyamakāla passages. He was a master of intricate rhythmic patterns. His compositions are well suited for concerts, bhajans and dance. The most fascinating thing in his compositions is the combination of svara, sāhitya and jati which he employed.

According to family sources – 'Rhythmic excellence and soul-filling music of Venkaṭa Kavi has all the elements of Bharatanāṭyam like alarippu, sabda-s, jatisvaram, varṇam, jāvaḷi, tillāna-jati-s and varṇameṭṭu-s and have therefore become the favourite of dancers.' The Maestro wrote Rudra Sabdam, Nandana Gīta, Rājagōpāla Nityōtsavam, Kāḷinga Nartana Prabhāvam and Śrī Kṛṣṇa Gānam with a part in kṛti form known as Rāsa padam.

Choice of Dancers

The works of Venkaṭa Kavi are always a delight for dancers. His compositions are a blend of intricate rhythms with Bhāva laden lyrics which offers vide scope for beautiful visualisation and choreography that can transport the artist to a higher dimension. Known for picturesque descriptions steeped in devotion and sparkling jati-s, Venkaṭa Kavi's compositions succeeded in gaining admiration and attraction in dance circles.

Visualisation

Venkaṭa Kavi's knowledge and fondness for dance are evident in many of his compositions. It seems he was inspired very much by the divine visionary of the dances of Kṛṣṇa, Vināyaka and Śiva. Also, the influence of Bhāgavata mela tradition that was prevalent those days in his region is also seen much in his works, which inspired him to compose pieces suitable for dance.

His description of dance reveals his extraordinary visualisation. This is evident from his approach to jati-s, svara-s and yati-s readily falling into places and blending seamlessly with the abhinaya-centric parts.

The following is an admirable example of his visualisation about Kṛṣṇa's dance in Rāga Nāṭṭai

Pallavi

āḍinān nartanam ādinān rāsa nartanam ādinān sarasa rāsa nartanam āḍinān sundarigaluḍan sarasa rāsa nartanam āḍinān vraja sundarigaluḍan sarasa rāsa nartanam mighu bhakti koṇḍa vraja sundarigaluḍan sarasa rāsa nartanam antaranga mighu bhakti koṇḍa vraja sundarigaluḍan sarasa rāsa nartanam…..

Here the Rāslīla of Kṛṣṇa – dancing with Gōpikas-s of Vraj - is visualised through the lyrics beautifully

Jati Patterns (Dance centric Rhythmic Syllables)

Venkaṭa Kavi stands ahead of many Carnatic composers for his affinity, spontaneity, versatality and variety when it comes to jati-s (rhythmic or dance syllables). He has incorporated wonderful jati-s in many of his compositions. The following are some beautiful examples:

1. Ananda nartana gaṇapatim – Nāṭṭai – Ādi

In this wonderfully rhythmic song, Venkaṭa Kavi prays to Vināyaka while He dances His divine dance.

Jati pā ma ga mā ga sa sā sa ri sā taka taṇaku dhimita kiṭa taṇangu taka dhimita dhimita tām taiï yaï tāmï tām taṇandari tām taka jhaṇam taṇandariï tāïm tām taṇandari jhaṇam taṇandari; tari tari tari; dhimi dhimi dhimi; ; . kiṭa kiṭa kiṭa.; jhaṇa jhaṇa jhaṇa; divipatinutam; padasarasijam ma ga pa ma ni pa ; marakatanibham ; mada karimukham ; praṇava ninadam ; ajitam anagham sugatam paramam kanakāmbara dharaṇam Eka radanam tattit taka jhaṇanta naga tari dhit taka jhaṇanta naga tari taka jhaṇanta naga tari tām tattit taka jhaṇanta naga tari dhit taka jhaṇanta naga tari taka jhaṇanta naga tari tām ; ; tattit taka jhaṇanta naga tari dhit taka jhaṇanta naga tari taka jhaṇanta nakaparam

2. Marakata maṇimaya çēla – Ārabhi – Ādi Tāḷam

In the last section of this kṛti, there is a mathematical reduction (kuraippu) from one cycle to half cycle before capping it off with another cycle. This feature is usually seen in solfa improvisations (kalpana svara-s). The composer brings in much beauty by switching between jati and lyrics in every alternate line. Most obviously, it is a popular choice in the world of dance.

Çaraṇam mānita guṇa śīlā dayālā mām pālayā varabālā gōpālā sā ni dha pa ma ga ri

muraḷīdharā nanda mukundā mama mānasa pada sarasīruha daḷa yugaḷā ādi

madhyānta rahitā vaibhava anantā kalyāṇa guṇā mama rakṣaka

Jati(madhyamakāla)

takiṭa dhrimita taka taka dhimi dhīmtaka taka tika tōm taka tōm taka dhiranā

vanaja nayana rādhāmukha madhukara rasika rasikavara rāsa vilāsa

takiṭa dhrimita taka taka dhimi dhīmtaka taka tika tōm takatōm taka dhiranā

navarasa kaṭitaṭa śōbhita vallabha nava vrajayuvatī manōllāsa

taka tika tōm taka taka tōm taka dhiranā kanaka maṇimaya nūpura dharaṇā

taka tika tōm taka tōm taka dhiranā kamala bhavanuta śāśvata caraṇā

kalpita kali kaluṣajvara mardana kāḷinga nartana katitha janārdana

3. Nīlavanam tanil – Punnāgavarāḷi – Ādi

This kṛti has jati interwoven in the Çaraṇa part as follows.

çaraṇam nadik-karaiyōrattilē (yamunai) anru oru nāl innērattilē anralarnda narumaṇa malarō

malaridaśhō un matimukham enradum mati mayangi vashamiśhanda enniḍam

manadirangi arul purindu shenradum maravēnē kaṇam tariyēnē dhittriku tariku dhīm-tattari dhīmita jhaṇuta jhaṇuta dhīm taka tadhingiṇatōm tattit takaṇak jhantari

dhittaṇaka jhantari takaṇaka jhantari kalangamilāda

4. Vanamālī svāgatam – Nāṭṭaikkuranji - Ādi

In this composition, one can find jati patterns in Anupallavi as well as Çaraṇam with gati bhēdam of Çaturaśra and Khaṇḍa gati as well.

Anupallavi sanaka sanādi muni gaṇārçita suguṇā çandra vadanā krta tākiṭa taka jhaṇanta

taka jhoṇutaka kiṭataka tari kiṭatōm takatari kiṭataka tākiṭa taka jhaṇanta taka

tām ta śa ni dha ni śa śa ni ni dha ni ma ma ga sa sa ni kiṭataka tarikiṭatōm

tām ta ŝa ni dha ni ŝa ŝa ni ni dha ni ma ma ga sa sa ni kiṭataka tarikiṭatōm sa ma ga mā ; ma ga ma ni dha guṇānga taka taḷāngu taka tōm ta

(khaṇḍagati) tattit dhṛkam dhṛka tataka tillānā - tattit dhṛkam takadhṛkam tataka tillānā

dhṛkata tillānā - tadingiṇat-tōm tāmta tillānā - tadingiṇatōm tāmtāmta tillāna

tadingiṇatōm

5. Nīradasama nīla Kṛṣṇa – Jayantaśrī – Ādi Triśranaḍa

In this composition, we can come across jati-s in both the gati-s, the triśra gati and khanḍagati. The jati is spread over both anupallavi and çaraṇam.

Anupallavi naravara stuti rūpa vēṣa nava vraja yuvatī samēta

nādhiru tadingiṇatōmdhittām kiṭataka tarikiṭa

nādhiru tadingiṇatōm dhittām kiṭataka tarikiṭa

(khaṇḍagati)
çaraṇam
makara kuṇḍala dharita mahanīya vēṣā sakala jana munigaṇa samūha mana mōhā tara

kaṭaka karatala jvla jvalita jālā / taka takiṭa tadingiṇatōm dhittām sa sa ma dha ni sa sa ga

ma dha ni ni sa ga ma pā pā ma dhā ni sa ga takku dhinnam tariku tarikiṭaku kukutattai

kukutaṇaku ḍhiṇḍhīngu tikuṇa kuku kiṭataka tarikiṭatōm

6. Muddu Kṛṣṇā Mēmudam Dēhi – Janjhūṭi – Ādi

In this composition, the jati is set in vilamba kāla at first then followed by jati in madhyamakāla, combining a high degree of sophistication and aesthetic sense.

Anupallavi

nitya yauvanālankṛtākāra nīla mēgha kōmaḷānga śarīra navanīta çōra mahanīya rūpa

rādhā vilōla tara vēṇugāna gōpālā vara bālā agaṇita vitaraṇa guṇaśīlā

Jati

{Vilamba kala} - dhittariku tariku tadingiṇatōm taka tadingiṇatōm takadika takadika

tadingiṇatōm / ga ma pa ni dha pā dha ma dha pa ma ga ri sa ri ga ma pā / tatām tadhīm

taṇam takum - tatām tadhīm taṇam takum – {Madhyamakala}(tatām tadhīm taṇam takum) / takkiṭa dhimi tirikiṭa dhimi taḷāngu takajham tari takkiṭa dhimi tirikiṭa dhimi

taḷāngu takajham tiri takkiṭa dhimi tirikiṭa dhimi taḷāngu takajhañu taḷāngu takajhaṇu

kāḽinga Nartana

7. Bṛndāvana nilayē – Rītigauḷa – Ādi

In this composition, we can find beautifully interspersed jati pattern in the samiṣṭi çaraṇa as follows

Samiṣṭi Çaraṇa

śṛngāra rasōllāsa caturē ……

vasudēva dēvaki nanda mukunda gōvinda kāḷinga nartana rasikē

Jati

takkiṭa taddhimi tattari tajjhaṇu tām sā ni dha ma gā ri sa ni takkiṭa taddhimi tattari tajjhaṇu tām / kiṭatōm dhīngiṇatōm tadhīngiṇa tōm / tām dhingiṇa tōm tām tām dhīngiṇatōm tām tām dhīngiṇa tōm tām dhīngiṇatōm tām tām dhīngiṇatōm tām tām dhīngiṇatōm tata jhaṇu tadingiṇa tōm taka tadingiṇa tōm taka tika tadhingiña tōm tām / ga ga ma ri ga ma sa ga ri ga ma ni ni sa ga ri ma ni ni sa sa nI sa sa ri sā ; ghiṇatōm taghiṇatōm tadhighiṇatōm taka tadhighiṇatōm taka tika tadhighiṇatōm

8. Bhuvana Mōha Saundara Sukumāra – Dhanyāsi – Ādi

In this composition, Venkaṭa Kavi has created jati patterns interspersed with svara-s and then composed lyrics to match these in the next line

Çaraṇam

muhūrita ravatu sanga tarangita kumkuma candana kaḷabha samiśṛta sundaram

……

su-vacanā tāpa samida mama kānta kānta taka dhīmta dhīmta kāḷinga nartana

(madhyamakālam)

tānamkiṭa tajham tarita sa ga ri ni sā tajham taṇam takum tarita - (jati with svara)

padāmbuja svayam jvalita naṭanavarā tajham taṇam takum tarita - (lyrics)

tānamkiṭa tajham tarita sa ga ri ni sā tajham taṇam takum tarita - (jati with svara)

pītāmbaradhara maṇimaya makara kuṇḍalam idam jhalam jhalana – (lyrics)

dhitōm dhitōm ri sā pa nī sa ni dha pa taṇangu kiṭa taḷāngu taka dhīmta

takku tarikiṭaku tarikiṭaku kiṭata tatdhṛta kiṭa jhaṇata tānam tadhīmta

nṛtya nṛtya vṛṣa-bhānu sukumāri vidhṛta pa-danyāsa bhāvāva rasika

ati nūtana kusumākara vraja mōhana sarasīruha daḷa lōcana mama

mānasa paṭu śōra su-svara gīta su-muraḷīdhara suramōdita bhava mōcana

9. Svāgatam Kṛṣṇā – Mōhana – Ādi (Triśra and Çaturaśra gati-s)

In this composition, the Pallavi and anupallavi are in triśra gati and çaraṇam is in çaturaśra gati followed by a combination of svaram and jati – first in çaturaśra gati and then in triśragati.

Çaraṇam – (çaturaśram)

muṣṭikāśūra çāṇūra malla malla viśārada mudhusūdanā

----

vraja yuvatī jana mānasa pūjita

Jati

sā dha pā ga rī pa ga ri sa dha sā

taddhit takajhaṇu tām / dhit takajhaṇu tām / takajhaṇu tām

takatari kuku taṇa kiṭataka dhīm / takatari kuku taṇa kiṭataka dhīm

takatari kuku taṇa kiṭataka dhīm / takatari kuku taṇa kiṭataka dhīm

(triśragati)
takatari kuku taṇa kiṭataka dhīm / takatari kuku taṇa kiṭataka dhīm / takatari kuku taṇa kiṭataka / takatari kuku taṇa kiṭataka dhīm / tari kuku taṇa kiṭataka dhīm / kuku taṇa kiṭataka

10. Kanaka sabhā nāyaka – Nāṭṭai - Ādi

This composition of Venkaṭa Kavi in Tamil on Lord Śiva is again an explicit example resplendent with beautiful and elegant madhyamakāla jati towards the end of the composition, ideal for a dance finale.

Çaraṇam

vēda kāṭṭilē viḷainda mai jñāna vittagamēviya karpakē aruḷ vindaiyē

----

nādhru takkat-takkattōm dhrutaka takkattōm takkattōm dhinattināvena nakuntaraku

dhina tillāna dhittillāna dhīm tarana dhīrana tāngu taṇattari jhomuku taṇattari taṇakiṇa

taṇakiṇa tākkināākta nagajhaṇu dhīm tanāk-tinākta nagajhaṇu dhīm tatā tatī tataita

jhomta kiṭaku tarikiṭaku dhittillāt-tatakajham tiritilātta takkakajham dhittillātta

tiri tillātta takajham tadikiṇatōm tatikiṇatōm tadīngiṇatōm

CONCLUSION

Many choreographers separately include various jati patterns (dance rhythms) in the compositions they choose, to create different movements in their dances. But we can find the natural flow of jati patterns interspersed in the main text of many compositions of Venkaṭa Kavi enabling many dancers and choreographers follow the song as it is, still creating the magical feat they wish for.

Thus, the genius of Ūtukkāḍu Venkaṭa Kavi can be highlighted through some of his compositions repleting with rhythmic dance syllables(jati-s) and can be considered a great choice for classical dance performances.

SANKĪRTANĀÇĀRYA ŚRĪ ANNAMĀÇĀRYA

Dr C.P.S. Madhuri

Academic Consultant (Teaching Faculty)

Department of Performing Arts

Sri Venkateswara University, Tirupati

ABSTRACT

Śrī Tāḷḷapāka Annamāçārya is one of the early vāggēyakāra-s in Telugu. He is well-known as '*Pada Kavitā Pitāmaha'* and '*Sankīrtanāçārya'*. His Sankīrtana-s contained the essence of Vēda-s, Itihāsa-s and Purāṇa-s. They were sung by him with great Viṣṇu Bhakti and Śaraṇāgati Bhāva to Lord Śrī Venkaṭēśwara of Tirumala. They came out from the depth of his heart and hence are of great interest to the sādhaka-s of the Bhakti-cult. Hearing them rendered musically is a great feast to the ears. They bring happiness to the mind. It is therefore no wonder, they are popular.

The present paper focuses on throwing some light on the sankīrtana-s of Śrī Annamayya, hailing his prowess as 'Sankīrtanāçārya'.

Key words: Annamāçārya, Sankīrtanāçārya, Sankīrtana, Bhakti, Vāggēyakāra

INTRODUCTION

India is a land of spirituality and Indian music is mostly spiritual in nature, finding its roots in the Sāmavēda with bhakti being an important factor ruling over it. It has been enriched with a large and vast repertoire of devotional literature by many Vāggēyakāra-s. Music became the vehicle to many of them to express their longing towards the Supreme Bliss and to outpour their feelings and emotions to the Almighty they strongly believed in. Thereafter, the Bhakti movement influenced music invariably for centuries.

Both North and South India made their own significant contributions towards the field of music with their divine writings. We had Jayadēva, Līlāśuka, Tulsīdās, Kabīrdās, Mīra etc., in the North whereas in the South, Aḷvārs – following the philosophy of Viśiṣṭādvaita of Śrī Rāmānuja propagated bhakti through the hymns of Nālāyira Divya Prabandham and Nāyanār-s, the Saivaite saints expressed their devotional emotions through Tirumurai and Tēvāram-s in Tamil. Meanwhile, in Kannada the ecstatic outpourings of Haridāsa-s called 'Dēvaranāma-s' and 'Dāsara Padagaḷu' gained tremendous popularity along with the 'Vaçana-s' of Śiva śaraṇa-s. Before the advent of Annamāçārya, in Telugu we had Kṛṣṇamāçārya's 'Simhagiri vaçana-s' and 'Narahari vaçana-s'. Annamayya's arrival on this scenario of India's devotional literature marked the beginning of a new era in the 15th century.

"Nāma sankīrtanam yasya - Sarva pāpa praṇāśanam" ||

(Bhāgavatam 12-13-23)

Endowed with a fertile imagination, Annamāçārya was a great scholar, Saint poet and his works described as 'Padakavita-s' are repositories of ancient wisdom. Through his Pada-s he sang the praise of the auspicious qualities of the Lord of the Universe embedding those songs with great philosophical truths. He brilliantly employed music and literature as tools to give spontaneous expression to his Bhakti Bhāva.

Life Sketch

The life sketch of Tāḷḷapāka Annamāçārya can be known from the diligent work titled "Annamayya Jīvita Çaritramu" by Tāḷḷapāka Tiruvēngaḷanātha (Śrī Annamāçārya's grandson) presented in the genere of "Dvipada kavya". Annamayya was born in 1408 in a small village called Tāḷḷapāka of Cuddapah district in Andhra Pradesh. His father was Nārāyaṇa Sūri and mother Lakkamāmba. They belong to Smārta Nandavarīka Brahmin family and are devotees of Lord Viṣṇu. Annamayya is said to be the incarnation of 'Nandaka' (the sword of Lord Viṣṇu).

Pilgrimage to Tirumala

Annamayya left Tāḷḷapāka village at the age of eight. He wanted to climb the Tirumala Hills on foot. At the very sight of the Tirumala Hills, Annamayya sings in ecstacy as follows

"Adivō Alladivō Śrīharivāsamu – padivēla śēṣula paḍagala mayamu"

While climbing the hills, he was tired and slept under a cool bamboo groove at a spot called 'Mōkāḷḷa Miṭṭa". The Tirumala hills are said to be full of Sālagrāma stones and he committed the mistake of wearing the foot wear unknowingly while climbing such auspicious hill. Goddess Alamēlumanga, the divine consort of Lord Venkaṭēśvara came to his rescue with abundant motherly affection. She blessed him with Lord's prasādam with which he regained his vigour and strength and resumed the journey. Inspired by the divine mother's flow of mercy, he spontaneously rendered one hundred verses in Her praise and dedicated to Goddess Alamēlumanga.

Vaiṣṇavism

Annamayya stayed in the sacred hills for eight years. He was initiated into Vaiṣñavism fold by a sanyasi 'Ghana Viṣṇu', after completing 'Pança samsakara-s'. From the age of 16, Annamāçārya took a vow to offer at least one composition a day to the lotus feet of the Lord. This mission was carried on by Annamāçārya till his last breath (Phālguṇa Bahuḷa Dvādaśi – 1503).

Back to Tāḷḷapāka – Marriage

Annamāçārya's parents came in search of him and obeying Lord's advice, he returned to his village with them. He married Timmakka and Akkalamma and had three children, Peda Tirumalāçārya being one among them.

Annamāçārya was greatly influenced by the pontiff of Ahōbala Muṭṭ – 'Śrī Ādivan Śaṭhagōpa Yati', and gave the essence of Viśiṣṭādvaita Philosophy to the understanding of the common folk, in his sankīrtana-s.

Sāḷuva Narasimharāya

Annamāçārya adorned the court of King Sāḷuva Narasimharāya of Penukoṇḍa. One day, overwhelmed by the sweetness of a particular sankirtana - ***"Emokō çiguruṭa dharamuna – eḍaneḍa kasturi niṇḍenu"*** composed by Annamayya, the king requested him to compose such a song on him also. Annamayya refused to do so, declaring that his songs are dedicated only and only on Lord Venkaṭēśvara and that he will not compose in praise of human beings, however great they may be. Felt insulted by this refusal, the king ordered the imprisonment of the saint composer. Annamayya prayed the Lord through the following Sankīrtana –

"Ākaṭi vēḷala alapaina vēḷala – tēkuva Hari nāmamē dikku mari lēdu"- who came for his rescue by breaking the chains. The king realised the greatness of Annamayya and fell at his feet. Annamayya disgusted with the court service, returned to Tirumala and settled there for the rest of his life.

Annamayya composed innumerable songs covering different aspects of life and afterlife. His sankīrtana-s cover all temple rituals, utsavam-s, processions etc. It is said that the famous dāsa saint of Karnataka – Purandaradāsa praised Annamayya as the incarnatiom of Lord Venkaṭēśvara and his sankīrtana-s as 'Parama Mantra-s'. Annamayya's sankīrtana arçana was carried by his son Peda Tirumalāçārya and his grandson Çina Tirumalāçārya. Another grandson Çina Tiruveṇgaḷanathuḍu known as 'Çinnanna' wrote his biography. Çina Tirumalāçārya also translated 'Sankīrtana Lakṣaṇamu' of Annamayya which was originally in Sanskrit and currently obsolete into Telugu language. This treatise explains the lakṣaṇa (theory) of the form Sankīrtana for which lakṣya (practical) can be found in Annamāçārya's sankīrtana-s.

Copper plates - Sankīrtana Bhāṇḍāramu

Annamāçārya's yeoman services to the field of poetry, music and bhajana tradition is very significant. He is aptly hailed as 'Padakavitā Pitāmaha', 'Sankīrtanāçārya' and 'Drāviḍāgama Sārvabhauma'. He composed 32,000 sankīrtana-s, but because of some greedy people and their ignorance we lost a major part of the greatest treasure. Presently only around 14,000 are available out of them. These are engraved on copper plates under the direct supervision of Peda Tirumalāçārya. The tradition of having compositions inscribed on copper plates is exclusive and unique to Tāḷḷapāka composers. They were stored in a place called 'Sankīrtana Bhāṇḍāramu' inside the temple premises at Tirumala, some at Ahōbilam and some in Śrīrangam. We find some palm leaf manuscripts of the same at Tanjore Sarasvati Mahal Library and Madras Oriental Manuscripts Library. It was A.D. Campbell who first mentioned the existence of these compositions way back in 1816. But these copper plates came to light only in 1922 through the discovery of The Tirumala Tirupati Devasthanams, TTD. The Sankīrtana Bhāṇḍāramu' in Tirumala temple holds the statues of Annamāçārya and his son Peda Tirumalāçārya on either side. Even to this day, the Lord of Seven Hills wakes up to Annamāçārya Sankīrtana which has become a part of the daily rituals at the hill temple.

Sankīrtana Legecy

Annamāçārya's sankīrtana-s can be broadly classified under two categories – Adhyātma sankīrtana-s (the devotional and philosophic compositions) and Śṛngāra sankīrtana-s (the erotic compositions replete with madhura bhakti concept). His compositions were mainly in Telugu language and a few in sanskrit language. His sankīrtana-s were a confluence of language and literature, the music and musicology and the philosophy and message. The style of the sankīrtana-s is simple, direct and colloquial. The common vocabulary of the contemporary age was liberally used and the native idiom is well expressed.

He adopted song as a mass medium to convey his ideas and ideologies and to propagate the 'Srinivasa Tatvam'. Ha called his song "Sankīrtana". Sankīrtana form was systematised and streamlined by Annamayya with a Pallavi, Anupallavi (rare usuage) and Ćaraṇam-s. The Pallavi contains the central idea of the sankīrtana and the theme is elaborated in the ćaraṇam-s following. Only rāga names were mentioned on the copper plates for the 14,000 odd compositions we have inherited of Annamāćārya, only 89 rāga-s have been employed out of which 25 have been used frequently. Though there is no mention of tāḷa-s on the copper plates, their pattern of singing employing different tala-s can be inferred from the pada singing tradition followed in Karnataka and Andhra according to Śrī Rāḷḷapalli Ananta Kṛṣṇa Śarma. He says, the bhava and language of the song itself leads us to infer its music. Many renowned Musicologists and contemporary musicians have composed tunes and published notations to the sankīrtana-s of Annamayya.

Annamyya extols the greatness of Sankīrtana in many of his own compositions. The following are a few of them:

- Annamayya conveys that Sankīrtana of Viṣṇu only is the pure eternal knowledge and that there is no other tool beyond Sankīrtana to attain eternity,

  "Mādṛśānām bhavāmaya dēhinām ----------

  ----------kēćidapinā viṣṇukīrtanam prītyā – sūćayantō vā śrōtum nanatiḥ"
- ***"Ćāladā bramhamidi sankīrtanam – jālella naḍagiṇću sankīrtanam***

  Sāmajamu gāćinadi sankīrtanam – sāmamuna kekkuḍī sankīrtanam

  Sāmīpyamindariki sanakīrtanam – sāmānyamā Viṣṇu sankīrtanam"
- ***"Ćaladā harināma soukhyāmṛtamau tamaku ----------***

  Tagu vēnkaṭēśu kīrtanamokaṭi ćaladā – jagamulō kalpabhūjammu valenunḍa"
- In the following sankīrtana he says – one sankīrtana is enough to protect me, let the rest be hidden in the treasure house.

  "Okka sankīrtanē ćālu oddikai mamu rakṣimpaga

  Takkinavi bhāṇḍārāna dāćiyunḍanī"

Conclusion

Annamāćārya's sankīrtana-s dazzle in poetic excellence and with a chiselled structure, carryout understanding musical element along with strong emotional element, enhancing their melodic, aesthetic and rhetorical value leading us through a great spiritual journey to attain the eternal bliss. Thus, Annamāćārya is hailed as 'Pada Kavitā Pitamaha' and 'Sankīrtanāćārya' in the right way.

Faculty, Academic Consultant Department of performing Arts,
S.V. University, Tirupati.

Abstract- **The historic period of Tamil Nadu started with the sangam age. Education in the arts is an integral part of the development of each human being. This study mainly will give importance to the origin and development of the fine arts in the history of Sangam period. Sangam age to fine arts had its progress in various fields and inspired the coming generations. The fine arts like music, dance, drama and painting were all developed in a conspicuous measure. Tamils embraced, there from not only literature but also music and drama. The concept of Muttamil comprising Iyal, Is I and Natakam had attained currency as early as the Sangam age.**

Keywords: **Music, fine arts, sangam age, sangampeople, art forms, instruments.**

INTRODUCTION:

The sangam period as the classical age of the Tamils analogues. The Sangam age in Indian history witnessed the rapid development of Arts and literary works in the southern reasons. Various fine arts were very popular in the sangam age. Poetry, music and dance were quite popular among the sangam people. Various fine arts were very popular in the sangam age. During the sangam period music and dance were highly developed and popular. Musical instruments of various types are described and included many kinds of yal and varieties of drums.

Music

Music is the subtlest and finest of all fine arts and it develops the faculty of human imagination and appeals to the soul and conscience of the people. Through its melody or harmony it gives infinite pleasure to the mind and the heart. Tamils of the Sangam age possessed a highly developed system of music. The **Purananuru** shows that the Tamils had acquired a remarkable skill in music from an early time. They took a great delight in assembling in large numbers for the purpose of enjoying music, vocal and instrumental as well as dance performances. From **Pattinappalai** we come to know that the people of **Kavirippumpattinam** often resorted to the common place of the city in order to witness dances and enjoy music recitals. A class of bards known as Vairiyar used to provide music in the public assemblies of the village. It is learnt that when the guardian tree of a hostile ruler was felled the **Vairiyar** used to sing songs in merriment. The bards used to sing in praise of kings in their palaces early in the morning. There were the ubiquitous panar, the roving musicians and dancers. The groups of Panar proceeded from place to place. Their womenfolk **Viraliar** also sang the glories of Kings and Chieftains. The Porunars were the bards who accompanied kings to battlefields in order to cheer up the soldiers by their war songs and music.

Porunar

The Porunar were well known for their resourcefulness ready wit and conspicuous skill in conversation also. Rich presents were given to the Porunar and their womenfolk by the Kings munificently. When the king or chieftain Won a victory, golden flowers were given to the Porunar and jewels and ornaments were presented to the Viraliar, Among the Porunar and Panar, though they belonged to the same class, the former were more esteemed and more gitted poets and musicians than the Panar, However the Panar themselves were men or notable skill in music and Ldance. The artistic performances of the Panar and their women were immensely relished by the common people too.

Usal vari

From time immemorial there was in vogue the practice of women singing lullabies in order to lull babies in the cradle' to sleep. This variety of song was known as "Usal Vari". The girls used to sing songs when they were swinging in the Unchal i.e, swings from branches of trees or other hangers Women pounding rice resorted to a particular variety of song during the ourse of their work was described as Vallaippattu, Kurava women are said to have sung songs in order to miti~ato the pain and agony of their husbands when they were writhin with pain.

Asunam

A bird known as Asunam, mentioned in Ahananuru and Narrinai (it is said to be an animal) is said to have had a remarkably sensitive ear for music was called the '**Isai Art Paravai Paravai**. The cc mmon belief was that those who

wanted trap the bird sang suitable songs in order to entice it. from the Aliananuru it is learnt that even wild animals were stunned -by' the spell of sweet 'music. The application –'Isai' given to music, is itself significant; it denotes that which- moves or meets. According to Parimelalagar tbe verses of Paripadal were attuned to music.

High Degree

Tamils claimed the highest degree of musical perfection though they were much indebted to folk music in the evolutionary stages. They excelled in soft melodies through the gamut that consisted of seven notes or svaras. They were known as kural, tuttam, Kaikkilai, Ulai, ili vilari and taram. These were identical with the swarams or symbols, sa, ri, ga,ma, pa, da and ni, Their Sanskrit equivalents are Shadjam, Rishabham, Gandaram, Madhimam, Panchamam, Daivatam, Nishadam respectively. The seven tones were divided into 22 quarter tones or rutis or matras. In Puram 152, Venbaranar mentions the twentyone'Musical Stages'. The commentator explains this as the twentyone stages obtained by playing the seven svaras at the three places viz Tharam, Madhiyamam , Uchcham, His alternative explanation is that number twenty one refers to the number of 21 strings on a yal.

Patumalai

Pan was raga or tune. Sevvali, Marudam, Palai etc. were 'Pans'; it was prescribed that Sevvali was appropriate to the afternoon" and Marudam to the dawn. There were seven kinds of palai, viz Cempalai, Padumalalppa lai, Cevvalippalai, Ammpalai, Kotippalai, Vilarippalai, Mercempalai that were in practie. But, K. Kothandapani Pillai in his rook Pazhan tamil' mentions that seven palais are entirely different from 'Palai Nurperum Pannum Elu Perum Palaiyum' of Perunkatai. It is for musicologists to think *it* over and decide whether all tunes were the sub-divisions or offshoots of main tune palai or not. It may be surmised that the term palai was used in a broad se n-,e ~ignifyillg seven different main tunes since some names Cevvali, Patumalai and Vilari are associated with the wow -patai' , In the- initial stages the-principal -runes or airs were four in number Palai, Kurinchl Marudam and Cevvali. When the knowledge of music developed there were many variations for each time based on emotions such as war, marriage or ceremony.

Musical Instruments

"Instrumental music has played a prominent part in the evolution of music of both the Orienl and the accident Man became very conscious of the fundametntal principles of musical science, through musical instruments. The rnonophonous voice was not much help to him in practically working out and understanding the various musical laws and phenomena" says Prof. P. Sambamurthy, tbe musicologist. Tamilagam of the Sangam age has evolved different kinds of musical instruments suitable for chamber music, open air music aod marital music. The musical instruments were termed in Tarnil works as Turiyam, Iyam and Kalam.

They were carefully preserved in covers called 'Kalap pais'. On the basis of note technique, the musical instruments may be clasified into two kinds, the monophonnus in-trurnents that can produce only one note at a time like the horn, and the polyphonous instruments that can produce rn vr e than one note at a tim- like the Yal, Generally the musical instrurnenre are classified into four kind, as follows. (1) Torkaruvi, (2) Tulaikkaruvi, (3) Narampukkaruvi and (4) Kanchakkaruvi.

The Tamils of different tinais or regions had their separate parais and musical instruments. Parai, the percussion instru- ment, and Yal, the stringed instrument denote the distinctive features of Tamils. They find place in the list of Karupporul as follows. Local festivals and Individual ceremonies offered ample scope apd O,pportunities for the musicians to have splendid display or their musical talents. However, music played an important part as a unifying force of different strata of society in many ways.

Torkaruvi or Percussion Instruments

Percussion instruments are generally based on the principles of talam or layarn or rhythm. They vary in size,structure, sound and manipulation. They are also differentiated according to the different occasions such as 'festival, marriage, worship etc. The names of percussion instruments found in the ancient Sangam works are as follows : Muracu or panai, mulavu, tannumal, kinai, tatari, patalai, parai, tattam, tontakam, Pampai tuti, akuli, paoripparai, manror sirnparai, mattari etc.

Morasu

Murasu was a big drum which had unique honour in royal "lnalaces. During village festivals also murasu was used. The urasu was considered an important feature of war, camp and he battlefield This gave encouraging sensation to soldiers in heir progressive expeditions. Generally-the murasu sign.fied be honour of kings and chieftains in T amilagarn. The unique place it had in royal palace is already mentioned. It's sound was compared with the rainfalls and the roar or he sea, and it was used as a simile for the sound of Waterfalls rid thunder bolt. There are references to the high pitched, odaimurasu for announcing chat ities. This drum was used, Dot only for the mass feeding of gallant soldiers but also for the poor people. In Paripada l the sound of manamurasu (marriage drum) produced at Madurai was like the roaring sound of the sea and that of lndras thunderbolt. Its echo was beard in Tirupparankuodram, the temple of Murugan.

Mulavu

Mulavu can be identified with the modern mattalarn in shape only. From Malaipadukadam and Ahananuru it is known

that a stick (mulavin ta laik k.rl or rnulaviu errkurnil) was used for playing on mulavu; this stick was helpful for 'travelling artists on slippery path. Mulavu might have been - played on one side of it With fingers and on the other side with . stick. The Mulavu appears to be a big 'Udakkai' or Pampai. played with' stick and hand in local temp- les. The identification of it with Mattalam appears to be improbable. Mulavu is. given a central and important place to draw the minor muslcaj , defects of other instruments. This is evident from Madurark- kanchi, When the devotees of Lord Muruga holding in their bands their offering to tne Deity, the choicest offering among them was Mulavu,

Tannumai

As regards Tannumai there is no clear definition or shape about it. The term Tanuumai was used by the Sangam Tamils, in different meanings. It is referred to in Padirruppattu as makkattannumai (Tannumai with black spot, i.e., the black substance (Man) applied on the face of it, In that context there is also reference or note that it was played on by hand (Kaiyalai aluka). According to the commentaries of Padirrup pattu tannumai is interpreted as murasarn in this contexts.' orppuratannumai arppelunto muvala'. In Narrinai it is noted as 'palavai tannum d' In Ahananuru and Kuruntogai it is mentioned that tannumai was used by the Vcttakkavalar of Vetar clan especially whilst lifting cattle. In Purananuru here is an imagery about the honey bees alarmed by the sound of this drum (tannumai) flyaway from their honey combs bamboo tree. From MulJaikkali we infer that tannumai was considered as a marriage drum during the Sanga m age There is a reference to 'pookkoleya tannumai' in Ahananuru, and Purananuru. They speak of this instrument played for gallant warriors to select the flowers or symbols suitable to the situations of warfare.

Kinai and Tatari

The Kinai and tatari are different kinds of drums that give the sound syllabus-'kin kin' and 'tata tata' respectively. Kinai is a double faced drum since the old commentary Oil Purananuru identifies this as Udukkai. The movement Kinai is compared with that of turtle. This was also play with both sticks and hands. A Ceylonese scholar S.Vidyananthan identifies this Kinai with tatari. There are al references to show that kioai and tatari are one and the sum It may be said that kinai, tatari and udukkai are synonyms.

Patalai

Patalai is identified with single faced large drum called! 'Orukan Makkinair, fhere are references to 'Orukan Makkinai'' and 'PlItatai Orukan' in Purananuru. The musical souad *or* patalai was belpful to note the time measure. So it was called 'Dotitaru paniya patalai' in Malaipadukadam. Mayilai Seeni Venkatasami suggests that the modern term ‘tabla' (tapalai) is only the word patalai suffering metathesis.

Tattai

Nachinarkkiniyar says that tattai is an instrument made of bamboos and adds that it is called Tattai since it resembles the clapping of hands. It was used to scare away the birds coming towards the corn fields. Tattai is identified with Karadikai having the sound of bear.

Tontakam

Tontakam is a small drum played by the people of the hilly tracts to scare away the birds coming to eat millet in the fields. Ahananuru speaks of a folkdance participated by both males and females to tbe musical accompaniment or tontakam in the hilly streets. The Tirumurukarruppadai describes kuravaikkuttu performed by drunken jungle people with their relatives to the musical beat of tontakam *Manror Siruparai* mentioned in Malaipadugadam may be identified with tontakam since the description are alike.

Akuli and ElIari

Akuli is described in Maduraikkanchi as 'Nunnirakuli' Malaipadukadam says that the sound of owls was just like the sound of Akuli. Ellari is also a small drum mentioned in Malaipadukadam, According to Nachinarkkiniyar it is called 'Calli' since it has the sound of - Cal', Purananuru speaks of ellari' in the sense of ‘Calli’.

Tudi or Udukkai

In Porunararrupp::tdai, the side of rudi when beaten is compared with the circular foot of an young elephant. Tudiyan was one who played on Tudi. Tudi was played when offerings were made to the deities like ‘nadukal'. Paripadal mentions the use of tudi during the dance perfor- mances. It was useful to give caution to the agriculturists against sudden floods. Tolkappiyam explains a situation Tudinilai,

Pampai

Narrinai mentions about Pampai a, kind of drum which IS still in use in village festivals. Makuli and Mattarai are mentioned in Paripadal,

Parai

The term parai was used in a broad sense in the Sangam period. Kalittogai mentions about the sound of parai as a caution for the people to guard themselves from the ruttish elephants coming along the streets. The ancient poets speak about a peculiar animal called a cunama which could not tolerate the harsh sound of parai.

TULAIKKARUVI OR WIND INSTRUMENTS

Wind instruments are considered by the scholars as the earliest musical instruments of Tamils. In these instrumens sound is produced by setting in vibration a column of air inside th'e tube-like middle part. They are either mouth

blown or bellows blown. The antiquity of the wind instruments is explained by Captain Day in his book" The Musical instruments of Southern India and eccan." The following are the wind instruments mentioned ill the 'Saogam works: Flute, conch, Neduvankiyam or tumpu and Horn or trumpet.

Flute

Flute is the most universally common wind instrument amongst all musical instruments. The commentary on Paripadal speaks of 'Pakarkular' as a keynote instrument. The standard tonic note was set by the flute according to 'which the Yal was tuned. Kalittogai speaks of flute as coni . rolling the musical timbre of 'Yal.' In Perumpauarruppadal and its commentary some points regarding the process of making a flute are mentioned. In Paripadal there is a reference to flutes with seven and five holes. Ba-roboo. ampal stem konrai fruit were used for making flutes, The musical sound produced by the shepherds and cowherds during the evening hours was considered inducing pathos in the minds of' sepa rated 'lovers is picturised in Kurinchippattu, In' Pattinappala there is a detailed-description ofYelan Veriyadal, a kind of dance in which mention is made of flute as being one of the musical instruments to that dance. There is ample' reason to believe that it is a divine musical instrument as it is associated with Lord Muruga in Tirumurukarruppadai.

Tumpu or Neduvankiyam

In the world of music instruments, flute and turnpu are interpreted as Vankiyam and Neduvankiyam by the commentators of the Sangam works. The Tumpu should also be a flute of larger size with sligbt difference. As the term tumpu is also meant for the trunk of an elephant, and the sound of the tumpu or the appearance of an elephant is noted as resembling elephants sighting it seems that tumpu might have been a vertically blown pipe .

Horn or Udu Kompu

It should have been made of animal horn, whereas might have been made of the cone of strong wood •

Valai

The Valai or conch was also another musical instrument used during the festivals and war times. The conch was regarded as a sacred instrument. Its blowing indicated specially a success in the battle field; it might be a precursor of the trumpet.

NARAMPUKKARUVI OR STRINGED INSTRUMENTS

Yal (Yazh) is considered the oldest Tarnil musical instrument which paved the way for the emergence of a number of stringed instruments-plucked, bowed and struck varieties, Regarding the origin of this instrument Prof. P. Sambamurthy says, “When the primitive man shot an arrow he heard the fascinating sound emanating from the string of the bow. The bow string or Vil Yazh is the earliest stringed instrument in the history of human culture.”

The TamiIs had for every Tinai special instruments Vil, Yal and Parai suited to these tinais. In this connection there were Kurunchi Yal, Mnllai Yal, Marudbam Yal, Neydal Yal and Palai Yal. In Paripadal the term -Kuttam' is used for Yal in general. Four of the Pattuppattu works, Porunararruppadai, Sirupanarruppadai, Perumpanarruppadai and Ma la ipadukadam or Kootharar ruppadai have fine descriptions of Yal (Yazh). While describing, the shape and other observation of things and imagination. In the midst of differences of opinion regarding the real shape of the 'Yal' Swami Vipulanandar has thrown some light on this in his -Yalnul', ,

In Porunararruppadai there is a hyperbole that even the highway robbers of desert region are renouncing their robbery when they hear the charming music of the Palaiyal. Kalittogai has got a reference to point out that even wild elephant was brought under control by the music of YaL In Narrinai tltil sound of Yal is used as a simile for the sweet voice of Kuruku, (a kind of bird). The comparison that the sweet voice of a woman is like the music of Yal indicates that the Yal should have been very popular musical instrument among the highly. artistic minded people. The Panars were called Yalppanar.

KANCHAKKARUVI OR BELL METAL INSTRUMENTS

In the Sangam age, tala or rhythm held an important place in music -Iogy. In the opening stanza of Malaipadu kadarn there is a list of various musical instruments that were used by ancient musicians. In that list, there are two kinds of Cymbals, viz Pantil, and ElIari mentioned vividly. Pantil was made of well melted bronze and was circular in shape as to produce a ringing sound. While describing elari, the large cymbal, Per un Kaucikanar author of Ma1aipadukadam uses the attributed attributive words (that which is being bright and loud) signifying subtly the features of Cymbals i.e. sound and shining. In. Ahananuru, the cymbal 'is-mentioned. The large cymbal was made of gold. Though it is mentioned here so gold should be taken -a ,broad .rerm for-metals in general, since it is not possible to get the ringing or musical sound from genuine gold.

Bells

.Tbe sound of bells also was required as one of the musical accompaniments for the dance performances for the dance performances. In Ahananuru the dancer Attanatti has been described as wearing a belt of small bells around his hip in order to have the musical sound keeping time measure with his dance. In Kuruntogai it is described that the musical sound produced from the small bright bells was like the Vilarippan. In Purananuru it is mentioned that -Iraimanl' was

during the sentimental offerings to the deity in the hope of healing a hero's wounds and scaring way the ghosts. God Muruga is described as bolding a bell in one of his twelve hands in Tirumurukarruppadai,

Musicians

In the Sangam age musicians of high repute were patronised and gifts were given to them by Kings and other affluent persons. Lotus flowers made of gold as well as flowers knitted together with a silver string were presented to them. Occasionally lands and entire villages; too, were bestowed on them as gifts. Among the rulers of Tamilagam Pari, Nalankilli, 'Palai Padia Perunkadungo and the Pandian Nambi were some of the well known patrons of poets and musicians.

DANCE

Dancing was. developed with great enthusiasm during the Sangarn age. It attained a high degree of excellence in the peried of tbe post Sangam. The kings and Chieftains patronised "-dancing no less than music. Verses sung in praise of Kopperuncholan and Pari testify to this. The poet, Uraiyur Mudukannan Sattanar adverts to tbe patronage of dance by Nalam Killi.

Dancing was known by several names like 'Attam', 'Koothu; and Kunippu', Tolkappiyam shows' that dancing was resorted to by all classes of people. Tolkappiyam mentions Vallikkoothu and Kalanilaikkoothu. Vallikkoothu was the representation of the supposed dance of Valli the consort of Lord Muruga. The second one was held in honour of those soldiers who firmly stuck to their posts, relentlessly fighting the enemy even after many of their compatriots had retrated. Another pattern of dance is described in the section on the Puratrinai Iyalof Tolkappiyam. It was dance held by the fellow kings in honour of a ruler who was killed in the battle. The references to ritual dance was found in Kuruntogai and Maduraikkanchi, There is an interesting dance description in Kuruntogai held' in honour of Murugan.

Dance could be performed by men as well as women. Adi Mandi, the daughter of Karikalan's husband Attan Athi was a dancer. Madurai Tamila Kuttanar was a dancer from Madurai who bad specialised in the kind of dance peculiar to Tamilagam. A koothan or a porunan was a male dancer or actor and a Kootti, a femall dancer. The male dancer was called attan, the dance was attam and the stage aderkalarn. Anion the Sangam works, the Malaipadukadam and Porunararruppadai in particular describe the skill of these professional dancers.

Kuravai and Tunangai were group dances. The Kuravai though common *in* the Marudam region was also adopted the Kurinchi and Mullai. A ferocious type of Kuravai was the Verikkuravai, commonly resorted to by Kuravar when in a wild temper. This dance was common among the kurava soldiers. Adorning themselves with palmyra garlands these Kurava used to do dance in a frency. Tunangai generally to place in the open theatre of the village. In was a dance which men women participated. The women used to embraced each other in the course of the dance.

Apart from this associated with the battlefield there another type of' Tunangai ' when the victory was won, the or the leader of the triumphant army used to lead this dance in the midst of the corpses lying all around. On festive occasion groups of women performed the Tunangai dance. The Malaipadukadam shows that there was dancing at festivals and that, at other times, too, hillmen and their wives danced in order to amuse themselves. Kalittogai describes the attention devoted to pose and facial expression during dance.

How far the Tamilian technique of dance was influenced by the North Indian pattern has become a matter of controversy. "Whether the Tamil system of dance was indebted to. Bharatha or not one thing is clear, that is, that Bharata himself acknowledges the highly developed nature of South Indian music and dance."

"Chitra Dakshina Vrtte tu saptarupe prakirtita Sopohane sanirgite devastutyabhinandite Naradadyais tu gandharvaih sabhayam Devadanavah

Nirgitam sravitah samyag Iayatalasemanitam". (Natyasastra, v.31-2)

"Now when songs in seven forms and in Chitra and Dakshina Margas together with the Upohana and Nirgita were started by musical experts like Narada in praise of Gods, all the Gods and Danavas in the assembly were made to hear the Nirgita performed with proper tempo and time beat." The above, translation is given by Manmohan Ghosh(Bib. Indi, 1951, p. 81). This shows that the Dakshina Marga of the southern pattern of music had attained a high position when Bharata wrote his work. There is another reference in chapter XIV of Bharatha's Natya Sastra shows that the South Indian dance too bad attained high measure of development.

The host of pure Tamil terms occurring in the early literature of the Tamils indicates the indigenous origin and development of music, dance and other fine arts. Such are words like Isai, Koothu, Tunangai, Kuravai, TalaikkoI, Porunan, Yal,' Pan, Kannul, Ulai, Ili and Oviyam. During the post Sa ngam period due to Aryan influence there seems to have occurred a combination of Sou rh with North. The division of 'Ariyakkootu' (Northern Dance) and 'TamiI Koothu' (Southern Dance) is an indication of the distinction between the exotic and indigenous form. In certain cases the Tarnil patterns seem to bave been adopted by the Northern system and Sanskrit names. Ahakkoothu and Purakkoothu became "Nritya" and Nritta' in the aspects of Bharatha dance. These varieties of dance mentioned in Silappadikararn might have developed from certain types of Sangam age. It is agreeable to accept that basically the dance was that of the Tamils but it seems to have had some influence in details at the hands of the Arvan settlers.

DRAMA

Reference to Natakam are found in the Tolkappiyam and other early works. 'Nataka Valakkilum, Ulakiyal Valakkilum' (Tol. Porul, 53) Though the interpretation in' this contex had varied with writers, it seems to denote drama.

The Maduraikkanchi states that dramas were enacted night during festive occasions. It is unfortunate that no early dramatic composition has survived barring no doubt the Silampu which is as much a work of drama as of literature. Even with regard to Silappadikararn a scholar Madurai University Tamil Department points out that Silappadikararn was only a Therukkoothu or street drama. The various aspects like Kattiyankaran etc made him to come to the above conclusion.

The section of the Tolkappiyam which is immediately striking as concerns the dramatic arts is the meypattiyal. Even though it appears that nurpa 251 which enumerates eight *meypadukal* would seem to contain the most relevant information in this section, nurpa 249 is of vital importance this discussion here in that it gives us Tolkappiyar's idea of how these meypattu originates Nurpa 251 of this same section of the Tolkappiyam is giving us a list of the **meypadukal** makes the level of development of dramatic performances during the Sangarn period. '

“Nakaiye alukai I1ivaral marutkai accam perumitam Vekuli uvakaiyenru appal ettam meypadenba".

(They say laughter, weeping. desnisedness, wonder. Rear fortitude, anger and delight are the eight meipadukal)

Richard A. Frasca says that the primary importance of this nurpa is that it indicates the sophistication of the Tamils' concept of the theatre during this period. The fact that they nalysed and classified these varied emotional manifestations is ample proof that dramatic performance had a very important place in this society. The eight meypadukal clearly had to be the central concept around which ancient Dravidian theatrical traditions developed.

Professor George L. Hart of the U.S.A. in his detailed study of Sangam literature has given a discussion of the various performers of this ancient period but has certainly missed the point in describing them only as poets or musician). Many of the Sangarn poems are 'dramatic utterances'. The dancing girls were called ‘nataka makalir’ and the performance conducted by them was spoken of as Natakam, Drama was definitely an important aspect of the Sangtrn culture. But Tolkappiyam does not specifically mention Koothu or Nada , Kam in its list of compositions (Yappu), Prof. V. R. R. Dikshitar in his valuable translation with notes of the Silappadikaram makes a direct equivalence between the pattu of the Aham and Puram and drama.

PAINTING

Painting was known by the pure Tarnil word 'Oviyam'. the class of painters was called "Oviyar ' or "Oviya Makkal. painters were also described by the significant expression .Kannul Vinainar, Nachinarkkiniyar explains this term by stating that skillful painters had the gift of captivating the onlooks by their art.

It is learnt from Maduraikkanchi that figures of god as well as scences of Nature were painted-on walls as well as on Canvas, Tamil works like the Paripadal reveal that there existed some treatises on painting. Nedunalvadai calls the outline drawing : which was not painted as Punaiya Oviyam. The pictures on the walls of the temple at Kavirippumpattina are referred in the Pattinappalai. Palai Padia Perunkadunko stated to have compared the brush employed for painting with a kind of soft flower called' Padiri' in Narrinai.

The reference to the Pandyan King**, 'Chittira Madattuttunjiya Seranmaran'** indicates that the royal palace had a hall or a picture galIery containing art exhibits. The temple of Lord Murugan on the hill of Tirupparankundram contain painted pictures on the walls. We learn from the Madurail kanchi about the existence. of painting probably on the wall of Jain monasteries in Madurai, It is learnt that the canopi of the royal cot on which the Pandyan ...ing Nedunchelia usedto sleep as welI as the walls and- ceilings of the room halS~, drawings of astronomical drawings representing the positiel of planets. We are not able to get any archaeological evidences old painting to estimate the quality of paintings. The litera references, however tend to show that paintings of high m ..were found. The poet andarattanar compares a handso damsel to the painting of a girl executed by a skillful painte As far as the available information goes the sculpture the early Tamils does not seem to have attained high stag development.

CONCLUSION:

The age of the sangam in the extreme South India was one of cultural transformation. At the turn of the first century B.C. South India moved from pre-historic period. That South India was absorbed into the cultural development of the sub-continent, which was taking place at the time. Thus the sangam age constituted a glorious era in the history of South India.

THIRUKURAL - TANAVARNAMS

DR. J. SANKAR GANESH
Assistant Professor, Department of Performing Arts, S .V. University Tirupati

Abstract: *Thirukural is composed by Thiruvalluvar and considered as one of the greatest works ever written on ethics and morality, it is widely acknowledged for its universality and secular nature, called as "Ulagapothu marai"(Common veda for the world) in Tamil. Tānavarṇam is one of the most important musical forms belong to modern period of carnatic music. It is the first item figured in traditional music recitals. Varṇams cultured the voice and make it perfectly fit for performances. Varṇams are like a bridge between abhyāsa gāna and sabha gāna. All of the nuances and essential features of the rāga is imbibed in a Varṇa. The idea of rendering Thirukural as the first item of a carnatic concert aroused in the mind of Sri V.S. Gomathisankara Iyer who was working as a Professor in veena in the Department of music and also involved in the assignment of collecting rare Tamil compositions for the Annamalai University music series publications. This idea of using Thirukural as a carnatic music composition was inculcated into Iyer by the great Tamil Scholar Dr.Mu.Varadharajanar. 11 Thirukural varna-s tuned in raga Todi and its janya-s published in a book entitled " Tanavarna Kadal vol.1 published and authored by Prof. V.S. Gomathisankara Iyer. This paper intended to highlight the various aspects of Thirukural Varna-s.*

Key words: *Tanavarnam, Thirukural Varnam, Sahithya bhava, Vowel extensions*

INTRODUCTION

Thirukural is composed by Thiruvalluvar and considered as one of the greatest works ever written on ethics and morality, it is widely acknowledged for its universality and secular nature, called as "Ulagapothu marai"(Common veda for the world) in Tamil. The text of Thirukural consists of 1,330 short couplets, or kurals, of seven words each. Ten kurals written under one Athikaram and there are 133 Athikarams are in Thirukural. This work is divided into 3 main sections which are named as 'Arathupal,(Virtue) Porutpal, (Wealth) and kamathupal (Love). Content of Thirukural is considered as more literary than musical. In recent times Thirukural is tuned and used as songs for various musical and dance performances. Thirukural was the only non religious work which has been translated into about 41 world languages. Thirukural translated in Gujarati language on 16th January 2015 by our Prime minister Sri Narendra Modi ji

TANA VARNAMS

Tānavarṇam is one of the most important musical forms belong to modern period of carnatic music. It is the first item figured in traditional music recitals. Varṇams cultured the voice and make it perfectly fit for performances. Varṇams are like a bridge between abhyāsa gāna and sabha gāna. All of the nuances and essential features of the rāga is imbibed in a Varṇa. This is considered to be the most complex item for vocal exercises. Varnams played a vital role in providing rhythm control. Practising Varṇa in second and third speed is helpful to gain control on rhythm and tempo. Swara phrases of various lengths and range is the main identity of Tānvarṇam hence it is melodic oriented. Tānavarṇam has two major segments i.e Purvangam and Uttarangam. Purvangam comprises of pallavi, anupallavi and mukthāyiswaram, and uttarāngam comprises with caraṇam and caraṇa swara-s. Sāhityam (text) is simple and less in Varṇa and it has plenty of vowel extensions. It has at least three or more Caraṇa swara-s. Pallavi, anupallavi and Caraṇa of Varṇam has Sahitya (text) and chittaswara/ mukthāyiswara and Caraṇaswara have no lyrics. Tāna Varṇams are normally composed in Ādi tāla and kandajāti Ata tāla.

The idea of rendering Thirukural as the first item of a carnatic concert aroused in the mind of Sri V.S. Gomathisankara Iyer who was working as a Professor in veena in the Department of music and also involved in the assignment of collecting rare Tamil compositions for the Annamalai University music series (Isai Kovai) publications. This idea of using Thirukural as a carnatic music composition was inculcated into Iyer by the great Tamil Scholar Mu.Varadharajanar.

PROF. GOMATHISANKARA IYER: THE MUSIC COMPOSER

Prof. Gomathisankara Iyer was born on August 21st 1908. His father Vasudevanallur Subbiah Bhagavathar (popularly known as "Pallavi" Subbiah Bhagavatar) was a well accomplished musician and Primary disciple of Sri Mahavaidyanatha Iyer . Gomathisankara Iyer initially trained in vocal music under his father's guidance. He later switched to veena and underwent advanced training under Karaikudi Subburama Iyer (the elder of the Karaikudi brothers) with whom he stayed for a period of 3 years. In 1931, only 23 years old, the young Gomathisankara Iyer joined Annamalai University as a veena teacher. Gomathisankara Iyer was associated with Annamalai University for the next 48 years until his retirement in 1979, as the Head of the Department of Music. In 1980, he moved to Madurai Kamaraj University with a UGC fellowship and retired from the University in 1983.

COMPOSING TUNE TO THIRUKURAL AS VARNAM

In general, Varnam is a 'Dhatu Prathana'(melody oriented) composition and lyrics/text are having less importance, vowel extensions in lyrics is commonly seen. Thirukural is not much suit for a musical composition like varnam because of its high literary value, especially the vowel extensions, the brand identity of Varnams, may obliterate the meaning of the text, however some kurals are carefully examined and identified by V.S.G. Iyer and he set tune for that kural-s in Varnam format. Mr.Iyer select two kurals from the same Athikaram of same concept and set it as purvanga of a Varnam and because of the requirement of short lyrics requirement for the charana, Mr. Iyer himself composed a single line text on par with the meaning of the selected kural-s for charanam.

Sri V.S. Gomathisankara Iyer published a book consists of 60 varnams in the name Thanavarna kadal vol.1 in December 1973 in which he has published around 11 following Tirukural varna-s. Mr.Iyer, mentioned in his book that the text is by Thiruvalluvar and only music set by him. During 1973, Annamalai University was very much involved in propagating Tamil Pann-s and Tamil Music. The idea of propagating Thirukural through Varnam musical form was very much received and appreciated.

SN	Starting word of the Varnam	Raga	Tala	Numbers of Thirukural-s used
1	Anbirkum Undo Adaikkum Thaazh	Todi	Adi	71 & 72
2	Irunthombi il Vazhvathellam	Dhanyasi	Adi	81 & 83
3	Ezhu Pirappum Theeyavai	Hindolam	Adi	62 & 66
4	Aravaazhi Anthanan	Asaveri	Adi	8 & 10
5	Nanri Marappathu	Suddha Dhanyasi	Adi	108 & 110
6	Serivarinthu seermai	Punnagavarali	Adi	123 & 126

7	Vaanninru ulagam	Revagupti	Adi	11 & 13
8	Arulilarku	Jayanthasri	Adi	247 & 249
9	Sirappu eenum Selvamum	Suddhaseemanthini	Adi	31 & 39
10	Naduvinri nanporul	Nagavarali	Adi	171 & 172
11	Purankuri Poithuyir	Ghanta	Adi	183 & 185

Around 22 Thirukural-s are tuned as Tanavarna-s in the 1st volume. All the 11 Varna-s are set to Adi tala . Among 1330 Thirukural-s, 22 Thirukural-s are very carefully selected for the above mentioned 11 varna-s as the tune didn't disturb or split the text, meaning and Thirukural's structure.

MUSICAL APPRECIATION

In general Varnam-s are taught to increase the knowledge of the student in rhythm, swara , and raga aspects of music. Rare raga-s like Suddhaseemanthini , Nagavarali, Revagupti, Ghanta, etc are used to compose Thirukural Varna-s. This shows the composer's interest in propagating Thirukural varnam-s among music society.

The first varnam is composed in Raga Todi which comprises 2 Thirukurals from the 7th athikaram 'Anbudaimai'(Loving- kindness)

"Anbirkum Undo adaikkumthaal Aarvalar
Punkanneer pusal tharum"

(What bolt can bar true love in fact the tricking tears reveal the heart.)

Todi is the 8th Melakartha raga which is very much suitable for the meaning of Thirukural-s selected. The core rasa of this raga is Karuna rasa as it is very much suits for the kural-s advocating the importance of Love and Kindness.

Thirukural is of 7 words in which the first line consists of four words and 3 words are in the second line. Thirukural is filled very much with meaning full text and it is really challenging to set tune for the lyrics without disturbing its structure. Adi tala is having 32 pulses per avartam. It is easy to distribute 4 words to 32 pulses but it is a bit difficult to distribute 3 words to 32 pulses by using vowel extensions without disturbing the meaning of the sentences. In the Thodi raga varna this problem is brilliantly handled by Prof. V.S. Gomathisankara Iyer

Raga – Thodi

Tala – Adi

Composer : Thiruvalluvar and tuned as varna by Prof. V. S. Gomathisankara Iyer

Pun - -	--kan	- - - -	nee- r	poo---	sal ---	tha--ru	m- - -

It is beautifully tuned in a manner that it is not disturbing the sentences and meaning but also have vowel extensions.

Next Thirukural is also selected from the same Athikaram for tuning as anupallavi

X	1	2	3	X	√	X	√
d , n ,	ṡ , , ,	d n ṡ ṙ	ġ ṙ ṡ ,	n ġ ṙ ṡ	n d ṡ n	, d p m	g m d n

CONCLUSION

In the book Tanavarna kadal vol.1 consists of 60 varnams and all the varnams are selected for compilation is in raga Todi and its janya-s. Thirukural varnam-s is a genius idea to propagate Thirukural through carnatic music. Unfortunately these varnams are not popularly performed by Carnatic musicians on stages now. Muthamizh included Literature, Music, and Drama. Thirukural is very popular among the Tamil community as a piece of Literature. It is not reached much to the

audience in the form of Tanavarna as much as the literature reached. However the effort of tune it in Tanavarna style is an appreciable innovative idea. The flow of Tamil Varnams, during 1970s into the music arena by various composers like Koteeswara Iyer, L.R. Neelamegam pillai, T.V. Lakshmi Narasimhan, K. Ponniah Pillai, Kunnakudi Venkatarama Iyer, Varahoor K. Muthukumaraswamy, Pathamadai Krishna Iyer, C.S. Natarajasundaram pillai, Nerur Srinivasachariar , V.S. Gomathisankara Iyer, etc…may be the another reason for the desertion from carnatic music stages of these Thirukural Varnams.

ఎస్.వి. విశ్వవిద్యాలయం, తిరుపతి.

పరిచయం :

దక్షిణ భారతదేశ చరిత్రలో ముగ్గురు వాగ్గేయకారులు, శ్రీ త్యాగరాజస్వామి వారు, శ్రీ శ్యామశాస్త్రివారు, శ్రీ ముత్తు స్వామి దీక్షితులు. వీరు ముప్పురూ కర్ణాటక "సంగీత రత్నత్రయం"గా వెలుగొందడమే గాక వీరి రచనల ద్వారా కర్ణాటక సంగీతము ఒక మహోత్కృష్టమైన, మహోన్నతమైన స్థానాన్ని అధిరోహించింది. అందుచేతనే '18' వ శతాబ్దం కర్ణాటక సంగీత "స్వర్ణయుగంగా" చెప్పబడుచున్నది.

Key Words (ముఖ్యాంశాలు) : Performing Arts, Music, Contribution life sketch.

వివరణ :

త్రిమూర్తులలో ముఖ్యంగా శ్రీ త్యాగరాజస్వామి వారు ప్రథమ స్థానాన్ని అధిరోహించడానికి వీరి రచనలు అని చెప్పవచ్చు వీరి రచనలు అన్నీ కూడా "పండిత పామర" రంజకంగా ఉండటమేగాక వీరి రచనాశైలి 'ద్రాక్షపాకంగా' ఉండటం ఒక విశేషము.

త్యాగరాజ స్వామి వారు అనేక రకాలైనటువంటి రచనలను మనకు అందించారు. వీటిలో దివ్యనామ సంకీర్తనలు, ఉత్సవ సాంప్రదాయ కీర్తలను, జోలపాటలు, లాలి పాటలు, గేయనాటకాలు, మేలుకొలుపు పాటలు, పంచరత్నాలు ఇలా అనేకం.

సంగీత సేవ :

ఇక రాగాల పరంగా చూచినట్లయితే స్వామి వారు "200" రాగాలు వరకు ఉపయోగించి రచనలు చేసినట్లు తెలుస్తున్నది. ప్రసిద్ధి చెందిన రాగాలు.

ఉదాహరణకు :

శంకరాభరణం, కళ్యాణి, కాంభోజి వంటి రక్తిరాగాలలోనేకాక, జన్యరాగాలైన మోహన, సావేరి, హంసధ్వని రాగాలలోను, అలాగే 'నాట' లాంటి వివాది రాగాలలోను అనేక రచనలు చేసారు.

అపూర్వ రాగాల గురించి వివరణ:

కర్ణాటక సంగీతంలో మొట్ట మొదటి సారిగా ఈ "అపూర్వరాగాలు" అందించినటువంటి ఘనత త్యాగరాజ స్వామి వారిదే. ఈ అపూర్వరాగాలు వీరి ద్వారానే ప్రచారంలోకి రావటం జరిగింది.

ముఖ్యంగా వీరు చేసిన అపూర్వ రాగ కృతులు ఎంతో అపురూపమైనటువంటి రచనలుగా చెప్పవచ్చు. '80' అపూర్వ రాగాలలో రాగనామాన్ని, సాహిత్యాన్ని అందించటమే కాక కృతి పల్లవిలోనే ఆ రాగ ఆరోహణ, అవరోహణని, రాగ పరిచయాన్ని ఒక్క సాహిత్య పాదంలోనే పొందుపరచటం స్వామి వారి ఘనతని చెప్పవచ్చు. ఈ 80 అపూర్వ రాగాలలో ఒక రాగంలో ఒక కృతి ఉన్నటువంటి రచనలు '60' రాగాల వరకు ఉండటం విశేషం.

ఏక రాగ కృతి – కొన్ని అపూర్వ రాగాలు :

రాగము	కృతి	తాళము
1. అమృతవాహిని	శ్రీరామ పాదము	ఆది
2. ఆందోళిక	రాగసుధారస	ఆది
3. బిందుమాలిని	ఎంతముద్ద	ఆది
4. చాయానాట	ఇదినమయము రా	ఆది

BHAVAVEENA

Contribution of women composers to South Indian Music

- Dr T. Girija Seshamamba *

Abstract :

Womens' Contributions through the centuries to South Indian Classical will be acknowledged and honoured. Many women composed many compositions in Telugu, Tamil and in Kannada towards south Indian music. Introducing such women composers and highlighting their contributions towards south Indian music, is the intention of presentation of this article.

Introduction:

In the God's creation creature of human is very miracle. Among human men and women are travelling putting hand in hand. Very latest, we found the vital role playing in all the fields by women. There are more opportunities today and women are overcoming inhibitions in every sphere of work. The same way women role in music also increased drastically. Undoubtedly the future of the music industry is going to fill with female singers and / or composers.

Women today are slowly but steadily being given their place no matter what field they are in and are being taken seriously. At this juncture, we are beginning to see female **composers** in the Indian music industry as well. As they are given their contributions irrespective of their gender, allowing their work to speak for themselves, female music creators are entering this erstwhile male dominated industry. We can find numerous female composers from the 1st century of sangam period from the southern states. Most of women from the 1st century CE Sangam period to the present day, there have been numerous female composers from the southern-most states.

Women Composers of South Indian Music:

1. Andal:

Andal is also known as Kothai, Nachiyar and Godadevi, was the any female Alwar among the twelve Hindu poet saints of south India. She was affiliated with the Sri Vaishnava tradition of Hinduism. Active in the 8th century Andalis created with two great Tamil works, "Tiruppavai and Nachiyar Tirumalai, which are still recited by devotees during the winter festival season of margali. Andal is a prominent figure for women in south India and has inspired several womens groups as Goda Mandali.

Academic Consultant, Dept. of Performing Arts, S.V. University, Tirupati. Mobile: 9492861661. Email Id: girijaseshamamba@gmail.com

Tiruppavai : Andal's first work is the 'TIRUPPAVAI' a collection of 30 verses in v Andal imagines herself to be a gopika, one of the cowherd girls known for unconditionaldevotion to Krishna. In these verses she describes the yearning to serve V and achieve happiness. Tiruppavai is the nector of Vedas and teaches philosophical va moral values, ethical values and the ultimate goal of life.

Nachiayar Tirumalai : The second work by Andal is the 'NACHIAR TIRUMA a poem of 143 verses. This is a classical Tamil poetic conventions and interspersing s from the Vedas and puranas.

2. Karaikkal Ammayiar :

Karaikkal Ammaiyar is one of the three women amongst the 63 nayanmars and c the gratest figures of early ?Tamil literature. She was born in Karaikkal, South India. Amm was a great devotee of Lord Siva, Karaikkal Ammaiyar produced 2 works Arputha Tiruva and Tirugattaimani malai.

3. Helavanakatte Giriyamma :

She was born in Rane bennoour. In kannada Dasa sahitya she was a first womı poser. She wrote many literatures in kannalda. She wrote 'CHITRAPATA R NAYANAM' IS ONE OF THE FORMOST LITERARY WORKS IN Kannada. She more than 40 songs in kannada language. Most of her literary works "Ankita Helavanakatte Ranga". She worte 5 narrative poems, all these poems are composed on her daily routines. Thebest known among which is the devotional 'CHANDRAHASANA KATHE".

. Akka Mahadevi :

Akka Mahadevi, a renowned poet. Saint from Karnataka. Shelives in 12th ce er 430 extant vachana poems and the two short writings called mantrogopya gangatrividhi are considered her most notable contribution to kannada literature. She an inspirational women in kannada literature and in the history of Karnataka. She u ne Chenna Mallikarjuna to refer to the Lord Shiva. Based on the use of her ankita lyric poems or vachanas are attributed to Akka Mahadevi.

Akka Mahadevi's works, like those of many other female bhakti poetstouch on enation, bothy from the material world and from social expectations and moves con en.

5. Tallapaka Tirumalamma :

Tallapaka Timmakka or Tirumalammma was a 15th century telugu poet. She worte 'SHUBADRA KALYANAM' in telugu. Timmakka was considered as the first telugu woman composer. Timmakka's main work, subhadra kalyanam with 1170 poems, is about the marraiage of Arjuna and Subhadra.

6. Molla :

Atukuri Molla (1440-1530) was a telugu poet who authored in telugu language 'RAMAYANA'. Molla is the second telugu poet of note after Tallapaka Timmakka. Her work is known as 'MOLLA RAMAYANAM' and is still one of the simplest of many Ramayanas written in Telugu.

Conclusion :

All above women are composers in Telugu, Tamil and Kannada literature. With the remarkable compositions of all these great women composers our South Indian Music and literature reached heights in the literature field.

వ్యాససంగ్రహం:

తెలుగు సాహిత్యచరిత్రలో అనేకమంది వాగ్గేయకారులు వివిధ రకాలైన సాహిత్య రచనలను మనకు అందించారు. సంగీతం, సాహిత్యం, భక్తి మూడింటిని మేళవించి భగవదర్పితంగా రచనలు చేసి కృతకృత్యులైన మహోన్నతులు తెలుగు సారస్వతప్రపంచంలో ఎందరో వాగ్గేయకారులున్నారు. ముఖ్యంగా పదకవితా పితామహుడు, వాగ్గేయకారుడైన అన్నమయ్య భక్తి, శృంగారం, వైరాగ్యం, వేదాంతసంబంధవిషయాలు, రామాయణ భారతేతిహాస పూర్వకమైన అంశాలను తన రచనలలో పొందుపరచి, వీరికి ముందు లేనటువంటి సాహిత్య రీతులను వీరి రచనల ద్వారా అందించడం ఒక విశేషంగా చెప్పవచ్చు. అన్నమాచార్య సంకీర్తనలలో రామాయణ, భారతేతివృత్తాలు ఏవిధంగా ఉన్నాయనే విషయాన్ని పరిశీలించి, విశ్లేషించడం అందించడం ఈ పరిశోధనావ్యాసం ముఖ్య ఉద్దేశ్యం. ముఖ్యగ్రంథాల ద్వారా, వివిధలక్షణగ్రంథాల ద్వారా అంతర్జాలంలో లభించిన ప్రామాణికవిషయాల ద్వారా ఈ వ్యాసం రూపుదిద్దుకుంది. అన్నమాచార్య రచనాప్రాభవాన్ని అర్థంచేసుకోవడానికి ఒక ముఖ్యసాధనంగా ఈ వ్యాసం ఉపయోగపడుతుంది.

Keywords: సాహిత్యము, సంకీర్తనలు, రామాయణము, భారతము, జీవితచరిత్ర.

1.ఉపోద్ఘాతం:

అన్నమయ్య వేదవిజ్ఞానం, శాస్త్రవైదుష్యం, పౌరాణిక జ్ఞానం అనంతం. సంకీర్తనా రచనా నైపుణ్యం అనుపమానం. చూసే చూపునుబట్టి అన్నమయ్య సంకీర్తనలు మనకు సమాచారాన్ని అందిస్తాయి. అన్నమయ్య ప్రతిభ అమోఘం కావడంలో ఆయనకు సమస్తవిషయాలు కరతలామాలకాలై సంకీర్తనల్లో ఒదిగిపోయాయి. అన్నయమ్య సంకీర్తనలు ఐతిహాసకులకు ఇతిహాసాలుగా స్ఫురిస్తాయి. రామాయణ, భారతాలు మన ఇతిహాసాలు. వాస్తవసంఘటనలకు అక్షరరూపమే ఇతిహాసం. అన్నమయ్య సంకీర్తనల్లో ప్రతిబింబించిన రామాయణ, మహాభారతాలకు సంబంధించిన అంశాల్లోని విశిష్టతను, తాత్వికతను అధ్యయనం చేయడం ఇటు సాహిత్యకులకు, సంగీతజ్ఞులకు ఎంతగానో ఉపయోగకరం.

2. రామాయణ, భారత ఇతివృత్త కీర్తనలు:

రామాయణము, మహాభారతం ఏవిధంగా చెప్పబడినాయో వివరిస్తూ అన్నమాచార్యుల వారు రచించిన ఒక కీర్తన ఈ విధంగా సాగింది.

2.1 రాగం - చారుకేసి; తాళం - ఆది

పల్లవి:

పేరు నారాయణుడవు బెంబాడి చేతలు నీవి

నోరు మూసుకున్న బోదు నున్నవి నీ సుద్దులు ॥

చరణం:

వేసులు మాకు జెప్పి విన భారతముగాగ

మోస నీపాల ముచ్చమి మొదలుగాను

రంతుల వాల్మీకి చెప్పి రామాయణముగాను

చెప్పి రామాయణముగాను

సంతగా తాటకాదుల జంపినడెల్లా (అధ్యాత్మ సంకీర్తనలు - సంపుటం 2)

మహాభారత కథాంశాన్ని, రామావతారంలో రాముడు ప్రదర్శించిన లీలలను, తాటకాదులను చంపిన విధానాన్ని అన్నమాచార్యులవారు ఈ కీర్తనలో వివరించారు. [6]

3. రామాయణసంకీర్తనలు:

అన్నమయ్య రామాయణ సంబంధిత సంకీర్తనలు ఎన్నింటిలో రచించారు. ఒక సంకీర్తనలో రాముని గుణగణాలను రామునిబాణ ప్రాశస్తి, కొన్ని సంకీర్తనలలో ఆంజనేయుని ప్రస్తావన ఇలా రచనలు చేసారు.[7]

రామకథనంతటిని ఒకే ఒక్క సంకీర్తనలో వివరించారు అన్నమయ్య.

3.1 రాగం - శుద్ధసావేరి; తాళం - ఆది

పల్లవి:

రాముడిదే లోకాభిరాముడితడు

గోమున పరశురామకోపమార్చె

చరణం(1):

యీతడే తాటకి జంపె యీపిన్నవాడా

ఆతల సుబాహు గొట్టి యజ్ఞము గాచె

చేతనే యీ కొమారుడా శివునివిల్లు విరిచె

సీతమ్మ బెండ్లాడె చెప్ప గొత్త కదవె ॥

చరణం(2):

మన కౌసల్య కొడుకా మాయామృగము నేసె

దనుజుల విరాధుని తానె చెరిచె

తనుమాడె నేడుదాళ్ళు తోడనే వాలి నడచె

చరణం(3): రావణు జంపి సీత మరల దెచ్చెను... (అధ్యాత్మ సంకీర్తనలు-సంపుటి 3)

శ్రీరాముడు అయోధ్యనాధుడైన దశరధుని పుత్రుడు. విశ్వామిత్రుని కోరిక మేరకు రామ లక్ష్మణులని యాగ సంరక్షణార్థం దశరథుడు పంపించాడు. విశ్వామిత్రుని సూచన మేరకు రామ లక్ష్మణులు మారీచ సుబాహులని సంహరించారు. ఆ తరువాత తాటకిని సంహరించాడు. శివుని విల్లు విరిచి సీతను పెండ్లాడినాడు. తరువాత వనవాసంలో మాయామృగాన్ని కొట్టినాడు. విరాధుడనే రాక్షసుని బాణంతో కొట్టి శాపవిమోచనం కలిగించాడు. (విరాధుడు పూర్వజన్మలో తుంబురుడు. కుబేరుని శాపంవల్ల రాక్షస రూపాన్ని పొందాడు. రామబాణంలో పూర్వరూపాన్ని ధరించాడు) తరువాత వాలిని సంహరించాడు. వారధికట్టి రావణుని జంపి సీతను తీసుకువచ్చాడు.

''రామాయణ''గాథ మొత్తాన్ని రామావతార విశేషాన్ని, రాముని తత్వాన్ని ఈ సంకీర్తనలో వివరించారు అన్నమయ్య. ఇలా ఈ ఒక్క సంకీర్తనలో రామగాథను మొత్తం ప్రస్తావించటం అన్నమయ్య సాహిత్య వైదుష్యాన్ని తెలుపుతున్నది. ఒక్కో సంకీర్తనలో రామాయణంలోని కొన్ని కొన్ని ప్రత్యేక ఘట్టాలని పొందుపరుస్తూ అన్నమయ్య పలు సంకీర్తనలు రచించారు. ప్రతీ సంకీర్తనలునూ శ్రీరాముని అవతారతత్వాన్ని ప్రతిబింబింప చేశారు అన్నయ్య.

ఈ సంకీర్తనలో అన్నమయ్య మరి కొన్ని విషయాలను ప్రస్తావించాడు.

3.2 రాగం - ద్విజావంతి; తాళం - ఆది

పల్లవి:

కౌసల్యా నందనరామ కమలాప్తకులరామ.. - అనే కీర్తనలో

చరణం(1):

''మునుపు దశరథరాముడవై తమ్ములు నీవు

జనించి తాటక జంపి, హరివిల్లు విరచి

సీత, పెండ్లాడి అనుమతి పరశురామునిచే గైకొంటివి''

చరణం(2): నుప్పనాతి శిక్షించి సొరిది రుషులగాచి

అపుడే ఖరదూషణాదుల గొట్టి

చొప్పుతో మాయామృగము సోదించి హరియించి

ప్పి హనుమంతు బంటుగా నేలుకొంటివి

చరణం(3):

సొలసి వాలి నడచి సుగ్రీవు గూడుక

జలధి బంధించి లంక సాధించి

వెలయు రావణు గెల్చి విభీషణుని మన్నించి

చెలగిత వయోధ్యలో శ్రీవేంకటేశుడా ॥ (అధ్యాత్మ సంకీర్తనలు - సంపుటి 1, 2)

ఈ సంకీర్తనలో పరశురాముని వృత్తాంతాన్ని పొందుపరచారు అన్నమయ్య. [6]

శ్రీరామ, పరశురాముల వృత్తాంతాన్ని ఈ సంకీర్తనలో ప్రస్తావించాడు. శూర్పణఖను శిక్షించిన విషయాన్ని హనుమంతుని బంటుగా చేసుకొన్న అంశాన్ని, సుగ్రీవునితో మైత్రిని, విభీషణుని మన్నించిన విషయాన్ని ఈ సంకీర్తనలో పొందుపరచారు అన్నమయ్య.

మరొక సంకీర్తనలో అన్నమయ్య శ్రీరాముని శరణాగత వాత్సల్యాన్ని వివరిస్తూ-

3.3 రాగం - హిందోళ; తాళం - ఆది

''కాకాసురు దోషము కడకుపరిహరించి

చేకొంటివి శరణంటే చేరి మడుగు

యీకడ మా నేరములు యింతకంటే నెక్కుడా

నీకే నే శరణంటి నీవు మమ్ము గాతువు'' (అ. సం.1 నుండి 4 సంపుటి)

అని రచించారు. తనపట్ల తప్పుచేసిన వారిని కూడ శ్రీరాముడు రక్షిస్తాడనటానికి కాకాసుర వృత్తాంతం నిదర్శనంగా నిలుస్తుంది.

మరొక సంకీర్తనలో అన్నమయ్య-

3.4 రాగం - ఖరహరప్రియ ; తాళం - ఆది

వంటి పరలోక కృత్యములు సేసితివి

యిరవైన శబరి రుచులివియె నైవేద్యమై'' (అ. సం.1 నుండి 4 సంపుటి)

అని రచించారు. జటాయువుకు శ్రీరాముడు అపకర్మలు గావించిన వృత్తాంతాన్ని, శబరి రుచిచూసి సమర్పించిన పళ్ళను స్వీకరించిన విషయాన్ని ఈ సంకీర్తనలో వర్ణించటమే గాక శ్రీరాముని భక్తవాత్సల్యాన్ని ప్రకటింప చేశారు అన్నమయ్య.

శ్రీరాముని సర్వలక్షణ తత్వాన్ని వివరిస్తూ అన్నమయ్య రచించిన మరొక సంకీర్తన.

3.5 రాగం - ముఖారి ; తాళం - ఆది

పల్లవి:

''రాముడు లోకాభిరాముడు త్రైలుక్య

ధాముడు రణరంగభీముడు వాడే''

చరణం 1:

వరుడు సేతకు ఫలాధరుడు మహాగ్రపు

శరుడు రాక్షస సంహరుడు వాడే

స్థిరుడు సర్వగుణాకరుడు కోదండ దీక్షా

గురుడు సేవక శుభకురుడు వాడే ॥ (అ. సం. సంపుటి, 1 నుండి 4)

''అంత్యాను ప్రాస'' విన్యాసంలో సాగిన ఈ సంకీర్తనలో శ్రీరాముని విశేషణాల ద్వారా, శ్రీరాముని తత్త్వాన్ని ప్రతిబింబింపజేశాడు అన్నమయ్య. రణ రంగంలో భయంకరుడని చెప్పడం ద్వారా యుద్ధభూమిలో తిరుగు లేనివాడని, అలాగే ''మహాగ్రపుశరుడు'' అనే విశేషాన్ని ప్రయోగించడం ద్వారా అమోఘమైన రామబాణం యొక్క గొప్పతనాన్ని స్పష్టపరచారు అన్నమయ్య ''రాక్షస సంహరుడు'' అనటం ద్వారా దుష్టశిక్షణ తత్త్వాన్ని, ''సేవక శుభకరుడు'' అని చెప్పడం ద్వారా తనను సేవించే శిష్యులకు మేలు చేకూర్చుతాడనే విషయాన్ని ఇలా ఈ సంకీర్తనమంతా శ్రీరాముని విశిష్టగుణాలని వివరించటం జరిగింది అన్నమయ్య.[5]

రామకథను పలు సంకీర్తనలలో వర్ణించిన అన్నమయ్య రామభక్తుడైన ఆంజనేయుని గూర్చి కూడ ఎన్నో సంకీర్తనలలో వివరిస్తారు.

3.6 రాగం - మలహరి ; తాళం - ఆది

పల్లవి:

నేల మిన్ను నొక్కటైననీబంటు వొక్క

వేలనే యక్షుని తెగవేసెగా నీబంటు

చరణం 1:

ఉంగరమెగరవేసి యుద్ధంలో పడకుండ

నింగికి చేయిచాచే నీబంటు

చెంగున జలధిదాటి జంటుమాలి నేలమీద

కుంగదొక్కి పదముల గుమ్మెగా నీబంటు

చరణం 2:

వెట్టగా రావణు రొమ్ము విరంగ చేతనే గుద్దె. (అ. సం. సంపుటి, 1 నుండి 4)

ఆంజనేయుని తత్త్వాన్ని వర్ణిస్తూ ఉంగరాన్ని పైకి ఎగురవేసి సముద్రంలో పడకుండా చేతితో పట్టుకొన్నట్లు వర్ణించాడు. జంబుమాలిని హనుమంతుడు కుంగదొక్కాడని అన్నమయ్య అచ్చతెలుగు పదాల్లో వర్ణించాడు.

అలాగే వివిధ వైష్ణవక్షేత్రాలలో వెలసిన హనుమంతుని అన్నమయ్య పలు సంకీర్తనలలో వర్ణించాడు. కలశాపురంలోని హనుమంతుని తత్త్వాన్ని అన్నమయ్య ఈ సంకీర్తనలు ఈ విధంగా ప్రస్తుతించాడు.

3.7 రాగం - అమృతవర్షిణి ; తాళం - ఆది

పల్లవి:

కలశాపురముకాడ గంధపుమాకులనీడు

అలరేవు మేలు మేలు హనుమంతరాయ (అన్నమయ్య సం. సంపుటి 1, పీటికలు-18)

4. మహాభారత ఇతివృత్తకీర్తనలు:

మహాభారత కథ అత్యంత విస్తృతమైనది. బహుపాత్రయుతమైనది కావటం వల్ల అన్నమయ్య ఒక సంకీర్తనలో మహాభారతాన్ని ఇమడ్చకుండా ఆయా సంకీర్తనలలో మహాభారత సన్నివేశాల్ని, పాత్రల్ని ప్రస్తావిస్తారు.

శ్రీకృష్ణుని జన్మను వర్ణిస్తూ అన్నమయ్య శ్రీకృష్ణుడు ఏయేపాత్రలతో ఎలాంటి బంధుత్వాన్ని కలిగి ఉన్నాడో ఈ విధంగా వర్ణించారు.

4.1 రాగం - హంసధ్వని ; తాళం - ఆది

పల్లవి :

అదర శ్రావణబహుళాష్టమి నేడితడు

నదురేయి జనియించినాడు చూడుగదరే ॥

చరణం 1:

గొంతిదేవి మేనల్లుడు గోపసతులమగుడు

పంతపు పాండవులకు బావమరిది

వంతుతో వసుదేవ దేవకుల కుమారుడు

ఇంతటి కృష్ణుడు జనియించి నీడుగదరే

చరణం 2:

బలరాముని తమ్ముడు పంచసాయకుని తండ్రి

మలసి మేలైన అభిమన్యుని మామ

లాలి సాత్యకి సుభద్రకు తోబుట్టినయన్ని" (అన్నమయ్య సం. సంపుటి 1, పీటికలు-18)

శ్రీకృష్ణునికి ఇతర పాత్రలతో ఉన్న బాంధవ్యం ఈ కీర్తనలో వివరించారు అన్నమయ్య. [4]

శ్రీకృష్ణునికి భక్తులపట్ల ఉండే పక్షపాతాన్ని వివరిస్తూ ఆయనకు దాస్యం చేసేవారిపట్ల ఆయనే దాసుడై ఉంటాడని అన్నమయ్య ఒక సంకీర్తనలో స్పష్టం చేశారు.

4.2 రాగం - మోహన ; తాళం - ఆది

''యిందరి పాలిటికిని ఈశ్వరుడ వేలికవు

వందవై యర్జును బండి బంటవైతివి

వందనకు నేలే దేవతలకే దొరవు (అధ్యాత్మ సంకీర్తనలు సంపుటి 4)

అందపు నీదాసులకు నన్నిటా దాసుడవు'' - అని అర్జునుని రథసారథ్య విషయాన్ని, శ్రీకృష్ణుని భక్త వాత్సల్యతను అన్నమయ్య ప్రస్తావించాడు.

ద్రౌపదీ వస్త్రాపరణ వృత్తాంతాన్ని స్మరిస్తూ అన్నమయ్య ఒక సంకీర్తనలో ''ద్వారకా నగరములో తగ నెత్తమాడే నీకు బీరాన ద్రౌపది మొరవెట్టిన యట్టు'' అని ద్రౌపది తనను రక్షించమని వేడుకొన్నట్లు ఈ కీర్తనలో వివరిస్తారు.[1]

శ్రీకృష్ణుని అవతారం దుష్టశిక్షణ, శిష్టరక్షణ అని తెలుపుతూ అన్నమయ్య ఒక సంకీర్తన రచించాడు.

4.3 రాగం - హిందోళం ; తాళం - ఆది

పల్లవి :

''ఎంతకత నడిపితి వేమి జోలి బెట్టితివి

చింతించ లోకములు నీ చేతివే కావా''

చరణం:

కౌరవుల పాండవుల కలహము వెట్టనేల

నేరిచి సారథ్యము నెరపనేలా

కోరి భూభార మణచే కొరకైతే నీచే చక్ర

మూరకే వేసితే దుష్టు లొక్కమాటే తెగరా । (అధ్యాత్మ సం. సంపుటి 1,2,3) [3]

శ్రీకృష్ణుని గూర్చి అన్నమయ్య ''ఎంత కత నడిపితివి'' అని అద్భుతంగా చెప్పారు. కౌరవ పాండవులకు కలహం పెట్టిదుష్ట శిక్షణ, శిష్టరక్షణను చేసినట్లు భావించిన అన్నమయ్య ప్రతిభ అనన్య సామాన్యం.

శ్రీకృష్ణుని విశ్వరూపాన్ని గూర్చి వివరిస్తూ అన్నమయ్య ఈ విధంగా రచించారు.

4.4 రాగం - కాపీ; తాళం - ఆది

''అనంత సూర్యచంద్రులు అనంతవాయువులును

అనంత నక్షత్రములనంత మేరువులు

కొనలు సాగేనన్నిటి కూటువ గూడుకొన్నట్లు

అనంతుడొక్కడే మించీనాది మూరితి'' (ఆధ్యాత్మిక సం. సంపుటి 1 నుంచి 4) [2]

అని వర్ణించారు.

5. ముగింపు:

- ప్రపంచసాహిత్యచరిత్రలోనే ప్రజల భాషలో పదకవిత్వం వ్రాసి ప్రపంచానికి అందించిన ప్రయోగశీలుడు అన్నమయ్య. భగవంతుని ఉనికిని, సమాజపు ఉనికిని విస్మరించకుండా తాను నమ్మిన సిద్ధాంతాన్ని బహుముఖీనంగా వ్యాఖ్యానిస్తూ సాధించిన ఫలితాలను సమాజానికి, దేవునికి సమర్పించిన దార్శనికుడు.
- ఈ వ్యాసంలో చర్చించిన రామాయణ, భారతాంశ ఇతివృత్త రచనలు ప్రతి ఒక్కటీ ఒక ప్రత్యేక రచనగా నిలుస్తాయి. భక్తి, శృంగార, వైరాగ్య రనచలు చేసిన అన్నమయ్య పురాణ, ఇతిహాసాలను కూడా తన రచనలలో ఇమిడ్చి రచించారు అని ఈ వ్యాసంలోని విశ్లేషణాంశాల ద్వారా తెలుస్తుంది.
- మొట్టమొదటగా వివరించిన రామాయణ సంకీర్తనలలో రామకథ ఇతివృత్తం మొత్తాన్ని ఒక సంకీర్తనలోనే పొందుపరచారు అన్నమయ్య. అలాగే ఆయా కీర్తనలకు ఉపయోగించిన రాగాలు, చారుకేసి, శుద్ధసావేరి, ముఖారి, వంటి రాగాలు కర్ణాటక సంగీతంలో ఎంతో ప్రాదాన్యత కలిగిన రాగాలని ఆయా సాహిత్య రీతులకు అనుగుణంగా కూర్చటం జరిగింది.
- తరువాత విశ్లేషించిన మహాభారత ఇతివృత్తకీర్తనలు కూడా శ్రీకృష్ణుని లీలలను, క్రిష్ణతత్వాన్ని కీర్తనల రూపంలో మలచారు అన్నమయ్య. ఆ కీర్తనలకు ఉపయోగించిన హంసధ్వని, మోహన, హిందోళ రాగాలలో కూర్చడం వలన సాహిత్యం మరింత సోభాయమానంగా ప్రకటితం అవుతుంది.
- అన్నమయ్య రనచలు ఎంత విశ్లేషించినప్పటికీ వారి రచనలలోని భక్తిని, భావాన్ని అర్థంచేసుకున్నప్పుడే ఆ సాహిత్యం మనకు అవగతం అవుతుంది.
- అన్నమయ్య కీర్తనలలో సాహిత్యం పరిపూర్ణంగా వ్యక్తం అయ్యేందుకు అవసరం అయిన మాధ్యమం సంగీతం. ఇటు సంగీతసాహిత్యాలను రెండింటిని మేళవించి పాడినట్లయితే అన్నమయ్య రచనలలో భావం, సంగీతం సుస్పష్టంగా అవగతం కాగలదు.

Selected Tanavarnam-s in Apoorva Raga-s

Dr. J. Sankar Ganesh
Associate Professor, Department of Performing Arts,
S.V. University, Tirupati, Andhra Pradesh
Email: jsankarganesh@gmail.com

ABSTRACT

Varnams are generally composed in popular raga-s which helps the learner to understand the nuances of that particular raga. There are number of varna-s are composed in raga-s like Todi, Kalyani, Sankarabharanam, Bhairavi, Dhanyasi, Begada, Abhogi, Purvikalyani, Sahana, Nattakuranji, etc. Post Trinity period was emerged with several new composers. Musicians shown their enthusiasm in doing experiments such as creating new raga-s, trying to sing rare raga-s mentioned in the various ancient Musical Treatises. Some of them composed music to varnam-s by tuning old poetry or literature and render it as varnam-s. Some musicians, who are get trained in both Carnatic and Hindusthani music systems, introduced Hindusthani raga-s to Carnatic music and composed varnam-s in it. This paper is intended to highlight some Apoorva raga'Tana Varnam-s', which is composed in rare or apoorva raga-s.

Keywords: Apoorva ragas, Tana Varnam, Thirukural Tana Varnam, Carnatic music.

Introduction

Tanavarṇam is one among the musical forms belong to modern period of carnatic music. It is the first item figured in traditional Carnatic music concerts. In general, Carnatic music compositions are divided into two major sections i.e 'Abhyasagana' and 'Sabhagana'. Abhyasa gana is for learners and Sabhagana is for performers after mastered in Abhyasagana. Varṇams are like a bridge between abhyasa gana and sabha gana. All of the nuances and essential features like sancharas, ranchaka prayogas, apoorva prayogas of the raga is glimpsed in a Varṇa. This is considered as most intricate and crucial item for vocal exercises. Varnams played a very important role in providing rhythm control to the music learner and practitioner. Practicing and performing Varṇa in second and third speed is helpful to gain control on rhythm, tempo and voice control over various sthayi-s. Hence it is melodic oriented, Swara phrases of various lengths and range is the main aspect of Tanvarṇam. Varnam, being a 'dhatu pradhana' composition, Sahityam (text) is simple, less in Varṇa and it has plenty of vowel extensions. These vowel extensions help to express the ragabhava by the performer through vocal cord. Tanavarṇam has two major segments i.e Purvangam and Uttarangam. Purvangam comprises of pallavi, anupallavi and mukthayiswaram, and uttarangam comprises with charaṇam and charaṇa

swara-s. Varnam is a unique composition only available in Carnatic music system and cannot be seen in any other music system in the world.

Varnams are generally composed in popular raga-s which helps the learner to understand the nuances of that particular raga. There are number of varna-s are composed in raga-s like Todi, Kalyani, Sankarabharanam, Bhairavi, Dhanyasi, Begada, Abhogi, Purvikalyani, Sahana, Nattakuranji, etc. Post Trinity period was emerged with several new composers. Musicians shown their enthusiasm in doing experiments such as creating new raga-s, trying to sing rare raga-s mentioned in the various ancient Musical Treatises. Some of them composed varnam-s are tuned old poetry or literature into varnam-s. Some musicians, who are well trained in both Hindusthani and Carnatic music systems introduced Hindusthani raga-s to Carnatic music and composed varnam-s in it. This paper is intended to highlight some of the Varnam-s which composed in rare or apoorva raga-s.

The idea of rendering Thirukural as the first item of a carnatic concert aroused in the mind of Sri V.S. Gomathisankara Iyer who was working as a professor in veena in the Department of music and also involved in the assignment of collecting rare Tamil compositions for the Annamalai University music series publications. This idea of using Thirukural as a carnatic music composition was inculcated into Iyer by the great Tamil Scholar Dr.Mu.Varadharajanar. Some of the Thirukural Varnam-s are tuned in rare ragas by V.S. Gomathisankara Iyer.

Raga-s : The epicenter of Indian Music

Music is the finest among the Fine arts. Music is a language of emotions. Music is the soul of Indian art and culture. It can influence all kinds of human emotions and feelings. Art music is bound by a System 'raga ' and 'tala'. Raga -s are vital to Indian music, especially to the Carnatic music, a music system of south India. Raga -s which originated centuries ago still have its refreshing beauty. The very heart of Indian music is ‘raga’. It is a melodic form upon which the musician improvises. A raga, is much more than a technical rule. Each raga in Indian music system depicts a mood. Some raga -s are suitable to be played during sun rise, some during sunset, some produce a devotional feeling, some raga produces a romantic feeling, and so on… The outstanding feature of Indian music system, then any other music system in the world, is raga system. Carnatic music system has 72 Mela Kartha raga -s. Raga -s have endless scope for variations and creations. Musical compositions are concrete form of raga -s. The beauty lying in raga is very subtle and delicate to elucidate and comprehend. A Musical composition can present only certain beauty aspects of a raga but a detailed alapana can expose the beauty of a raga to some extent.

After the emergence of 72 Melakartha systems into Carnatic Music many raga-s which were previously in vogue before the 72 Melakartha scheme assigned according to their

swarasthana-s or Characteristic features, under a Melakartha i.e Janaka ragas as Janya raga. These Janya ragas, classified mainly into two ie 'Upanga and Bhashanga'.

Upanga raga-s has the following classifications

1. Shadava – Sampurna
2. Audava – Sampurna
3. Sampurna – Shadava
4. Sampurna- Audava
5. Shadava - Shadava
6. Shadava - Audava
7. Audava - Shadava
8. Audava – Audava

Apart from the above classifications, classifications like the following Vakra ragas, Bhashanga Ragas, Nishadantya, Dhaivadantya Panchamantya, Madyamantya raga-s, Ghana, Naya, Desya Ragas, Karnataka – Desya ragas, Suddha, Chayalaga, Sankeerna Ragas, Common ragas and parallel ragas etc…are seen in the modern music. Among the above-mentioned classifications Prasiddha and apoorva raga-s is one classification. Prasidda means Popular and Apoorva means rare.

Some Apoorva Raga Varna-s

A raga, in which only one or a very few compositions composed, which is performed rarely in concerts is called apoorva raga or rare raga. Some Apoorva raga Varna-s is listed below

Sl.No.	Varnam	Raga	Tala	Composer
1.	Egan Aagi Anegan Agi	Nagavarali	Adi	Varagur. K. Muthukumaraswamy
2.	Naduvintri (Thirukural Tana Varnam)	Nagavarali	Adi	Thiruvalluvar Music Composed by V.S.Gomathi Sankara Iyer
3.	Sri Durga Lakshmi Saraswathi	Nagavarali	Adi	Pathamadai Krishna Iyer
4.	Thondanukku Kuraiyethum	Veenadhari	Adi	V.S.Gomathi Sankara Iyer
5.	Adi nathane Azhagiya Velane	Veenadhari	Adi	Varagur. K. Muthukumaraswamy
6.	Veenadhanda Kamandala	Veenadhari	Adi	V.A.Dandayutha Dikshitar
7.	Varuvanodi vanna malar	Veenadhari	Adi	S.Srinivasa Iyengar
8.	Sondamum bandamum	Megaranjani	Adi	V.S.Gomathi Sankara Iyer
9.	Maa Karunai pozhi	Megaranjani	Adi	Varagur. K. Muthukumaraswamy
10.	Sevikunavillatha pozthu (Thirukural Tana Varnam)	Megharanjani	Adi	Thiruvalluvar& Music Composed by V.S.Gomathi

				Sankara Iyer
11.	Megharanjani Ganamrutha	Megharanjani		Pattamadai Krishna Iyer
12.	Sevadi Tharuvai	Vahini	Adi	Varahur. K. Muthukumaraswamy
13.	Parinil nee kameswari	Vahini	Adi	Kshirapthisastri Thiruvananthai
14.	Aimkara Hrimkara	Omkaraswarupini	Adi	Adi Sankarar Music composed by TK Govindarao

Nagavarali

Aro : Ṇ S R G M P M D,,

Ava : N D P M G R S Ṇ D Ṇ S

Upanga janya of Todi, 8th Melakartha. Swarasthanas are Suddha Rishabam, Sadharana Gandharam, Suddha madhyamam, Suddha dhaivatham and Kaisiki Nishadam.

Raga Nagavarali also called as 'Nagadvani' in ancient Tamil music. In Tamil Pann System this pann comes under Marutha Yazh under thiram 'Nivir' evolved from Perugiyal. It ranges from Mandra stayi nishadam to Madhyasthayi nishada. But according to old tradition it has been performed Mandra stayi Dhivatham to Tara sthayi Gandharam. This raga, the swaras have to be sung without gamakas. Vakra swara prayogas like 'nrsgrmgsrns', 'gmdpg,rs', nsmm', 'gmdnrs' are raga ranjaka prayogas of Nagavarali raga.

'Eagan Agi Anegan Agi' is a Tamil Tana Varnam composed in Nagavarali raga set to Adi tala composed by Varagur. K. Muthukumaraswamy is a beautiful example for the ragalakshana of Nagavarali discussed above. Prayogas like the following exhibits the nature and raga ranchaka prayogas of this raga.

In pallavi prayogas like- ' ndmp, gmdp', 'rsrg mgmp- dpd- mpgrs'

In Anupallavi Prayogas like –'g,d, pmgr mndp, mpm', 'mpdmgr srgm'

In Muktayiswaram prayogas like- 'gmgrsrg,m', 'pndp ndpm', gmrg srgm n,d n, smg , nddpm grn

The above 'thaatu' prayogas are frequently occurs in this raga and these are also the raga ranchaka prayogas of raga Nagavarali. Apart from the above 'Thaatu prayogas' janta prayogas nddppmgr, nddpm, without gamakas also a special feature of this raga which is perceptible in this varna.

Veenadha

Aro : S G P D N Ṡ

Ava : Ṡ N D P M G R S

This raga is Janyam of 16th Mela Chakravaham. The swarsthanas are Suddha – Rishabam, Antara- Gandaram, Suddha- Madhyamam-, Chathusruthi- Dhaivatham, Kakali- Nishadam

Name of this raga mentioned in the book Sangitaswara prastara sagaram (p.425). Apart from the book Sangita Swaraprastara Sagaram, Sangita Chandirikai, Ragakosa, Palaiyali, Sangitakaumudi, and Pudiya Ragangal are a few grandhas mentioned this raga with same arohana and avarohana. A kriti 'Girija Deviya Bhajiselo' is composed by Sri Muthiah Bhagavathar in this raga, which is one among the Chamundamba Ashtotharasata Kirtana-s.

Tamil Varna-s ' Adi nathane – set to Adi tala composed by Varahur K. Muthukumaraswamy , Thondanukku Kuraiyethum –Adi composed by V.S. Gomathisankara Iyer, Veenadandakamandala – Adi composed by V.A. Dandayutha Dikshithar, Varuvanodi Vannamalar – Adi composed by S. Srinivasa Iyengar, Idikkuth thunai yarai –A' Thirukural' Tana varnam composed by Thiruvalluvar and music composed by V.S. Gomathisankar Iyer and A Tana Varnam in Telugu, Sari Evvarunnarura- Adi Composed by Pathamadai Krishna Iyer are perceptible in this raga.

In the Varnam 'Sari Evvarunnarura-Adi – Pathamadai Krishna Iyer , in pallavi the following phrases are ragachaya and raga ranjaka prayogas can be seen.

'grs, gpd ndpm',- 'm,grsgp,'- 'grsgpgp,'- 'dn,dpmgr'

In Anupallavi, the melody move up to tarastayi panchama 'dṅṡ,ġ,ṗṁġṙ', through this prayoga . In charanaswaras ,Janta swara prayoga like 'ṡṡnnddppmmgg'is used. Through the melodic structure of this varna the Swarasanchara-s , Ragaranchaka prayogas, Tarasthayi Sancharas, and Thatuprayogas has been observed.

Megharanjani

Aro: S R G M N Ṡ

Ava: Ṡ N M G R S

This is upanga Janya raga of 15th Mela Mayamalava Gowla. Swarasthanas figuring in this raga are Suddha rishabam, Antara Gandharam, Suddha Madhyamam, Kakali Nishadam. Panchama and Dhaivatha are varja. This raga is mentioned in many lakshanagrantha-s with note of its capability in stimulating rain when it was properly sung. A very few compositions are perceptible in this raga. Venkateswara Yadava – Rupaka – Muthuswamy Dikshitar and Karunato Nannu- Adi – Ramnad Srinivasa Iyengar is noteworthy. This raga also mentioned with the name 'Megharanji' in some texts.

Pallavi of the Tana Varnam ‘ Sondamum Bandamum’ –Adi , composed by V.S. Gomathisankara Iyer, begins with Madhyashayi Madhyama with the prayoga ‘mgm, n,; ṡnṡṙṡ, ;’ melody ranges up to tarastayi madhyama in the prayoga ‘ṡnṡ, ṙġṁ-ṁġṙṡ’ .

In the anupallavi of this varnam melody ranges up to tarastayi madhyama ‘ ṙġṁ,ġ, n, ṁ, ġ ṙṡnṡ,’

Vakra prayogas like ‘ṡ, nṙṡ-nġṙṡ’,and in mukthayiswara, Thatu prayogas like ‘gmrgsrns’and Srotovaha yati pattern with vakram like ‘ ṙnṙ - mnṙ- gmnṙ are perceptible. The varjam of Panchama and dhaivatha gives a western tint and swift swing effect to this raga.

Vahini

Aro : S G M P D N Ṡ

Ava: Ṡ D P M G R S

This raga is a upanga janyam of 16th Mela Chakravaham. This raga is mentioned with the name ‘Nabomargini’ with same arohana and avarohana in the book ‘ Ganavidya Prakasini’ authored by Perungulam Srinivasa Iyengar. ‘Sangeetha Swara prastara Sagaram’Authored by Nadamuni Pandithar and ‘Sangeetha Raga kadal’ written by Mahadevan in Tamil also mentioned this raga as Nabomargini. In this raga Thirukural Tana Varnam ‘ Kadanarinthu’ – Adi – Composed by Thiruvalluvar and music composed by V.S. Gomathisankara Iyer, and a Tamil Tana Varnam ‘Sevadi Tharuvai- Adi , composed by Varagur K. Muthukumaraswamy is perceptible in this raga.

In the Varnam ‘Sevadi Tharuvai’ by Varagur Muthukumaraswamy, the pallavi has following sancharas ‘dnṡd p,mg,’ ‘pmdpmgrs,’ ‘sḍṇs,’ ‘mgr, sgmg, mpm,’. In anupallavi melody ranges upto tarasthayi panchama ‘ṡ, ġṁṗṁġṙṡ,,,,’ ‘ṡġ, ṁġṙṡ’ the phrases are showing the tarasthayi sanchara-s of this raga. Janta swara prayogas like ‘ggrrss, pm gg rr ss’, are perceptible in the Charana swaras of the Tana Varna ‘Parinil nee Kameswari’ – Adi Composed by Thiruvananthai Ksheerabdi Sastri.

Omkaraswarupini

Aro : S R G M P N S

Ava : S NP M G R S

This is Janya raga of 62nd Mela Rishabapriya. The Swarasthana-s are Chathusruthi Rishabam, Antara Gandharam, Prati Madhyamam, and Kaisiki Nishadam . Tana Varnam ‘Aimkara Hrimkara’ is a Sloka composed by Adi Sankaracharya and music composed by Sri T.K. Govindarao. This raga is mentioned in ‘Palai Yazhi’ written by Dr. B.M. Sundaram. No other composition is seen in this raga except this varna.

In pallavi the melody ranges up to mandrastayi madhyama in the prayoga 'sṇ̲pṃp̲s, ṇ' Prayogas like 'srg –grs , rgm –mgr, are perceptible in the pallavi. In Anupallavi the melody glides up to Tarasthayi Gandhara in the prayoga ' ṡpṅṡṙ, ṙġ ṙ ṡn' In the Muktayiswaram Prathyagatha prayogas like 'rs-gr-mg-pm-np-mg',and Thatu prayogas like 'sr-sg-rm-gp-mn-pṡ' are interesting to observe.

Conclusion

In general Varna-s, taught to students to understand the framework, structure, and melodic movement of a raga. The sanchara-s and prayoga-s helps the learner to understand the melodic nature of that particular raga. Varna-s in apoorva ragas certainly helps the learner's to understand melody and nature of that raga. In general Tana Varna-s are having less text and plenty of vowel extensions to emphasis the melody.But closely observing to the above Varnas , the Thirukural Tana varnam and the Varnam tuned for the sloka of Sri Adisankaracharya is surprisingly match exactly to the music and set in Varna format without disturbing it's text. This shows the mastery of those composers who all are set music to that literature piece and change it into beautiful music composition 'Tana Varna'.

THE MODERN ANDHRA VAGGEYAKARAS: THEIR CONTRIBUTIONS TO CARNATIC MUSIC

DR T.GIRIJA SESHAMAMBA
Academic Consultant, Dept. of Performing Arts, S. V. Univesity, Tirupati

Abstract: *Indian classical music is believed to be a divine art form which originated from the origin of Vedas. The Samaveda which is believed to have a laid the foundation for Indian classical music, consists of hymns from the Rigveda. In Rigveda time 3 notes were existed that was vudatta, anudatta, swarita. Carnatic music based on samaveda.*

"Samavedadidam geetam sanjagraha pitamahaha"

In Bhagavad Geeta – Sri Krishna also says

'Vedanaam samavedosmi"

The Yajnavalkya smriti mentions

"Veena vadana tatvagna sruti jati visaradha"

Talagnascha prayasena moksha margam niyaschati"

The one who is well versed in veena, one who has the knowledge of sruti, and one who is adopt in tala, attains moksha without doubt. Sruiti, Ragam, Talam the most elements in our carnatic music. Raga is the pivotal concept of in our carnatic music. There is no carnatic music without ragam and swaram.

This papers is intended to highlight and to promote 19th, 20th centuries and some modern Andhra vaggeyakaras. In the development of carnatic music.

Key words: *Performing arts, Music, Raga, Art forms, Composers, Fine arts.*

INTRODUCTION

Carnatic music, known as carnataka sangeetam in the south Indian languages, is a system of music commonly associated with south India, including the modern Indian states of Andhra Pradesh, Karnataka, Kerala, Tamilnadu and Telangana. It is one of two main subgenres of Indian Classical music that evolved from ancient Hindu texts and traditions, particularly the 'Samaveda'. Carnatic music based on the 3 elements of Sruti, Raga, Tala. Carnatic music is mainly sung through compositions, especially the kriti or kirtanam. Carnatic music is as usually taught and learned through compositions. Telugu language predominates in the evolution of carnatic music. Carnatic music is based as it is today on musical concepts raga, tala and swara that were described in detail in several ancient works, particularly the 'Bharata's Natya Sashtra. The18th century golden age of carnatic music, three gems of the canatic music – they are saint Thyagaraja, Shyamastry and Deekshitar were composed and created many compositions. In this time music was established many ways. After trinity period in the10th,20th century many telugu composers also came to vogue. This contribution was also tremendous. The new composers of the 19th, 20th centuries are introduced many new ragas (apoorva raga) and many new creations to carnatic music. Example: Dr Nookala China Satyanarayana garu, K.V.N. Sastry garu, Sri Hari Nagabhushanam garu etc. Like this many composers have given marvelous contribution towards carnatic music.

MODERN ANDHRA VAGGEYAKARAS: THEIR CONTRIBUTIONS TO CARNATIC MUSIC

1. SRI HARI NAGABHUSHANAM

"Vaggeyakara Ratna" Sri Harnaga Bhushanam garu hails from Krishna district Machilipatnam. He lives in the years 1884 to 1959. He was exponent in Music, literature English and violin. Also expert in Harikatha Kalakshepam. Not only expert in all these aspects he is an advocate.

Nagabhushanam was one of the sishya parampara of saint Thyagaraja. He composed many compositions like kritis and keertanams. In his compositions insted of his mudra saint Thyagaraja mudra occurs more of the compositions. He composed kritis in the raga Bilhari, Saranaga were popular ragas in carnatic music and also he created new ragas like Suddha Bhairavi and Madhava priya.

In the apoorva raga Madhavapriya was his creations.

Some of his compositions like:

Raga - Saranga - Kriti - Vinayakamu vighna - Aditala

Raga - Bilhari - Ninne nammi yunnavada - Rupaka tala

Apoorva Raga:

Raga - Madhavapriya – Madhava priye - Aditala

2. SRI MAHENDRAVADA BAPPANNA SASTRY

Sastry garu hails from Injamuru village Yanam district in Andhra Pradesh state. He was one of the modern Andhra composers. He lived in the years 1904 to 1979. He composed many tana varnas, kritis and javalis. He was a great exponent in manodharma sangeetam of swarakalpana part. He composed 195 compositions in our carnatic music. In these 150 kritis, 30 tana varnams, 15 javalis are there. His compositions are kept in the book "Harihara kriti manjari". He used the mudra "Vijaya gopala, Injaram in his compositions.

Some of his compositions like:

Raga - Mayamalava goula - Kriti - Vinnanura - Kandachapu tala

Raga- Sahana - Kriti - Bharamayana - Adi tala

3.SRI PATRYANI SEETA RAMA SASTRY

Sastry garu hails from Manapullam town near Gudivada, Vijayanagaram distirct. . He lived in the years 1900 to 1957. He was one of the modern Andhra composers. Actually sastry's surname was "sannidhi" but his fore fathers were worked in Navy. In navy soldiers the higher authority people was called "patrayadu" because of that sastry's surname was changed to "patrayani". In his child hood Sastry garu spent with his grand father, at that time he learned "Bala Ramayanam" and by-heart the Balaramayanam. This is only the Sastry gari preliminary education. His father was a well known musician. His father taught to sastry garu. He shifted to barampuram. At the age of 16 years sastry garu started writing his own compositions. After 16 years of age Sastry garu settled in saluru. He father Narasimha sastry garu called as "pedda guru of saluru and Sastry garu was a small guru of saluru. His father and sastry garu both are popularize the saluru gurus. He composed 30 kritis in is compositions some of swarajatis, kritis, varnam and javalis also.

Some of his compositions like:

Raga - Hamsadhwani - Kriti - Gananada smarana - Adi tala

Raga - Smurti ranjanai - Kriti - Ihapara sadhaname - Adi tala

Raga - Mukhari - Kriti - Nanda nanda - Adi tala

4. SRI TADEPALLI VENKATA SUBRAHMANYA SASTRY

He hails from "Peravali" village. He lived in the years 1918 to 1989. Professionally he was a teacher and also a graded artist in All India Radio. He composed 700 compositions on different Gods and Goddess. Sastry garu introduced 500 new ragas to carnatic music. He composed 72 melakarta ragas also. He wrote 2 harikatas namely "Thyagaraja Vijayam" and "Kusuma Haranatha Charitram".

Some of his compositions:

Raga - Naata - Kriti - Vighna nivarana vinayaka - Adi tala

Raga - Todi - Kriti - Yenni Nallaku Kaligeno - Rupaka tala

Rare Raga:

Raga - Vimali – Kriti - Visuddha chakra nilaya - Rupaka tala

One of his compositions he has created Rare raga (Apoorva Raga) name "Vimali

5. SRI MANUGANTI VENKATA RAO PANTULU

He hails from Kakinada town at Andhra Pradesh state. He lives in the 1902 to 1964. He started music at very early age. He was exponent in concerts. He composed many compositions in carnatic music.

Some of his compositions:

Raga - Pravrutti - Kriti - Neeve gati bhavaneepathi - Adi tala

The "pravrutti" raga is the one of the apoorva ragas in carnatic music. This raga is one of his creations.

6. SRI TUMARADA SANGAMESWARA SASTRY

Sastry garu hails from Bobbili. He lives in the years 1874 to 1931. He was exponent in veena. He was a great vidwan in veena. He attended regular concerts in madras and Thanjavur also. Sastry garu was not only exponent in veena and he was expert in nadaswaram, violin also. He composed many tana varnams also. The Pithapuram asthanam felicitated Sastry garu for his great playing of veena. Sastyi's life was spent in the Maharaja of Pithapuram. He composed many compositions in carnatic music. He was a great guru and he trained music to many students. He used mudra "Sangameswara" in his compositions.

Some of his compositions:

Raga - Kalyani - Kriti - Gananayakam subha gayakam - Adi tala

7. SRI VINJAMURI VARADARAJA IYENGAR

He hails from Guntur. He lives in the years 1915 – 1991. He was a disciple of Sri Tiger Varadachari". He has given many tunes to Annamacharya kirtanas, Sadasiva Bhahmendra, Tumu Narasimha Dasu. He composed varnams, Kritis, Javalis, Tillanas also.

Some of his compositions :

Raga – Manirangu - Javali - Kante Saiga chesenu - Adi tala

8. SRI DR. NOOKALA CHINA SATYANARAYANA

He hails from Visakhapatnam – Anakapalli village. He lives in the years 1927 to 2013 He was a great guru and also Maha Vidwan in CArnatic music. He was one of modern 20th century's telugu vaggeyakaras. He got the greatest award "Padma Bhushan" in the year 2010. He worked as a teacher, Principal in different colleges and universities like S.V. Music College, Tirupati, Telugu University , Hyderabad, Vijayawada – Govt. College as a principal also. INTRODUCTION

There are many musical forms enriching Carnatic Music genre. Musical forms are still performed which belongs to medieval period are Tevaram, Prabhanda-s and Divyaprabhanda-s. During Ancient and Medieval period, Musical forms, used for devotional purposes to spread bhakthi culture. Generally, Musical forms used as a part of temple rituals. Raga, the epicentre of Indian music kept alive through centuries through these musical compositions. Later centuries many musical compositions were developed. Musical forms belong to modern period are Sanchari Gita, Lakshana Gita, Swarajathi, Jathiswaram, Tanavarna, Padavarṇa, Kriti, Nottuswara, Utsavasampradaya kirtana, Divyanamakirtana, Padam, jawali, and Thillana. The above-mentioned musical forms composed in Sanskrit, Telugu, Tamizh, Kannada, languages and Manipravala enriched Carnatic music heritage. However, Javali belongs to Carnatic Music composition group; it is consider under the category of exotic songs or light songs. C.R.Day in his book 'Music and Musical Instruments of the Southern India' (published 1891) says that Javali-s are songs of light and pleasing nature such as love songs, cradle songs, sung during the performance of a peculiar dance called karwar. These songs are comparatively recent introduction first sung by Kanarese musicians of the court of Sivapuri a petty state near celebrated Hampi ruins." According to Day's statement, the Javalis , mostly sung only in the Telugu language in the deep south of India known then as Madras Presidency.

JAVALI AS A MUSICAL COMPOSITION

Javali is one form of musical composition rendered both in music and dance concerts. Javali-s corresponds to the 'Ghazal' of Hindustani music. Javali-s are highly pleasing compositions with a lilting gait and catchy music and over the past 200 years, they have gained wide currency as songs expounding Sringara rasa. They characterized by their relative brevity and amorous themes. Because of their musical excellence and lively rhythm they have become popular not only in dance

music but also as pieces of art music and acquired the status of a much sought after item on concert platform s in the last portion of a concert. The music, although classical, is still of a lighter variety and hence Javali-s are invariably rendered towards the closing stages of concerts. Singing of a Javali at the end comes like a flash and imports on enlivening charm to the entire recital. Composing of Javali shows the talent and aesthetic sense of a composer. There are almost 1,000 Javali-s existing today though only about 50 are popularly performed, renowned musicologist Dr. Pappu Venugopal Rao opined, "Many of them are openly erotic with some even using obscene language accounting for their gradual disappearance from concert platforms as musicians probably felt squeamish about rendering them in public performances.

List of Some Popular Javali-s

SN	Javali	Raga	Tala	Composer
1	Celi Nenetlu	Pharas	Adi	Chinnaya (Tanjore Quartret)
2	Saramaina	Behag	Rupaka	H.H.Swathi Thirunal Maharaja
3	Emi Mayamu	Khamboji	Rupaka	Pattabhiramayya
4	Samayamide	Behag	Rupaka	Patnam Subrahmanya Iyer

JAVALI AS A DANCE COMPOSITION

As an item of dance, the Javali is quite welcome after the long drawn out heavy Music & Dance performance of the Padam. The evolution of Javali traced to the various compositions depicting different shades and patterns of love that over the years emerged on the scene from time to time. Javalis are usually in praise of deities, patrons and rulers. Javali-s are songs of exotic nature composed in lighter vain, they are sensuous in concepts of spirit. The characters -Nayaka, Nayaki and Sakhi- often indulge in banter and good-natured wit and Sarcasm. The characters -Nayaka, Nayaki and Sakhi- often indulge in banter and good-natured wit and Sarcasm. Unfaithful Nayakas are common. Most of the Javalis are composed in the voice of Nayaki or Sakhi and those composed in the voice of Nayakas are rare. In general, unfaithful Nayaka is in the themes of many Javali-s. The Nayika and the Nayaka may be of the Uttama, Madhyama or Adhama type. The nayika may be 'Sveeya', 'Parakeeya' or 'Samanya'. The depiction of the eight varieties of Nayika known as the 'Ashtanayika', based on their expressive form, become integral in the presentation of the Javali-s. Javali-s, mostly portraying three varieties of Nayika, they are,

- The 'vipralabdha', (the betrayed one),
- The 'virahotkanthita' (yearning in separation) ,
- evoking viyoga shringara rasa, 'khandita' (the angry one).

The nayaka involved in the lyrics would often be

- The 'upapati' i.e. married to one and seeking another woman,

- A ‘vaisika’ i.e. who may or may not married, but seeks a woman for a price. He may also a ‘shata’ or a liar.

Unfaithful Nayakas are common in Javali-s. Nayaki or Sakhi sings most of the Javalis and those sung by Nayakas are rare. Javali-s is portrayed diverse moods in different depending on the type to which the Nayaki belongs. The dancer found immense scope to perform Nritta and Nritya for Javali-s.

ORIGIN OF JAVALI

Javali had its roots in the numerous lyrics composed by Giriraja Kavi and other poets in honour of their royal Maratha rule and flowered at the court of the Mysore Maharajas and the palaces of many chieftains’ and Zamindars. It has believed that Javali had its birth in the nineteenth century. While considering the language of Javali, it is worthy of mention that this musical form has been composed in all the south Indian languages apart from Hindi and English. The simple and following language is colloquial bordering on obscenity and sometimes couched in double meaning.

There are different opinions are prevailing about the name Javali assigned to this musical form. From region to region, environment, culture and local language were the reasons for the name differences.

- It is believed that the word ‘Jhavali’ to have been derived from of the word ‘ Jhali’ of the Urdu language.
- In Marathi, the word ‘Jhavali’ means a gesture of the eyes in the language of love.
- The word Javali also be related to the Telugu term ‘Java’, means speed of quickness.
- The term ‘Jhamvali’ was current in the Hindustani music and popular in Mysore during the reigns of Chikkadevaraja Wodeyar and Tippu Sultan and this might have been the forerunner of the name Javali.
- In Kannada ‘Jhavadi’ or ‘Javali’ connotes a piece of poetry. Javala is a kannada term figuring in the BasavaPurana to denote a lay person. Kittel’s Kannada Dictionary, mentions that Javali as a kind of lewd poetry.
- The Conjecture is therefore possible that Javali refers to a musical form liked by the lay people. In this language, Java refers to dawn time. As such, the word Java may imply a love song requiring the Nayaki to come at dawn.
- Jya in Sanskrit connotes the bowstring and its Kannada equivalent is je. "Pode" or "vode" is striking. Jevode is striking a bowstring or danushtankara. As the appeal of the Javali may compare to the danushtankara of Kamadeva, the God of love, it is possible that the rasikas of earlier times called these compositions "Jevode" which later became Javadi or Javali.

STRUCTURE OF JAVALI-S

Several Javali-s have been composed on the pattern of kriti. Just like kriti, Javali too possesses 3 Anga-s namely Pallavi, Anupallavi and Charanam. ln some Javali-s multiple charanams are observed. In few Javali-s, Anupallavi is omitted. Sahithyas of Javali-s conform to the rules of prosody and are replete with different literary beauties. There are exceptions to this rule. For example the Javali "Sariga Kongu" by Ghanam Krishna Iyer is of two lines, one pallavi and one charanam.

MUSIC OF JAVALI-S

The bright and attractive music is the main uniqueness of Javali-s. The fast rhythm and catchy tunes attracted the people and gain popularity. Javalis have been composed in popular Desi and Bhashanga ragas. Several Javalis are composed in Desi ragas like Behag, Darbari kanada, Desi Todi, Yamunakalyani, Hamirkalyani, Sindhubhairavi, HindusthaniKapi, Pharaz, Jenjhutti, Kamas etc. There are also many Javali-s composed in well-known rakti ragas like Athana, Darbar, Bilahari, Saveri, Kamboji, Bhairavi, Surutti, Kalyani amd Mukhari. Javalis have been set to different thala-s such as adi, roopaka,chapu etc. and rarely we can find Javali-s in Vilomachapu,Tisralaghu,Misralaghu and Tisragathi.

Javali-s composed in several grahams. The Javali 'Sariyemi' in Rupaka tala Composed by Sri Pattabhi Ramayya , Anupallavi and Charnam commenced in Athitha graham. In the Javali 'Chalamela' in raga Nattakurinji set to Rupaka tala composed by Chinnaiah (Tanjore Quartet) Pallavi is in 'Athitha Graha', Anupallavi is in Anahatha (1/2) beat after tala commeneces, and charnam is in Sama graham. In the Javali ' Elaradayane' in Bhairavi raga set to Adi tala composed by Chinnaiah, pallavi is in Athitha graha, Anupallavi is in samam and charanam is in Anagatam. Rhetorical beauties like Swaraksharas, Dwitiakshara prasa, Anuprasa, Antya prasa, Yati, Prasa Yati, etc are figuring in Javalis. Vadi Samvadi aspect is found in many Javali-s i.e. Samayamide- Behag –Rupaka- Pattnam Subrahmanya Iyer , Pallavi commences with Madhyasthayi Shadjam, Anupallavi begins with Madhyasthayi Madhyama and Charanam commences with Madhyasthayi panchama. In 'Vaddaninne – Kapi –Rupaka - Pattnam Subrahmanya Iyer, Pallavi begins with Madhya sthayi panchama and Anupallavi begins with Tarasthayi rishaba.

COMPOSERS OF JAVALI-S

The most prominent composers of Telugu Javali-s were Darmapuri Subbarayar, Pattabhiramayya, Swati Tirunal Maharaja, Tanjore Quartet, Patnam Subramania Iyer, Ramanad Srinivasa lyengar, Karur Chinnadevudu and Dakshinamoorthy, Tirupati Narayanasamy, Tacchur Singracharyulu Brothers, Veena Krishnamachari and Chandrasekhara Sastri, etc.. 90% of total Javali-s is composed in Telugu language. JAVALI-S IN 'MANIPRAVALA' INCLUDING ENGLISH

It is interesting to find out some Javali-s is composed in English and in Manipravala with a mixture of Telugu , English and Tamil.

SN	Javali	Raga	Tala	Composer
1	Oh my lovely lalana	Kharaharapriya	Adi	Karur Sivaramayya
2	My dear come			Karur Sivaramayya
3	What has become of thy Promise*	Purvikalyani	Adi	Pattabhiramayya

*English translation of Telugu Javali 'Nee matale Mayanura'

CONCLUSION

Though Most Javali-s composed in Telugu, oldest Javali-s belongs to Kannada language by Kappani from 18th Century. These Javali-s composed in praise of Lord Nanjundeswara of Nanjunguda. This Javali-s are called as Vairagya Javali-s and manuscripts are preserved in Kannada Research Institute, Mysore University. Javali, considered as an important dance form for 'Sathir' Dance recitals in Temples. However after 'Sathir' developed as Bharathanatyam, Javali is continuing its placement in dance and as a musical form. Role of Veenai Dhanammal and her disciples has mentioned in particular for the procurement and propagation of Javali-s to the present music community. Vina Dhanammal's family learned from Subbarayar about 60 javalis. Dhanammal's sister had a repertoire of Dharmapuri javalis even richer than Dhanammal's. The direct disciples and indirect disciples called Dhanammal School propagated rare padams and Javali-s. Veena Dhanammal made his Javali-s famous through her concerts and her grand-daughter T. Balasaraswati made them the most sought after items in her dance programmes exploring its scope for abhinaya through her expertise.

A large amount of confusion regarding authorship of some Javali-s is perceptible because of the fact that in some cases the same composer had employed different mudras, in other way the same mudra used by different composers. Some Javalis have sangathis. A few musicians occasionally

sing kalpanasvaras for this amorous form. However, in general Javali-s, are Mathu Pradhana Compositions lyrics oriented compositions. Chitta svaras are out of place in Javali-s although Ramnad Srinivasa Ayyangar has introduced a Chitta svara to his javalis "Vega nivu vani rammanave" in Surati raga. There are more than 1000 Javali-s and its lyrics are available now in all four languages including Sanskrit in websites.

Introduction

International relationship is essential for any country and the results of maintaining good international relations reflect on the social and economical growth of a country. The all round development of a country can be achieved through joined ventures more effectively. Globalization of economy has major impacts on the sphere of human life and it generates the demand of maintaining good international relations for every nation. During covid -19 disaster and post covid-19 era proved the importance of upholding good International relations. Maintaining good relationship with other nations becomes a crucial requirement for countries like African countries which are in the set course of rapid development. International relations are maintained through multifaceted activities like sports, summits, industrial collaborations and business conferences.

'A Nation's culture resides in the heart and in the soul of its people'

-Mahatma Gandhi

Culture is the reflection of every civilization and it illustrates the style and deeds of life in the past and present. Development of a country is graded through the agenda and policies dedicated for its cultural intensification. Cultural heritage confers face value to a nation. All the artistic outcome of a society is named as cultural activities or art forms. It includes music, dance, theatre arts, sculptural and painting works which are known as the natural emphasizes of humanity. These art forms are more powerful in delivering the feelings through its efficient method to correspond the expressions than any other medium. In recent times these performing art forms are playing a vital role in cultural exchange activities. This paper is intended to highlight some key aspects of performing art forms exercised in the development of bilateral relationship between India and African countries

Cultural Exchange

Cultural exchange is a universally accepted remarkable technique for maintaining international relations.

""Culture is this thing that we can exchange among ourselves as human beings to knock aside our differences and build upon our similarities. Cultural exchange is the ultimate exchange."

-Chuck.D.

Cultural relations and exchange programs are frequently discussed in regional, national and international platforms on various distinctive themes and modes. Top priority is given to cultural exchange activities in the agenda of every nation. Different forms of cultural exchange activities are in practice to facilitate the understanding of social and cultural background of two different countries and to communicate the benevolence. In recent times core theme of cultural aspect performing art forms are given top priority in cultural exchange activities.

Significance of performing art forms

"If we danced and shared music, we'd be too busy en-joy-in' life to start a war."

E.A. Bucchianeri, Brushstrokes of a Gadfly,

An art form which is suitable to perform on the stage in group or in solo, capable to stir a kind of emotion in the mind of the audience is called Performing arts. Performing art forms are the mirror of creativity and inheritance of a society. It has no boundaries and reflects the social and chronological enormity of a country. It is one of the most powerful medium capable to reach the mind of people without any discrimination. Performing art form includes dance, music, drama, mime, martial arts etc… is very much successful in manifesting the cultural and traditional strength of a nation it belongs to. It is the only art form competent to address and attract the attention of entire society from mass to class. Performing art forms are universally used to carry sociable messages to maintain good relationship between nations.

Role of Performing arts in cultural exchange activities

Performing art forms are inseparable from the history and traditional influence of a country. Through the presentation of performing art forms the significance of cultural and historical ethnicity can be straightforwardly conveyed to the audience more successfully than any other means. The bilateral performance of performing art groups' helps both people to understand the cultural heritage of each other's and it is the simplest way to transmit a depiction of the conventions of both countries. The presence of performing art forms in cultural exchange activities brings proximity among people and societies. Example: India – Japan, India – Singapore, etc…

Performing art forms are powerful mediums in conveying messages to the heart of people. It is capable to change the character and attitude of a person from his heart. (Example: Mahatma Gandhi developed a habit of telling truth by the influence of a drama on the story of Harishchandra). Performing art forms are having cultural linkage towards others since every society has its own performing art forms on their pride. Learning of any performing art form is an endless journey which offers additional understandings on its spiritual and religious connections, concepts and values to the learner.

'I regard the theatre as the greatest of all art forms, the most immediate way in which a human being can share with another the sense of what it is to be human being'

- Oscar Wilde

Language is one of the most significant barriers commonly observed in maintaining international relations since every region has its own languages and any communication in other than the regional languages may successful as statement but habitually fails to bring proximity in hearts. But every performing art form is accomplished to convey the communication in a unique manner direct to the hearts. The communication transmitted through feelings involves and administer the feelings of the audience and the message is successfully delivered to the hearts.

Performing arts performances perpetually made the minds of the people to evaluate the idea with the art forms of their own region. It leads to further interest in comparative cram, and further analysis to explore the performing arts of other's. Exchange of themes figuring in theatre, dance and music arena is tentatively exercised mutually and got a massive appreciation. Music dance and theatre arts are common assert for all the nations and every country feels proud for the possession of various art forms in their stride with their own pinch. Aspiration of cultural exchange is not accomplished without the presence of performing arts in it.

Indian cultural Tradition

India has an incredible cultural heritage. A country like India is standing for the plurality and individuality of its ethnicity. India has one of the world's largest collection of songs, music, dance, theatre, folk traditions, performing arts, rites and rituals, paintings and writings that are known as the 'Intangible Cultural Heritage' (ICH) of humanity. India has a lot of classical

performing art forms. These art forms are originated and developed into classical art forms from the different regions of this country. '*Bharathanatyam'* (Tamilnadu) , '*Mohiniattam'* (Kerala), '*Kathakali'* (Kerala), '*Odissi'*(Orissa) , '*Kuchipudi'* (Andhrapradesh), *kathak* (Northern regions), '*Manipuri*' (Manipur) and '*Sattriya'* (Assam) are popular classical dance forms of India. These dance forms are unique and having its own different styles and traditions. The modus operandi of thematic movements, expressions, makeup costumes, accompaniment and mode of presentation differs from each other. Classical Music of India is divided into two major divisions which is *Carnatic music* and *Hindusthani music*. *Carnatic music* is practiced in South Indian states and *Hindusthani music* is in northern region of India. A large number of folk art forms are in practice in India and every region has its own. *Kolattom, Bihu, Aliai –ligang , Bagurumba, Garbha, Tippani, Yakshagana, Kavadiattam , Puliyattom, Mayilattom, Dollukunitha, Cheraw, Girida, Bhanjara, Karagattom,* etc…, are some of the popular folk dance forms of India.

African cultural tradition

"The curious beauty of African music is that it uplifts even as it tells a sad tale. You may be poor, you may have only a ramshackle house, you may have lost your job, but that song gives you hope". *-Nelson Mandela*

African tradition and culture is expressed through many different art forms, such as music, dance, art, sculpture and beadwork. Many African languages are not scripture but "tonal languages. Oral tradition plays a vital role in African culture. The passage of cultural practices like tunes, folk songs, folk traditional stories from one generation to another mostly passed through oral tradition. Listening is an equally important skill, which has been perfected by the traditional oral practices.

Dance and music are the integral part of African culture and tradition. As like in India songs and music accompany in marriages, birth and death rites, hunting and congregations for various occasions. Dance with different masks and dresses used to communicate anger sorrow and joy. The mask in dance is very significant in African society. It is believed that the Holy Spirit will possess the dancer as they wear the holy mask.

India – Africa cultural exchange program

India has more than a three thousand year history of cultural and commercial relations with Africa. Today, Indian communities in Africa constitute 12.37 per cent of the total strength of India Diaspora and they reside in 46 countries of Africa. As a part of Incredible India campaign, India signed a Bilateral Agreement-Cultural Exchange Program with Algeria in October 2003 to strengthen the cultural relations between the countries, under which cultural troupes of both countries exchange their visits.

The **djembe** drum is said to have been invented in the 12th Century by the Mandinke tribe in what is now Mali, in West Africa. It has been played by West Africans for generations forming an integral part of ritualistic life in Mali, Guinea, Senegal and other neighboring West African countries. Algeria sent their cultural troupe named 'Djembe Africa' a cultural group of drummers and dancers to India during the India-Africa Forum Summit in New Delhi in April 2008, another 32-member ballet troupe in December 2010 and an Algerian classical music group participated in the India-Africa Forum Summit held in Addis Ababa in May 2011.

The significant role of exercising Performing art forms in summits is clearly perceptible in the India- Africa Forum Summit conducted in New Delhi in the year 2015. It's a union of cultures, shared histories and entwined dreams. Blend of the ancient sounds of African drums and sufi songs from Egypt with classical Indian dance, Vedic chants and Bollywood music, the India-Africa Forum Summit pulsated with creative energies of Indian and African artistes. It is mentioned in the summit report that the summit kicked off with a magnificent multi-media cultural programme, which included 'Chants of Faith', seeking blessings for the revitalization of India and Africa.

Vedic recitations mingled with African song Kealebog, expressed India's diversity and Africa's awakening. The show concluded with One Beat, One Rhythm and One Vision of a radiant future of Africa and India. The Rashtrapati Bhavan shone with a captivating spectacle of Indo-African fusion music and dance at the end of the summit on October 29. The gala show, which artistes from Africa and India in a celebration of shared culture, was staged before the leaders of African countries at the presidential banquet, and elicited a rapturous applause.

In the run-up to the summit, a host of cultural events were organized that brought out ancient and modern cultural connections between Indians and Africans. The cultural synergy rippled forth at the music-and-dance shows staged at the dinners hosted for senior officials and ministers ahead of the summit. The utilization of Performing art forms of both the countries help to change the mindset positively and respect towards the others.

India celebrated the carnival spirit of Africa at the 'Welcome Africa' concert in Nehru Park in Delhi on 2015, As a Part of Delhi International Arts Festival, in the evening with an enthralling performance of Sufi rock and Ghana-based musicians, who effortlessly mingled traditional African percussion music with Hindi songs. Ghanaian performers had the crowd dancing with their renditions of popular Hindi songs. The dance group from Ethiopia wove a magic spell, with many in the audience joyously joining in.

Indian performing arts in Africa

In African countries especially in South Africa to understand and appreciate Indian dance as we know it today, it is essential to precede this with a brief discussion on the living conditions of Indians during and after the indenture period. The accommodation Indians were offered was extremely primitive. The “coolie barracks” were overcrowded and soon became slums. Working hours extended from 6am to 5pm. On Saturdays work stopped at 1 pm, after which rations were handed out.

Suffering and unhygienic living conditions gave rise to a “high degree of diseases and illnesses”. Because of the drudgery experienced in their daily lives the early immigrant hungered

for diversion and recreation. Although the Indentured labourers were considered illiterate by the British colonialists, they certainly did not lack a quest for religion, music, song and dance.

Indian dance, particularly Bharatha Natyam and Kathak, was not introduced in South Africa for many decades following the arrival of the early Indian settlers. The early dance forms that did exist then were known as North Indian Nautch (a light lilting dance style) and the South Indian dance drama, the Therukoothu. Performances were presented in open grounds, under shaded trees and under crudely constructed shelters with only a demarcated area for a stage.

The Therukoothu or "street dance" had its beginnings in the ancient popular mode of story-telling. During the post-harvest period in the rural areas there existed a "lull" in the lives of the early Indians, and religious education in the form of storytelling was pursued fervently. The performers were only men who also played the roles of women. The earliest performances of this dance form began in Mount Edgecombe along the North Coast of KwaZulu Natal, and were part of the annual religious celebrations known as Thirunaal, which means "Festival Day"

Since the first batch of Indentured labourers were mainly from South India, and from an agricultural background, Therukoothu. This folk art form made its appearance in almost all Indian settlements on sugar estates in South Africa.

However, before the pursuance of the ancient classical dance styles of Bharatha Natyam and Kathak in South Africa, many folk styles emerged during Hindu festivals, highlighting socio-religious festivals such as Navarathri, Deepavali, Krishna Asthami. At the popular social events like Harvest festivals (Pongal) and wedding celebrations, folk dances such as the South Indian Kummie, Kolattam and and the Gujarati Garbas were performed respectively. Since Natal had the largest Indian population, localities such as Pentrich, Pietermaritzburg, and the suburbs of Clairwood, Overport, Mayville,Cato Manor, Stella Hill, Puntans Hill, Riverside, Seaview and Central Durban became centres of cultural activities. Further afield, Indian Culture thrived in regions like Port Elizabeth, East London, Kimberly, Fordsburg,Vrededorp, Benoni, Germiston and Pretoria.

Classical dance forms particularly Bharatha Natyam and Kathak were not introduced into South Africa for many decades following the arrival of the early Indian settlers. Between 1860

and 1940 these classical forms were virtually non-existent. Based on the premise that Bharatha Natyam suffered a decline in status in India and that only after the 1930s was there a resurgence of this ancient temple art, could be a reason for the interest and subsequent introduction of this art form to this country,

Today, classical dance, both Kathak and Bharatha Natyam, has evolved into a fine art form and can claim a status of its own amongst all other performing arts both nationally and internationally. There are numerous schools where Indian dance is being taught and the interest has continuously gained momentum since its inception .It must be noted that in the face of numerous obstacles experienced by Indians in South Africa, they fervently pursued an art form that was beyond the boundaries of the host country. It would appear that a shift in place and time would not deter their quest in maintaining and perpetuating a cultural heritage so steeped in religious-ritual and aesthetic character. Perhaps this is one of the reasons for the classical dance Bharatha Natyam to have successfully earned the reputation of being the most popular in African countries.

On seeing the dance recital by Kalakshetra organized by ICCR in South Africa, Ms. Verushka Pather, a Bharatanatyam dancer from South Africa impressed at her age of five and started learning Bharathanatyam at the local dance school under the tutelage of Smt Savitri Naidu. She had her ‘arangetram’(first stage performance) in 1998 and family members from South Africa and Japan came India to watch her dance recital. Verushka has got the golden opportunity to perform at the Tirumala Tirupati Devasthanam for the Brahmotsavam. A few years ago, she showcased her own production Sri Krishna Leela in India and she also revived the tradition of temple dancing. She organized a temple dance tour (with the help of Tamil Nadu government) in South India. Verushka is also collaborating with an African dancer for a show that will be a fusion of Bharatanatyam and African contemporary dance. Verushka is one of the finest example to understand the status of Indian performing art forms in African countries.

ZENITH International Journal of Multidisciplinary Research _____ISSN 2231-5780

In 1994 the Surialanga Dance Company of Durban was invited to present 'a gift of art' to the first democratically elected pren sident of South Africa. The cultural part of the inauguration celebrations took the form of a programme entitled 'Many Cultures, One Nation'. The theme was welcomed by the company whose prime objectives included intercultural experimentation and empowerment through dance. The company consisted of trained Indian classical dancers, most of whom had graduated from different schools of dance from Durban and its surrounding areas in KwaZulu - Natal. Those members of the company who had been through a full training programme were entitled to teach the ancient art of Bharathanatyam, one of the four main classical dances of India.

Patrick Ngcobo was another classic example for influence Indian performing art forms on African countries, Mr. Patrick born in Durban, and was a Zulu Singer, He learned classical music from Padmasri Dr.K.J.Jesudas and performed and organized many programs in South African Lotus FM Radio.

In July 2016, our Indian Prime Minister, Sri Narendra Modi Visited a 5 day tour to African countries. In this picture it is evident that Indian Prime minister playing drums to pay respect to the traditionalistic aspect and culture of Tanzania. This is a typical example for exercising of Performing arts in cultural exchange and bilateral relations.

Conclusion

"For Africa and India, diversity is our lifeblood; it enriches us and makes us even stronger. It ensures that we value coexistence, dialogue, mutual understanding and peace. These are perspectives on the human development that India and Africa share, these are perspectives that we can together contribute to the rest of the world for handling conflicts and crises."

-Ex-President Pranab Mukherjee

International cultural policy focuses on cultural diplomacy: using art and culture to benefit international relations. To participate in the formulation and implementation of policies and programmes relating to India's external cultural relations, to foster and strengthen cultural relations and mutual understand between India and other countries. It is also intended to promote cultural exchange with other countries and peoples; to establish and develop relations with national and inter-national organizations in the field of culture;

After three successful summits, India extends its hand to strength the relationship with Africa by opening of 18 embassies in 18 African countries including Rwanda, Republic of the Cango, Eritrea, and in Liberia. The bilateral trade value reached 100 billion in the FY 2022-23.

India and African countries have vast history and tradition. They both have various diversities in tradition, language culture and ethnicity. Both are having their own traditional dance, music, art and sculptures. The friendship among these two countries is now closely observed by the global giants. It is clearly perceptible both the countries are trying to get closure to each other by exposing their cultural strength and vast historical ethnicity by exercising their own performing art forms in cultural relation programs and summits keeping the successful development in vision.

THE CONCEPTION OF MIND IN INDIAN PHILOSOPHICAL PERCEPTIVE

Dr.B.Sreenivasulu Naik
Assistant professor
Dept. of Philosophy,
S.V.University, Tirupati.

Abstract : In this paper I would like to discuss the place of mind in philosophical systems of India is briefly discussed. The philosophies selected are - Upanishads, Six systems of philosophies (saddarsanas), That mind is only an instrument of knowledge it is the internal sense-organ directed by the *Atman It is full of its content such as struggle, unhappiness and misery. Mind is full of symbols and images. It has collected its content through its experience. It is completely under the pressure of greed, jealousy, fear, imitation and obedience. So the mind is deformed and damaged. It is the storehouse of knowledge and memory.*

Keywords : Upanisads, saddarsanas, *Atman* and Indian Philosophy

The nature of mind and its constituents have been agitating the minds of philosophers for a long time. There have been various theories about the mind. But there is no doctrine that is completely satisfactory. Each theory conflicts with the other. Often the point of difference centre round the relation between mind and body. There are theories which are not only different from each other, but contradict each other. Either the mind is made subservient to matter or vice versa. Consequently many problems of perception and will are still being debated. Many thinkers have differentiated mind from body on the one hand and equated mind with the self on the other. If mind is pure body then the problem of will cannot be solved. If it is pure self, the problem of physical perception remains unsolved. Mind and body, as Ryle says, do not lend themselves to disjunctive treatment.

The Upanisads maintain that what are the necessary for knowledge is neither mere senses nor their proper functioning in conjunction with *manas*, but the Self which perceives through these. The self is often called either *prana* (breath) or *prajna* (intelligence). This is given in the form of a story. There is a dispute between the senses, *manas* and life as to superiority. The principle formulated is that which is most essential for existence is supreme. Each sense in turn leaves the body, and finds that for the existence of the body, it is

not essential. Finally, when the turn came for breath to leave the body, it was established that all others could not be without breath.

The mind is the internal sense-organ directed by the *Atman.* The mind directs the other sense-organs. This is revealed in the parable of the chariot in the Katha-Upanishad. A comparison is drawn between the chariot and man. *Atman* is the lord of the chariot. It is the enjoyer of the fruits of activity. Devoid of the *Atman*, the body has no meaning. This body is drawn into various channels of activity by the senses which are comparable to the horses. But the charioteer is the *buddhi* or intellect. It holds the reins which is *manas* and thus controls the horses. Here the word *manas* is used in a very restricted sense to mean only the characteristics of volition and doubt. And *buddhi* is used to mean intelligence.

According to Krishnamurti' *manas* is only an instrument of knowledge. The Self in Indian psychology has taken a different line of development than that of western psychology. The Self is that which is beyond the workings of the mind. So the aspects of *manas* and its working are described in great detail in the Upanisads. The cognitive aspect of mental life receives a great deal of attention. It is by the mind that one attains knowledge. Aitareya Upanisad says that the heart is the seat of the mind. We have various references to this in the Upanisads. If we examine some of the theories given by western thinkers regarding the seat of the mind, such as the Cartesian pineal gland, and the more common identification of the brain with the mind, this theory of the Upanisads does not at all sound absurd. The heart is the central organ on which the life of an organism depends. Without the heart there is no life, and similarly without mind there is no knowledge. The bodily functions such as movement and sensation are dependent on the working of both heart and mind. Hence the Upanishads maintain that the heart and the mind are fundamentally one. Because of the essential unity of the heart and the mind, they act together and perception is made possible.

The Nyaya and Vaisesika theories of *manas* are to a large extent similar and also identical. Although the Vaisesika Sutras lay their emphasis on the ontological aspect, the Nyaya Sutras emphasise, the epistemological aspect. Both these systems reflect the ideas of *manas* that are given in the Upanishads. As in the Upanishads, they do not regard *manas* the same as soul or *Atman*. They strengthen this idea by logical arguments. They prove that *manas* is material. According to the Vaisesikas *manas* is one of the categories, *dravyas* or substances. *Draya* is one of the categories or *padarthas*. A substance is that which has qualities. Soul or *Atman* is a substance, though spiritual in nature having spiritual qualities like intelligence. *Manas* is similarly one of the substances. The interest in *Atman* is here twofold. Negatively, it is shown that mind is the internal organ serving as the instrument of knowledge for the soul. Both the Nyaya and the Vaisesika systems maintain that *manas* is different from *Atman*.

Kanada gives us reasons which seek to prove the existence of *manas*. Both Nyaya and Vaisesika rely on the important factor of "attention" in their proof for the existence of *manas*. The dependence of intellectual activities, whether they be perceptual or conceptual, on attention is stressed and from this the instrument of intellection is inferred. The Vaisesikas have been led to acknowledge the existence of manas, because of the fact that though the sense organs are functioning, the self does not get any knowledge of the object. *Manas*

must be in contact with the object through the medium of the sense organ on the one hand, and with the self or the atman on the other hand. The sense-organs might be in contact with the object and the *manas* with the soul: still, if there is no contact between *manas* and the sense-organ, no knowledge can arise. That is why, though objects are before us, we do not see them: though sounds are heard we do not hear them i.e., get their meaning and understand them. *Manas* is occupied elsewhere and that the object on which the *manas* is concentrated or attending that alone is cognized by the Soul.

The Prabhakara Mimamsaka proves the existence of mind by pointing out that the qualities of the self such as buddhi, pleasure, pain, etc., would never become manifest but for the activity of the mind. The contact of the mind with the soul is necessary before cognition can take place. This mind along with the other five organs of perception constitute the six sense-organs. Internal organ of sense acts as the co-ordinator for the functions of the other external senses. It is the only way of perceiving mental states such as pleasure, pain, etc. The Mimamsa proves that the mind is atomic by arguing in the following way. Everything requires two kinds of causes, the material and the immaterial or the effective cause. The immaterial or effective cause always takes the form of either circumstances or qualities which by contact with the material cause produces the given effects. In the case of cognition, soul is the material cause because cognition is a specific quality of the soul. This atomic substance or the mind must also reside in the body, as otherwise no contact with the soul is possible. Mind is such an atomic substance. It by itself has no color or smell, but can bring into existence these things by contacting the organs such as the eye and the nose on the hand and the Atman on the other hand.

The Samkhya and Yoga theory says that there are three fundamental characteristics which are seen in everything that is experienced and they are *sttva* (intelligence stuff), *tamas* (mass and interia), and *rajas* (energy). *Prakrti* is defined in the Samkhya Sutras as "Primal matter which is the state of equipoise of *sattva*, *rajas* and *tamas*" (*Sattva-rajas tamasam-samya-vastha prakrtih*). Primal matter of *Prakriti* is nothing else but these three. But it does not mean that these are qualities which are to be found in a substrate which act as their receptacle.

The primal matrix, because of the proximity of Purusa who is pure intelligence, begins to create. The first product of creation is *mahat* or mind. This consciousness stuff, satta-matra, is the pure *sattva* where as *rajas* and *tamas* exits as subordinate elements. This is that which in its course creates two different aspects of our experience, viz. the material and mental. Vijnana Bhikshu characterizes this *mahat* as mind or *manas* in the sense that its function is thinking which is determinative in character. Thinking here means *niscaya* or judging.

In the Samkhya karika, we find a verse which not only says that "ascertainment is intellect" but also differentiate between two varieties of it. The Gaudapada Bhasya on the first part of this Sutra says,…"as in the seed the future germinating shoot is contained, so is determination (in intellect). This is a jar, this is cloth: that intellect which will so determine is to be so defined".

For Sankara the two words *manas* and *antahkarana* are interchangeable but due to division of functions, the same *manas* is referred to by various names as *manas, buddhi, ahamkara* and *citta. Manas* or *antahkarana* by itself is that which refers to the past, present and the future. This internal organ is that which controls and rules over the other organs of sense-perception. It is the apperceptive agent. In support of this Samkara says that *budhi*, which is the determinative aspect of *antahkarana*, is understood in five ways, corresponding to the cognitive organs. These along with the five *karmendriyas* are under the control of *manas* which is the chief indriya. It is problematic here whether Samkara meant the *manas* to be a sense-organ since *buddhi*, an aspect of the *antahkarana* is involved with the *jnanendriyas* during the process of perception, or whether he meant *manas* to be merely a co-ordinating factor, not having anything directly to do with the sense activities. *Manas* may be considered as that which co-ordinates the organs of perception and the organs of action. This would be something like the theory of the western physiological-psychologists who say that the motor and sensory impulses are controlled and directed by the brain which is the seat of the mind. The different aspects of the mental activities as given in the *Brhadaranayaka Upanishad* are here accepted by Samkara.

According to Krishnamurti mind is conditioned by past. It is full of its content such as struggle, unhappiness and misery. Mind is full of symbols and images. It has collected its content through its experience. It is completely under the pressure of greed, jealousy, fear, imitation and obedience. So the mind is deformed and damaged. It is the storehouse of knowledge and memory. Memory is material structure built in the brain by thought. A mind that is burdened with memory cannot possibly understand that which is real. Krishnamurti says, “Reality is not a thing which is knowable by the conditioned mind because the mind is the result of the known. Therefore the mind must understand itself and its functioning. Only then is it possible for the unknown to be.

Mind has to be free the past from at the psychological level. The understanding of the complications of the mind is the only factor of freedom. Freedom happens to be when there is the fundamental change in the psyche. It is the liberty of the mind from inner contradiction. Freedom liberates the mind from all formulas, from all constraints. It belongs to the realm of the unknown. Thought is useless to understand the unknown. It should realize the fact that it cannot work in the area of the unknown. It works only in the field that is already known to it. Thought has to realize that it cannot operate in the areas of the unknown. This is the only Truth that brings about a radical revolution in the brain cells, truth is the only liberating factor. The mind that does not perceive this will ever be in bondage. The panaceas, disciplines, sacrifices have no value in relation to truth.

Thought arises out of the past. It is a material process. Thought is the source of pleasure and fear. It records the past events and gives validity to them by giving them continuity. It is a measurement and comparison in terms of high or low, good or bad. Thought as measurement is a movement in time. It creates time by creating the picture of tomorrow. Thought having registered the biological pleasure or pain creates tomorrow of having or not having it again. Thought meets everything with a forced conclusion. It wants to

become something psychologically in time. Since thought implies time, the result of the past, it cannot know the truth which is ever new.

Thought is the cause of human predicament. It invents an ideal, the 'what should be' in order to be free from predicament. But the ideal is never obtained, since it is the result of desire. Mind must celibate itself without having any end in view. It must shed its hopes, knowledge, fears and all the content that is built by thought. It has to wipe away all the psychological accumulations. It must be unique by itself. Actual uniqueness lies in the discovery of what is true. This real individual uniqueness is not to be found in possessions either material or spiritual. It is to be found in understanding oneself by oneself. This uniqueness which is freedom comes through self understanding. Celibacy is to have a mind that is free from all images. It means understanding the whole process of fear and pleasure.

The mind is a store-house of memory. It is full of its attachments. It is dead with the weight of the past. One has to brush aside all the marks that experience has left on the brain cells. Then there comes an immense space in the mind. Death is the ending of all attachments to things, ideas and people. Death means the ending of the known, the cessation of all images. It is the ending of all the memory at the psychological level. It is possible only by submitting oneself to what is. One has to end the memory everyday that is acquired. According to Krishnamurti it is only when we die each day to all that is old that there can be the new. The new cannot be there where there is continuity. The new is the creative, the unknown, the eternal, or God. The conditioned mind cannot be the abode of freedom. It cannot meet the psychological death, the Unknown. The conscious part of the conditioned mind is at work in all daily activities. The conscious part of it is full of images. We try to bring transformation at the conscious, superficial layers of the mind. Our mind is keeping on with our hidden motives and formulas. The conscious mind is accustomed to respond according to the intensions of the unconscious mind.

In freedom the old mind with all its burden of knowledge comes to an end and so there is the beginning of the new mind which is spacious and empty. The empty mind is an innocent and sensitive mind. The new mind knows the art of observing, listening and learning. Art means putting everything in its right place. The new mind is not occupied with anything. The new mind is a perceptive mind. Perception is seeing the fact with one's whole being. It is seeing with a heart and mind which are completely cleansed of the past. The new mind is an attentive mind. Attention means the cessation of the psychological distance between the observer and the observed. Gandhiji's says that attention means complete attention, of the body and the psyche. The free mind is a religious mind which is not conditioned by its environment. The religious mind creates a holistic world, not the world of the Communist or the Capitalist, not of Brahmins or Roman Catholics. Religious mind demands a great honesty and a great sense of humility. It is not caught in experience and does not work for a belief or ritual. Religious mind has neither motive nor an end in view. It is an orderly mind which is true in itself. Being factual the religious mind understands the total quality of thought. So it is devoid of conflict, fear and authority. The religions mind is full of love in its true sense. Life devoid of true love is like a flower without fragrance. It is like the earth that has never grown a tree, a bush or a flower.

Religious mind does not belong to any cult, group or organized religion. It is not the Hindu mind, the Christian mind, the Buddhist mind or the Muslim mind. It is not the mind that goes to churches, temples or mosques. It does not entertain any from of belief or dogma. It does not belong to any group, sect, belief or church. Therefore it is capable of looking at things directly and understanding them immediately. It is a light to itself.

The religious mind is not fragmentary. It deals with facts, with what is actually happening in the world. It is capable of creating the true human being. A true human being is one in whom the scientific spirit and the true religious spirit go together. A true human being is one in whom there is a great honesty and a great sense of humanity. The religious mind is an orderly mind which is true in itself. It does not have any type of goals. It is utterly attentive to all outward and inward action. It is something entirely different from the mind that believes in an organized religion. It has a great sense of beauty which forms the basis for right relationship. Like a mirror it reflects the world within and the world without any distortion. Whereas the conditioned mind distorts the actuality according to the dictates of its own conditioning. The conditioned mind is full of images, hidden fears, urges and frustrations. It works like a photographic plate on which images have been permanently impressed. Whereas, the liberated mind works like a mirror in two way. Firstly, there is no distortion in its perception. It sees things exactly as they are. Secondly, there is no pathological accumulation of images in it. There is neither the thinker nor the images. It does not consciously eliminate the images. But the images eliminate themselves of their own accord instantaneously and effortlessly. The liberated mind is characterized by this quality of dying.

Conclusion

According to Indian Philosophical perceptive the human mind does not confine the human being to the conditioned mind. The human mind is limited to consciousness as we know it to be. The conditioned mind constitutes only a limited part of the brain. He is against the idea that there is nothing beyond the conditioned mind which is in utter confusion. He holds that there is an absolutely free mind beyond the conditioned mind. A radical transformation of the limited mind brings about the free mind. He says, “I realize that thought and thinker are very limited and I do not stop there”.

Transformation of the mind is possible when the conditioned mind is aware of itself without choice. Awareness should be devoid of choice, for choice is the product of the conditioned mind; choice is the movement of thought; there is no choice without the past. Awareness is observation in which the mind observes its nature without the observer.

Awareness is to be without the observer since the observer is the residue, the refuge, of the mind only; the observer is the thinker ‘who’ is thought itself; the thinker is only a modified continuity of thought. Awareness is alert passivity wherein the mind ‘holds’ the totality of the content without any remnant. In awareness the mind perceives the actuality of itself and realizes its truth. “Awareness is a state of being, in which truth can come into being, the truth of ‘what is”.

Radical transformation of the mind happens to be only when the mind directly faces the fact of its being totally. It takes place when the mind comprehends the fact of its being totally. An absolute observation of the fact of its structure brings about a radical transformation in the mind. He says, that the "Facts, if one observes carefully, in themselves bring about a change". But the mind always avoids the "understanding" of the fact of itself by verbalizing, justifying or condemning it: it prevaricates through the process of agreeing, disagreeing, affirming or denying. It deviates itself from the 'what is' of itself by interpreting, comparing or concluding it; it distorts the fact by suppressing, modifying or resisting it. The mind does not realize but only moulds the fact by identifying or recognizing it according to its own conditioning. The activities of verbalizing, justifying condemning and so on are only the movements of the mind in a modified from. Instead of bringing about a real change in the mind they merely manifest the mind in several different ways. They are the subtle means through which the mind chooses to continue itself endlessly.

The intelligent mind is a perceptive mind it does not experience but perceives the 'what is'. The conditioned mind experiences the 'what is' through knowledge, thought and time. Whereas the perceptive mind 'sees' the 'what is' from moment to moment. Its perception is without knowledge, thought and time. Perception is not experience. Experience is continuous whereas perception is momentary, without beginning and end. The first perception is the last perception. There is a total gap between two moments of perception. The one is not the continuity of the other. 'Perception, is like the light of a candle which has been put out and relit. The new light is not the old, though the candle is the same". The perspective mind 'sees' clearly the truth or the falsity of the 'what is' and dies to it completely. It does not reduce the moment of perception to memory by verbalizing it. It does not translate it in terms of thought. It does not create the continuity of the causal chain of the moments.

Only two things are significant for the free mind – intelligence and biological survival. Intelligence uses the factual thought strictly for biological survival. It guides thought in a proper direction and confines it to the physical realm. It does not allow thought to enter the 'psychological' world. It does not disturb the emptiness which is the foundation for harmonious human relations. It also forms the basis for peaceful so-existence of humanity. In freedom thought works 'though' intelligence, just as the sound of the drum is produced out of emptiness. Thought confines itself to technological realm. In freedom thought functions in the world with sanity, without going astray. It promotes a sustainable development of humanity. Intelligence is the only way of living a meaningful life. Bereft of intelligence life is absurd, full of problems. Intelligence is bliss which knows no sorrow. It is not touched by any of the human emotions or qualities which the conditioned consciousness is subjected to. So there are only two things left. The highest from of intelligence and survival which is entirely different from animal survival. Only then will humanity be good both at the technological and at the psychological level.

The Historical Background of Patanjali Yoga

Dr.B.Sreenivasulu Naik
Assistant Professor
Department of Philosophy,
S.V.University, Tirupati

Abstract

In this paper we discuss historical background of yoga, The science of Yoga is a psychology of a philosophical nature. The very introduction of the system of Yoga by Patanjali is by way of an instruction that the mind has to be controlled – Yogahs-chitta-vritti-nirodhah. Patanjali does go into the details of the philosophical background of the necessity to control the mind, the background that comes in Samkhya Indian philosophy. Simply explains that Yoga is control of the mind, restraint of the mind-stuff. Yoga is an experiential science. The most important benefit of yoga is it balances our physical and mental conditions.

Keywords : *yogah cittavritti nirodhah, Indian philosophy and Astanga-marga*

Yoga is one of six schools of Indian philosophy. These are Nyaya, Visheshika, Mimasa, Sankhya, Yoga, and Vedanta. A brief review of those six schools or systems will easily clarify the true nature of authentic Yoga being a system of spiritual pursuit. The word Yoga, in Sanskrit, has the meaning of "yoke", from a root yuj, to unite. To unite the body, mind, and soul to become one. Yoga is a physical work out with the mental benifits of calming and relaxing the mind. Together with the work of the body using asanas, (postures) connecting with our breath using the practice of pranayama.

As per Yogic scriptures the practice of Yoga leads to the union of individual consciousness with that of the Universal Consciousness, indicating a perfect harmony between the mind and body, Man & Nature. According to modern scientists, everything in the universe is just a manifestation of the same quantum firmament. One who experiences this oneness of existence is said to be in yoga, and is termed as a yogi, having attained to a state of freedom referred to as mukti, nirvana or moksha. Thus the aim of Yoga is Self-realization, to overcome all kinds of sufferings leading to 'the state of liberation' (Moksha) or ‘freedom’ (Kaivalya). Living with freedom in all walks of life, health and harmony shall be the main objectives of Yoga practice."Yoga” also refers to an inner science comprising of a variety of methods through which human beings can realize this union and achieve mastery over their destiny. Yoga, being widely considered as an ‘immortal cultural outcome’ of Indus Saraswati Valley civilization – dating back to 2700 B.C., has proved itself catering to both material and spiritual upliftment of humanity. Basic human values are the very identity of Yoga Sadhana.

Historical development of Yoga

Yoga is one of the oldest sciences of the world originated from India, which is very useful for both getting and maintaining the physical, mental and moral health. This yoga was started with the development of civilization. According to one of the classical texts of yoga known as Hatha yoga pradipika, Lord Shiva is the first teacher of yoga, where as Bhagavad-Gita tells Lord siva is the first teacher of yoga. Some historical researchers have proved that yoga was present during the time of Vedas. After the period of Vedas, a great sage Maharshi Patanjali systematized yoga, its meaning and its related knowledge through his Patanjali yoga sutras. After the Patanjali, many sages contributed greatly to the field through their practices and literatures.

*" **yogah cittavritti nirodhah** "*

"Yoga is the cessation of movements in the consciousness"

Yogameans union or integration from the outermost layer to the innermost self, that is, from the skin to the muscles, bones, nerves, mind, intellect, will, consciousness and self.

Cittameans consciousness, which is made up of three factors: mind (manas), intellect (buddhi) and ego (ahamkara). Citta is the vehicle of observation, attention, aims and reason; it has three functions, cognition, conation or volition, and motion.

Vritti means state of mind, fluctuations in mind, course of conduct, behaviour, a state of being, mode of action, movement, function, operation.

Nirodhahmeans obstruction, stoppage, opposition, annihilation, restraint, control, cessation.

Yoga is defined as restraint of fluctuations in the consciousness. It is the art of studying the behaviour of consciousness, which has three functions: cognition, conation or volition, and motion. Yoga shows ways of understanding the functioning of the mind, and helps to quieten their movements, leading one towards the undisturbed state of silence which dwells in the very seat of consciousness. Yoga is thus the art and science of mental discipline through which the mind becomes cultured and matured.

This vital sutra contains the definition of yoga: the control or restraint of the movement of consciousness, leading to their complete cessation.

Citta is the vehicle which takes the mind (manas) towards the soul (atma). Yoga is the cessation of all vibration in the seat of consciousness. It is extremely difficult to convey the meaning of the word citta because it is the subtlest form of cosmic intelligence (mahat). Mahat is the great principle, the source of the material world of nature (prakriti), as opposed to the soul, which is an offshoot of nature. According to Samkhya philosophy, creation is effected by the mingling of Prakriti with Purusa, the cosmic Soul. This view of cosmology is also accepted by the yoga philosophy. The principles of Purusa and prakriti are the source of all action, volition and silence.

Words such as citta, buddhi and mahat are so often used interchangeably that the student can easily become confused. One way to structure one's understanding is to remember that every phenomenon which has reached its full evolution or individuation has a subtle or cosmic counterpart. Thus, we translate buddhi as the individual discriminating intelligence, and consider mahat to be its cosmic counterpart. Similarly, the individuated consciousness, citta, is matched by its subtle form cit. for the purpose of Self-Realization, the highest awareness of consciousness and the most refined faculty of intelligence have to work so much in partnership that it is not always useful to split hairs by separating them. The thinking principle, or conscience (antahkarana) links the motivating principle of nature (mahat) to individual consciousness which can be thought of as a fluid enveloping ego (ahamkara), intelligence (buddhi) and mind (manas). This 'fluid' tends to become cloudy and opaque due to its contact with the external world via its three components. The sadhaka's aim is to bring the consciousness to a state of purity and translucence. It is important to note that consciousness not only links evolved or manifest nature to non-evolved or subtle nature; it is also closest to the soul itself, which does not belong to nature, being merely immanent in it.

Buddhi: possesses the decisive knowledge which is determined by perfection and experience. Manas gathers and collects information through the five senses of perception, jnanendriyas, and the five organs of action, karmendriyas. Cosmic intelligence, ego, individual intelligence, mind, the five senses of perception and the five organs of action are the products of the five elements of nature – earth, water, fire, air and ether (prthvi, ap, tejas, vayu and akasa) – with their infra-atomic qualities of smell, taste, form or sight, touch and sound (gandha, rasa, rupa, sparsa and sabda).

In order to help man to understand himself, the sages analysed humans as being composed of five sheaths, or kosas. They are annamaya, pranamaya, manomaya, vijjnanamaya, anandamaya.

The first three sheaths are within the field of the elements of nature. The intellectual sheath is said to be the layer of the individual soul (jivatman), and the blissful sheath the layer of the universal Soul (paramatman). In effect, all five sheaths have to be penetrated to reach emancipation. The innermost content of the sheaths, beyond even the blissful body, is purusa, the indivisible, non-manifest One, the 'void which is full'. This is experienced in nirbija Samadhi, whereas sabija Samadhi is experienced at the level of the blissful body.

The sadhaka is influenced by the self on the one hand and by objects seen, so that it does not become enmeshed by them. Through yoga, he should try to free his consciousness from the temptations of such objects, and bring it closer to the seer. Restraining the fluctuations of the mind is a process which leads to an end: Samadhi. Initially, yoga acts as the means of restraint. When the sadhaka has attained a total state of restraint, yogic discipline is accomplished and the end is reached: the consciousness remains pure. Thus, yoga is both the means and the end.

"*Vrttayah pancatayyah klishta aklistah***"**

The movements of consciousness are fivefold. They may be cognizable or non-cognizable, painful or non-painful. Fluctuations or modifications of the mind may be painful or non-painful, cognizable or non-cognizable. Pain may be hidden in the non-painful state, and the non-painful may be hidden in the painful state. Either may be cognizable or non-cognizable. When consciousness takes the lead, naturally the seer takes a back seat. The seed of change is in the consciousness and not in the seer. Consciousness sees objects in relation to its own idiosyncrasies, creating fluctuations and modifications in one's thoughts. These modifications, of which there are five, are explained. They may be visible or hidden, painful or not, distressing or pleasing, cognizable or non-cognizable.

It also explains that the consciousness involves the seer with the objects seen by it, and invites five types of fluctuations which can be divided and subdivided almost infinitely.

"*Pramanaviparyayavikalpanidrasmrtayah***"**

Pramana valid knowledge, experienced knowledge which is studied and Verified, proof, or evidence. They are caused by correct knowledge, illusion, delusion, sleep and memory. These five - fold fluctuations or modifications of consciousness are based onreal perception, or correct knowledge based on fact and proof; unreal or perception, or illusion; fanciful or imaginary knowledge; knowledge based on sleep; and memory. Consciousness has five qualitative types of intelligence: mudha (silly, stupid, or ignorant), ksipta (neglected or distracted), viksipta (agitated or scattered), ekagra (one-pointed or closely attentive) and niruddha (restrained or controlled). Since conscious intelligence id of five types, fluctuations are also. Wrong perceptions (viparyaya) are gathered by the senses of perception and influence the mind to accept what is felt by them (as in the story of the six blind men and the elephant). Fanciful knowledge (vikalpa) causes the mind to live in an imaginary state without consideration of the facts. Memory (smrti) helps one to recollect experiences for right understanding. Sleep (nidra) has its own peculiarity. As a jar when empty is filled with air, so consciousness is empty in sleep. It exists in space, without a place, and is filled with dormancy. In sleep, one has a glimpse of a quiet state of mind, manomaya. This dormant state of mind is felt only on waking. Just as a flower when at rest is in its bud, so the consciousness rests in its bud, the conscience. Correct knowledge (pramana) is direct knowledge from the core of the being. It is intuitive, therefore pure, and beyond the field of intellect. Direct knowledge leads man beyond the conscious state. This state of consciousness is called amanaskatva.

"*Abhyasavairagyabhyamtannirodhah***"**

Practice and detachment are the means to still the movements of consciousness. The fluctuations of consciousness, painful or non-painful, are to be controlled through repeated yogic practice. Mental strength must also be developed, to attain detachment and freedom from desires. Practice is involved in all the eight limbs of yoga. Evolutionary practice is the onward march towards discovery of the Self, involving yama, niyama, asana, and pranayama. The evolutionary path of renunciation involves pratyahara, dharana, dhyana and Samadhi. This inward journey detaches the consciousness from external objects. To be adept in yoga, yama and niyama must be observed carefully throughout the yogic sadhana. This is abhyasa. The discarding of ideas and actions which

obstruct progress in sadhana is vaIragya. Vairagya is a practice through which thesadhaka learns to be free from desires and passions and to cultivate non-attachment to things which hinder his pursuit of union with the soul. A bird cannot fly with one wing. It needs two wings to fly. To reach the highest spiritual goal, the two wings of yoga, abhyasaandvairagya are essential.

"*tapahsvadhyayaisvarapranidhananikriyayogah***"**

Burning zeal in practice, self-study and study of scriptures, and surrender to God are the acts of yoga. Tapas is the blazing desire to burn away the impurities of body, senses and mind.

Svadhyaya is the repetition of sacred mantras and the study of spiritual sacred texts in order to comprehend one's own self.

Isvarapranidhana is surrender of one's body, mind and soul to God through love for him.

Kriyayoga has come to have a wider connotation than the path of action, the path knowledge, or even the dedication of all actions to the Divine (karma, jnana, and bhakti-marga). This is because Isvarapranidhana means not only the surrender of the fruits of actions, but of all actions themselves to the Divinity. Love of God and the act of surrender to Him, is the path of bhakti. Hence, bhaktimarga too is encompassed by kriyayoga. The path of action (karma –marga) is the discipline (tapas) of body, senses and mind. The path of knowledge (jnana-marga) is the study of the self (svadhyaya) from the skin to the core and back again. The path of love of God (bhakti-marga) is surrender (pranidhana)of all to God. The first represents life, the second wisdom. The third, through the surrender of ego, brings the humility that leads to the effulgent, sorrow less light of Isvara, God

"*tasyavacakahpranavah***"**

He is represented by the sacred syllable aum. He is represented in aum. Aum is considered to be the symbol of divinity. It is a sacred mantra, and is to be repeated constantly. Aum is called pranava, which stands for praise of the divine and divinity. Sound is vibration, which, as modern science tells us, is at the source of all creation. God is beyond vibration, but vibration, being the subtlest form of his creation, is the nearest we can get to Him in the physical world. So we take it as His symbol. The letters a, u, m symbolize speech (vak). Mind (manas), and breath of life (prana). As leaves are held together by a twig, all speech is held together by aum. Aum is the ever last ring spirit, a symbol of serenity, divinity, majestic power, omnipotence and universality. They also represent the triad of divinity: Brahma the creator, Visnu the sustainer, and Siva the destroyer, of the Universe.

Yama	self- restraint, vows of abstention, control
Niyama	fixed observance, fixed rules, precepts, established order, law
asana	sitting in various postures, seat in general, a posture
pranayama	regulation of breath, restraint of breath
pratyahara	retreat, withdrawal of the senses
dharana	the act of concentration, act of holding, keeping the mind collected
dhyana	meditation, contemplation, reflection, attention

Samadhi	putting together, collection, composition, profound meditation, absorption, superconciousness

Moral injunctions (yama), fixed observances (niyama), posture regulation of breath (pranayama), internalization of the senses towards their source (pratyahara), concentration (dharana), meditation (dhyana) and absorption of consciousness in the self (Samadhi), are the eight constituents of yoga. In Pantanjali's system of duality, reality consists of two separate dimensions: purusha and prakriti. Purusha is pure consciousness, the transcendental Self, the immutable, eternal, attribute-less essence of life. Prakriti is creative energy-essentially everything else, not only physical matter in all its myriad manifestations but ideas, thoughts and subtle energy patterns. All is Prakriti. The world as macrocosm and the mind as microcosm both belong to prakriti, though the essence of both is purusha. The mind-as everything else in the three worlds-has both purusha and prakriti aspects. Because purusha is without attributes, it is difficult to say much about it. It is absolutely beyond the grasp of our senses and intellect, not to mention language. Prakriti, however, can be described in precise detail, and is in the Yoga Sutra. As purusha is pure consciousness, so prakriti is absolute insentience. All consciousness or awareness is the light of purusha shines upon the patterns of prakriti, making them luminous and apparent. As creative energy, prakriti is always moving, all manifestation never ceasing its dance of change and transformation. But despite this, the forms of prakriti in themselves remain devoid of consciousness. Prakriti is pure object, a shimmering mirror that the light of purusha illuminates with endlessly changing forms.

Yoga practice inverses this process. It is evolution in reverse. In yoga, one begins with the physical body and grosser forms of mind and works back through the subtler layers of prakriti to the ultimate source in purusha. Purusha is our true identity-at the core of all manifestation lies the absolute of pure awareness, the true nature of the mind. Vedanta calls this Atman, identical to Brahman, the Ultimate Transcendental Reality.(Atman in the microcosm, Brahman in the macrocosm, but this is only perspective. The Self is everywhere one.) Yoga calls this transcendental reality the purusha, but it is the same thing. The goal of yoga is total realization of this purusha nature, of pure bliss consciousness-our True Identity. This necessarily involves a detachment from all that is finite, temporal and limited, from all that is prakriti.

Legal Rights of Girl Child: Indian scenario

Dr. I.V.Lalitha Kumari, Professor, Dept. of Social Work, Sri Padmavathi Mahila Visvavidyalayam, Tirupati, A.P-517502.
&
Dr.T.Chandrasekarayya, Associate Professor, Dept. of Population Studies & Social Work, S.V.University, Tirupati, A.P-517502.

Abstract

International Day of the Girl Child increases awareness of issues faced by girls around the world. International Day of the Girl Child is an international observance day declared by the United Nations; it is also called the Day of Girls and the International Day of the Girl. October 11, 2012, was the first Day of the Girl Child. In 2022, we commemorate the 10th anniversary of the International Day of the Girl (IDG). In these last 10 years, there has been increased attention on issues that matter to girls amongst governments, policymakers and the general public, and more opportunities for girls to have their voices heard on the global stage. Yet, girls' rights remain limited and girls around the world continue to face unprecedented challenges to their education, their physical and mental wellness, and the protections needed for a life without violence. The paper aims at discussing Legal Rights of Girl Child and their situation in Indian scenario based on secondary data.

Keywords

Female Foeticide, Education, Safe environment, Abusive, Stridhan, Child marriage, Sexual harassment and Work place

Introduction

India's population of the girl child and adolescents is 253 million as per UNICEF report and the sex ratio at birth is 929 per 1000 male children as per NFHS-5. Girl is considered of no value in her parental home. Out of 12.5 million children married in India, 8.9 million are girls as per UNICEF report. India is the only large country in the world where more baby girls die than baby boys. The gender differential in child survival is currently 11 per cent, states UNICEF. A woman gives birth to a daughter the new mother risks being shamed and abused by her own family. A daughter may be considered a financial burden and likely not be able to support her and her husband in their older age. A strong preference for sons is a consequence of patriarchal and 'patrilineal' societies that favour men in both power and status. It can be most pronounced in highly agricultural and subsistence societies. These systems value sons over daughters because family assets are passed through male family members (patrilineal), and the greater earning potential of men in patriarchal societies leads

households to rely on boys as future supports as parents age. Though there are many laws in favour girl children in India, practices, such as, female foeticide, female infanticide, child marriage, malnutrition, exploitation, child trafficking, neglect and discrimination, child mortality and child abuse. In addition, opportunities need to be promoted to facilitate education and employment opportunities among them.

Objective and method

The main purpose of this research paper is to acquire an understanding of status of girl child in India. The paper aims at discussing the legal rights of girl children and examines the prevailing situation in India based on secondary data collected through various sources. It will helpful to create awareness on the legal rights of girl children and their situation in India.

Discussion

The legal rights of girl children in India and their prevailing situation briefly discussed hereunder.

Right against female Foeticide

Female foeticide refers to a practice which removes the female foetus after 18 weeks of growth in the uterus. It has been still practicing at high rate all over India though the government of India banned pre-natal sex determination under the PC-PNDT Act 1994. It was enacted on 20 September 1994, amended and effectively implemented in 2003 and strictly amended in 2011with the intent to prohibit prenatal diagnostic techniques for determination of the sex of the foetus leading to female feticide. Therefore, one cannot find out the sex of their unborn child till birth. Though it has been illegal in India since 1996, at least 9.0 million (0.9 crore) female births went “missing” between 2000 and 2019 because of female-selective abortions, as per Pew Research Centre. However, the average annual number of baby girls “missing” in India fell from about 480,000 (4.8 lakh) in 2010 to 410,000 (4.1 lakh) in 2019, the Center’s analysis finds (Yunping Tong, 2022). According to Amartya Sen (1990) around 37 million females missing from the Indian population, caused by a deepening crisis of gender inequality that had led to the widespread practice of sex selective abortions, female infanticide and neglect of girl-children. Gender-biased sex selection is a profound form of discrimination that results from the combination of three factors: strong preferences for sons within a society, the rising use of modern technologies, and generally declining fertility rates.

Right to Education

The Right to Education Act, 2009, provides all children between the ages of 6 and 14 years the right to free and compulsory elementary education. Although this law is gender-

neutral, it gives a push to the education of girl children, by giving them enhanced access to schooling. Further, the recent National Education Policy (NEP) 2020 envisages equitable and inclusive education for all, with special focus on children and youth, especially girls, from socially and economically disadvantaged groups. The policy's focus is important because despite effort to educate women, the dropout rate for girls is still high after secondary education. The enrolment ratio too dips at the secondary and higher secondary levels. Among many reasons, the onset of menstruation and the lack of availability of hygienic toilets are responsible for girls leaving school without completing education. The National Family Health Survey-5 (2019-21) indicates that over 21,800 girls who had dropped out of school before the 2019-20 school year, just over 13% girls did so as they were required for house work and almost 7% did so as they were married off even though child marriage is illegal. UNICEF's U-Report poll (2022) reveals that 38% of respondents knew at least one female student to have dropped out of school.

Right to be raised in a safe environment

All children, including female children, have the right to be brought up in a safe and protected environment. The Juvenile Justice Act, 2015 makes it illegal for parents and guardians of children to abuse, assault, neglect, or abandon a child. Study on Child Abuse: India (2007), out of the total working children, 23.2% was child domestic workers. Among these 81.16% were girls. Out of all child domestic workers, 44.19% were in the age group of 5-12 years followed by 33.27% in the age group of 15-18 years and 22.54% in the age group of 13-14 years. Further, the study reveals that majority of the girl child respondents (70.57%) reported neglect of one form or the other by family members. 48.4% of the girls reported having gone through such feelings as less attention, less food, less time for recreation, more household work, etc. an overwhelming majority 68.99% reported physical abuse, out of which most of the respondents (54.68%) were boys. UN Women supported survey, 2013 in Delhi shows 95 per cent of women and girls feel unsafe in public spaces.

Right against abusive family members

The Domestic Violence Act, 2005 protects all females from any kind of physical, emotional, sexual, or financial abuse by family members. The protection extends to all family members with whom the female shares a house-including her own family members like parents, siblings, uncles, aunts, etc. Therefore, this law protects female children from being abused at home. But, the Ministry of Women and Child Development (MWCD, 2007) released a study report on child abuse. Of the young adults (ages 18-24)

interviewed, almost half of them reported having been physically or sexually abused as children.

Right to stridhan

'Stridhan' is the property of a female, both movable and immovable, which is her own. It can be a gift, inheritance, maintenance, or even her own earnings. Only she has rights over her 'stridhan' and she can exclusively decide what she wants to do with it. This law applies only to Hindus. Since 2005, Hindu women have equal rights as men to inherit property. Therefore, a girl can inherit the same amount of property as her brother. Inheritance can be through a Will or through succession (if the deceased person does not leave a Will, the property will pass on to legal heirs according to the law). Supreme Court of India passed a landmark judgement declaring that all gifts made over to a woman at the time of her marriage remained her absolute private property till the end; and that her husband, or any other, had no right to them without her sanction.

Right against child marriage

The minimum age of marriage for girls is 18 years (and for boys, it's 21 years). Any adult responsible for marrying a female child under the age of 18 can be punished by law. Interestingly, the Parliament is now looking to increase the marriageable age for girls to 21 years now (on par with boys). In spite of the Prohibition of Child Marriage Act (2006), the practice of child marriage remains pervasive due to factors spread across the socio-ecological spectrum, including structural inequalities and regressive social norms in India. Girls with either no or below primary level education have experienced higher levels of child marriage. As per theNFHS-5, 23.3% women got married before attaining the legal age of 18 years from 26.8% reported in NFHS-4 and 48% of girls with no education were married below 18 years of age as compared to only 4% among those who attained higher education

Right against sexual harassment

Sexual harassment broadly means any kind of unwelcome physical contact, sexual gestures, comments, sexual advances, requests for sexual favours, etc. by a man to a woman. Indian law protects all women from sexual harassment by men. By virtue of this law, every girl child in India is protected against sexual harassment. Sexual violence is a major problem faced by women and girls in India. It is already a challenge for survivors to obtain justice in the Indian legal system, and those from the country's marginalized communities face even more major barriers. According to official crime data, there were 3,486 reported cases of rape against Dalit (Scheduled Caste) women and girls in 2019, and 1,110 reported rape cases against Adivasi women and girls (Scheduled Tribes). According to the latest National Family

Health Survey (NFHS-5), nearly 1 in 3 Indian women age 18-49 have suffered some form of spousal abuse; and around 6% have suffered sexual violence. Study on Child Abuse: INDIA 2007 reveals that among respondents, 48% of boys and 39% of the girls faced sexual abuse. The prevalence of sexual abuse in upper and middle class was found to be proportionately higher than in lower or in lower middle class. Sexual abuse was found to be prevalent in both joint and nuclear families.

Right against sexual harassment at work place

It is common for young girls these days to intern or work in offices, while they are still studying. The Prevention of Sexual Harassment at Workplace Act 2013 protects all female workers, whether they are full-time, part-time, consultants, or even interns, against any kind of sexual harassment at work. It defined sexual harassment; lay down the procedures for a complaint and inquiry, and the action to be taken. It broadened the Vishaka guidelines, which were already in place. As per NCRB Report 2020, total cases of sexual harassment reported stood at 17,003 in 2020, down by 1,331 cases from 2019's 18,334. With most people working from home in the last year, only 485 incidents of workplace sexual harassment were reported, down marginally from 2019's 505 cases.

Right to abortion

Abortion was legalized in the country in 1971. A female child has the right to abortion to terminate an unwanted pregnancy. The Medical Termination of Pregnancy Act, 1971 permits a minor girl to have an abortion, with the written consent of her guardian. However, abortion is only permitted under special conditions like if the pregnancy is 'likely to cause injury to the physical or mental health of the pregnant women'. At least 7% of all women aged 15-19 years began child-bearing in 2019-21, as per National Family Health Survey-5. Teenage pregnancies are higher in rural India (8%) than urban (4%). UNFPA's State of the World Population in 2008 suggested that teen pregnancy in India is high with 62 pregnant teens out of every 1,000 women. In 2015, abortions among teenage girls had seen an alarming rise at 67 per cent. Abortion among girls under the age of 15 in Mumbai has risen by 144 per cent over the last three years as per BMC (The Times of India, 2015).

Conclusion

India is home to 20 per cent child population of the world. Here, nearly 100 million children fall in the poorest wealth quintile. Though the girl children has legal rights, they facing many problems such as Female infanticide and Foeticide, Early Marriage, better education, health, Neglect and Discrimination, Trafficking, Abuse , exploitation and Violence etc. However, The opportunity to be born, opportunity to grow in a safe and secure

environment, opportunity to develop ones' full potential are some of the major issues concerning the girl children in India must be taken into account for giving girl children their due position in India.

Women's Empowerment in India:A critical analysis based on NFHS-5

Dr.K.V.Sunil Kumar[1] and Dr.T.Chandrasekarayya[2]
[1]Academic Consultant,and [2]Associate Professor, Dept. of Population Studies, S.V.University, Tirupati, A.P.

"You can tell the condition of a nation by looking at the status of its women."

- Jawaharlal Nehru

Abstract

Women's empowerment refers to the process of enabling women to have greater control over their lives and to be able to make their own decisions. This can include empowering women to participate fully in the economy and in the political process, as well as empowering them to make decisions about their own health and well-being. It is the key to improving their participation in decision-making, which is the most crucial factor in socio-economic and cultural development. India is a developing country, has a very poor economic status of females due to its male-dominated nature. Women constitute roughly 50 per cent of the country's population, and most of them are still economically dependent, unemployed, and in many ways inferior to men. However, women's empowerment is very necessary to create a bright future for the family, society and country. Empowering women would mean encouraging women to self-sufficiency, financial independence, positive self-esteem, creating confidence in difficult situations and active participation in various socio-political development endeavours. The paper aims at examine the six key indicators on women empowerment, based secondary data collected from NFHS-5 by taking descriptive research design and suggestions are made to empower women in India.

Key words

Women Empowerment, Household Decisions, Work Participation, Own of Property, Access to Bank & Mobile Phone, and Health withHygienic

Introduction

Women's empowerment can be defined to promoting women's sense of self-worth, their ability to determine their own choices, and their right to influence social change for themselves and others. It means increasing and improving the social, economic, political and legal power of women, ensuring equal rights and sufficient self-confidence for women to claim their rights and develop independently. Women's empowerment equips and allows women to make life-determining decisions through the different societal problems.The empowerment of women is a key aspect in achieving gender equality, where men and women

have equal power and opportunities for education, health, economic participation and personal development. The empowerment of women is essential for the health and social development of families, communities and countries. Panda (2017) opined that the empowerment of women is not a necessary fact for our country, but it is necessary for the sustainable development of the nation. When women live safe, satisfied and productive lives, they can reach their full potential. In addition, they contribute their skills to the workforce and can raise happier and healthier children. Women are key factors in the economy and play an important role in the workforce and contribute to the growth and development of the family, society and nation. India's journey towards women empowerment has its ups and downs.

Seema Singh and Antra Singh (2020) concluded that while thinking about improving educational attainment and political participation, the downward trend in economic participation and opportunity and health and survival segment has been quite significant.Women empowerment refers to women's ability to make strategic life choices that were previously denied themAs India progresses economically, the country is encouraged to pay more attention to social and human development, including women's empowerment. The equal rights of men and women are enshrined in Articles 14 to 16 of the Constitution of India, which came into force on 26 January 1950 (Constitution of India, 2020). Empowerment refers to a situation where the powerless gain greater control over resources and ideologies. It is associated with concepts such as autonomy, power, status and agency. The empowerment of women in India is highly dependent on several variables which include geographical location (urban/rural), social status (caste and class), educational status, marital status, religion and age. As a traditional patriarchal society, women have been given a secondary status, which is reflected economically, socially and politically. However, women's equality and empowerment has always been a priority and taken very seriously by stakeholders (Seema Singh and Antra Singh, 2020).

Review of Literature

Shettar (2015) concludes that access to education; employment and changes in the social structure are only factors contributing to the empowerment of women. Khatri (2016) focuses on the impact of literacy and education on the empowerment of women and a proposal to improve the changes considered for the empowerment and economic development of women. Suresh and Sivakumar (2017) found that the empowerment of women is essentially a process that raises the economic, social and political status of

traditionally disadvantaged women in society. It is a process to protect them from any kind of violence. A study by Banashri Mandal (2018) shows that women empowerment means increasing and improving the social, economic, political and legal power of women to ensure equal rights for women and make them confident enough to demand their rights.SangeethaMenon et al (2020) examined at indicators of women's empowerment such as women's decision-making power in domestic affairs, economic autonomy, also freedom of movement and access to education. Sobha Rani (2023) states that the empowerment of women would mean giving women financial independence, self-confidence and positive evaluation so that they can face difficult situations and participates in development activities.

Objective

1. The paper examines the six key indicators of women empowerment in India and
2. Suggest measures to improve women status in India.

Methodology

The paper is descriptive in nature also based on secondary data collected from NFHS-5 (National Family Health Survey-2019-21) for India and 14 States /UTs included in two Phases of the Survey and gathered information from 6,36,699 households covering 7,24,115 women of aged 15-49 years. The six key indicators of women empowerment considered in paper are:1. Currently married women who usually participate in three household decisions (Decisions about health care for herself, making major household purchases, and visits to her family or relatives), 2. Women who worked in the last 12 months and were paid in cash 3. Women owning a house and/or land (alone or jointly with others) 4. Women having a bank or savings account that they themselves use, 5. Women having a mobile phone that they themselves use and 6. Women age 15-24 years who use hygienic methods of protection during their menstrual period (Locally prepared napkins, sanitary napkins, tampons, and menstrual cups are considered to be hygienic methods of protection.)

Results and Discussion

The women empowerment aspects such as participation of women in household decision, paid work, Ownership of house/land, Access to mobile phone and bank and Practice of Menstrual Hygiene are briefly discussed hereunder.

Women in Household decision

One of the characteristics of women's empowerment is decision-making. The participation of women in household decision-making can reduce the perceived gender inequality. Nowadays, married women reveal their position in the family, usually involved in making three household decisions (e.g. self-care, important household purchases, and

visitingfamily or relatives).Acharya,et al. (2010) found that almost half (47.1%) of ever-married women made their health care decisions alone or with their spouse. This proportion is 52.8% for large household purchases, 57.6% for everyday household purchases and 56.6% for family/friends.

Table-1: Currently married women who usually participate in three household decisions

Source: Government of India; 2019-21: Ministry of Health And Family Welfare, Compendium of Fact Sheets, India and 14 States/UTs (Phase-11), National Family Health Survey (NFHS-5)

Table-1 depicts that currently married woman (aged 15-49) who usually participate in three household decisions like health care for herself, making major household purchases, and visits to her family or relatives has been slightly increased from NFHS-4 to NFHS-5. Further, women who reside in urban areas have more involved in household decisions than their rural counterparts. Women who participated in household decisions were differing by states and union territories.

Participation in paid works

Paid work is still the privilege of few women around the world, although it can be said that all women work. One of the main factors preventing women from controlling household decisions is the value of the work they do. There is substantial evidence that women in India have limited opportunities to participate in paid work outside the home (Mehrotra et al., 2016).

Table-2: Per cent of women who worked in the last 12 months and were paid in cash

Source: Government of India; 2019-21: Ministry of Health And Family Welfare, Compendium of Fact Sheets, India and 14 States/UTs (Phase-11), National Family Health Survey (NFHS-5)

Table-2 portrays that currently married woman (aged 15-49) who worked in the last 12 months and were paid in cash has been meagrely increased from NFHS-4 to NFHS-5. Further, women who reside in urban areas have worked in the last 12 months and were paid in cash than their rural counterparts. Women who worked in the last 12 months and were paid in cash were more or less similar in many states and but differ in union territories.

Ownership of house/land

Women's access to and control over productive resources, especially ownership of agricultural land, is key to their economic empowerment, social status, physical security, and their own and their families' overall well-being. It also analyses intra-gender gaps, and identifies the factors–individual, household and regional–affecting a woman's likelihood of owning land. Despite significant advancement towards equality in inheritance laws, women are found to constitute barely 14% of landowners owning 11% of agricultural land in rural landowning households, averaged across states. (Agarwal, B., et al, 2020).

Table-3: Percent of women owning a house and/or land (alone or jointly with others)

S.No	India/ State/ Union Territory	NFHS-5(2019-21)			NFHS-4 (215-16)
		NFHS-5(2019-21)			NFHS-4 (215-16)
		Urban (%)	Rural (%)	Total (%)	Total (%)
1.	India	38.3	45.7	43.3	38.4
2.	Arunachal Pradesh	69.8	70.3	70.2	59.7
3.	Chhattisgarh	46.1	45.5	45.6	26.4
4.	Haryana	35.7	41.0	39.3	35.8
5.	Jharkhand	57.4	66.5	64.2	49.7
6.	Madhya Pradesh	35.8	41.3	39.9	43.5
7.	Odisha	35.4	45.5	43.5	63.5

Government of India; 2019-21: Ministry of Health And Family Welfare, Compendium of Fact Sheets, India and 14 States/UTs (Phase-11), National Family Health Survey (NFHS-5)					

Table-3 reveals that women owning a house and/or land (alone or jointly with others)have been significantly increased from NFHS-4 to NFHS-5. Further, significantly higher per cent of rural women owned a house and/or land (alone or jointly with others) than women reside in urban areas. Women who owning a house and/or land (alone or jointly with others)were significantly varied in many states and but differ in union territories.

Access to Bank

Financial inclusion is essential for economic growth and sustainable development; for women, it is a pathway to economic and social empowerment. Expanding financial access for women is proven to have a positive impact not only on the women themselves but, consequently, on household incomes. Banks as part of their programs facilitate women by providing personalised banking services which are designed specially according to their needs and preferences. Jan DhanYojana is an initiative towards financial inclusion which also paves way for women financial empowerment. ShrutiJha (2019) stated that various initiatives are being implemented and more to roll out, Indian women is on the way of empowerment, socially and financially, to reach towards the goals of gender equality and empowerment.

Table-4: Per cent of women having a bank or savings account that they themselves use

		Urban (%)	Rural (%)	Total (%)	Total (%)
1.	India	80.9	77.4	78.6	53.0
2.	Arunachal Pradesh	86.0	76.7	78.2	56.6
3.	Chhattisgarh	77.9	81.1	80.3	51.3
4.	Haryana	76.3	72.4	73.6	45.6

15.	Puducherry	90.9	96.6	97.9	85.0

Source: Government of India; 2019-21: Ministry of Health And Family Welfare, Compendium of Fact Sheets, India and 14 States/UTs (Phase-11), National Family Health Survey (NFHS-5)

Table-4 shows that women having a bank or savings account that they themselves use have been significantly increased from NFHS-4 to NFHS-5. Further, significantly higher per cent of urban women having a bank or savings account that they themselves use than women reside in rural areas. Women who women having a bank or savings account that they themselves use were significantly varied in many states and but differ in union territories.

Access to mobile phone

Many have heralded mobile phones as promising new tools for women's empowerment in the Global South. The mobile phone revealed the opportunities and freedom of women to make their own choices, improve their social network, change attitudes and change their lives. The mobile phone is changing the general socio-economic, political and psychological life of women. Only 28% of all 612 million women own mobile phones, compared to 43% of men. The gender gap in mobile phone ownership is as high as 114 million. "Gender inequality is relatively large and widespread in India, affecting women's access to and use of mobile phones.Ashim Nandi (2021) found that mobile phone use generally facilitates women's empowerment, but mobile phone use does not support women's empowerment in a male-dominated economy.

Table-5: Per cent of women having a mobile phone that they themselves use

S.No	India/ State/ Union Territory	NFHS-5(2019-21)			NFHS-4 (215-16)
		Urban (%)	Rural (%)	Total (%)	Total (%)

Source: Government of India; 2019-21: Ministry of Health And Family Welfare, Compendium of Fact Sheets, India and 14 States/UTs (Phase-11), National Family Health Survey (NFHS-5)					

Table-5 illustrations that women were having a mobile phone that they themselves use have been significantly increased from NFHS-4 to NFHS-5. Further, significantly higher per cent of urban women having a bank or savings account that they themselves use than women reside in rural areas. Women who women having a mobile phone that they themselves usewere significantly varied in many states and but differ in union territories.

Practice of Menstrual Hygiene

Poor menstrual hygiene,however, can lead to serious health risks, such as reproductive and urinary infections, which in the future can lead to infertility and birth complications. Not washing your hands after changing menstrual products can spread infections such as hepatitis B and thrush. Dasgupta and Sarkar(2008) found that 78 (48.75%) girls knew how to use sanitary napkins during menstruation. Of the practices, only 18 (11.25%) girls used sanitary napkins during menstruation. When cleaning, 156 (97.5%) girls used both soap and water. Singh, A., Chakrabarty, M., Singh, S. jt 2022)

Table-6: Per cent of women age 15-24 years who use hygienic methods of protection during their menstrual period

S.No	India/ State/ Union Territory	NFHS-5 (2019-21)			NFHS-4 (215-16)
		Urban (%)	Rural (%)	Total (%)	Total (%)
1.	India	89.4	72.3	77.3	57.6
2.	Arunachal Pradesh	93.5	91.4	91.8	73.4
3.	Chhattisgarh	83.2	64.8	68.8	47.1
4.	Haryana	96.7	91.6	92.2	78.3
5.	Jharkhand	88.2	70.8	74.9	49.6
6.	Madhya Pradesh	81.9	53.4	60.5	37.6
7.	Odisha	91.7	79.5	81.5	47.4
8.	Punjab	95.4	91.1	93.2	84.4
9.	Rajasthan	92.2	81.9	84.1	55.2
10.	Tamil Nadu	98.6	98.0	98.3	91.4
11.	Uttar Pradesh	86.7	68.4	72.6	419.1
12.	Uttarakhand	94.5	89.7	91.2	69.9
13.	Chandigarh	93.3	-	93.0	92.1
14.	NCT Delhi	96.9	98.4	96.9	90.0
15.	Puducherry	99.1	99.1	99.1	96.5

Source: Government of India; 2019-21: Ministry of Health And Family Welfare, Compendium of Fact Sheets, India and 14 States/UTs (Phase-11), National Family Health Survey (NFHS-5)

Table-6 depicts that women age 15-24 years who use hygienic methods of protection during their menstrual period (Locally prepared napkins, sanitary napkins, tampons, and menstrual cups are considered to be hygienic methods of protection) have been significantly increased from NFHS-4 to NFHS-5. Further, significantly higher per cent of urban women having a bank or savings account that they themselves use than women reside in rural areas. Women who women having a mobile phone that they themselves use were significantly varied in many states and but differ in union territories.

Conclusion

Most of the currently married women (aged 15-49 years) have usually participated in three household decisions. But, only about one-fourth of currently married woman (aged 15-49) had worked in the last 12 months and was paid in cash. On an average, less than half of women were owned a house and/or land (alone or jointly with other). Nearly four-fifths of women had a bank or savings account that they themselves used. Nearly half of the were having a mobile phone that they themselves used and nearly four-fifths of women aged 15-24 years had used hygienic methods of protection during their menstrual period by way of locally prepared napkins, sanitary napkins, tampons, and menstrual cup. However, the six

empowerment aspects examined have been increased from NFHS-4 to NFHS-6 period, but rural-urban differentials were observed. Based on the findings, it is suggested that gender discrimination can be reduced by creating awareness on need of women empowerment and their benefits. Further, apart from new programmes, existing women empowerment policies should strengthen in rural areas, where in more women are residing. Women empowerment helpsthe women to handle their issues in better.It can direct them towards progress and development by channelizing their energies and efforts into productive purposes, thus creating gender equality and accelerating the speed of development of the Indian economy.

Determinants of the performance achieved by the Auxiliary Nurse Midwifes under MCH Services in National Rural Health Mission - A study

Valluri Venkata Vara Prasad, PhD Scholar & Dr.T.Chandrasekarayya, Associate Professor,
Dept. of Population Studies & Social Work, S.V.University, Tirupati, A.P-517502.

Abstract

India's Primary Health Care and the Family Planning Programs have come a long way after the independence in improving health indicators in general, yet it has high 'maternal' and 'under five' mortality rates. However, a lot of ground still needs to be covered to complete the demographic and epidemiological transition and improve Maternal and Child Health Indicators in a country which is as big as a continent. It is important to understand why the role of Auxiliary Nurse Midwifes (ANMs) changed from primarily a Midwife in 60s to a Preventive Health Worker with focus on Family Planning and Immunization. Changes in Program Priorities - emphasis on Preventive Services, lack of focus on Curative/Midwifery Services, changes in monitoring mechanism, lack of supervision/training, weak management, neglect by International Agencies and NGOs are major factors associated with this change. The present study aims at examines the Determinants of the performance achieved by the Auxiliary Nurse Midwifes under MCH Services in National Rural Health Mission. It is based on primary date by covering the sample size of 175 Auxiliary Nurse Midwifes with simple random sampling technic and suggestions are made for policy implications

Keywords

Auxiliary Nurse Midwifes The National Rural Health Mission, Maternal and Child Health, Health Care System, Performance and Rural Areas.

Introduction

The National Rural Health Mission (NRHM) launched by the Hon'ble Prime Minister on 12th April 2005 throughout the country with special focus on 18 states, including eight Empowered Action Group (EAG) states, the North-Eastern states, Jammu & Kashmir and Himachal Pradesh seeks to provide Accessible, Affordable and Quality Health Care Services to Rural Population, especially the Vulnerable Sections. The NRHM operates as an omnibus broadband programme by integrating all Vertical Health Programmes of the Departments of Health and Family Welfare including Reproductive & Child Health Programme and various Diseases Control Programmes. The NRHM has emerged as a Major Financing and Health Sector Reform Strategy to strengthen States Health Systems. The National Rural Health

Mission (NRHM) has been launched with a view to bringing about dramatic improvement in the Health System and the health status of the people, especially those who live in the Rural Areas of the Country. The Mission seeks to provide Universal Access to Equitable, Affordable and Quality Health Care which is accountable at the same time responsive to the needs of the people, reduction of Child and Maternal Deaths as well as Population Stabilization, Gender and Demographic Balance. In this process, the Mission would help achieve goals set under the National Health Policy and the Millennium Development Goals during the Mission Period i.e., 2005-2012. Later, the Mission Period has been extended up to 2017. To achieve these goals NRHM will:

- ✓ Facilitate increased Access and Utilization of Quality Health Services by all.
- ✓ Forge a partnership between the Central, State and the Local Governments.
- ✓ Set up a platform for involving the Panchayat Raj Institutions and Community in the management of Primary Health Programmes and Infrastructure.
- ✓ Provide an opportunity for promoting Equity and Social Justice.
- ✓ Establish a mechanism to provide flexibility to the States and the community to promote Local Initiatives.
- ✓ Develop a framework for promoting inter-spectral convergence for Promotive and Preventive Health Care.

The Objectives of the NRHM Mission

The influences of major determinants like a) Socio-Demographic Characteristics viz., Age, Marital Status, Religion, Caste, Education, Income b) Awareness on NRHM Goals and c) Professional Factors like Experience and Transfers on the performance rendered under MCH Services by the ANMs were presented. MCH Services viz., 1). ANC Registration, 2). IFA Tablet Distribution, 3). TT(PW), 4). Total Deliveries, 5). Institutional Deliveries, 6). BCG, 7). OPV, 8). Hepatitis-B, 9) Fully Immunized and 10). Family Planning Cases of the ANMs for the last two years have been taken as the dependent variable, and the influence of different factors like Socio-economic, demographic, knowledge and professional factors on it have been analysed.

Review of Literature

A study on Factors governing the performance of Auxiliary Nurse Midwives in Pune district, India by Pyone T et al concluded that focusing on the tasks of ANMs with technical inputs alone is insufficient to achieve the full potential of ANMs in a changing context. Systematic efforts tackling factors governing ANMs in their workplaces can produce a useful cadre that can play an important role in achieving universal health coverage in India. Razee

.H et al (2012) focussed on 'Listening to the rural health workers in Papua New Guinea-the social factors that influence their motivation to work'. Sunder Gujral (1991) studied the determinants of community health workers' performance in India. Bhombe, Ishwari et al (2019) studied the workload and work pattern of ANMs and identify the causes for improving work efficiency of ANMs and conclude that clarity about job responsibilities of ANMs is lacking and available working time is not effectively utilized. Time spent on supporting tasks such as travel and waiting is maximum and training to manage time for priority tasks and to improve skills is required. Factors influencing ANMs in their practices, scope of work and the mechanisms that influence ANMs' performances remain understudied. According to Zahra Hadizadesh Talasaz, Shahla Nourani Saadoldin et al, Mashhad, Iran, (2014), the mean age of the participants was 39.63±6.92 years. Spearman Correlation Test showed a direct correlation between Job Satisfaction and the Total Score of Job Performance ($P<0.001$, $r=0.490$). A direct relationship was also found between Job Satisfaction and the quality of Educational Performance ($P<0.001$, $r=0.415$), Care Performance ($P<0.001$, $r=0.335$), and Communicative Performance ($P<0.001$, $r=0.510$). There was a positive correlation between Job Satisfaction and Job Performance of Midwives. Ch. Platis, P. Reklitis, S. Zimeras et al, (2014**):** Relation between Job Satisfaction and Job performance in Healthcare Services

Objective

The paper aimed to study Determinants of the performance achieved by the Auxiliary Nurse Midwifes under MCH Services in National Rural Health Mission in Krishna District, Andhra Pradesh, India.

Methodology

The study is based on primary data consisting of 170 Auxiliary Nurse Midwives working in 18 PHCs covering a total of all the 109 Sub-Centres were interviewed with a semi structured questionnaire. There are ten MCH services of the ANMs during 2014-15 & 2015-16, weightages have been to MCH services rendered by ANMs. Basing on the performance under MCH services of the ANMs, the average performance of the each ANM per year was calculated and all the ANMs under study have been categorized into three groups based on the individual achievements under each service' are categorized in three as "high performance, average performance and poor performance".

Results and Discussion

These changes will require sustained and careful planning and resource allocation. Increasing resources along with systemic reforms will improve health status of the women

and children who are the focus of Reproductive Child Health programs. Nurses' Job Satisfaction is an important indicator of Nurses' Job intent to stay, provide quality of Nursing Care and Professional Performance, which therefore needs a greater focus of Administrators or Managers. The determinants such as Job-satisfaction, Attitude and Awareness about the programme those are likely to influence the performance of the Auxiliary Nurse Midwives (ANMs).

Table-1: Association between the Type of appointment of ANMs and their performance under MCH Services

Type of Appointment	Performance under MCH Services						Total	
	High		Average		Poor			
	No.	%	No.	%	No.	%	No.	%
2nd ANM	20	21.74%	42	45.65%	30	32.61%	92	100.00%
Regular ANM	18	23.08%	44	56.41%	16	20.51%	78	100.00%
Total	38	22.35%	86	50.59%	46	27.06%	170	100.00%
Chi-Square Value	Degree of freedom		P - Value				Inference	
3.28	2		> 0.05				Not Significant	

From Table-1, slightly more proportion of Regular ANMs (23.08%) recorded 'High Performance' as against (21.74%) among 2nd ANMs. (56.41%) of Regular ANMs manifested as 'Average Performance' as against (45.65%) among 2nd ANMs. (32.61%) of 2nd ANMs recorded under 'Poor Performance' as against (20.51%) among Regular ANMs. The difference observed is statistically not significant at $P > 0.05$.

Table-2: Association between the Religion of the ANMs and their performance under MCH Services

Religion	Performance under MCH Services						Total	
	High		Average		Poor			
	No.	%	No.	%	No.	%	No.	%
Hindus	34	21.25%	82	51.25%	44	27.50%	160	100.00%
Christians	4	40.00%	4	40.00%	2	20.00%	10	100.00%
Total	38	22.35%	86	50.59%	46	27.06%	170	100.00%
Chi-Square Value	Degree of freedom		P - Value				Inference	
1.91	2		> 0.05				Not Significant	

From the table-2, out of total 170 ANMs (both Regular and 2nd ANMs), only meagre number i.e., only 10 ANMs are recorded under 'Christians'. However, slightly more proportion of 'Christians' category ANMs recorded 'High Performance' as against 21.25% of 'Hindu' category ANMs. 51.25% of 'Hindu' ANMs recorded 'Average Performance' as against 40.00% of 'Christian' ANMs. 27.5% of 'Hindu' ANMs recorded 'Poor Performance' as against 20.0% of 'Christian' ANMs.

Table-3: Association between the Income of the ANMs and their performance under MCH Services

Income (per month)	Performance under MCH Services						Total	
	High		Average		Poor			
	No.	%	No.	%	No.	%	No.	%
< Rs. 15,000/-	20	21.74%	42	45.65%	30	32.61%	92	100.00%
Rs. 15001/- to Rs. 30,000/-	0	0.00%	4	100.00%	0	0.00%	4	100.00%
> Rs. 30,001/-	18	24.32%	40	54.05%	16	21.62%	74	100.00%
Total	38	22.35%	86	50.59%	46	27.06%	170	100.00%

From the table-3, It is evident that slightly more proportion (24.32%) of ANMs whose income is more than Rs: 30,001/- recorded 'High Performance' as against (21.74%) among ANMs whose Income is less than Rs: 15,000/-. No one is recorded 'High Performance' among ANMs whose Income is in between Rs: 15,001/- & Rs: 30,000/-. Though, meagre number 100 % (4) ANMs whose Income is in between Rs: 15,001/- & Rs: 30,000/- recorded 'Average Performance as against 54.05% among ANMs whose Income is more than Rs. 30,001/- and 45.65% among ANMs whose Income is less than Rs. 15,000/-. More proportion (32.61%) of ANMs whose Income is less than Rs: 15,000/- recorded 'Poor Performance' as against (21.62%) among ANMs whose Income is more than Rs: 30,001/-. No one is recorded 'Poor Performance' among the ANMs whose Income is in between Rs: 15,001/- & Rs: 30,000/-.

Table-4: Association between the Education of the ANMs and their performance under MCH Services:

Education	Performance under MCH Services						Total	
	High		Average		Poor			
	No.	%	No.	%	No.	%	No.	%
Up to 10th Class	22	19.64%	48	42.86%	42	37.50%	112	100.00%
Inter/PUC	14	29.17%	30	62.50%	4	8.33%	48	100.00%
Degree & above	2	20.00%	8	80.00%	0	0.00%	10	100.00%
Total	38	22.35%	86	50.59%	46	27.06%	170	100.00%

Education is an important influencing factor in rendering better services in any sector. From the table-4, also it is quite evident that better the education higher the performance. 'High Performance' is recorded in high proportion i.e., 29.17% of ANMs who studied 'Inter/PUC' as against 20% among ANMs studied 'Degree & above' and 19.64% among ANMs studied 'Up to 10th Class'. However, out of total 172 ANMs, only 10 ANMs studied 'Degree & above'. 'Average Performance' is recorded in high proportion i.e., 80% of ANMs who studied 'Degree & above' as against 62.5% among ANMs studied 'Inter/PUC' and

42.86% among ANMs studied 'up to 10th Class'. High proportion (37.5%) of ANMs studied 'up to 10th Class' recorded 'Poor Performance' as against 8.33% of ANMs studied 'Inter/PUC'. No one from ANMs studied 'Degree & above' recorded 'Poor Performance'.

Table-5: Association between Total Length of Service of ANMs and their performance under MCH Services

Length of the Service of the ANMs (Yrs)	Performance under MCH Services						Total	
	High		Average		Poor			
	No.	%	No.	%	No.	%	No.	%
Up to 10 Yrs	26	23.21%	56	50.00%	30	26.79%	112	100.00%
> 10 to < 20 Yrs	8	30.77%	12	46.15%	6	23.08%	26	100.00%
> 20 Yrs	4	12.50%	18	56.25%	10	31.25%	32	100.00%
Total	38	22.35%	86	50.59%	46	27.06%	170	100.00%
Chi-Square Value	Degree of freedom		P - Value				Inference	
2.93	4		> 0.05				Not Significant	

From the table-5, slightly more proportion (30.77%) of ANMs whose service is in between '10 Years & 20 Years' recorded 'High Performance' as against (23.21%) of ANMs whose service is 'Up to 10 Years' and (12.5%) of ANMs whose service is '> 20 Years'. High proportion (56.25%) of ANMs with '> 20 Years' of service recorded 'Average Performance' as against (46.15%) of ANMs with service 'between 10 & 20 Years' and (50%) of ANMs with service 'Up to 10 Years'. (31.25%) of ANMs with '> 20 Years' of service recorded 'Poor Performance' as against (23.08%) of ANMs with service between 'between 10 & 20 Years' and (26.79%) of ANMs whose service is 'Up to 10 Years'. The said difference is statistically not significant at P > 0.05.

Table-6: Association between Preferences of ANMs to join in the present post and their performance under MCH Services:

Preference to join in the present post	Performance under MCH Services						Total	
	High		Average		Poor			
	No.	%	No.	%	No.	%	No.	%
Interest and desire to serve the people	36	25.00%	66	45.83%	42	29.17%	144	100.00%
Economic Necessity/ Shifted from the other department	2	7.69%	20	76.92%	4	15.38%	26	100.00%
Total	38	22.35%	86	50.59%	46	27.06%	170	100.00%
Chi-Square Value	Degree of freedom		P - Value				Inference	
8.71	2		< 0.01				Highly Significant	

From the table-6, it is evident that the ANMs who joined in the present post with 'Interest and desire to serve the people' have performed better MCH Services. 25% of ANMs who joined with 'Interest and desire' recorded 'High Performance' as against only 7.69% of ANMs who joined with 'Economic necessity'. 76.92% of ANMs joined with 'Economic Necessity' recorded 'Average Performance' as against 45.83% of ANMs joined with 'Interest and Desire'. 15.38% of ANMs joined with 'Economic Necessity' recorded 'Poor Performance' as against 29.17% of ANMs joined with 'Interest and Desire'. The said difference is statistically highly significant at $P < 0.05$.

Table-7: Association between ANM's present Sub-Centre happens to be her native place and their MCH Services:

Present Sub Centre whether native place or not of the ANM	Performance under MCH Services						Total	
	High		Average		Poor			
	No.	%	No.	%	No.	%	No.	%
Yes	8	12.90%	32	51.61%	22	35.48%	62	100.00%
No	30	27.78%	54	50.00%	24	22.22%	108	100.00%
Total	38	22.35%	86	50.59%	46	27.06%	170	100.00%
Chi-Square Value	Degree of freedom		P - Value				Inference	
6.48	2		< 0.05				Significant	

From the table-7, it is evident that the performance of ANMs who's present Sub-Centre is not her Native Place recorded 'high' when compared with the performance of ANMs who's present Sub-Centre happens to be her Native Place. Slightly more proportion (27.78%) of ANMs who's present Sub-Centre is not her native place recorded 'High Performance' as against (12.9%) of ANMs whose present Sub-Centre happens to be her native place. The difference observed is statistically significant at $P < 0.05$.

Table-8: Association between the Transfers of the ANMs and their performance under MCH Services:

No., of Transfers in the service	Performance under MCH Services						Total	
	High		Average		Poor			
	No.	%	No.	%	No.	%	No.	%
No Transfers	28	25.93%	50	46.30%	30	27.78%	108	100.00%
One Transfer	2	9.09%	16	72.73%	4	18.18%	22	100.00%
Two & more Transfers	8	20.00%	20	50.00%	12	30.00%	40	100.00%
Total	38	22.35%	86	50.59%	46	27.06%	170	100.00%
Chi-Square Value	Degree of freedom		P - Value				Inference	
5.76	4		> 0.05				Not Significant	

From the table-8, slightly more proportion (25.93%) of ANMs who have not been transferred in their service recorded 'High Performance' as against (20%) of ANMs who

have 'Two & more transfers' and (9.09%) of ANMs who have 'No Transfer'. 46.3% of ANMs with 'No Transfer', 72.73% of ANMs with 'One Transfer' and 50% of ANMs with 'Two & more Transfers' recorded 'Average Performance' where as 27.78% of ANMs with 'No Transfer', 18.18% of ANMs with 'One Transfer' and 30% of ANMs with 'Two & More Transfers' recorded 'Poor Performance'. The difference is statistically not significant at P > 0.05.

Conclusion

The findings of all these major aspects related Determinants of the performance achieved by the Auxiliary Nurse Midwifes under MCH Services to may be very useful for the administrators and decision makers of health sector in identifying the shortfalls in National Health Mission and to change its administrative policies accordingly, to get good results in terms of principles of Primary Health Care namely Equitable Distribution, Community Participation, Intersect oral Co-ordination and Appropriate Technology. Therefore, it is recommended that Health Care Administrators provide organizational supports for Midwives to improve their Professional Performance.

Abstract

Land is a basic natural resource. It forms the basis for all the biological, human and economic activities. In the developing countries like India, where agriculture is the main source of economy and livelihood for more than two-thirds of the working population, proper utilisation of land resource is vital.

Introduction

In recent years, serious concern has been shown on ecological management and optimum utilization of land resources for the benefit of mankind. Hence the use of land resource is "central to all discussions of land problems and policies [(1)] . Land use at any region is a complex, diversified and dynamic concept. It is due to the operation of whole range of environmental factors but modified by socio-economic and historical elements. In dry areas, the use of land resources is virtually associated with climatic and edaphic conditions, besides the socio-economic needs of the mankind. Undoubtedly, the erratic behaviour of the monsoon, frequent occurrences of drought and prolonged dry spells have had a devastating and debilitating effect on land use pattern and as a result, the landscapes in dry areas gets continuously varied and modified. Since land itself is one of the important components of the ecosystems, a critical study on landscape ecology and its planning calls for greater attention to be paid to the drought prone areas to keep the ecological balance between the environment and the socio-economic needs of the region.

Ecological View of Landscape

In the sense of ecology, land carries ecosystems, but is itself also a part of these ecosystems. Although the use of land resource may be considered from abroad view of human welfare, its use is always a process of modifications of ecosystem. The idea that land use is a process of modification of ecosystem was well explored by Simmons [(2)] .

He suggested that land use ecology might form a central theme in biogeography. It is also mentioned that the ecosystem concept provides the necessary modern scientific framework to the study of land use. The form and function of land use is a human enterprise, while the development of landscape is the continuous efforts of man for his needs and sustenance under every possible combinations of terrain, climatic, edaphic and vegetative conditions. By all means, it suggested that any scientific and rational land use planning should see that the ecological balance was not disturbed and that proper equilibrium between the environment and the socio-economic needs of the area be maintained.

Ecological Problems of Land Use

In the process of land use management and optimisation, ecological problems are becoming a most serious concern. The ever increasing pressure of population and decreasing man-land ratio are posing challenging problems to the land-use planners. Structurally, a land-use system consists of three interacting spheres namely, ecological (environmental), economic and social. Each sphere has its own unique set of human-ascribed goals. Ecological problems are those, which appear in connection with human socio-economic needs, change the quality of the physical environment and indiscriminate use of natural resource base. Ecological problems appear in different types of physical environment and various socio-economic, technological and political conditions.

The negative ecological effects like degree of decertification, land degradation, soil erosion, soil salinisation, chemical contamination and water pollution are frequent in the dry areas but taking place in different intensities and degree of criticality. The other problems related to land use are under-utilisation, over-utilisation and mis- utilisation of land resources. So the question is what are the reasons for the appearance of negative ecological effects in different environmental and socio- economic conditions. Off all, undoubtedly, man's indiscriminate use of land resources has resulted in the creation of negative ecological effects. His failure to recognise the long term implications of deforestation, faculty methods of cultivation, overgrazing, massive application of fertilisers and pesticides, practice of single crop monocultures, imbalances in the input and output factors and large scale exploitation of land and soil resources throughout an entire ecosystem. Results in widespread degradation.

The practice of monoculture was accompanied subsequently by great losses of genetic varieties in the fields, involving high risks of large hectarages being destroyed by single drought or pest. To cultivation of the same crop continuously and their synthetic fertilisation year after year has resulted in the disruption of the soil balance. With diminishing organic matter in the soil, its ability to retain moisture is also reduced and as a consequence, the soil becomes sterile and dry. To circumvent some of these problems a critical examination of landscape ecology is essential for a more rational approach to land use planning and conservation of resources.

Eco-development and Ecological Planning of Land Use

Generally speaking, ecological planning is a fundamental tool for landscape and regional planning, such that many landscape ecological studies are now done as integral parts of landscape and regional planning projects[3] . It offers an effective means of helping mankind to adapt to the dynamic changing environment of which he is but one integral part. Mc Harg[4] has defined ecological planning as "an instrument for revealing regions as interacting and dynamic natural systems having intrinsic opportunities and constraints for all human uses.

The goals of such planning are derived from the region and its people as proffered by locations where all or most advantageous (safe, healthy and beautiful) factors exist with none or few detrimental factors for any and all anticipated future uses. What constitutes 'detrimental' or 'advantageous' is derived from the use itself and the value system of the initiating person or group. The concept of eco-development forms the main strategy of 'Habitat Ecology'. It helps in explaining the form of planned growth which is concerned with the development of local available land resources within the constraints of local environment with a view to optimise the local capacities of the biosphere to support the welfare of life. The eco-development approach is very close to ecological and environmental planning to balance and harmonise the various enterprises of land use which man for his own benefit has superimposed on physical environment.

The eco-development approach related to land use rests on (i) rational utilisation, (ii) development of mankind pertaining to their well-being rather than in economic sense, and (iii) advancing a true symbiosis between man and environment. To activate and regulate the harmony between landuse development and environment both the demand and supply side of the equation must be acted upon. In the eco-development and ecological planning sense, any land use planning should not be considered merely from the agricultural point of view and bringing more land under the plough making it viable for cultivation, but should include rational utilisation of land resource, conservation of land from erosion, development of nutrients and soil cover through multiple vegetative systems, improving the potential capacity of land, application of modern scientific technology and lastly the preclusion of over exploitation of land.

Study Region

Anantapur district is one of the chronically drought-prone areas in the country. It is located in the rain-shadow region of

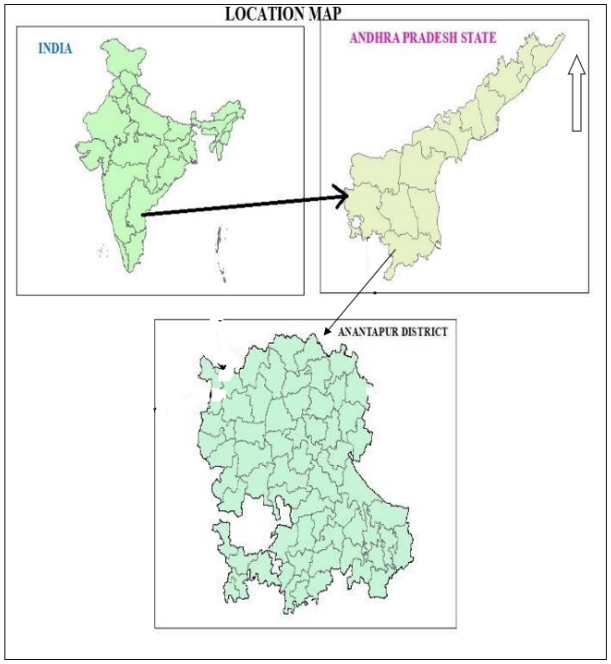

Fig. 1. Location map

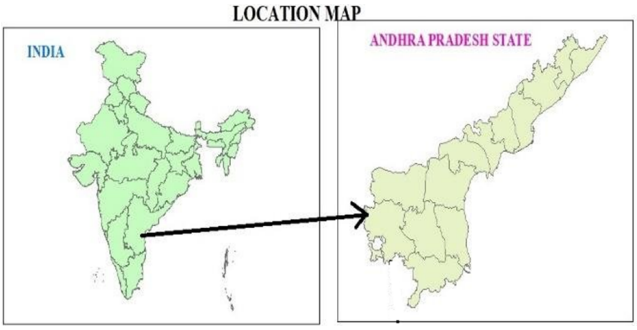

Fig. 2. Location map

the Western Ghats in Andhra Pradesh. It is the largest district in terms of area in the State. The population spread is very sparse with a density of population of 166 persons per Sq.Km. Agriculture is the predominant occupation of the people. The average annual rainfall of the district is 544 mm. with the lowest number of rainy days of 35 in the State. The district has been experiencing a drought once in every two years which is really serious and detrimental to stable agriculture.

Methodology

The spatial distributional pattern and changes in important land use types namely, forest land, fallow land and crop-land are examined and delineated with the help of both quantitative and cartographic techniques. The quantum of change is determined through percentages, regression trend and growth rates The impact of rainfall on land use types is measured with correlation testing.

Forest Land Use

Forests form distinct ecosystems. In fact, Anantapur district is very poor in forest cover with only 10.3% of the total geographical area of the district. The nature and character of forests in the district does not indicate any dense growth of tree population with different variety of plants. The forests of the district may be described as dry mixed deciduous and thorny open scrub types.

The distribution of forest-cover in the district is not only very low in proportion but also most uneven. Relatively, higher concentrations (15.1-20% and >20%) of forest-cover are found in southern, south-eastern and north-eastern parts of the district. In these areas, the amount of rainfall is comparatively higher than the other parts of the district. The western part of the district is found with very thin forest cover with discontinuous thorny thickets and scrub woodlands whose vegetative growth is stunted due to poor edaphic and very low isohyetal conditions.

During the three decades under consideration (1960-90) total area under forest has not shown any substantial change but showed a small increase of 0.1 per cent or 2000 hectares. The regression analysis has also revealed that the trend of forest land is marginally positive with 2 per cent of the goodness of fit. The annual compound growth rate has also shown a negligible rate of increase of 0.003 per cent.

Planning for the Development of Forest Land

In drought-prone areas, maintenance of ecological balance is one of the most important considerations to build-up the humus contents in the soil, avert soil erosion, increase the moisture in the atmosphere, raise the ground water level and heap in ground water recharge and storage besides other economic purposes. However, the poor quantity of forest cover in the district is too short to fulfil the requirement of ecological balance and is seriously jeopardizing the ecosystem of the region it is necessary to take up massive efforts on war-footing to develop forest-cover in the district

The development of forest-cover in the district heavily depends upon the (i) plantation of drought resistant species in large parts of the reserve forest areas, which are devoid of any vegetative cover, (ii) there are number of tanks in the district which are silted and do not fill up with meagre rainfall The foreshore of these tanks can be planted with eucalyptus and subabul plantations., (ii) depending upon the suitability of site and topography, particularly in the slopy agricultural lands and cultivable wastelands and all along the road sides the species like tamarind, neem, gulmohar, eucalyptus, fruit and flowering plants can be planted extensively. Agave species

can be planted in 'estate concept' mainly to yield raw material for fibre extraction and to put otherwise unproductive areas to productive use and (iv) pasture development can be taken up on the barren hills, slopy soils, community lands and village poramboke lands. Having all the afforestation schemes, it is utmost necessary to convert this dry belt gradually into a green belt for balancing the ecosystem.

Fallow Land Use

Land under fallows accounted for 17 per cent of the geographical area of the district. which is indeed a high proportion. More than one fifth of the geographical area under fallows is found in 17 mandals mostly located in western and north-eastern parts of the district.

During thirty years period, the proportion of fallow land has increased by 5.6 per cent amounting to about 106 thousand hectares. The increase is found in many parts of the district. The regression analysis has also confirmed this trend of increase of fallow land but is accounted by 22 per cent of co-efficient of determination. It indicates that the increase in the area under fallows is not perpetual from year to year but highly fluctuating. The annual average rate of increase is 0.6 per cent.

It is suggested that an increasing trend of fallow land should be controlled and utilised at optimum level through scientific land use management systems. If possible all the fallow lands should be brought under dry farming cultivation with suitable drought resistant rain-fed crops like millets, pulses, fodder crops and agro-forestry A considerable change in the outlook of farmers is to be brought out from traditional practices to new methods of dry farming for optimum use of fallow lands with multi-tier vegetations in different ecological systems and the sound management of Sylvi-Agri-Pastoral Systems.

Agricultural Land Use

The district has vast agricultural land resource base but suffers from instability due to vagaries of monsoon. The net area sown in the district accounted for 49.9 per cent of the total geographical area which is significantly. Higher than the average proportion of net sown area in Andhra Pradesh State (41.3 per cent)

The quantum of change in the proportion of net area sown during 1960- 1990 showed a significant decline of 5.5 per cent amounting to 105 thousand hectares. The trend of net area sown in the district has been negative. The goodness of fit of the regression trend states that the present negative trend is to the tune of 11 per cent only. It means that the negative trend of the net area sown is not exactly perfect but it is highly fluctuating from year to year depending on the variation of rainfall On an average, the annual compound growth rate declined at 0.03 per cent.

Impact of Rainfall on Arable Land

In the drought-prone region, where rain-fed farming is predominant and irrigation development is very low, it is a common assumption that the increase or decrease in either cropped area or fallow land will be in close association with the success or failure of monsoons. In the present study, the correlation analysis has revealed that there has been a positive correlation between rainfall and net area sown in the district to the tune of 0.55 Co-efficient value and negative correlation between rainfall and fallow land to the tune of 0.62 co-efficient value. A high negative correlation of 0.85 is found between net area sown and fallow land. It shows that if there is an increase in rainfall, the land under cropping may increase or if there is decrease in rainfall, the land under fallows may increase. It indicates that these two land use types are inversely correlated and functionally related with each other.

Strategy for the Development of Suitable Cropping Pattern

The present cropping pattern dominated by groundnut, cannot be treated as inappropriate and it appears to be a more or less natural consequence of the poor natural resource endowments of the district. Now that it required all the more is the optimisation and strengthening of present cropping pattern without further spatial extension of mon-crop groundnut. In view of varying drought conditions and agricultural drought which differs from one crop to another crop in an area, an extending monoculture groundnut farming to wider area may not be advisable, as a wide-spread drought may adversely affect the agricultural economy of the district. In such circumstances, all rainfed crops which are of high value and low water consuming must be preferred. The risks from droughts could be reduced by popularising suitable inter-cropping methods. If there is failure of rain, at least one of the component crops will yield something and thereby minimise the risk of total loss. The non-traditional crops like sunflower, safflower and castor etc. should also be grown in the suitable soil and moisture conditions.

Soil Characteristics and Problems

The soil is a dynamic layer which immediately reacts to the pattern of its use or changes in the soil forming environment. The district has 82 per cent of red soils and 18 per cent of black soils. The phosphorus and organic matter 3 content is poor in 82 to 90 per cent of the soils. But more than 90 per cent of the soils are moderately rich in potash more than 95 per cent of the soils are neutral or weakly alkaline. Less than 5 per cent of the soils are having severe saline and or alkaline problems.

The results of studies made by different organisations reveal that the soil characteristics are being changed in a short span of time by such activities of man like (i) removal of vegetation cover, (ii) application of heavy irrigation, (iii)

change of cropping pattern and (iv) change of morphology. The conclusions are that (1) in the undulating piedment regions where dry farming is practiced there is an increase of rill and gully erosion, (2) there is steady increase in the salinity and alkalinity problems in the canal irrigated mandals like Rayadurg, Gooty. Tadipatri and Anantapur, (3) there is a decreasing tendency in the potassium content of the soils particularly in the paddy cultivated areas and (4) with the shift from millet oriented to groundnut oriented cropping pattern, the soils have shown sulphur and zinc deficiency. Iron deficiency is also predicted in the near future.

Soil Management

The soil management programme in a semi-arid region like Anantapur district should be comprehensive and integrated one. First and foremost adequate importance should be given to the extension programmes to create the awareness in the farming community about the dangers of the mismanagement of the soil ecosystem and to motivate them to follow proper soil management 2 guidelines. The soil forming environment could be improved by managing catchments at t micro-level Construction of check dams and watersheds on small catchments serves as a multi-purpose schemes in this direction Both agronomic and engineering measures of soil conservation should be implemented in a complementary manner to achieve better results. The alkalinity and salinity problems of the soils have to be solved with suitable measures like zypsum application and leaching of excessive salts with suitable dosage of irrigation respectively Proper care should also be taken to minimise water sepage from the irrigation canals which will lead to the problems of salinity and alkalinity.

Conclusion

It has been observed that man, rather than the nature is bringing considerable change in the quality of land in a short span of time. The short- sighted and unplanned commercial and subsistence gathering of resources from the nature's bounty have caused considerable damage to the land system Many of his activities though fetching short-term gains, are causing long-term and sometimes irreversible damages to the quality of landscape system in this dry region. In view of very low proportion of forest cover, high proportion of fallow land, instability in agriculture land followed by mono-cultures and poor nature of soil cover, the landscape ecosystem of this region is delicate and is being easily disturbed.) The maintenance of ecological balance is one of the most important 4 considerations and is to be looked into it very seriously. To achieve the required goals, "Sustainable Land Use Development" is the way of environmental feature. Jacobs [5] has referred to sustainable development as "the offspring of ecological planning". To understand both and carry them out, environmental education is essential at all levels and in all sectors of the population.

It is also often emphasised that the transformation of rural habitat is the fundamental lead for the eco-development of the region the integrated Rural Development (IRD) is to be concerned with ecological and environmental issues in addition to the integration of sectors and policies in space-time dimensions. The IRD concept is also to be conceived as strategic design of problem solving planning process for the effective involvement of local human and physical resources to improve the socio-economic and ecological situation of the rural habitat.

REGIONAL INEQUALITY IN LITERACY ASPECTS IN INDIA: AN ANALYSIS

[1]Dr. I.V.Lalitha Kumari, [2]Dr.T.Chandrasekarayya
[1]Professor, [2]Associate Professor
[1]Dept. of Social Work
[1]Sri Padmavati Mahila Visvavidyalayam, Tirupati, India

Abstract

Literacy forms an important input in overall development of individuals enabling them to comprehend their social, political and cultural environment better and respond to it appropriately. It acts as a catalyst for social upliftment enhancing the returns on investment made in almost every aspect of development effort, be it population control, health, hygiene, environmental degradation control, employment of weaker sections of the society. Literacy rate in India (Census of India, 2011) was found to be 74.04 percent. When compared to the adult literacy rate, the youth literacy rate was about 9 percent higher. During the last decade, the highest improvement in literacy rate was observed among rural females (24 percent). This paper is descriptive in nature and examines the regional inequality in literacy aspects in India based on 75th round of National Sample Survey data. This will be useful in decision support, frame policy measures to improve literacy rate among the regions.

Key Words

Literacy, Education, Region, Inequality, gender and Census of India

Introduction

Educational attainment is the first and foremost step towards improving quality of life, awareness level and also level of skill of people in the society. Considering the importance of education, India has enacted ‘ Right to Education Act,2009’ to ensure free and compulsory Education for children in the age group 6-14 years. Literacy and education are important indicators in a society and play a central role in human development that impacts overall social-economic development milieu. Higher levels of literacy and education lead to better attainment of health and nutritional status, economic growth, population control, empowerment of the weaker sections and community as a whole. Also, higher literacy rates improve

development indicators consistently. Census obtains information on literacy for every individual, as this is recognised as one of the most important social characteristics. In census, a person aged seven years and above who can both read and write in any language, is treated as ‘ literate’ . A person, who can only read but cannot write, is not considered as ‘ literate’ (Census of India, 2011).

Literacy is the main foundation for social and economic growth. Literacy is the ability to identify, understand, interpret, create, communicate and compute, using printed and written materials associated with varying contexts. Literacy involves a continuum of learning in enabling individuals to achieve their goals, to develop their knowledge and potential, and to participate fully in their community and wider society (UNESCO, 2018). Generally, literacy also encompasses numeracy, the ability to make simple arithmetic calculations. Literacy and education is also one of the main components of human development index (HDI), as it has direct impact on the per capita income, level of living and ultimately on life expectancy. There is a strong empirical co-relation between literacy and life expectancy (Khan, 2004). In international usages, literacy is defined as the ability to read write and at least a simple message in any language (Hassan, 2005). Education is the single best development investment and a powerful instrument to develop an economically prosperous society. The long term social and economic return from education is enormous. The level of development of any region or any area may be gauged through the socio-economic characteristics of people. Of the various elements of population characteristics, the level of literacy and education gives the best exposition of regional development because of its dual functions as cause and effect of modernization.

Review of literature

Gopala Krishan and Madhav Shyam (1978) describe and interpret the regional aspects of the urban-rural differential in literacy in India in relation to economic, society and educational history different of India on the basis of 1971 census data. Siddiqui Shafiqullah (2011) attempted to analyses the trends of differential in literacy rate, spatial patterns of urban-rural differential and the relationship between differential index and selected variables of development among the districts of Uttar Pradesh, India. Kalyan Sundar Som and Ramesh Prasad Mishra (2014) examined the literacy and their differential in West Bengal, India. Ghanshyam Prasad Jhariya and C.K.Jain (2014) attempted to study the trends and pattern and their differential (Male-female and urbanrural) of literacy in Madhya Pradesh. The male – female and rural – urban differential has been worked out. There are remarkable gaps between male and female and between rural and urban rates in the state. Jangra, Ravinder and Kaushik, Satya (2015) describe and interpret the regional aspects of the urban-rural differentials in female literacy during 1991, 2001 and 2011, identify the correlates of female literacy in an agro-based economy, the total female literacy rate has increased significantly during the study period, and there are wide gaps in urban-rural female literacy. Comparatively, the increase is more remarkable in rural areas and gap is narrowing down. Vachaspati Shukla and Udaya S

Mishra (2020) examined the progress in literacy among the Indian states are evaluated here from an age cohort perspective.

Objectives

1. To examine the inequality in literacy aspects in India, also its states and
2. To suggest measures to improve aspects of literacy

Method and Material

The paper is based on descriptive and data collected from 75th round of National Sample Survey conducted on Household Social Consumption: Education during 1st July 2017 to 30th June 2018. A stratified multi-stage design was adopted for the 75th round survey and covers whole of the Indian Union except the villages in Andaman and Nicobar Islands. In this survey, total number of persons of age 3 to 35 years surveyed was 2, 86,456 (1, 73,397 in rural areas and 1, 13,059 in urban areas). Percentage of literates among persons of age 7 years and above has been defined as literacy rate.

Analysis and Discussion

Literacy rate

Literacy and level of education are basic indicators of the level of development achieved by a society. Spread of literacy is generally associated with important traits of modern civilization such as modernization, urbanization, industrialization, communication and commerce. Literacy forms an important input in overall development of individuals enabling them to comprehend their social, political and cultural environment better and respond to it appropriately. Education is a human right. Education is essential for human emancipation and social development. It contributes to better health, higher productivity, greater income, human freedom, capability and esteemed living, increased participation in community life. Literacy is an important demographic element of human process. It is essential for human character, social and economic development. Education includes new ideas for a better building of the society and their personal life style. Table- 1 gives data on literacy rate (in per cent) among persons of age 7 years and above for different States and regions.

Table-1: Literacy rate (in per cent) among persons of age 7 years and above for different states and regions

State	Rural			Urban **(in per cent)**			Rural+Urban **(in per cent)**		
	Male	Female	Person	Male	Female	Person	Male	Female	Person

Note: Figures for rural Delhi is not presented separately. However, ' rural + urban' for Delhi includes, ' rural' also.
Source: NSS 75th Round, July 2017 – June 2018.

Table-1 depicts that higher literacy rate is found in the region of north-east followed west, north, central, east and south. Central and east region had lower literacy rate than all India level. Among the regions, lowest literacy rate registered Uttar Pradesh in north, Gujarat in west, Madhya Pradesh in Central, Bihar in East and Andhra Pradesh in South in order. In the regions and states, literacy rate was lower for females. The differentials in literacy rate in regions and states can be attributed to disparities in socio-economic, cultures, physical conditions, infrastructure facilities and education related policies.

Years of formal education

Number of years completed in formal education or levels of education and literacy lead to a greater awareness and also contributes in improvement of economic and social conditions. Also better literacy and educational level definitely have a positive impact on the health as well as other sectors that influences level of development. Data on average number of years completed in formal education among persons of age 15 years and above for different states and regions presented in table-2

Table-2: Average number of years completed in formal education among persons of age 15 years and above for different states and regions

State	Rural			Urban			Rural+Urban

Source: NSS 75th Round, July 2017 – June 2018.

Table-2 reveals that the average number of years completed in formal education among persons of age 15 years and above has registered in region of north followed by south, west, north east, west and east region. Enteral and east regions registered lower literacy rate than national level. Among the regions, Uttar Pradesh in north, Andhra Pradesh in south, Gujarat in west, Madhya Pradesh in Central and West Bengal in east in order had lower average number of years completed in formal education among persons of age 15 years and above. Average number of years completed in formal education was lower for females. It is generally influenced by socio-economic status and cultural aspects along with parents' perception on importance of higher education.

Gross Attendance Ratio (GAR)

GAR is one of the important indices of literacy rate. For each level of education, GAR is the ratio of the number of persons attending in the level of education to the number persons in the corresponding official age-group. GAR is calculated as " Number of persons attending in particular Classes/ estimated population in the respective classes' age-group x100. Table-3 furnishes details of Gross Attendance Ratio (GAR).

Table-3: Gross Attendance Ratio (GAR) at different levels of education for different States and region (rural+urban person)

State	Level of education					
	Primary level	Upper primary/ Middle level	Primary and Upper primary/ Middle level	Secondary level	Higher Secondary level	Post higher Secondary level
Jammu and Kashmir	101.9	96.9	100.2	115.7	77.0	33.1
Himachal Pradesh	99.3	92.1	96.1	100.9	110.0	34.1
Haryana	106.3	93.8	101.3	96.7	70.3	25.2
Punjab	101.5	94.9	99.1	95.4	79.4	22.8
Uttarakhand	99.8	111.6	104.0	80.7	98.7	32.8
Uttar Pradesh	98.9	88.8	95.4	64.0	60.4	20.8
Delhi	100.2	90.6	96.8	93.6	86.2	29.6
Rajasthan	110.5	87.0	101.6	82.4	70.1	28.9
North Region	**102.3**	**94.5**	**99.3**	**91.2**	**81.5**	**28.4**
Gujarat	106.0	89.1	99.1	88.3	59.2	15.3
Maharashtra	101.1	96.5	99.5	104.0	74.3	29.3
West Region	**103.6**	**92.8**	**99.3**	**96.2**	**66.8**	**22.3**
Chhattisgarh	102.4	100.4	101.6	90.3	66.9	16.2
Madhya Pradesh	95.3	97.5	96.1	83.9	59.9	17.3
Central Region	**98.9**	**99.0**	**98.9**	**87.1**	**63.4**	**16.8**
Bihar	97.2	98.4	97.6	82.0	65.7	16.2
Jharkhand	112.4	91.4	105.3	90.0	51.3	16.8
Odisha	103.4	91.3	98.8	87.2	53.4	14.5
West Bengal	101.6	105.2	103.0	92.4	59.3	18.7
East Region	**103.7**	**96.6**	**101.2**	**87.9**	**57.4**	**16.6**
Assam	103.6	104.7	104.0	86.6	56.0	16.5
Northeast Region	**103.6**	**104.7**	**104.0**	**86.6**	**56.0**	**16.5**
Andhra Pradesh	99.3	81.9	92.2	114.1	73.0	26.1
Telangana	92.8	106.1	97.7	109.0	96.8	28.9
Karnataka	104.4	90.1	99.3	92.3	73.4	21.7
Kerala	103.6	97.2	100.9	97.3	99.9	37.6

Tamil Nadu	103.2	96.4	100.4	89.8	91.9	35.4
South Region	**100.7**	**94.3**	**98.1**	**100.5**	**87.0**	**29.9**
All India	**101.2**	**94.4**	**98.7**	**86.4**	**68.3**	**22.8**

Note: Figures for rural Delhi is not presented separately. However, ' rural + urban' for Delhi includes, ' rural' also.
Source: NSS 75th Round, July 2017 – June 2018.

Table-3 reveals that the gross attendance ratio in primary level was lower in central region and southern than all India. In upper primary/ middle level, least GAR was recorded in west region. In primary and upper primary/middle level, least GAR recorded in south. In secondary level, least GAR recorded in north-east. In higher secondary level, least GAR recorded in east region. In post higher secondary level, least GAR recorded in east and central region. In primary level, Telangana of south region had least GAR. In Upper primary/Middle level, Rajasthan of north region had lowest GAR. In Primary and Upper primary/Middle level, Andhra Pradesh of south region had lowest GAR. In Secondary level, Uttar Pradesh of north region had lowest GAR. In higher secondary level, Jharkhand of east region had lowest GAR. In post higher Secondary level, Odisha of east region had recorded lowest GAR. Thus, differential in Gross Attendance Ratio (GAR) at different levels of education for different States and region were recorded. It can be due to differential in socio-economic and cultural progress, access of education facilities and other factors.

Net Attendance Ratio (NAR)

Net Attendance Ratio is the better indicator than GAR and shows level progress in literacy rate .It is the ratio of the number of persons in the official age-group attending a particular level of education to the total number of persons in the age-group. NAR is calculated as " Number of persons currently attending in particular Classes/ estimated population in the age-group in those particular classes x100.

Table-4: Net Attendance Ratio (GAR) at different levels of education for different States and regions (rural+urban person)

State	Level of education					
	Primary level	Upper primary/ Middle level	Primary and upper primary/ Middle level	Secondary level	Higher Secondary level	Post higher Secondary level
Jammu and Kashmir	88.1	78.4	91.3	69.6	46.1	29.5
Himachal Pradesh	90.1	80.6	90.7	68.2	67.5	28.1
Haryana	89.9	77.2	90.6	63.2	47.5	20.9
Punjab	88.8	78.1	90.9	65.3	49.7	19.8

All India	**86.1**	**72.2**	**89.0**	**57.6**	**43.4**	**19.4**

Note: Figures for rural Delhi is not presented separately. However, ‘ rural + urban’ for Delhi includes, ‘ rural’ also.
Source: NSS 75th Round, July 2017 – June 2018.

Table-4 reveals that in primary level, a difference in net attendance ratio was meager. However, Uttar Pradesh in North, Madhya Pradesh in Central, Bihar in east, and Telangana in south region recorded lowest net attendance ratio. In upper primary/middle level, lowest net attendance ratio observed in east region. In primary and upper primary/middle level, north region recorded lowest. In secondary level, net attendance ratio was lowest in north-east region. Lowest net attendance ratio found in east region in higher secondary level and central region in post higher secondary level. Among the states, except post higher Secondary level, Uttar Pradesh recorded lowest net attendance ratio.

Dropouts

Inspite of huge expenditure spent by the national and states/UTs on education sector along with several education policies, dropout is still serious issue in India. Parent’ s attitudes, unwillingness of students, distance and lack of facilities, bad school environment and building are the few of causes for dropouts. A Study of Dropout rate of School Children in Punjab by Inderpreet Kaur (2018) highlights the alarming rate of school dropouts, find out the causes of students drop out rates and their impact on Indian economy also report that children within the rural areas drop out of school earlier than those in the urban areas. An ever-enrolled person was considered as dropped out if he/ she did not complete the last level of education for which he/she enrolled and currently not attending any educational institution for reasons other than ‘ completion of the desired level of education’ .

Table-5: Percentage of persons dropped out among ever enrolled persons of age 3 to 35 years for different States

State	Rural			Urban			Rural+Urban		
	Male	Female	Person	Male	Female	Person	Male	Female	Person
Jammu and Kashmir	10.4	13.9	11.9	7.9	10.2	8.9	9.8	13.1	11.3

Note: Figures for rural Delhi is not presented separately. However, ' rural + urban' for Delhi includes, ' rural' also. Source: NSS 75th Round, July 2017 – June 2018.

Table-5 shows that percentage of persons dropped out among ever enrolled persons of age 3 to 35 years was east and west region. Rural of all regions recorded higher dropped out in rural than urban and higher for females than males. This clearly reveals some of the hurdles like poverty and social norms access to education in rural and for females. In northern region, highest dropout recorded in Rajasthan. Similarly, Gujarat in west region, Madhya Pradesh in central region, West Bengal in east, Assam in north east, and Kerala, Karnataka and Andhra Pradesh states in south recorded higher dropouts. Thus, significant differential in dropouts recorded among the regions, states, rural-urban areas and by gender.

Summary and policy implications

Among the regional and states, inequality in literacy rate, years of formal education, gross attendance ratio, net attendance ratio and dropped out among ever enrolled persons of age 3 to 35 years was found. Hence, tackle the inequality in examined literacy aspects, emphases should be given to special educations of New Education policy 2020 apart from strict implementation of free and compulsory education as per Right to Education Act, 2009 by considering the level of literacy, influencing obstacles such as geographical, socio-economic and cultural apart from other aspects that prevails at regional and states level.

Measures to improve Literacy Rate

- Encouraging every female to study
- Teaching in mother tongue
- Develop love for reading
- Use of technology in teaching and learning
- Encourage learning by doing
- Institutional Social Responsibility (ISR)
- Social Responsibility of every educated and employed citizen

Every citizen should be given a compulsory task to educate children in their own neighbourhoods. Local Governing bodies can target the area to analyse and formulate plan to cover up the population in bringing up the rate of literacy in India.

Limitation

The main limitation of the study is that for north-east region, data related to education aspects available for Assam state only.

A Study On Socio-Economic And Demographic Characteristics Of HIV Positive Pregnant Women Attending ART Centre

Mrs.A. Suchitra, PhD Scholar, Dept. of Population Studies & Social Work, S.V.University, Tirupati, A.P-517502.

Prof.T.Chandrasekarayya, Dept. of Population Studies & Social Work, S.V.University, Tirupati, A.P-517502.

Abstract

The women are mostly engaged in the unorganised sector as labourers. They face the problems of job insecurity and exploitation on par with the male workers. In addition, they are subjected to wage discrimination and the nature of work assigned to them is usually drudgery in nature. They are also subjected to sexual exploitation at the work place. In the homes they are expected to do all the domestic chores. Therefore, the women with Human Immunodeficiency Virus (HIV) positive in lower starts of society need urgent and special attention. Moreover, the women in India are characterized by low status, low level of education, low level of health conditions and employment. They are suffering from insecurity, exploitation in addition to poverty. The paper aims at examines the Socio-Economic and Demographic Characteristics and based on primary data collected from HIV positive pregnant women attending Antiretroviral therapy (ART) Centre.

Keywords

Socio-Economic and Demographic Characteristics, Antiretroviral therapy and Human Immunodeficiency Virus

Introduction

India is one such Third World country which is characterized by poverty and unemployment. According to 2001 census 35 per cent of the population is living below poverty line and 25 per cent below poverty line huge are of developmental benefits are going in favour of a small section of the society, who have high socio-economic status. This has been resulting in the widening of income and wealth disparities. Consequently, the intensity of poverty has been rising and as a result, high incidence of poverty has been falling on women. Rural women are mostly engaged in the farms as agricultural labourers. They face the problems of job insecurity and exploitation on par with the male workers. In

addition, they are subjected to wage discrimination and the nature of work assigned to them is usually drudgery in nature. They are also subjected to sexual exploitation at the work place. In the homes they are expected to do all the domestic chores. Therefore, the rural women in lower starts of society need urgent and special attention. Msamanga, G.I et al (2006) examined the Socio-economic and demographic factors associated with prevalence of HIV infection among pregnant women in Dar es Salaam, Tanzania.

The women will face different problems for their existence depending upon the class to which they belonged to. Therefore, treating all the women as one category may not be helpful in proper understanding often phenomenon. The women belonging to the upper strata are relatively at some advantage, while women in poorer sectors are to wage struggles for their existence. The women in the upper strata of the society have the problem of leisure and the problems that go with the leisure, the middle class women are under the stresses and strains of deteriorating living standards. It is the middle class women who compete for the jobs in the organized sector and encounter stiff competition. The third category of women who belong to the poorer classes and are engaged in the basic struggle for existence, particularly in the rural areas face a different type of problems. Chauhan G (2014) HIV positive pregnant women were younger, primi and housewives. HIV positive antenatal women need to be followed rigorously to link them to ART services. Caroline Granberg (2015) found that higher level of education and belonging to a higher level of wealth quintile were significantly associated with having knowledge about PMTCT. All categories for education showed a significant difference.

The rural women are mostly engaged in the farms as agricultural labourers. They face the problems of job insecurity and exploitation on par with the male workers. In addition, they are subjected to wage discrimination and the nature of work assigned to them is usually drudgery in nature. They are also subjected to sexual exploitation at the work place. In the homes they are expected to do all the domestic chores. Therefore, the rural women in lower starts of society need urgent and special attention. The rural women in India are characterized by low status, low level of education, low level of health conditions and employment. They are suffering from insecurity, exploitation in addition to poverty. Socio-economic status (SES) is often measured as a combination of education, income, and occupation. It is commonly conceptualized as the social standing or class of an individual or group. When viewed through a social class lens, privilege, power and control are emphasized. Furthermore, an examination of SES as a gradient or continuous variable reveals inequities in access to and distribution of resources. The SES is relevant to all realms of behavioural and social science including research, practice, education and advocacy. Padmaja Y et al (2017) studied the demographic characteristics among pregnant and postpartum HIV positive women. Social class and educational status play a vital role in establishing awareness and ensuring the antenatal care and compliance. Empathetic, inclusive and responsive by health care providers in convincing women to get tested goes a long way.

Literature Review

Anne WanjaKibera et al (2017) found that HIV infections in Kenya were predominantly among the resourceful newly married,young educated adults. Gender distribution difference was insignificant (2.2%) in the numbers by sex it was at (2%). The youngest participant was 18 years old implying that the

mode of transmission in this population was sexual and or any other but unlikely to be mother to child. Ottop F. Manyi et al (2020) aimed to describe the socio-demographic profiles of naive to antiretroviral therapy (ART) HIV-infected pregnant women. A total of seventy (70) women were enrolled with age range varying between 15 and 40 years, the Muslim religion, education below secondary level and the profession of housewife were significantly associated. Unyime Patrick Udoudo et al (2021) examined the socio-economic characteristics such as age, marital status, employment status, place of residence, level of education. The result showed that the marital status, place of residence and level of education has a negative relationship with the probability of a pregnant woman having a positive HIV status. Feny Deya Virdausi et al (2022) found that women's age, education level, wealth quintile, residential area and region, access to information, owning cell phones and autonomy were significantly associated with positive knowledge and attitudes toward HIV/AIDS.

Objective

To study the Socio-Economic and Demographic Characteristics of HIV positive pregnant women attending ART Centre

Method and material

The paper is based descriptive research design and based on primary data collected with interview scheduled from 250 HIV positive pregnant women coming to Antiretroviral therapy Center at SVRR Government General Hospital, Tirupati, Andhra Pradesh.

Results and discussion

Age

Age is an important factor which determines the physical ability to work. Age is very important factor besides the active participation in innovative activities and risk taking ability. To understand the working age group, it is necessary to classify the respondents according to their age. Age shows understanding nature and shouldering the responsibility. The age of the respondents is presented in the table-1.

Table-1: Age of the Respondents

Sl. No.	Age	No. of Women	Percentage
1	Below 25 years	75	30.0
2	26 - 35 years	101	40.4
3	Above 35 years	74	29.6
	Total	**250**	**100.0**

The table-1 shows that 40.4 per cent of the respondents are in the age group of 26–35 years, 30 per cent are in the age group of below 25 years and 29.6 per cent are in the age group of above 35 years. Above all, it is concluded that more than 40 per cent of the respondents are in the age group of 26–35 years.

Marital Status

The marital status of the respondents is shown in the table-2.

Table-2: Marital status of the respondents

Sl. No.	Marital Status	No. of Women	Percentage
1	Married	248	99.2
2	Unmarried	2	0.8
	Total	**250**	**100.0**

The table-2 shows that 99.2 per cent of the respondents are married and mere 0.8 per cent is spinsters.

Caste

Caste is another variable to analyse and understand the socio-economic characteristics of the respondents. Caste has become very important in India, for meaningful study it is not possible and feasible without taking caste into consideration. The caste composition of the respondents is furnished in the table-3.

Table-3: Caste of the respondents

Sl. No.	Caste	No. of Women	Percentage
1	Forward Caste	52	20.8
2	Backward Caste	120	48.0
3	Scheduled Caste	60	24.0
4	Scheduled Tribe	18	7.2
	Total	**250**	**100.0**

The table-3 portrays that 48 per cent of the respondents belong to Backward Caste, 24 per cent to Scheduled Caste, around 21 per cent to Forward Caste and a little over 7 per cent belong to Scheduled Tribe.

Education

Education plays a very important role to empower women and for development of society. It gives analysing capacity and wisdom to thinking and decision making capacity. Education - formal and informal - improves awareness for better life and generates positive impulses for socio-economic advancement. It controls the attitudes, opinions and behaviour of the people and influences the economic destiny of the family. The educational status of the respondents is presented in the table-4.

Table-4: Literacy of the Respondents

Sl. No.	Education	No. of women	Percentage
1	Illiterate	106	42.4
2	Up to Primary	39	15.6
3	Up to 10th	85	34.0
4	Intermediate	11	4.4
5	Graduation	9	3.6
	Total	**250**	**100.0**

It is quite obvious from the table-4 that 42.4 per cent of the respondents are illiterates, 34 per cent have SSC qualification, around 16 per cent have primary education, 4.4 per cent have Intermediate and around 4 per cent are graduates.

Occupation

It is a common fact that the occupation of the individual determines his position in the society and standard of living. Table-5 reveals the occupational structure of the sample population. Most of the respondents in the sample are doing business and are in employment. Only a few persons are Involved in agriculture. Majority of the respondents from the employment and business categories show higher fertility and higher additional expected family size compared to the cultivators in the sample population.

Table-5: Occupation of the Respondents

Sl. No.	Occupation	No. of Women	Percentage
1	Housewife	128	51.2
2	Coolie	90	36.0
3	Petty business	11	4.4
4	Daily labourers	14	5.6
5	Private jobs	7	2.8
	Total	**250**	**100.0**

The table-5 shows that 51.2 per cent are housewives, 36 per cent are coolies, around 6 per cent are daily labourers, 4.4 per cent have petty business and around 3 per cent are working in private sector.

Financial Support

The financial support the respondents getting is shown in the table-6.

Table-6: Mode of financial support

Sl. No.	Mode of financial support having to live	No. of Women	Percentage
1	Family members	159	63.6
2	Friends	42	16.8
3	Relatives	49	19.6
	Total	**250**	**100.0**

The table-6 shows that around 64 per cent of the respondents have financial support from their family members to live, around 20 per cent have financial support from relatives and around 17 per cent have financial support from friends.

Conclusion

This study showed that as many women as men were equally vulnerable to HIV infections. Risk factors for HIV infections were being young adults, mostly backward and scheduled caste, illiterate or primary education and majority are being housewife, and receiving financial support from family members most are being married or cohabiting couples, a contrast with the notion that marriage was a protective institution against HIV infections. The high prevalence rate of HIV was attributed to low level of sexual health education and condom use. Low risk factors for HIV infections were associated with low level of education. As such, policy makers should review HIV programmes and consider the contribution of socio-economic and demographic factors done so that gaps in the prevention and control of HIV in could be sealed to reduce the negative impact of HIV infections.

Sl. No.	Marital Status	No. of Women	Percentage
1	Married	248	99.2
2	Unmarried	2	0.8
	Total	**250**	**100.0**

The table-2 shows that 99.2 per cent of the respondents are married and mere 0.8 per cent is spinsters.

Caste

Caste is another variable to analyse and understand the socio-economic characteristics of the respondents. Caste has become very important in India, for meaningful study it is not possible and feasible without taking caste into consideration. The caste composition of the respondents is furnished in the table-3.

Table-3: Caste of the respondents

Sl. No.	Caste	No. of Women	Percentage
1	Forward Caste	52	20.8
2	Backward Caste	120	48.0
3	Scheduled Caste	60	24.0
4	Scheduled Tribe	18	7.2
	Total	**250**	**100.0**

The table-3 portrays that 48 per cent of the respondents belong to Backward Caste, 24 per cent to Scheduled Caste, around 21 per cent to Forward Caste and a little over 7 per cent belong to Scheduled Tribe.

Education

Education plays a very important role to empower women and for development of society. It gives analysing capacity and wisdom to thinking and decision making capacity. Education - formal and informal - improves awareness for better life and generates positive impulses for socio-economic advancement. It controls the attitudes, opinions and behaviour of the people and influences the economic destiny of the family. The educational status of the respondents is presented in the table-4.

Table-4: Literacy of the Respondents

Sl. No.	Education	No. of women	Percentage
1	Illiterate	106	42.4
2	Up to Primary	39	15.6
3	Up to 10th	85	34.0
4	Intermediate	11	4.4
5	Graduation	9	3.6
	Total	**250**	**100.0**

It is quite obvious from the table-4 that 42.4 per cent of the respondents are illiterates, 34 per cent have SSC qualification, around 16 per cent have primary education, 4.4 per cent have Intermediate and around 4 per cent are graduates.

Occupation

It is a common fact that the occupation of the individual determines his position in the society and standard of living. Table-5 reveals the occupational structure of the sample population. Most of the respondents in the sample are doing business and are in employment. Only a few persons are Involved in agriculture. Majority of the respondents from the employment and business categories show higher fertility and higher additional expected family size compared to the cultivators in the sample population.

Table-5: Occupation of the Respondents

Sl. No.	Occupation	No. of Women	Percentage
1	Housewife	128	51.2
2	Coolie	90	36.0
3	Petty business	11	4.4
4	Daily labourers	14	5.6
5	Private jobs	7	2.8
	Total	**250**	**100.0**

The table-5 shows that 51.2 per cent are housewives, 36 per cent are coolies, around 6 per cent are daily labourers, 4.4 per cent have petty business and around 3 per cent are working in private sector.

Financial Support

The financial support the respondents getting is shown in the table-6.

Table-6: Mode of financial support

Sl. No.	Mode of financial support having to live	No. of Women	Percentage
1	Family members	159	63.6
2	Friends	42	16.8
3	Relatives	49	19.6
	Total	**250**	**100.0**

The table-6 shows that around 64 per cent of the respondents have financial support from their family members to live, around 20 per cent have financial support from relatives and around 17 per cent have financial support from friends.

Conclusion

This study showed that as many women as men were equally vulnerable to HIV infections. Risk factors for HIV infections were being young adults, mostly backward and scheduled caste, illiterate or primary education and majority are being housewife, and receiving financial support from family members most are being married or cohabiting couples, a contrast with the notion that marriage was a protective institution against HIV infections. The high prevalence rate of HIV was attributed to low level of sexual health education and condom use. Low risk factors for HIV infections were associated with low level of education. As such, policy makers should review HIV programmes and consider the contribution of socio-economic and demographic factors done so that gaps in the prevention and control of HIV in could be sealed to reduce the negative impact of HIV infections.

حضرت عبدالحق شہ میر ثالثؒ کی نعت گوئی

حضرت سید عبدالحق شہ میر ثالثؒ خاندانِ شہ میریہ کے چشم و چراغ ہیں۔ آپ کی ولادت ۱۸۷۱ء میں شہر کڈپا میں ہوئی اور ۱۹۳۵ء میں اس دارِ فانی سے کوچ کر گئے۔ آپ ایک صوفی باصفا اور عالم باعمل بزرگ تھے۔ آپ شاعر بھی تھے اور نثر نگار بھی۔ آپ کا شعری سرمایہ دیوان شاہ میر ہے جو ۱۹۲۱ء میں زیورِ طبع سے آراستہ ہوا تھا۔ اس دیوان سے متعلق حضرت محمود بخاریؒ اپنی تصنیف شہ میری اولیاء میں لکھتے ہیں:

''دیوان شاہ میر' حضرت شاہ میر کے کلام حمد و نعت' سلام و منقبت کا لاجواب مجموعہ ہے۔ دیوان کیا ہے! تصوف کا خزانہ' مُعارف کا گنجینہ' عشقِ حقیقی کا پیغام' حُبِ نبوی کا لبریز جام ہے۔'' (ص:۱۱۲)

دیوان شاہ میر میں حضرت شہ میر ثالثؒ نے وافر نعتیں کہی ہیں اور خوب کہی ہیں۔ بقول میر انیسؔ: ''ایک پھول کا مضمون ہو تو سو رنگ سے باندھوں'' کے مصداق حضرت نے حضور اکرم حضرت محمد صلی اللہ علیہ وسلّم کی تعریف و توصیف میں عقیدت کے رنگ برنگ پھول نچھاور کیے ہیں۔ آپ کے کلام کے مطالعہ سے بخوبی اندازہ ہوتا ہے کہ یہ ایک عاشقِ رسول کا کلام ہے۔ جس میں آمد ہی آمد ہے۔ اپنی نعتیہ شاعری پر آپ کو خود ناز تھا۔ کہتے ہیں:

گوہرِ نعتِ رسولِ عربی سے پُر ہے
مرے دیوان کا لے کر یہ خزانہ دیکھو
جتنی غزلیں ہیں سب نعتِ حضرت میں ہیں
قابلِ وصف میرا یہ دیوان ہوا

حضرت کا کلام اپنے اجداد کے کلام کے مقابلے میں کافی نکھرا ہوا ہے۔ انہوں نے کلاسیکی شعری روایات بالخصوص تغزل کی آمیزش سے اپنے نعتیہ کلام کو آراستہ کیا ہے۔ پروفیسر مظفر علی شہ میری نے اپنی تصنیف: حضرت عبدالحق شہ میر ثالثؒ۔ حیات' شخصیت اور فن'' میں یوں رقم طراز ہیں:

''انہوں نے اپنے خاندانِ صوفیہ کے مخصوص موضوعاتِ شاعری کے اظہار اور زبان و بیان میں جو جدت و ندرت پیدا کی ہے' اس کی حیثیت نعتیہ و ذوقیہ شاعری میں اجتہاد کیا ہے۔ ان کے نعتیہ کلام میں غزل کا لوچ اور مٹھاس رچ بس کر باہم شیر و شکر ہو گئے ہیں۔ یہ اپنی نوعیت کا جدید رنگ ہے جو ان کے شعرائے سَلَف کے یہاں نہیں ملتا۔'' (ص:۴۲)

حضرت شہ میر ثالثؒ کی صاف زبان' شائستہ بیانی' سادگی و سلاست' نرم و شیریں لہجے نے شہ میری اولیا کے کلام میں آپ کو منفرد مقام عطا کیا ہے۔ جس کا آپ کو خود احساس تھا۔ فرماتے ہیں:

میں نازاں ہوں رسول اللہ کی مدحت سرائی پر
کوئی شہ میر مجھ جیسا غزل خواں ہو نہیں سکتا

حضرت شہ میر ثالثؒ کے نعتیہ کلام میں سرکارِ دو عالم حضرت محمد مصطفیٰ صلی اللہ علیہ وسلّم کی عظمت و بزرگی کا بیان' اوصاف حمیدہ کا عقیدت سے بھرا اظہار، قد و قامت' صورت و سیرت کا ذکر' دیدار مصطفیٰ کی تمنا اور مدینہ منورہ کی سرزمین سے محبت کا والہانہ اظہار ملتا ہے۔ ان موضوعات کو حضرت نے نہایت عمدگی سے شعر کے قالب میں ڈھالا ہے۔ حضرت کا نعتیہ

ستار فیضیؔ کی شاعری میں مذہبی عناصر

ڈاکٹر محمد نثار احمد

اسوسی ایٹ پروفیسر، شعبہ اردو ایس-وی-یونیورسٹی، تروپتی (آندھرا پردیش)

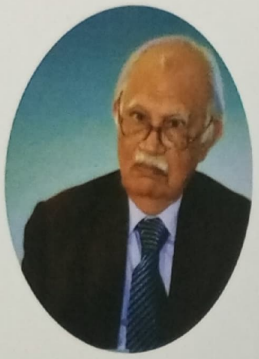
جناب ستار فیضی کا نام شیخ عبدالستار ہے۔ قلمی نام ستار فیضی اور تخلص فیضیؔ۔ یکم جون 1965 (انیس سو پینسٹھ عیسوی) کو کڈپہ میں پیدا ہوئے۔ اردو میڈیم سے تعلیم حاصل کی۔ انھیں اردو سے والہانہ محبت ہے۔ 1989ء (انیس سو نواسی عیسوی) میں اردو کے مدرس بنے۔ اُس وقت سے آج تک انھوں اردو درس و تدریس اور اردو شعر و ادب کے لیے اپنے آپ کو وقف کر دیا۔ اِن دنوں ستار فیضی کڈپہ ضلع میں میدکور کے ضلع پریشد اردو ہائی اسکول میں اسکول اسسٹنٹ کی حیثیت سے خدمات انجام دے رہے ہیں۔

ستار فیضی آندھرا پردیش کے اہم اور ممتاز شعراء میں شمار کئے جاتے ہیں۔ انہوں نے شاعری میں مختلف اصناف پر طبع آزمائی کی ہے۔ حمد، نعت، مناجات، منقبت، غزل اور نظم کے علاوہ انھوں نے کہانیاں اور مضامین بھی لکھے ہیں۔ ان کی کہانیاں اور نظمیں مختلف اخبارات، رسائل و جرائد میں شائع ہوتے ہیں۔ چند ایک کے نام یہ ہیں: گل بوٹے ممبئی، بچوں کی دنیا دہلی، الحیات رانچی، روشن ستارے حیدرآباد، دعوت دہلی، الہدیٰ نیپال، ندائے صالحات کڈپہ، قومی صحافت لکھنؤ، صدائے بسمل جارکھنڈ، تریاق ممبئی، ماہنامہ اردو دنیا، ماہنامہ تریاق، بدرِ کامل ناندیڑ کے علاوہ سالار و یکلی، روزنامہ سیاست، روزنامہ اعتماد اور روزنامہ رہنمائے دکن میں ان کے مضامین شائع ہوتے ہیں۔

ستار فیضی کا مجموعۂ کلام ''دھنک'' کے نام سے اردو اکیڈمی آندھرا پردیش کی جزوی مالی تعاون سے 2014ء شائع ہو چکا ہے۔ ان کے مضامین کا مجموعہ ''مہک'' اور شعری مجموعہ ''کسک'' زیرِ طبع ہے۔ سرورِ کونین کے نام سے ایک شراکتی نعتیہ مجموعہ بھی اردو اکیڈمی کے مالی تعاون سے منظرِ عام پر آ چکا ہے۔ اس کے علاوہ ''چھتیس حرکاتی نظمیں''، ''فیضی کے سو 100 شعر''، ''فیضی کی پچاس پہیلیاں''، ''ایکٹیوٹی بک''، ''لطیفوں کا مجموعہ ''مسکان''، بچوں کی نظمیں ''غنچہ غنچہ''، ''بھارت میرا مہان'' اور گذشتہ دنوں ان کی نعتوں پر مشتمل ایک مجموعہ ''شاہِ اُمَم'' کے نام سے شائع ہو چکا ہے۔ ستار فیضی صاحب نے تیلگو میں بھی چند کتابچے شائع کئے ہیں۔ اردو ساہتیہ نُو رتنالو، بھکتی مُکتی، بھارتیہ پرمُکھا مسلم مہیللو، وغیرہ شائع ہو چکے ہیں۔

ستار فیضی کی ادبی شخصیت کی کئی جہتیں ہیں۔ ستار فیضی نے اپنی شاعری میں مذہبی موضوعات کو مختلف جہتوں میں پیش کیا ہے۔ حمد و نعت اور دعا و مناجات کے علاوہ دیگر منظومات میں بھی دینی، اسلامی اور

Urdu Adab Ke Faroug [illegible]
Mazhabi Adab Ka [illegible]



اردو زبان [illegible] کے ظرف میں بہت وسعت ہے۔ اسلامیات اور دیگر مذہبی لٹریچر کی اردو ادب میں بڑی اچھی کھپت ہوسکتی ہے، اس سے ہمارا ادب نہ صرف تازہ اور توانا بنے گا بلکہ زبان وادب سے عوام کی دلچسپی میں جو زبردست کمی دیکھنے کو مل رہی ہے یہ کمی بھی دور ہوجائے گی۔ آج مذہبی نظریات وتعلیمات میں عوام کی دلچسپی بڑھ رہی ہے، مذہب بے زاری کے بادل جو کمیونسٹوں کے گمراہ کن پروپگنڈہ سے عوام کے ذہنوں پر چھائے ہوئے تھے وہ اب چھٹنے لگے ہیں۔ اردو ادب کو بھی ان زنجیروں سے چھٹکارا حاصل کرلینا چاہیے۔

پروفیسر بی شیخ علی کی تعلیمی خدمات - ایک جائزہ

ڈاکٹر محمد نثار احمد

صدر شعبۂ اردو، ایس۔ وی۔ یونیورسٹی

تروپتی، آندھرا پردیش

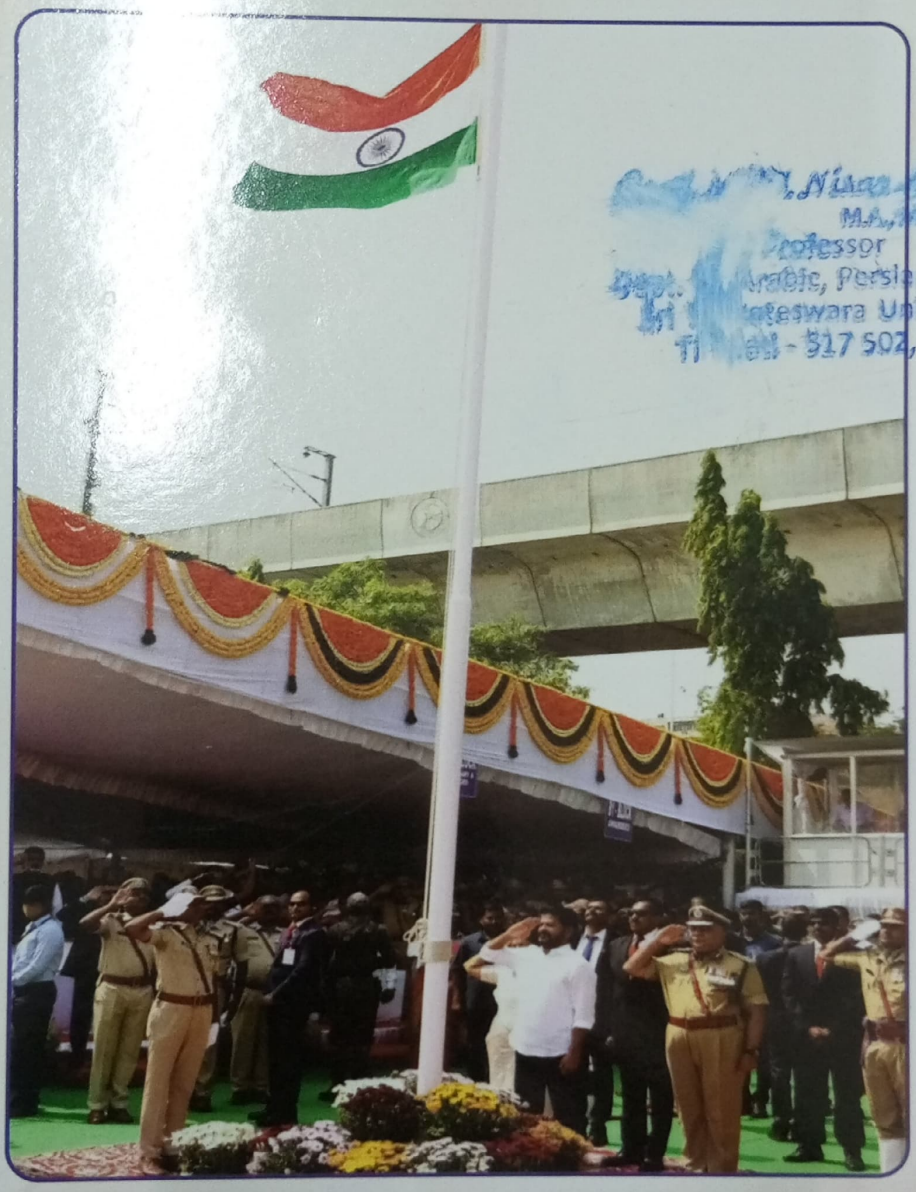
پروفیسر شیخ علی کی شخصیت کرناٹک ہی نہیں بلکہ جنوبی ہند کی قد آور شخصیت تھی۔ انہوں نے ہندوستان اور بیرون ہند بھی اپنی تحقیقات اور تصنیفات کے ذریعے ایک بلند مقام حاصل کیا۔ پروفیسر شیخ علی ایک مشہور مؤرخ، فلسفۂ تاریخ کے رمز شناس، محقق اور مصنف تھے۔ ان کا دائرہ کار صرف تاریخ تک محدود نہیں تھا بلکہ مذہب، ادب، صحافت اور سماجیات و سیاسیات پر بھی انہیں گہرا عبور حاصل تھا۔ ان کی شخصیت ہمہ جہت شخصیت تھی۔ وہ مختلف عہدوں پر فائز رہے۔ ان کی تعلیم میسور یونیورسٹی، علی گڑھ مسلم یونیورسٹی اور لندن یونیورسٹی میں ہوئی۔ انہوں نے ان دونوں یونیورسٹیوں سے تاریخ میں پی ایچ ڈی کی ڈگری حاصل کی یعنی علی گڑھ مسلم یونیورسٹی اور لندن یونیورسٹی۔

انہوں نے اپنی مادر علمی میسور یونیورسٹی سے اپنی تدریسی خدمات کا آغاز کیا۔ تقریباً چالیس سال پروفیسر کی حیثیت سے خدمات انجام دینے کے بعد ملک کی دو مؤقر یونیورسٹیوں کے وائس چانسلر کی حیثیت سے شاندار کارنامے انجام دیئے۔ یونیورسٹی آف گوا اور منگلور یونیورسٹی میں ان کی گراں بہا خدمات کا اعتراف کیا جاتا ہے۔ یہ اعزاز بہت کم افراد کو حاصل ہوتا ہے۔

اعلیٰ تعلیمی اداروں میں اعلیٰ تعلیم حاصل کرنے اور شاندار تدریسی خدمات انجام دینے کی وجہ سے انہیں تعلیم کی اہمیت اور افادیت کا بخوبی اندازہ تھا۔ تعلیمی اداروں کے انتظام اور نظم و نسق کے سلسلے میں طویل ترین تجربہ ان کے ساتھ تھا۔ وہ ہمیشہ قوم و ملت کی تعلیمی ترقی کے لیے فکرمند رہتے تھے۔ ان کا ایقان تھا کہ تعلیمی ترقی ہی کے ذریعے قوم و ملت کی ترقی ہو سکتی ہے۔

پروفیسر شیخ علی تعلیم کی اہمیت اور علم کی فضیلت کے بارے میں ایک جگہ لکھتے ہیں:

''اسی لیے کہتے ہیں کہ قوموں کا مستقبل درسگاہوں میں ڈھلتا



ہے اور قوموں کے معمار معلم ہوتے ہیں۔ علم ہی ایک ایسی واحد دولت ہے جو لٹانے سے بڑھتی ہے اور بچانے سے گھٹتی ہے۔ مذہب اسلام کی ابتداء اقراء یعنی پڑھنے کے حکم سے شروع ہوئی۔ یہ قرآن مجید کی پہلی وحی ہے۔ جو رسول اکرم صلی اللہ علیہ وسلم پر نازل ہوئی۔'' (ارمغانِ سالار، ص:68)

پروفیسر شیخ علی ایک ماہر تعلیم تھے۔ انہوں نے فلسفۂ تعلیم کی مشہور شخصیات کا گہرا مطالعہ کیا تھا۔ وہ خاص طور پر عالم اسلام کے مفکرین سے متاثر تھے جن میں مولانا رومی، حافظ شیرازی، امام غزالی، سرسید احمد خان، علامہ شبلی نعمانی، مولانا حالی، علامہ اقبال، مولانا ابوالکلام آزاد اور ڈاکٹر ذاکر حسین وغیرہ قابل ذکر ہیں۔ ان مفکرین کے افکار اور تعلیمی تصورات سے متاثر ہو کر انہوں نے ان افکار کو اپنے فکر و نظر میں شامل کر لیا تھا۔ وہ ان بزرگوں کی تعلیمی خدمات کے معترف تھے۔ انہوں نے اپنے مضامین میں خاص طور پر تعلیمی تصورات کا ذکر کیا ہے۔ انہوں نے ماہر تعلیم ڈاکٹر ذاکر حسین پر انگریزی میں ایک کتاب کرناٹک کے گورنر خورشید عالم خان کے ساتھ لکھی جسے ساہتیہ اکیڈمی نے شائع کیا۔ پروفیسر ابوالکلام قاسمی نے اس کا اردو ترجمہ کیا ہے۔ اس کتاب میں پروفیسر شیخ علی نے نہایت عمدہ اسلوب میں ڈاکٹر ذاکر حسین کے تعلیمی تصورات کو مبسوط اور مفصل پیش کیا ہے۔ اصلاحِ نصاب کے سلسلے میں سابق صدر جمہوریہ ہند ڈاکٹر ذاکر حسین کے حوالے سے ایک جگہ لکھتے ہیں:

''ایک اور اہم بات یہ ہے کہ ہمارے طرزِ تعلیم میں اصلاح چاہیے۔ ڈاکٹر ذاکر حسین صاحب ماہر تعلیم نے تعلیمی اسلوب کے جو طریقے سکھائے ہیں، ان کی تعمیل چاہیے۔ انہوں نے کہا کہ انگریزوں نے تعلیم کا جو مقصد قرار دیا تھا، وہ اب تک باقی ہے یعنی نوکری۔ اس کو بدل کر اخلاقی شخصیت کی تعمیر تعلیم کا مقصد ہونا چاہیے۔ مقصد کے تعین کی کسوٹی تہذیب ہے۔'' (ارمغانِ سالار، ص:76)

پروفیسر شیخ علی کی تعلیمی خدمات کے سلسلے میں قابل ذکر پہلو یہ ہے کہ وہ ایک طرف الامین تعلیمی تحریک سے وابستہ رہے۔ اس کے روحِ رواں اور سرپرست کی حیثیت سے ابتداء

میرؔ کے کلام میں سادگی اور پُرکاری

خدائے سخن میر تقی میرؔ (ولادت 1722 - وفات 1810) اردو کے ممتاز ترین شعراء میں سب سے نمایاں مقام کے حامل ہیں۔ ان کے کلام کی گوناگوں خصوصیات کی وجہ سے ان کی اہمیت آج بھی اردو دنیا میں امتیازی مقام اور اہمیت کی حامل ہے۔ مستقبل میں بھی ان کے کلام کو اہمیت دی جاتی رہے گی۔

میرؔ کے کلام میں بہت سی ایسی خصوصیات ہیں، جن کی وجہ سے میرؔ کو یہ مقام و مرتبہ حاصل ہوا ہے کہ ان کو خدائے سخن قرار دیا گیا۔ ان کے کلام کے بہتر نشتر تو مشہور ہیں ہی، اس کے ساتھ ساتھ ان کے کلام میں سادگی، سلاست، تاثیر اور اثر آفرینی کی خصوصیات ان کو اردو کے شعرا میں ممتاز اور منفرد مقام عطا کرتے ہیں۔

سادگی اور پُرکاری دراصل میرؔ کے کلام کی نمائندہ اور ممتاز خصوصیت ہے۔ میرؔ کے کلام میں الفاظ و معنی کی سطح پر پیچیدگی کے بجائے سادگی کا غلبہ زیادہ ہے۔ وہ سہل اور آسان الفاظ کے ذریعہ عام فہم اسلوب میں اپنے خیالات کو پیش کر کے متاثر کرنے کا گُر جانتے ہیں۔ میرؔ نے اسی سادگی کے ذیعہ اپنی پُرکاری کا جادو جگایا ہے۔ ان کا یہ جادو سر چڑھ کے بولتا ہے۔ تاثیر اور تاثُر کا وفور میرؔ کے کلام کی جان ہے۔ اسی خصوصیت نے ان کے کلام کو ایک نئی جہت عطا کی ہے۔

میر تقی میرؔ کا خیال ہے کہ ان کے اشعار اگرچہ کہ خواص کو پسند ہیں لیکن ان کے مخاطب عوام ہیں۔ گویا خواص اپنے طور پر پسند کرتے ہیں جب کہ خود انہوں نے عوام کو مخاطب کیا ہے۔ وہ خود کہتے ہیں:

شعر میرے ہیں گو خواص پسند
پر مجھے گفتگو عوام سے ہے

میرؔ کے کلام میں یہی وہ خصوصیت ہے کہ وہ خود خواص میں بھی مقبول ہیں اور عوام میں بھی۔ انہوں نے عوام سے گفتگو کرنے کو ترجیح دی اور خواص خود ان کے کلام کی جانب التفات کرنے پر مجبور ہیں۔ اس سے ان کے مزاج اور شعری رجحان کا بخوبی اندازہ لگایا جا سکتا ہے۔ میرؔ کو خود اس بات کا بھی احساس تھا کہ ان کے کلام میں جو روانی اور سلاست ہے، یہی ان کی شاعری کا کمال ہے اور اس کا اظہار انہوں نے اپنے ایک شعر میں یوں کیا ہے:

میرؔ، دریا ہے، سنے شعر زبانی اس کی
اللہ اللہ رے، طبیعت میں روانی اس کی

میرؔ کے کلام میں نہ کوئی ایہام ہے نہ ابہام ہے۔ ان کے یہاں صنائع اور بدائع یا پھر فنی مرصع کاری بھی نہیں لیکن ان کی سادگی اور سلاست نے ان کو مقبولیت عطا کی ہے۔ میرؔ کے شعر یوں متاثر کرتے ہیں۔ جذبات کی صداقت اور تجربات کی حقیقت بیانی کے ساتھ ان کے اظہار میں وہ دلکشی اور جاذبیت ہے کہ وہ متاثر کرتے ہیں اور تاثر بھی دیرپا

غالبؔ دکن ۔یسیرؔ کرنولی

پروفیسر محمد امین اللہ
شعبۂ عربی، فارسی واردو، جامعہ سری وینکٹیشورا، تروپتی، آندھراپردیش۔انڈیا

دہلی کے بلّی ماراں محلّہ سے مرزا اسداللہ خاں غالبؔ کی شہرت کا سلسلہ شروع ہوتا ہے۔ جورفتہ رفتہ ہندو پاک اورایران کی سرحدوں کو پار کرتے ہوئے دنیائے ادب پر چھا گیا ہے۔ غالبؔ ایک آفاقی شاعر ہیں۔ان کی شاعرانہ عظمت کے چرچے صرف اردو اور فارسی تک محدود نہیں ہیں۔ بلکہ دنیا کی دیگر زبانوں کے ادیبوں اور شاعروں نے بھی غالبؔ کو بڑا شاعر تسلیم کیا ہے۔مختلف زبانوں میں غالبؔ کی شاعری کے ترجمے ہورہے ہیں۔اور روز بہ روز غالبؔ کے شیدائیوں اور پرستاروں میں اضافہ ہورہا ہے۔اُنہیں پرستاروں میں ایک نام امیر علی خاں یسیرؔ کرنولی کا ہے جو غالبؔ دکن کے لقب سے مشہور ومعروف ہیں۔

یسیرؔ کرنولی کی ولادت، غالبؔ کی ولادت کے سو سال بعد ۱۹۰۶ء میں جنوبی ہند کی ریاست آندھراپردیش کے شہر کرنول میں ہوئی۔ پٹھان گھرانے میں پیدا ہوئے۔ابا واجداد جاگیردار تھے۔یسیرؔ نے بی۔اے۔اور ایم۔اے۔کی تعلیم حاصل کی۔ بعد میں بی۔ایل۔بھی پاس کیا۔سرکاری ملازم ہوئے۔ ملازمت کو اپنی طبیعت سے ناموافق پاکر استعفی دے دیا۔وکالت کی۔یہاں بھی دل نہ لگا۔پیشۂ وکالت کو بھی خیرباد کہکر گھر پر رہنے لگے۔پھر کسی پیشہ یا ملازمت سے وابستہ نہ ہوئے۔اور شادی بھی نہیں کی۔وراثت میں جاگیر ملی تھی۔گزر بسر کے لیے یہی کافی تھی۔شعر کہنے میں اور شاگردوں کی اصلاح میں مصروف رہے۔ ۱۹۸۸ء میں وفات پائی۔

یسیرؔ کرنولی نے اپنا دیوان ''نفیر شوق'' بطور یادگار چھوڑا ہے۔ جو ۱۹۸۰ء میں کرنول سے شائع ہوکر منظر عام پر آیا۔اس دیوان کے مطالعہ سے بخوبی واضح ہوتا ہے کہ یہ غالبؔ کی پیروی میں لکھا گیا ہے۔اس دیوان کی بیشتر غزلوں کی زمینیں، ردیف وقافیے، موضوعات، زبان، انداز بیان دیوان غالبؔ سے مماثلت رکھتی ہیں۔اور یہ سچ بھی ہے۔اس کا اندازہ ہمیں اس بات سے بھی ہوتا ہے کہ انہوں نے اپنا دیوان ''نفیر شوق'' غالبؔ کے پرستاروں کے نام معنون کیا ہے۔ انتساب میں لکھتے ہیں:

''نجم الدولہ دبیر الملک نواب مرزا اسداللہ خاں غالبؔ کے پرستاروں کے نام۔'' (نفیر شوق، ص:۳)

یسیرؔ کرنولی نے شاعری کی ابتداء تحصیل علم کے زمانے میں ہی کی تھی۔ غالبؔ کی طرح یسیرؔ کے خاندان میں بھی کوئی شاعر گزرا ہے اور نہ ہی ان دونوں نے شاعری میں کسی کی شاگردی اختیار کی ہے۔بغیر کسی استاد کے عروض کی کتابیں پڑھیں۔استاذی شعراء میرؔ، غالبؔ، مومنؔ، ذوقؔ، نصیرؔ اور ناسخؔ کا مطالعہ کیا۔مزاج شاعرانہ تھا اور طبعیت میں روانی تھی۔ بہت جلد فن شعر پر دسترس حاصل کرلی اور شعر کہنے لگے۔ چوں کہ وہ غالبؔ سے بے حد متاثر تھے، لہذا غالبؔ ہی کے رنگ میں شعر کہنا اپنا شیوہ بنالیا۔ڈاکٹر یعقوب شریف لکھتے ہیں:

''یسیرؔ، غالبؔ سے بہت متاثر رہے ہیں۔انہوں نے نہ صرف غالبؔ کے طرزِ ادا اور اسلوب کی پیروی کی ہے بلکہ غالبؔ کی غزلوں کی بحریں، زمینیں، ردیف وقافیے بھی من وعن اپنا لیے ہیں۔'' (غالب دکن۔یسیر کرنولی، ص:۱۶۴)

یہی وجہ تھی کہ یسیرؔ کو ''غالبؔ دکن'' کہا جانے لگا۔غالبؔ دکن کے لقب سے متعلق ملک الشعراء اوج یعقوبی یورقم طراز ہیں:

''جب اُس مشاعرہ میں غالبؔ کی ایک سنگلاخ زمین میں یسیرؔ صاحب نے غزل سنائی تو خود میری ہمہ گوئی اور ہمہ دانی کا احساس متزلزل رہ گیا۔ میں سوچ بھی نہیں سکتا تھا کہ کرنول جیسے دور افتادہ مقام میں ایسا شاعر بھی ہوگا۔ میں اگر زیادہ صاف گوئی سے کام لوں تو بلا جھجک یہ کہہ سکتا ہوں کہ رفع شک کے طور پر میں نے ان سے کچھ سنانے کی خواہش کی۔ چنانچہ یسیرؔ صاحب نے غالبؔ ہی کی زمینوں میں مزید دو غزلیں سنائیں۔ نتیجہ کے طور پر مجھے کہنا پڑا کہ علامہ یسیرؔ کو غالبؔ دکن کا خطاب دینا چاہیئے۔ غالباً یہ بات میرے دل کی گہرائیوں سے نکلی تھی جس میں بھرپور خلوص تھا کہ آج سارا آندھرا پردیش آپ کو غالبؔ دکن ہی کے نام سے جانتا ہے۔'' (نفیر شوق' ص:۴ اور ۵)

اوج یعقوبی نے سنگلاخ زمینوں کے استعمال پر یسیرؔ کو غالبؔ دکن کہا تو مولوی سید افتخار احمد نے فکری اعتبار سے یسیرؔ کو غالبؔ دکن سے یاد کیا ہے۔ خود یسیرؔ کرنولی ''نفیر شوق'' میں لکھتے ہیں:

''میرے مکرم دوست مولوی سید محمد افتخار احمد صاحب بشرؔ نے پہلی بار مجھے غالبؔ دکن کے نام سے یاد کیا' اس بنا پر کہ میرے شعر غالبؔ کے اشعار کی طرح دعوتِ فکر دیتے ہیں۔'' (نفیر شوق' ص:۳۵)

اس میں کوئی شک نہیں کہ یسیرؔ کرنولی نے غالبؔ کی پیروی کی ہے۔ غالبؔ اور یسیر کے درمیان ایک صدی کا فاصلہ ہے۔ یسیرؔ کے زمانے میں اردو کی شعری روایات کافی بدل چکے تھے۔ تاہم یسیرؔ نے اپنی شاعری میں کلاسیکی روایات کی پاس داری کی ہے۔ عشقیہ واردات کی ترجمانی' فارسی تراکیب کا استعمال 'غزل کی لفظیات اور طرز بیان ان سب سے یسیرؔ کی غزل مزین ہے۔ کلاسیکی روایات کا لحاظ کرتے ہوئے غالبؔ کی سنگلاخ زمینوں میں غزل کہنا یسیرؔ کرنولی کا وصف خاص رہا ہے۔ غالبؔ پسندی کا ذکر کرتے ہوئے ڈاکٹر ابوالفضل سید محمود قادری لکھتے ہیں:

''غالبؔ اور یسیرؔ کے درمیان ایک صدی سے زیادہ عرصہ کا فصل موجود ہے۔ اس طویل عرصے میں ادبی اقدار نے طرح طرح کی کروٹیں بدلیں' لیکن یسیرؔ کے ذہن و شعور پر غالبؔ ہی غالب رہے۔ یہاں تک کہ ترتیبِ دیوان کے مرحلے پر بھی 'نقش فریادی ہے کس کی شوخیٔ تحریر کا' کی زمیں میں یسیرؔ نے بھی نفیرِ شوق کو کاغذی پیرہن میں پیکرِ تصور بنایا۔'' (نفیر شوق ایک جائزہ' ص:۷ اور ۸)

''نفیر شوق'' کی پہلی غزل ہی اس بات کی غماز ہے۔ جس میں دیوان غالبؔ کی پہلی غزل کی زمین' ردیف و قافیہ کی پیروی کرتے ہوئے نہایت خوب صورت شعر کہے ہیں۔ دیوان غالبؔ کے پہلے دو شعر ملاحظہ ہوں:

نقش فریادی ہے کس کی شوخیٔ تحریر کا — کاغذی ہے پیرہن ہر پیکر تصوری کا
کاو کاوِ سخت جانی ہائے تنہائی نہ پوچھ — صبح کرنا شام کا لانا ہے جوئے شیر کا

اسی طرز پر لکھے یسیرؔ کرنولی کے شعر ملاحظہ ہوں:

ہے یہ عالم اضطرابِ شوق کی توقیر کا — ضبط بھی صیدِ زبوں فتراکِ دار و گیر کا
اشکِ خوں میں بہہ گیا دل عاشقِ دلگیر کا — تشنہ لب رہ جائے گا پیکاں کسی کے تیر کا
جذبۂ ایثار کی گرمی کا عالم دیکھنا — دیر تک فتراک سے ٹپکا لہو نخچیر کا
یوں بھی غالبؔ کی زمینوں میں غزل لکھنا یسیرؔ — فکر کے کہسار سے لانا ہے جوئے شیر کا

غالبؔ اور یسیرؔ کی غزلوں کا تقابلی مطالعہ کیا جائے تو ان دونوں کے اشعار میں بحر' ردیف اور قافیہ کے علاوہ فکر اور احساس میں بھی مماثلت اور یکسانیت کو دیکھا جا سکتا ہے۔ چند شعر ملاحظہ ہوں:

غالبؔ: بازیچۂ اطفال ہے دنیا میرے آگے ہوتا ہے شب و روز تماشا مرے آگے
یسیرؔ : ایک وہم ہے رنگینیٔ دنیا مرے آگے یہ محو تماشا ہے ' تماشا مرے آگے

غالبؔ: ابن مریم ہوا کرے کوئی میرے دکھ کی دوا کرے کوئی
یسیرؔ : اک زحمتِ نظر تو گوارا کرے کوئی میرے غمِ دوراں کا مداوا کر ے کوئی

غالبؔ: کیا کیا خضر نے سکندر سے اب کسے رہنما کرے کوئی
یسیرؔ : جنابِ خضر کو بھی ہمسفر میں کر نہیں سکتا ابھی جو فرق کر نا ہے مجھے رہبر و رہزن میں

غالبؔ: کیوں جل گیا نہ تابِ رخِ یار دیکھ کر جلتا ہوں اپنی طاقتِ دیدار دیکھ کر
یسیرؔ : یوں کھو گئے جمالِ رخِ یار دیکھ کر ہم دیکھتے رہے انہیں سو بار دیکھ کر
غالبؔ: میں نے مجنوں پہ لڑکپن میں اسدؔ سنگ اُٹھایا تھا کہ سر یاد آیا
یسیرؔ : حالِ مجنوں پہ اڑے ہوش یسیرؔ سنگ یاد آیا نہ سر یاد آیا

غالبؔ کی طرح یسیرؔ نے بھی فارسی تراکیب کا بخوبی استعمال کیا ہے۔یسیرؔ' دکن کے شاعر ہیں۔تاہم انہوں نے اشعار میں فارسی تراکیب کو اس خوبصورتی سے برتا ہے کہ ایسا لگتا ہے کہ یسیرؔ شمالی ہند کے کلاسیکی شاعر ہیں۔جیسے :صیدِ زبوں' انیسِ شام' پروانۂ شتاب' چرخ نیلی فام' چراغِ سرِ مدفن' لباس حریر ضبط وغیرہ۔

مثال کے طور پر دو شعر ملاحظہ ہوں:

خیالِ یار کو میں نے انیس شام کیا طلوعِ صبح، تمنا کا اہتمام کیا
زندگی کانپتے گزری ہے شبِ فرقت میں ایک افسردہ چراغِ سرِ مدفن

مذکورہ بالا اشعار میں یسیرؔ کرنولی نے انوکھی اور دلاویز تشبیات سے شعروں میں معنوی دینا آباد کردی ہے جو کلام غالبؔ کی بھی ایک نمایاں خصوصیت ہے۔جیسے خیال یار کو انیس شام اور مشکل بھری زندگی کو چراغِ سرِ مدفن۔

غالبؔ اور یسیرؔ کے کلام میں دقیقہ رسی اور مشکل پسندی کے ساتھ ساتھ سہل الممتنع کی کیفیت بھی پائی جاتی ہے۔نفیر شوق کے مطالعہ سے ایسا محسوس ہوتا ہے کہ یسیرؔ نے بعض مقامات پر کلام غالبؔ کی تقلید و تتبع کرنے کی کوشش کی ہے۔ذیل میں یسیرؔ کے چند مطلعے ملاحظہ ہوں:

ان کا انداز نظر یاد آیا ساتھ ہی زخمِ جگر یاد آیا
یوں کھوگئے جمالِ رخِ یار دیکھ کر ہم دیکھتے رہے انہیں سو بار دیکھ کر
ایک وہم ہے رنگینیٔ دنیا میرے آگے ہر محو تماشا ہے تماشا مرے آگے
ملا ہے درد' حیاتِ رواں دواں کے لیے نفیر شوق ضروری تھی کارواں کے لیے

غرض یسیرؔ کرنولی کا شمار غالبؔ کے معنوی شاگردوں میں ہوتا ہے۔ انہوں نے من وعن غالبؔ کی پیروی کرنے کی کوشش کی ہے۔ غالبؔ کی طرح سنگلاخ زمینوں میں غزلیں کہی ہیں۔ بحر، ردیف اور قافیہ کا اہتمام کیا ہے۔ کلاسیکی روش کو اختیار کرتے ہوئے بہترین شعر کہے ہیں۔ اس میں شک نہیں کہ یسیرؔ کرنولی نے ''نفیرِ شوق'' کی شکل میں غالبؔ شناسی کا مبیّن ثبوت دیا ہے۔

شہہ میریہ خانوادہ کے چند شعرا کا دکنی کلام

پروفیسر محمد نثار احمد
صدر شعبۂ اردو، سری وینکٹیشورا یونی ورسٹی، تروپتی، آندھرا پردیش۔انڈیا

ریاست آندھرا پردیش کے علاقۂ رائل سیما کے معروف صوفی خانوادۂ شہہ میریہ کو یہ امتیاز حاصل ہے کہ یہ ایک علمی وادبی خانوادہ ہے۔اس سلسلہ کے کئی شعرا کا کلام محفوظ ہے۔اس خانوادے کے شعرا نے دکنی میں کئی تصانیف یادگار چھوڑی ہیں۔اس خانوادے کا ادبی سرمایہ شاعری اور نثر دونوں میں موجود ہے۔

ہندوستان کے دیگر صوبوں کی طرح آندھرا پردیش میں بھی صوفیاء کرام کی آمد ہوئی اور یہاں کے مختلف خطوں میں انھوں نے اسلام کی تبلیغ واشاعت اور تلقین کا فریضہ انجام دیا۔رائل سیما صوبۂ آندھرا پردیش کا ایک اہم خطہ ہے اور یہ چار اضلاع پر مشتمل ہے، کرنول، کڑپہ، انت پور اور چتّور۔رائل سیما میں صوفیانہ شعروادب کی روایت حضرت خواجہ بندہ نواز گیسودرازؒ سے وابستہ ہے۔

خانوادۂ شہ میریہ کے بعض قلمی تصانیف سے بھی پتہ چلتا ہے کہ رائل سیما میں صوفیانہ شعروادب کی روایت حضرت خواجہ بندہ نواز گیسودرازؒ ہی سے وابستہ ہے۔حضرت جلال الدین اکمل فرزندِ حضرت شاہ کمال ثانی جامیٔ دکن کی تصنیف ''مقصود السالکین'' کے اس اقتباس سے بھی واضح ہوجاتا ہے کہ رائل سیما کے صوفیاء نے جب تصنیف وتالیف کا آغاز کیا تھا تو ان کے سامنے حضرت میراں جی شمس العشاق، حضرت برہان الدین جانم اور حضرت امین الدین اعلیٰ کی ادبی روایتیں موجود تھیں۔مقصود السالکین کا یہ اقتباس ملاظہ ہوں:

''حضرت شاہ برہان الدین جانم بیجاپوری والدِ ماجد حضرت امین الدین اعلیٰ قدس سرہٗ جو ہمارے پیروں کے پیر اور حضرت خواجہ سید محمد حسینی گیسودراز بندہ نوازؒ قدس سرہٗ کے سلسلہ اور خلفاء میں ہیں۔'' (مقصود السالکین۔ص۲۳)

رائل سیما میں شہ میریہ خانوادہ میں کئی علماء، شاعر، ادیب، صاحبِ تصنیف بزرگ گذرے ہیں۔شہ میریہ خانوادہ بخارا سے نکل کر شمالی ہند، گلبرگہ، بیجاپور ہوتے ہوئے حیدرآباد، کرنول، کڑپہ، گرم کنڈہ پہنچا۔رائل سیما میں یہ خانوادہ تقریباً چار سو سال کی تاریخ رکھتا ہے۔اس خانوادہ میں جو صاحبِ تصانیف بزرگ گذرے ہیں وہ یہ ہیں: حضرت شاہ میرؔ، حضرت شاہ نورؔ، حضرت شاہ کمالؔ، حضرت بیرنگؔ، حضرت سالکؔ، حضرت مقبلؔ، حضرت لامعؔ اور حضرت اکملؔ وغیرہ۔ان بزرگوں نے حقائق ومعارف کے ذریعہ تبلیغِ اسلام واحسان کی اہم خدمات انجام دیں۔

حضرت شاہ میرؔ:

حضرت شاہ میرؔ حضرت سید شاہ جمال الدین کے لڑکے اور حضرت سید شاہ کمال اول کے پوتے تھے۔آپ کا اسمِ گرامی سید محمد حسینی اور لقب شاہ میر تھا۔آپ حضرت مخدوم جہانیانِ جہاں گشتؒ کی اولاد میں سے تھے۔شاہ میر کے بھائی شاہ نوراللہ بخاری اپنی تصنیف 'تجلیٔ انوار' میں لکھتے ہیں ؎

حضرت سید محمد مرشد روشن ضمیر تاجِ سر سلطان کا' اور قطبِ حق دوران کا

ڈاکٹر رفیعہ سلطانہ لکھتی ہیں:

''ان کا نام سید محمد حسینی اور لقب شاہ میر تھا۔ والد کا نام سید شاہ جمال الدین تھا جو حضرت مخدوم جہانیان جہاں گشتؒ کی اولاد سے تھے۔'' (اردو نثر کا آغاز وارتقاء۔ص ۲۳۷)

نصیرالدین ہاشمی کے الفاظ ملاحظہ ہوں:

''شاہ میر دکن کے ایک صوفی بزرگ گذرے ہیں جو قادریہ اور حسینی طریقہ کی بیعت لیا کرتے تھے۔.....شاہ میر شاہ میاں کے لقب سے بھی موسوم تھے۔''

مندرجہ بالا تمام بیانات سے یہ بات واضح ہوجاتی ہے کہ بام سید محمد حسینی تھا۔ لیکن آپ نے اپنے تخلص شاہ میرؔ کے نام سے شہرت پائی۔ آج بھی دنیائے ادب اور خانقاہوں میں آپ شاہ میرؔ ہی کے نام سے جانے اور پہچانے جاتے ہیں۔

حضرت سید محمد حسینی میرؔ تخلص کیا کرتے تھے۔ کہیں کہیں شاہ میرؔ یا شہ میرؔ بھی تخلص کے طور پر باندھا ہے۔ ذیل کے اس شعر میں تخلص میر استعمال کیا ہے ؎

کر تلاوت رات دن اپنا وجود باتدبر میرؔ در ہر فصل و باب (شاہ کمال۔ کلماتِ کمالیہ۔ص۔۲۰۸)

حضرت شاہ میر نے اپنی رباعی میں اپنے مشہور نام کو بطور تخلص استعمال کیا ہے۔

شہ میر نہ کر فکر تو کچھ قوت کی واللہ
رازق تیرا قادر و قیوم ہے اللہ
چیرا ہے جنے منہ کو تیرے ولے رزق نہ دے وے
لاحول ولاقوۃ الا باللہ!!

حضرت شاہ میر کا نمونۂ کلام:

ذات کو ہر شئے کے نیں ہے انقلاب اور صفت کو انفکاک و انسلاب
جو کہ آب آتش نہ ہوئے عکس نیر سلب نہ ہوئے عرق آتش غرق آب
نا ہوےء صرفِ عدم محض وجود حال بیداری نہ ہوئے حال ِخواب
نا مبدل ذات نا متغیر صفات یہ عقائد سنت و راہِ صواب
ذات کو ہر دم تلبس ہے و لیک صورت ہر وصف سے اے کامیاب
اور صفت کو صورت افعال سے ہے تلبس ہر زماں بے ارتیاب
فعل کو آثار کے صورت سے ہے ہم تجلی ہم تلبس ارتکاب
ذات کو ہر شئے کے یوں ہے خلع بس اس کو کہتے ہیں تجدد ذولباب
گر نہ یوں ہو ذات کیونکر ہو بدیع بے بدیعیت کا یہ سارا حساب
خلع کو کہتے عدم در اصطلاح بس کو بولیں وہ وجود اے بہرہ یاب
مصطلح اہلِ حقایق کا سخن نیں لغت سے کام ان کو اے صحاب
کیا فنا اور کیا موت وحیات یا دو غفلت انکشاف و احتجاب
عینیت اور غیریت وصل و فراق ذوق و جدان و یقیں ریب ونقاب
کفر و ایمان راہِ منزل اور مقام سیر وطیر و جذب وسعی واکتساب

نفی و اثبات اورقرب و حضور بیخودی و باخودی کشف و حجاب
یہ مسائل اصطلاحی ہیں سمجھ یک بہ یک واللہ اعلم بالصواب
کر تلاوت رات دن اپنا وجود باتدبر میؔر در ہر فصل وباب
(کلماتِ کمالیہ۔ص۲۰۸)

حضرت شاہ نوؔر:

نام سید نوراللہ حسینی الملقب بہ سید شاہ نوراللہ بادشاہ بخاریؒ۔آپ کا نام خود آپ کی تصانیف میں اس طرح لکھا ہوا ہے۔حضرت شاہ نوؔر رسالۂ ارشادِ نوریہ میں اس طرح لکھتے ہیں:''ہندی زباں سوں سید نوراللہ بن جمال الدین آسان کرکر حضرت سید محمد حسینی شاہمیر صاحب قدس سرہٗ کی فیض ہورارشادِنوریہ کی برکت سوں ہورحق تعالیٰ کی عنایت ہور ہدایت کی اعانت سوں لکھتا ہے۔''(ارشادِنوریہ۔ص۷۶)

آپ نوؔر تخلص کیا کرتے تھے۔آپ اپنے فارسی واردو کلام کے کئی بیتوں میں تخلص نوؔر استعمال کیا ہے۔اس کی چندایک مثالیں ملاحظہ ہو:

محبوب ندا کند کہ اے نوؔر آنجا کہ توئی منم ہمیشہ (تجلیِ انوار۔ص۱)
بندی نورکونورایمان دے تیرادیدجنت منی دان دے (عقائدِنوریہ۔ص۵)

حضرت شاہ نوراللہ بخاری کے ہمعصروں میں کئی صوفیاء کرام اورعلماء وشعراء ہیں۔جن میں حضرت شہ میر اول،مولانا باقر آگاہ ویلوری،شاہ فی الحال کرنولی،وجدی کرنولی،سراج اورنگ آبادی کے علاوہ آپ کے بھائی حضرت سید شاہ کمال مصنف''مخزن العرفان''وغیرہ تھے۔

شاہ نوؔر کثیرالتصانیف بزرگ ہیں۔آپ کو عربی،فارسی اوراردو زبانوں پرعبور حاصل تھا۔شاہ نوؔر فارسی اوراردو میں کئی تصانیف اپنی یادگار چھوڑی ہیں۔جن میں عقائدِ نوریہ،تجلیاتِ نورانی اورمجموعہ التکسیر ہیں۔یہ تمام کتابیں قلمی ہیں اورکتب خانۂ کمالیہ،گرمکنڈہ،ضلع چتّور میں موجود ہیں۔

نمونۂ کلام:

ذاتِ رب کی جسم و جسمانی نہیں نفس بی نیں اور نفسانی نہیں
قلب و قلبی بھی نہ پہچانے اوسے بلکہ نیں ہی روح وروحانی نہیں
ذات وذاتی ذات اوراسکے صفات یوں جو نا سمجھے سو عرفانی نہیں
معرفت رب کی،ہر اک پرفرض ہے ہور عبادت انکی جس ثانی نہیں
ذاتِ مطلق ہے ہمہ باطن ہے لیک باہمہ ظاہر ہے پنہانی نہیں
منشائ ہر دوھے وحدت جمع توں او حقیقت احمدی فانی نہیں
بعد اس کے ہے الٰہیت سو کیا غیر نفس الامر انسانی نہیں
بعدہٗ ہے جان ارواح ومثال جاں اگن پانی پوں پانی نہیں
(تجلیِ انوار،ص۔۲۶)

حضرت شاہ کمالؔ:

حضرت شاہ کمالؒ(دوّم)۔حضرت سید شاہ کمال الدین بخاری رحمۃ اللہ علیہ اپنے وقت کے بلندمرتبت ولی کامل گزرے ہیں۔علم وعرفان کی دنیا میں آپ کی ذات قطعاًمحتاج تعارف نہیں۔درس وتدریس،تالیف وتصنیف،پندونصائح اورمجاہدہ وریاضت ایسے جملہ امور میں اپنی نظیر آپ تھے۔حضرت شاہ کمال اپنے عہد کے ایک قادرالکلام اور باکمال اور پرگو شاعرومصنف ہیں۔آپ ایک فطری اوروہبی شاعر تھے،بلا مبالغہ ہزاروں اشعار آپ کے نوکِ قلم سے تخلیق

پائے ہیں۔آپ کے اشعار کا موضوع تصوف واحسان ہونے کے باوجود آپ نے اس پامال مضمون کو اپنے قلمِ معجز رقم سے زندۂ جاوید بنادیا،اس کی نظیر اس دور کے دیگر شعرا میں ملنا بہت مشکل ہے۔آپ کو عربی، فارسی اور دکنی اردو تینوں زبانوں پر عبور حاصل تھا۔آپ نے عربی، فارسی اور دکنی اردو زبانوں میں تصانیف چھوڑی ہیں۔حضرت سلطان ٹیپو شہیدؒ نے آپ کو بجا طور پر ''جامیٔ دکن'' کے خطاب سے سرفراز فرمایا تھا۔بقول محمد سخاوت مرزا آپ کو اپنے تمام ہم عصروں میں اپنے طرز و رنگ کے لحاظ سے فوقیت حاصل ہے۔حضرت شاہ کمالؒ (دوم) کے علم وفضل وتقویٰ و بزرگی کا عالم یہ تھا کہ عوام تو عوام خواص الخاص بھی آپ کے عقیدت مندوں کی قطار میں نظر آتے تھے،جن میں جلیل القدر سلطان ٹیپو شہیدؒ کا بھی نام شامل ہے۔

آپ کا نام سید شاہ کمال الدین تھا۔آپ سید شاہ جمال الدین بخاریؒ کے تیسرے فرزند تھے۔شاہ کمال نے اپنے دیوان ''مخزن العرفان'' میں اپنا نام اس طرح لکھا ہے ؎

دیکھ اس کے حال پر اپنی نوازش کی نظر جم جم کمال الدین تیرا بندہ ہے کمتر یا جمال الدین

(دیوانِ مخزن العرفان۔ص۱۸۶)

رسالۂ اردو میں سخاوت مرزا نے بھی حضرت شاہ کمال کا نام کمال الدین ہی لکھا ہے۔سخاوت مرزا لکھتے ہیں:

''اسمِ گرامی کمال الدین سادات الحسینی الحسنی ابن سید جمال الدین۔۔۔۔۔'' (رسالۂ اردو۔بابت ماہ اپریل،۱۹۳۹ء ص۔۲۶۳)

ڈاکٹر زور نے بھی کتب خانہ اداریۂ ادبیات اردو،حیدرآباد کی وضاحتی فہرست جلد سوم میں حضرت شاہ کمال کا ذکر یوں کیا ہے:''سید شاہ کمال الدین ولد سید شاہ جمال الدین شاہنور (بیجاپور) کے رہنے والے تھے۔بعد کو کڑپہ اور کرنول میں مقیم ہوئے۔'' (وضاحتی فہرست جلد سوم۔کتب خانہ اداریہ ادبیات اردو ،ص۲۰۷)

نصیر الدین ہاشمی نے بھی حضرت شاہ کمال کے بارے میں اپنے خیالات کا اظہار کیا ہے۔وہ لکھتے ہیں:''شاہ کمال المتخلص بہ کمال کڑپہ آپ کا مولد تھا۔صاحبِ باطن بزرگ تھے۔'' (وضاحتی فہرست کتب خانۂ سالار جنگ میوزیم،ص۔۷۶۸)

حکیم محمود بخاری لکھتے ہیں:''اسمِ گرامی کمال الدین جامیٔ دکن لقب کمال تخلص فرماتے تھے۔آپ سید جمال الدین بادشاہ بخاری اول کے تیسرے فرزند اور سید محمد حسینی شاہ میر اول کے چھوٹے بھائی ہیں۔'' (شہ میری اولیاء،ص۔۱۱۳)

شاہ کمال الدین کمالؔ تخلص کیا کرتے تھے۔دکن کے پہلے صاحبِ دیوان شاعر محمد قلی قطب شاہ کی طرح آپ نے بھی کئی تخلص اپنائے۔شاہ کمال اپنے کلام میں کمالی،کمالا،کمال اللہ اور کمالیا کو تخلص کے طور پر استعمال کیا ہے۔کہیں کہیں پورا نام کمال الدین بھی تخلص کے طور پر باندھا ہے۔اس طرح انھوں نے اپنے نام اور تخلص کو کلام میں مختلف طرح سے لکھا ہے۔

دیوانِ مخزن العرفان (منظوم دکنی اردو)،معراج نامہ (منظوم دکنی اردو)،ضیافت نامہ (منظوم دکنی اردو)،حسن السوال وحسن الجواب (منظوم دکنی اردو)۔فارسی زبان میں بھی شاہ کمال نے کئی تصانیف قلم بند کی ہیں۔جن میں نصاب،کمال المعرفت،کلماتِ کمالیہ،معدنِ محاسن،رحیما اور دیوانِ کمال بہت مشہور ہیں۔

اول الذّکر تصنیف حضرت شاہ کمالؔ کا منظوم دکنی اردو دیوان ہے۔جس میں انھوں نے اپنے سارے تجربوں،مشاہدوں اور فنی وادبی صلاحیتوں کو اس دیوان کے ذریعہ اجاگر کیا ہے۔شاہ کمالؔ نے اپنے صوفیانہ نظریات کو بڑی حکمت و آسانی کے ساتھ سمجھایا ہے۔اس دیوان کے دو حصّے ہیں جس میں کئی غزلیات،رباعیات،مثنویات کے علاوہ منقبتی کلام بھی موجود ہے۔دیوان میں نعتیہ کلام سے زیادہ تصوف کے مسائل بیان کئے گئے ہیں۔اس کے علاوہ مختلف بزرگانِ دین کی مدح میں بھی کئی نظمیں لکھی گئی ہیں۔ساتھ ہی شاہ کمالؔ نے ریختی صنف پر بھی طبع آزمائی فرمائی اور انھوں نے اپنی ریختیوں کے ذریعہ صوفیانہ نکات کو واضح کیا ہے۔اس کے علاوہ شاہ کمالؔ نے ایک چکّی نامہ بھی اپنی یادگار چھوڑا ہے۔اس چکّی نامہ کو شاہ کمالؔ نے تمثیلی انداز میں پیش کیا ہے جو معرفت کے خزانے

سے مزین ہے۔حضرت شاہ کمالؔ نے اپنی صوفیانہ شاعری کے ذریعہ فصاحت و بلاغت کے دریا بہائے ہیں۔آپ کی شاعری میں آمد ہی آمد نظر آتا ہے۔شاہ کمالؔ کوالہامی شاعر کہا جائے تو بے جانہ ہوگا۔ذیل میں آپ کے کلام سے چند ایک نمونے ملاحظہ فرمائیں۔

جیئو مین پیئو عیان تھا مجھے معلوم نہ تھا آشکارا ہو نہاں تھا مجھے معلوم نہ تھا
میں سمجھتا تھا مرا پیئو ہے مرے سے جدا سربسر وہم وگماں تھا مجھے معلوم نہ تھا
پیئو کے ہی ذات وصفت باطن وظاہر ہے مرا میں تو نامی بہ میاں تھا مجھے معلوم نہ تھا
متلبس ہو وہ یک پیئو سدا جلوہ نما درلباسِ دوجہاں تھا مجھے معلوم نہ تھا
پیئو ہے ہست بجز نیست نہیں پیئو کا غیر عینِ ایمان یہ بیاں تھا مجھے معلوم نہ تھا
پیئو زمین پیئو زمان پیئو مکین پیئو مکان پیئو تن پیئو ہی جاں تھا مجھے معلوم نہ تھا
پیئو کو پیر سے پانا ہے وگر نئیں تو محال پیر یوں فیض رساں تھا مجھے معلوم نہ تھا
پیئو نے پیر کے گھنگٹ میں دکھایا ہے جمال یہ عجب رازِ نہاں تھا مجھے معلوم نہ تھا
پیئو نے پیر نما آپ ہوا ہے ورنہ پیئو بے نام ونشاں تھا مجھے معلوم نہ تھا
پیر نے پیئو کو ہر شئی میں بتایا ہے مجھے نئیں تو وہ پیئو کہاں تھا مجھے معلوم نہ تھا
پیئو کو پیئو سے دکھلانے مرے تئیں یہ کمالؔ پیر شہمیر ضماں تھا مجھے معلوم نہ تھا

(مخزن العرفان،ص۱۰۵)

حضرت شاہ کمال کی ایک ریختی کے چند شعر:

تجھ حُب کا جب سے لذت پائی ہوں اے دھنی میں
تب سے بندھی ہوں اپنی راحت سے دشمنی میں
قُمری نمن لگا کر سب تن کو راکھا اپنے
تجھ سرو قد کے کارن بن گئی ہوں جوگنی میں
چولے پہ تجھ برہ کے سینہ کے رکھ توے کو
دل اور جگر اُپس کا دھنیان نمن بھنی میں

حضرت شاہ کمال کے کلام میں صنائع اور بدائع کے مطالعہ سے پتہ چلتا ہے کہ آپ جملہ محاسنِ سخن کے رمز شناس تھے۔آپ نے اپنے کلام میں اسرارِ معرفت کے بیان اور اپنی غزلوں میں جہاں علوم ومعارف کے اسرار ورموز بیان کئے ہیں، وہیں آپ نے ظاہری محاسن اور جملہ کلام کے خصائصِ لفظی ومعنوی کا بھی بطورِ خاص لحاظ رکھا ہے۔

حضرت شاہ کمال کے کلام میں غزل،حمد ونعت اور مناجات کے علاوہ دیگر اصناف جیسے قصیدہ،منقبت،مرثیہ اور مثنوی کے ساتھ ساتھ مخمس،ترجیع بند، رباعی،سی حرفی اور ریختی پر بھی طبع آزمائی ملتی ہے۔

مخزن العرفان کی زبان اردو کی قدیم دکنی زبان ہے۔لیکن یہ دکنی زبان نہایت قدیم اور مشہور دکنی تصانیف کی طرح غریب لفظیات کی حامل نہیں ہے ،جیسا کہ قلیؔ،وجہیؔ،غواصیؔ،ابن نشاطی وغیرہ کے ہاں قدیم دکنی الفاظ ہی ملتے ہیں۔حضرت شاہ کمال کا زمانہ اس کے کافی بعد کا زمانہ ہے،جس کی وجہ سے زبان میں کافی اصلاحات ہوچکی تھیں اور زبان میں معیاری الفاظ کے استعمال کا رواج عام ہو چکا تھا۔یہی وجہ ہے کہ مخزن العرفان میں شامل کلام میں معرب اور مفرس

الفاظ کے ساتھ ساتھ معیاری زبان کے الفاظ بھی ملتے ہیں۔ یہ کہا جا سکتا ہے کہ اس عہد تک دکنی زبان نے کافی ترقی کر لی تھی۔ بھاشا کے الفاظ اور جنوبی ہند کے علاقائی زبانوں کے الفاظ بھی ملتے ہیں، بلکہ اگر یہ کہا جائے تو بیجا نہ ہوگا کہ حضرت شاہ کمال کے کلام میں مستعمل اردو زبان کافی معیاری اور معتبر لسانی ساخت کے ساتھ فصاحت و بلاغت کے تمام محاسن سے لبریز ہے۔

حضرت عبدالحق شاہ میرؔ:

سید عبدالحق نام عرف شاہ میر بادشاہ اور تخلص شاہ میرؔ تھا۔ آپ کی پیدائش ۱۲۸۷ھ میں محلّہ نبی کوٹ کڑپہ میں ہوئی۔ حکیم محمود بخاری نے شہ میری اولیاء میں لکھتے ہیں: ''اسمِ گرامی عبدالحق عرف شاہ میر بادشاہ، شاہ میرؔ تخلص فرماتے تھے۔ سن بارہ سو ستیاسی ہجری (۱۲۸۷ھ) مطابق اٹھارہ سو ایکہتر عیسوی میں بہ مقام کڑپہ (محلّہ نبی کوٹ) اپنے قدیم آبائی گھر میں پیدا ہوئے۔'' (شہ میری اولیاء، ص۔۱۷)

حضرت شاہ میر سن ۱۲۸۷ھ مطابق اٹھارہ سو ایکہتر عیسوی میں بہ مقام کڑپہ (محلّہ نبی کوٹ) اپنے قدیم آبائی گھر میں پیدا ہوئے۔

حضرت شاہ میر کے اکیسویں دادا حضرت سید جلال الدین حسین جلال اعظم سرخ بخاریؒ سلطان شہاب الدین غوری کے زمانہ میں ملتان تشریف لائے اور نویں دادا حضرت سید جمال الدین بخاریؒ نے ملتان سے گلبرگہ آکر حضرت سید محمد حسینی بندہ نواز گیسو درازؒ کی پڑپوتی سے شادی کی۔ سید جمال الدین بخاری کے پوتے حضرت سید کمال الدین بخاری نے گلبرگہ سے بیجاپور آکر چندے قیام فرمایا۔ پھر شاہ نور اور کرنول ہوتے ہوئے کڑپہ پہنچے اور گرمکنڈہ جا کر انتقال فرمایا۔ اس طرح یہ خاندان تقریباً تین سو سال سے علاقۂ رائل سیما میں آباد ہے۔

آپ کی تصانیف میں دیوانِ شاہ میر، حقیقتِ محمدیہ، گلدستہ اشرف العالمین، فضائلِ توبہ، منازل المصحف، نصابِ نصیحت قابلِ ذکر ہیں۔ آپ کا دیوان، دیوانِ شاہ میر کے نام سے طبع ہو چکا ہے۔

نمونۂ کلام کے طور پر حضرت شاہ میر کی ایک نعت پیش ہے:

آتش ہجر پیمبر میں ہوں جلتا جاتا — ہے دھواں آہ کا سینے سے نکلتا جاتا
دن قریب آئے ہیں طیبہ سے جدا ہونے کے — چشمۂ غم مرے دل سے ہے ابلتا جاتا
ذکرِ رخصت جو کیا کرتے ہیں زائر باہم — غمِ فرقت سے مرا دم ہے نکلتا جاتا
مجھ سے کیوں کہتا ہے زائر کہ چلو طیبہ سے — دل مرا ایسی ہی باتوں سے ہے جلتا جاتا
ہند کے رہنے سے حیراں و پریشاں تھا میں — اب مدینے میں جو ہوں دل ہے بہلتا جاتا
دل کو دیتی جو کبھی طاقتِ رفتار جواب — سر کے بل راہِ مدینے میں میں چلتا جاتا
دشتِ طیبہ کو جو جاتا ہوں تو ہر پتھر سے — مثلِ فرہاد سر اپنا ہوں کچلتا جاتا
خوابِ غفلت میں عبث عمر کی شب کٹتی ہے — شمع کی طرح ہوں اس غم میں پگھلتا جاتا
آرہا ہے مرے لب پر جو محمد کا نام — دل ِ بیتاب ہے سینے میں اچھلتا جاتا
غیرتِ گوہر ِ نایاب ہے وہ اے شہ میرؔ — سخن نعت جو منھ سے ہے نکلتا جاتا

حضرت سید جلال الدین اکملؔ:

حضرت سید جلال الدین نام اور اکملؔ تخلص ہے۔ آپ حضرت شاہ کمال الدین بخاری کے فرزند اور خلیفہ تھے۔ آپ نے درس نظامیہ کی تکمیل مدراس میں فرمائی۔ تحصیل علم ظاہری کے بعد آپ نے خرقۂ خلافت اور فیض باطنی والد ماجد سے حاصل فرمایا۔ آپ کے دو صاحبزادے تھے۔ سید مراد علی عرف علی مراد شاہ

افضلؔ اور سید فقیر محی الدین متقبلؔ۔ آپ کی وفات ۱۲۷۷ھ میں ہوئی۔ مزارِ اقدس محل، ضلع چتّور میں واقع ہے۔

اکملؔ کو نثر اور نظم دونوں پر قدرت حاصل تھی۔ آپ کی تصانیف میں مقصود السالکین اور چہل حدیث قابلِ ذکر ہیں۔ چہل حدیث اکملؔ کی منظوم تصنیف ہے جو آپ کے والد ماجد کی فارسی نظم چہل حدیث کا منظوم ترجمہ ہے۔ اس کے علاوہ آپ نے چند ایک حمد و نعت بھی کہے ہیں۔ نمونہ کلام ملاحظہ ہوں: ؎

کروں حمدِ خدا یہ دم ہے کہاں — یہ لب و لہجہ اور فہم ہے کہاں
کس طرح یہ رقم ہونا — دست و لوح اور قلم ہونا
ایسا دست اور دوات و خامہ کہاں — وہ سکت یہ سیاہ نامہ کہاں
ہے زبس یہ ثنا کا بام بلند — کیوں وہاں پہنچے فکر کا یہ کمند

حضرت جلال الدین اکملؔ کے چیدہ کلام سے دو غزلیں اور ایک رباعی بطورِ نمونہ پیش ہیں۔

رات دن پیچ و تاب ہے ہم کو — طلب آفتاب ہے ہم کو
اپنے چہرے سے تو اٹھایا نقاب — نے حجابی حجاب ہے ہم کو
حسنِ خلق اے فرشتہ خو تیرا — گلِ باغ گلاب ہے ہم کو
معنیٔ وجہ حق سمجھنے کو — تیری صورت کتاب ہے ہم کو
رات دن یاد بن نہ گزرے تری — اپنے دم کا حساب ہے ہم کو
ہم تو ہیں خاکسار اے اکملؔ — جد علیؓ بو تراب ہے ہم کو

حضرت اکملؔ نے مناجاتِ بجناب سرورِ کائنات علیہ التحیہ والتسلیمات کے عنوان سے ایک مناجات بھی لکھے ہیں۔ اسکے چند ابیات یہ ہیں ؎

عرض ہے یہ حضورِ انور سے — تیری درگاہِ پاک و برتر سے
شاق ہے مجھ پہ ہجرِ دلبر کا — چمنِ نازک کے صنوبر کا
سرور گلزار جس کی قامت ہے — جس سے اس دل پہ اک قیامت ہے
جب سے اس دل کو اس نے چھین لیا — دل لیا اور میرا دین لیا
آہ وزاری ہے بے قراری ہے — یا نبی وقت انتظاری ہے
یہ زمانہ تو ہے عجب الٹا — جس کو دیکھو تو ہے کہ ڈھب الٹا
ایسا کچھ کرئے یا رسولِ کریم — کہ ملے مجھ سے میرا یار قدیم
جس نے مجھ کو کیا فریفتہ ہو — یاد سے اس نے ہمارا شیفتہ ہو
آہنِ دل کو اس کے گرم کرو — موم کی طرح نرم نرم کرو
ماہِ رخ مہربان ہو جائے — ملتفت جانِ جان ہو جائے
یا محمد تم اس ستم سے چھڑاؤ — اپنے یوسف کو بند غم سے چھڑاؤ
میرے دلبر سے مجھ کو جلد ملاؤ — یا نبی میری التجا بر لاؤ

حضرت سید علی مراد شاہ افضلؔ:

آپ کا اسم مبارک مراد علی عرف مراد شاہ اور افضلؔ تخلص کیا کرتے تھے۔ آپ حضرت سید جلال الدین اکملؔ کے بڑے صاحبزادے اور شاہ کمال جامیؒ

دکن کے پوتے ہیں۔۱۲۴۹ھ میں آپ کی ولادت ہوئی۔ابتدائی تعلیم والد صاحب سے حاصل کی۔علومِ ظاہری کے بعد نعمتِ باطنی اور خلافت اپنے والدِ ماجد حضرت اکمل سے پائی۔

نمونۂ کلام:

نہ ورد میں ہے نہ لالہ میں نہ سمن میں ہے — بہار جو ترے رخسار کے چمن میں ہے
نہ زعفراں میں نہ ہے مشک میں نہ عنبر میں — جو نکہت اس شہ کونین کے بدن میں ہے
ہو کس طرح نہ دل ہر کدام کا پروانہ — کہ شمع نور کی تیرے ہر انجمن میں ہے
ہے نور صدید ِبیضا کا ہر کف پا میں — اثر ہزار مسیحا کا ہر سخن میں ہے
فقط نہ روئے زمیں پر ہے تذکرہ تیرا — وظیفہ چرخ پہ شام وسحر عدن میں ہے
ہے ہم سے ذکرِ الٰہی میں دو جہاں مشہور — ترا ہی نام ِمقدس ہر اک دہن میں ہے
صفات وذات میں تیرا عدیل اورمانند — نہ کوئی قدرت خلاق ذوالمنن میں ہے
نصیب کیجئے شاہا سفر مدینے کا — مزہ وہ رنج کا کب راحتِ وطن میں ہے
کبھی نہ بھول وظیفہ درود کا افضلؔ — کہ لفظ ِصلّ ِعلیٰ کاہراک دہن میں ہے

بہ اعتبارِ مجموعی کہا جاسکتا ہے کہ حضرات شہہ میری اولیاء نے علاقۂ رائل سیما اور آندھرا پردیش کے علاقوں کو اپنی صوفیانہ تعلیمات سے متاثر کیا۔اس عہد کی مقبول عام دکنی زبان کو اظہارِ خیال کا وسیلہ بنایا۔دکنی میں شہہ میری خانوادے کے شعرا کا کلام اہمیت کا حامل ہے۔آج بھی عوام وخواص اس سلسلہ سے جڑے ہوئے ہیں اوران صوفیائے کرام کی تعلیمات سے فیض حاصل کررہے ہیں۔شہہ میری سلسلہ کے دکنی رسائل اور کتابوں پر تحقیق کا سلسلہ بھی جاری ہے۔

Abstract

In recent decades, "environmental xenobiotic-mediated endocrine disruption", especially by xeno-estrogens, has gained a lot of interest from toxicologists and environmental researchers. These estrogen-mimicking chemicals are known to cause various human disorders specifically triggering breast disorders in women. Pesticides are the most heavily used harmful xenobiotic chemicals around the world. The estrogen-mimicking potential of the most widely used organochlorine and organophosphate pesticides are well established. However, their effect is not as clearly understood among the plethora of effects these persistent xenobiotics are known to pose on our physiological system. Estrogens are one of the principal risk modifiers of various disorders, including cancer, not only in women but in men as well. Despite the ban on these xenobiotics in some parts of the world, humans are still at apparent risk of exposure to these harmful chemicals as they are still widely persistent and likely to stay in our environment for a long time owing to their high chemical stability. The present work intends to understand how these harmful chemicals may affect the risk of the development of estrogen-mediated human cancer.

MERCURY INDUCED ALTERATIONS IN PHOTOSYSTEM-II PHOTOCHEMISTRY IN MAIZE PLANTS

[1]Srinivasulu P, [2]Divya B.J. and [3]Murthy S.D.S.

[1]Research Scholar, [2]Academic Consultant, [3]Professor

Department of Biochemistry, S.V.University, Tirupati, India.

Abstract:

Mercury is a toxic heavy metal and it inhibited PS-II catalysed electron transport activity in a dose dependent manner. 50% loss was noticed with the treatment of 15μM $HgCl_2$. Spectral measurements clearly indicated that there is an enhancement in F_o value due to changes in LHC-II complex of PS-II in maize leaves. There is a positive correlation between the loss of PS-II and Chl a fluorescence which clearly demonstrates that the inhibitory site lies near PS-II reaction centre of maize thylakoids.

Key words: Electron transport; Fluorescence; Mercury;Maize plants; Photosystem II.

INTRODUCTION:

Heavy metals like Zn, Cd, Ni, Cu, Hg, Co and Pb can inhibit photosynthetic electron transport at multiple sites (Van Assche and Cl ijsters, 1980; Cl ijsters and Van Assche, 1986; Mohanty *et al.*, 1989). Photosynthetic organisms showed reduction in PS II supported electron transport activities when they were grown *in vivo* in the presence of supra optimal level of heavy metals like Cd (Baszynski *et al.*, 1980), Zn (DeFilippis *et al.*,1981b). Majority of the observations on the effect of heavy metal ions on partial photochemical reactions are made in isolated systems *in vitro*. The PS II supported electron transport activity is more susceptible to heavy metals like Zn, Ni (Tripathy *et al*, 1981), Co (Tripathy *et al.*, 1983), Cu, Cd and Zn, Cd (Bazzaz and Govindjee, 1974a) Cu (Cedeno- Maldonado *et al.*, 1972; Shioi *et al.*, 1978a; Shioi *et al.*, 1978b; Samuel son and Oquist, 1980; Renganathan and Bose, 1989; Mohanty *et al.*, 1959al Co, Ni, and Zn (Mohanty *et al.*, I 989b) Pb (Bazzaz and Gov i nd j ee, 1974b) and Hg^{2+}(Honeycutt and Krogmann, 1972; Samson and Popovic, 1990). In addition to this it was also shown that this heavy metal ion induced inhibition is dependent on the illuminating intensity (Zn, Cu: Cedeno- Maldonado *et al.*, 1972). At light limiting conditions, the extent of inhibition was found to be less than that at light saturating conditions. Sites of heavy metal action in PS II catalyzed electron transport. Restoration of Hill activity by semicarbazide in the heavy metal ion treated plant chloroplasts (Zn: Van Assche and Clijsters, 1980; Van Assche and Clijsters, 1986) and by $MnCl_2$ (Cd: Baszynski *et al.*, 1980) indicates that the water splitting site is the site of action of heavy metals. In Cd treated maize chloroplasts restoration of Hill activity by DPC suggests that OEC is the site of action (Cd: Bazzaz and Govindjee, 1974b). In this investigation the effects of mercury on PS-II photochemistry as been compared with spectral alterations in maize plants.

MATERIALS AND METHODS:

Healthy seeds of Maize (*Zea mays. L*) were obtained from Regional Agricultural research station, Tirupati. The seedlings were randomly placed in plastic trays and grown in a growth chamber providing with fluorescence light (Phillips, India) with a light intensity of 30- 35 μ moles m^{-2} s^{-1} at 25 ± 1^0C. Fully expanded 8th day leaf segments (4-5 cm long) were cut from apical region and used for treatment. Isolation of thylakoid membranes was done according to the procedure described by Sabat *et al.* (1986). PS II catalyzed electron transport assay (H_2O → *p*-BQ) activity was measured as O_2 evolution in the thylakoid membranes. The 2 ml reaction mixture contains reaction buffers [50 mM HEPES-NaOH (pH 7.5),100 mM sucrose, 2mM $MgCl_2$ and 5 mM KCl], 0.5 mM freshly prepared p-BQ and thylakoid membranes equivalent to 40 μg of Chl. Fluorescence emission and excitation spectras were recorded by using Jasco FP777 Spectrofluorimeter. PAM kinetic fluorimeter is used for measurements.Lipid peroxidation has been measured according to the method of Carmak and Horst (1991).

Abstract:

Entomopathogenic nematodes (EPNs) have been utilized in classical, conservation, and augmentative biological control programs. The vast majority of applied research has focused on their potential as inundatively applied augmentative biological control agents. Extensive research over the past three decades has demonstrated both their successes and failures for control of insect pests of crops, ornamental plants, trees and lawn and turf. So Production and application technology is critical for the success of entomopathogenic nematodes (EPNs) in biological control. Production approaches include *in vivo* and *in vitro* methods (solid or liquid fermentation). For laboratory use and small scale field experiments, *in vivo* production of EPNs appears to be the appropriate method. *In vivo* production is also appropriate for niche markets and small growers where a lack of capital, scientific expertise or infrastructure cannot justify large investments into *in vitro* culture technology. *In vitro* technology is used when large scale production is needed at reasonable quality and cost. Infective juveniles of entomopathogenic nematodes are usually applied using various spray equipment and standard irrigation systems. Enhanced efficacy in EPN

applications can be facilitated through improved delivery mechanisms (e.g., cadaver application) or optimization of spray equipment. Substantial progress has been made in developing EPN formulations, particularly for above ground applications, e.g., mixing EPNs with Talc, kaolinite and cocopeat. Bait formulations and insect host cadavers can enhance EPN persistence and reduce the quantity of nematodes required per unit area. This study demonstrated successful control of several other insects that affect production and application of EPNs and offers insights for their future in biological insect suppression by increasing the shell life.

Keywords: Entomopathogenic nematode, *heterorhabditis*, production, *steinernema,* biological control, commercialization.

1. INTRODUCTION:

Nematodes that parasitize insects, known as entomopathogenic nematodes (EPNs), have been described from 23 nematode families (Koppenhofer, 2007, 2020). Of all of the nematodes studied for biological control of insects, the Steinernematidae and Heterorhabditidae have received the most attention because they possess many of the attributes of effective biological control agents (Kaya and Gaugler, 1993; Grewal et al., 2005a; Koppenhofer, 2007) and have been utilized as classical, conservational, and augmentative biological control agents. Entomopathogenic nematodes (EPNs) of the families Heterorhabditidae and Steinernematidae are obligate parasites of insects and are used as biological control agents of economically important insect pests. The vast majority of applied research has focused on their potential as inundatively applied augmentative biological control agents (Grewal et al., 2005a).The two major genera are Heterorhabditis (Poinar, 1976), and Steinernema (Travassos, 1927), with 85 species described to date. These nematodes possess a symbiotic association with pathogenic bacteria from the Xenorhabdus and Photorhabdus genera, associated with Steinernema and Heterorhabditis respectively (Poinar, 1990). EPNs are parasites of arthropods in nature that are only horizontally transmitted and possess an infective juvenile (IJ) stage that actively invades the insect host. They are always associated with symbiotic bacteria that play an important role in host infection. The biology of the EPN-symbiotic bacteria complex has been extensively reviewed in Burnell and Stock (2000), Griffin et al. (2005), Lewis and Clarke (2012), Stock (2015), and Shapiro-Ilan et al. (2017, 2018). Infective juveniles (IJs), considered the only free-living stage of EPNs, enter the host insect through its natural apertures (oral cavity, anus and spiracles) or in some cases through the cuticle (Dowds and Peters, 2002). After penetrating the insect's hemocoel, IJs release their symbiotic bacteria, which are the primary agents responsible for host death and also provide the nematodes with nutrition and defense against secondary invaders (Poinar, 1990). The nematodes complete their development and live for two or three generations inside their host. When food is depleted, IJs exit from host cadaver searching for new hosts (Grewal and Georgis, 1999, Koppenho¨fer, 2020). The host range of most known EPN species remains mostly unknown to date (Peters, 1996; Shapiro-Ilan et al., 2017, 2018) because most species have been isolated from

ABSTRACT

Background: Medicinal plants serve dual roles, offering remedies for various diseases and income-generation opportunities. Ancient Indian texts, including Ayurveda, extensively document plant use in healthcare. Globally, medicinal plants are vital resources in the fight against severe diseases. Essential oils in plants provide distinct aromas, flavors, and pathogen protection. Tithonia erecta flower oil boasts a complex composition with diverse beneficial properties. Exocarp extract from Citrus sinensis differs from juice or leaf extracts, containing more lipophilic compounds but fewer glycosylated compounds and lacking cyanidins and sterols. Eucalyptus globulus oil acts as an antiseptic and anti-spasmodic stimulant for respiratory issues. Scented candles are a popular relaxation method, promoting well-being through ambient lighting. This study aims to create practical scented candles using natural materials like soy wax, beeswax, and essential oils. The desired candle should offer a long burn time, be cost-effective, and pose no health risks to users. The candle composition includes gel wax, vegetable or animal fat, eucalyptus leaves, marigold petals, and orange peels. This study involves preparing and evaluating polyherbal scented candles using volatile oils extracted through the enfleurage method. **Results:** The phytochemical analysis of these extracts revealed the presence of volatile oils, alkaloids and proteins. The FTIR analysis reveals the presence of OH group in these extracts. **Conclusion:** This research successfully developed a natural polyherbal scented candle with extended burn time, cost-effectiveness, and user safety. Antioxidants prevent undesired

Abstract. The conventional treatment strategies for hepatocellular carcinoma (HCC) are associated with some limitations viz. low aqueous solubility, higher drug doses, non-specific targeting towards HCC cells and associated toxicity or side effects. Biodegradable polymer-based nanomedicines offer a promising approach to augment the HCC cell uptake of the drug, by prolonging the drug blood circulation, increasing the retention time, and releasing the drug to specific target. The present review summarizes the recent advancements in designing of polymeric nanocarriers for HCC to overcome the persistent challenges associated with traditional HCC-chemotherapy. The different blueprints discussed here, will further provide an important lead in order to develop and formulate an effective nanomedicine-based treatment for the hepatocellular carcinoma.

Keywords. Nanoparticles (NPs), nanomedicine, drug delivery, biodegradable polymer, chemotherapy, hepatocellular carcinoma (HCC).

INTRODUCTION

Cancer is a significant health care problem, which is characterizes by abnormal and uncontrolled increase in cell proliferation, it is the most serious life-threatening disease worldwide. According to World Health Organization (WHO), it is expected that cancer death rates will increase to 12 million cases by 2030, whereas, the rate of cancer diagnosis is expected to reach 24 million globally by 2035 [1].

Despite recent advances in cancer diagnosis and treatment options, therapeutic interventions for several malignancies are still insufficient. For example, mortality rates of Hepatocellular Carcinoma (HCC) are increasing annually by 2.7% (women) and 1.6% (men) accounting for 3% or 6% of cancer related deaths in the United States [2]. The design and development of smart nanoplatforms represent an attractive and interesting direction in the field of cancer therapy. In contrast to nanocarriers, these nanoplatforms exhibit intelligent characteristics because they transport and control the release of cargo at a specific location. In order to facilitate the clinical transformation, the nano-drugs should be prepared by the simple process and the selected component should be approved by the FDA (U.S. Food and Drug Administration). Due to the complexity of these multifunctional systems, it is very important to ensure their reproducibility.

ABSTRACT

During childhood stomach is infected with *Helicobactor pylori* and used to cause peptic ulcers, under normal conditions they are not detected. It is present in more than half of the world population. To cure these peptic ulcers and get protection from bacteria antibiotics are used. Ornidazole is one of the antibiotics used to get protection from H pylori bacterium and cure the ulcers of stomach. Ornidazole helps to prevent infection after surgery and is used to treat dental infections, ulcers and pressure sores. So, it is the most beneficial drug to human beings. Considering the significance of this principle we proposed a formulation of ornidazole in our laboratory.

INTRODUCTION

Conventional drug delivery system achieves and maintains the drug concentration within treatment only when taken several times a Day. It often results in damaging side effects and leads to poor control after therapy and there is a significant fluctuation in drug levels. In recent years, several advanced techniques have been made to result in the development of new techniques in administering required concentration of drug in a therapeutic range. The concept of sustained or prolonged release of biologically active agents has been well appreciated and rationalized for decades. Controlled release refers to the use of a delivery device within the objective of releasing the drug into the patient body at a predetermined rate or at specific times or with special release profiles (Gilbert and Christopher, 2005).

Nephroprotective Effects of Mycophenolate Mofetil and Glibenclamide on Streptozotocin-induced Diabetic Renal Injury in Rats: An Experimental Study

Sangeetha Lakshmi Boju[1], Peddanna Kotha[2], Nasreen A[3], Swapna Gurrapu[4], Estari Mamidala[4], Ram R[1], Srilatha Chintamaneni[3], Appa Rao Chippada[2], Siva Kumar Vishnubhotla[1]

ABSTRACT. Diabetic renal injury is a microvascular complication associated with inflammation and oxidative stress, culminating in renal dysfunction. Conventionally, it is treated with hypoglycemic agents to address metabolic perturbations. However, the way to mitigate immunological, inflammation, and oxidative stress have seldom been studied. Hence, in the present study, the nephroprotective role of immunosuppressive and anti-inflammatory drugs, mycophenolate mofetil (MMF) in combination with the oral hypoglycemic agent glibenclamide, on streptozotocin (STZ)-induced diabetic renal damage was studied. Bodyweight, fasting blood glucose, and glycosylated hemoglobin levels were altered in the diabetic rats. Furthermore, renal injury was indicated by abnormal levels of urinary protein and creatinine and serum markers of renal function in diabetic rats. Hyperglycemia-induced oxidative stress and inflammation were also observed in the diabetic rats. The combination of MMF and glibenclamide treatment significantly attenuated the abnormal effects of hyperglycemia, oxidative stress, and inflammation-induced renal injury in diabetic rats. Histopathological studies confirmed the nephroprotective role of MMF and glibenclamide by reversing renal injury in diabetic rats. The present study suggests that MMF and glibenclamide have a protective role in STZ-induced diabetic renal damage.

Introduction

Diabetic renal injury, a microvascular complication of diabetes mellitus, is the leading cause of end-stage renal disease. Diabetic nephropathy (DN) is characterized by a progressive decrease in the glomerular filtration rate and increased urinary albumin excretion.[1] DN is characterized by the presence of hypertrophy of the glomeruli, thickening of the capillary basement membrane, the accumulation of extracellular matrix in the mesangium and the interstitium, and tubular injury in experimental

Abstract: This study aimed to investigate the antidiabetic and antihyperlipidemic activity of the active fraction of *Asparagus gonoclados* root tubers (AGAF) in streptozotocin-induced diabetic rats. After 45 days of treatment with the active fraction (AGAF) of *Asparagus gonoclados* at a dose of 50 mg/kg b.w.t., the levels of fasting blood glucose (FBG), hemoglobin, HbA1c, insulin, serum lipid profiles, and renal and hepatic function markers were measured in all experimental groups of rats. Treatment with AGAF remarkably normalized the FBG, insulin, and lipid profile levels. AGAF also normalized the hepatic and renal function markers in STZ-induced diabetic-treated rats. The findings from our current study confirm that AGAF successfully alleviates diabetes mellitus and its associated complications by improving insulin secretion and action with no apparent toxic effects on the liver or kidney.

Keywords: *A. gonoclados*, Antidiabetic activity, Streptozotocin, Insulin, Hyperglycemia.

Introduction

Diabetes mellitus is a disorder of abnormally high blood sugar (glucose) levels due to deficient production of insulin to meet its needs and is a leading cause of morbidity and mortality. Type 2 diabetes is characterized by low levels of high-density lipoprotein cholesterol (HDL-C) and high levels of triglycerides (TG). Increased serum concentrations of total cholesterol (TC), triglycerides (TG), and low-density lipoprotein cholesterol (LDL-c), as well as decreased HDL-C, are considered lipid parameters that

ABSTRACT

The modern medicines available for the management of diabetes exert serious side effects, So the antidiabetic drug discovery has shifted its focus to natural plant sources having minimal side effects and high efficacy. The aim of the present investigation was to evaluate the antidiabetic and antihyperlipidemic activity of *Pennisetum glaucum* seeds in STZ-induced diabetic rats. Diabetes was induced in male wistar albino rats by a single intra peritoneal injection of STZ (50mg/kg bw). FBG levels were measured by glucose oxidase-peroxidase reactive strips. Aqueous extract of seeds of *Pennisetum glaucum* (AqSPG) at a dosage of 250 mg/ kg bw, was orally administered to diabetic rats along with normal rats up to 30 days. For comparison diabetic rats treated with a standard drug glibenclamide 20mg/kg bw. Serum biochemical parameters such as HbA1c, plasma insulin, total lipid profile, hepatic and renal functional markers were measured. Long term oral administration of aqueous extract of seeds of *Pennisetum glaucum* (AqSPG) resulted in significant reduction in FBG and HbA1c levels in diabetic rats, with the corrections of diabetic dyslipidemia, plasma insulin compared to untreated diabetic rats. There was a significant decrease in the activities of liver and renal functional markers in diabetic treated rats compared to untreated diabetic rats indicating the protective role of the AqSPG against liver and kidney damage and its non-toxic property. Based on results it is concluded that AqSPG have significant antidiabetic and antihyperlipidemic effects. Further studies are required to identify the active principle (s) from the extract.

AN OVERVIEW OF ANTIDIABETIC MEDICINAL PLANTS AVAILABLE IN THE SESHACHALAM HILL RANGE

[1]Sireesha Yallanki, [2]Rajasekhar Allagadda, *, [2]Chippada Appa Rao

[1]Department of Chemistry, Sri Padmavathi Women's Degree College, Tirupati, 517501, Andhrapradesh, India.

[2]Department of Biochemistry, Sri Venkateswara University, Tirupati, 517502, Andhra Pradesh, India.

Abstract

Diabetes mellitus is a syndrome characterized by hyperglycemia, metabolic changes in carbohydrates, lipids, and proteins. In the long term, DM causes eye, kidney, cardiovascular, and neurological complications. In the last few years, there has been exponential growth in the field of herbal medicine in both developing and developed countries. This review article was designed to report on some of the medicinal plants available in the Seshachalam hill ranges of the Rayalaseema region of Andhra Pradesh. India is the largest producer of medicinal plants and is called the Botanical Garden of the Globe." WHO establishes a global center for traditional medicine. "Ensuring all people have access to safe and effective treatment ´is an essential part of WHO's mission. Studies have been carried out globally to verify their efficacy, and some of the findings have led to the production of plant-based medicines. India trades 7,000 species of medicinal plants annually. The current review focuses on the antidiabetic effect of the medicinal plants available in the Seshachalam Hill range of the Rayalaseema region of Andhra Pradesh.

Keywords: Diabetes mellitus, medicinal plants, antidiabetic activity, Seshachalam hill range, Phytochemicals.

Introduction

Diabetes is a chronic endocrine disorder that occurs either when the pancreas does not produce enough insulin or when the body cannot effectively use the insulin it produces. Diabetes mellitus, characterized by hyperglycemia, may over time lead to serious damage to the heart, blood vessels, eyes, kidneys, and nerves. Some reasons, like stress, the rapid development of cities, a substantial increase in purchase power, lifestyle ease, and metro life, have led to health issues. According to the WHO global report, the prevalence of diabetes is steadily increasing. By the year 2030, approximately 438 million people (7.8%) of the adult population are expected to have diabetes. Managing diabetes involves a series of cost-effective interventions, such as blood glucose control, through a combination of diet, physical activity, and, if necessary, medication. The cost of treating diabetes and associated complications exceeds $100 billion per year, and complications are far less common. The treatment of diabetes with synthetic drugs is generally not preferred because of their high cost and side effects. It is necessary to develop traditional and alternative medicine. Plant drugs are frequently considered to be less toxic and free of side effects than synthetic ones. Many herbs have been shown to have hypoglycemic action in animals and humans.

Antidiabetic effects *of Setaria italica* seeds aqueous extract in STZ induced diabetic rats. A Histopathological study

[1]Y. Sireesha, [2]A. Rajasekhar, 3Ch. Appa Rao

[1]Department of Chemistry, Sri Padmavathi Women's Degree College, Tirupati, 517501, Andhrapradesh, India.
[2,3]Department of Biochemistry, Sri Venkateswara University, Tirupati, 517502, Andhra Pradesh, India.
Corresponding Author: **Dr. Chippada Appa Rao**

Abstract-

Background: ***Setaria italica*** **is commonly known as Foxtail millet. In India it is chiefly cultivated in Andhra Pradesh, Telangana and Tamil Nadu. It can be taken as sweet or savoury food in all ways that rice is used. Due to the presence of high fibre content, it is suggested as a food for diabetic patients.**

Objectives: To evaluate the protective effects of SISAE on STZ induced diabetic rats.

Materials and Methods: The rats were divided into five groups (six rats in each group).

The animals in group 2 and 4 were given daily oral dose of 300mg of SISAE /kg b.w/day while groups 1 and 3 rats were given water alone and group 5 rats were treated with Glibenclamide at a dose of 20mg/kg b.wfor a period of 30 days. All the five groups were sacrificed on the last day of treatment by cervical dislocation and then blood, pancreas, liver and kidney were collected and stored in 10% formalin after washing 3 times with normal saline. Serum was separated and stored for further biochemical investigations. The tissues were washed, dehydrated with alcohol, cleared with xylene and paraffin blocks were made. Serial sections of 5 micrometres thickness were cut using a rotary microtone. The sections were then deparaffinised with xylene and hydrated in descending grades of alcohol. The slides were then transferred to haematoxylin for 10 minutes, followed by rinsing with water, differentiated in 1% acid alcohol, rinsed in water, blueing in running tap water or 1% lithium carbonate differentiated in 1% alcohol. Later they were counterstained with eosin, rinsed with water, dehydrated with ascending grades of alcohol, cleared with xylene and mounted on glass slides. These slides were examined under 10X and 40X using microscopes.

Results: In histopathological examination, Stained sections of pancreas of diabetic untreated rats showed destruction of beta cells with lymphocytic infiltrations and atrophy. Diabetic treated rats with SISAE showed regenerative changes with tissue architecture. Kidneys sections of diabetic untreated rats showed tubular damage and haemorrhage. But after treatment with SISAE damage of the kidney tissue was controlled. Stained sections of the diabetic untreated rats showed degenerative liver with severe congestion of central vein, haemorrhage in the sinusoidal spaces with hazy nucleus. Whereas, treatment with SISAE in diabetic rats showed improvement in histological structure of liver sections of diabetic rats with normal appearance of the liver lobules.

***Key words*: *Setaria italica*, seeds aqueous extract, (SISAE), Diabetes mellitus (DM), Streptozotocin (STZ), hyperglycemia, histopathology.**

INTRODUCTION

Diabetes mellitus is a metabolic disorder affecting a huge number of populations in the world. It is characterized by chronic hyperglycemia, resulting from defects in insulin secretion or insulin action. It is predicted that the number of diabetic persons in the world could reach 366 million by the year 2030. From the data available through literature, it was found that plant having antidiabetic activity is mainly due to the presence of secondary metabolite. Oxidative stress is involved in development of diabetes and a lot of other diseases. Diabetes mellitus is one of the oxidative stress conditions in which free radicals are increased and antioxidant mechanisms are inhibited. Plants impose their activity through this mechanism and can reduce the toxic effects of drugs. Ayurveda is an ancient Indian form of medicine which deals with plants and plant extracts. Plant drugs are frequently considered to be less toxic and freer from side effects than synthetic ones. Many herbs have been shown to have hypoglycaemic action in animals and humans. *Setaria italica* belongs to family Poaceae commonly known as Foxtail millet. The edible part of the plant is seed. The millet has protein and fiber content compared to other millets. In previous studies anti hyperglycemic and hypolipidemic activity of aqueous seed extract of *Setaria italica* in streptozotocin induced diabetic rats (Sireesha et al. 2011) was reported with improved activities of carbohydrate metabolic and antioxidant enzymes. (Sireesha, et al. 2023). In this paper, the protective effects of SISAE against diabetes induced damage are presented.

HISTOLOGY OF PANCREAS

Pancreas is a pistol shaped gland located inferior and deep to the stomach. It's about 6 inches or 15 cms long. It has both endocrine and exocrine functions. Its exocrine functions are to produce digestive enzymes. Its edoncrine functions pertain to regulating blood glucose. Pancreas produce insulin and glucagons, two hormones that regulate sugar levels in blood. Insulin and glucagons are secreted from pancreas directly into blood.

Nephroprotective Effects of Mycophenolate Mofetil and Glibenclamide on Streptozotocin-induced Diabetic Renal Injury in Rats: An Experimental Study

Sangeetha Lakshmi Boju[1], Peddanna Kotha[2], Nasreen A[3], Swapna Gurrapu[4], Estari Mamidala[4], Ram R[1], Srilatha Chintamaneni[3], Appa Rao Chippada[2], Siva Kumar Vishnubhotla[1]

[1]Department of Nephrology, Sri Venkateswara Institute of Medical Sciences, Tirupati, [2]Department of Biochemistry, Sri Venkateswara University, Tirupati, [3]Department of Pathology, Sri Venkateswara Veterinary University, Tirupati, Andhra Pradesh, [4]Department of Zoology, Kakatiya University, Warangal, Telangana, India

ABSTRACT. Diabetic renal injury is a microvascular complication associated with inflammation and oxidative stress, culminating in renal dysfunction. Conventionally, it is treated with hypoglycemic agents to address metabolic perturbations. However, the way to mitigate immunological, inflammation, and oxidative stress have seldom been studied. Hence, in the present study, the nephroprotective role of immunosuppressive and anti-inflammatory drugs, mycophenolate mofetil (MMF) in combination with the oral hypoglycemic agent glibenclamide, on streptozotocin (STZ)-induced diabetic renal damage was studied. Bodyweight, fasting blood glucose, and glycosylated hemoglobin levels were altered in the diabetic rats. Furthermore, renal injury was indicated by abnormal levels of urinary protein and creatinine and serum markers of renal function in diabetic rats. Hyperglycemia-induced oxidative stress and inflammation were also observed in the diabetic rats. The combination of MMF and glibenclamide treatment significantly attenuated the abnormal effects of hyperglycemia, oxidative stress, and inflammation-induced renal injury in diabetic rats. Histopathological studies confirmed the nephroprotective role of MMF and glibenclamide by reversing renal injury in diabetic rats. The present study suggests that MMF and glibenclamide have a protective role in STZ-induced diabetic renal damage.

Introduction

Diabetic renal injury, a microvascular complication of diabetes mellitus, is the leading cause of end-stage renal disease. Diabetic nephropathy (DN) is characterized by a progressive decrease in the glomerular filtration rate and increased urinary albumin excretion.[1] DN is characterized by the presence of hypertrophy of the glomeruli, thickening of the capillary basement membrane, the accumulation of extracellular matrix in the mesangium and the interstitium, and tubular injury in experimental

SV University Tirupati-517502

Sub: Award of Research Associate to Dr. Rajasekhar Allagadda, on project entitled, "Antidiabetic beneficial effects of Basella rubra L. whole plant in High fat-diet/STZ induced type 2 diabetic Male Albino Wistar rats"

Sir,

I am glad to inform you that the ICMR has awarded Research Associate to Dr. Rajasekhar Allagadda on a stipend of Rs. 47,000/- p.m. to carry out research on the project mentioned above under your guidance. H.R.A. and Medical reimbursement will be paid as per the rules of your Institute.

The award of Research Fellow will be subject to the following terms and condition:

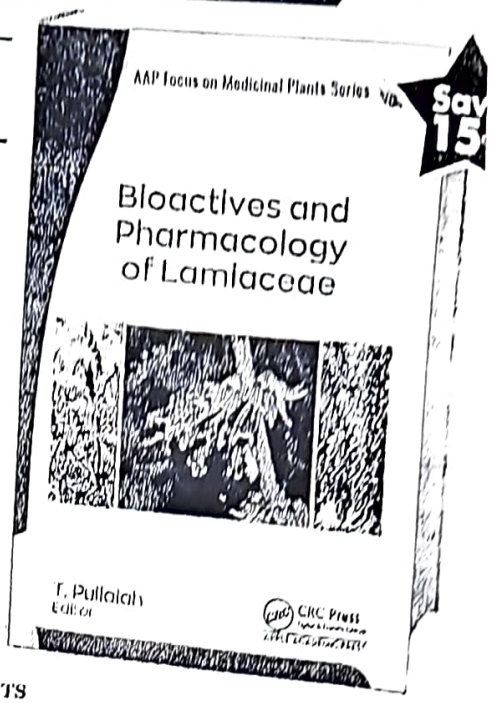
TENURE: It will be tenable for one year only from the date of joining duty and further extension will be on yearly basis subject to maximum of Three Years based on the review of progress report by expert group.

The event of his/her leaving before completing one year on the fellowship, he/she may be required to refund the stipend drawn by him from the date of joining to the date of leaving the fellowship.

PRIVATE PRACTICE: Private Practice of any kind, or taking up any appointment even in an honorary capacity during the fellowship is not permitted.

ADMINISTRATIVE CONTROL: The candidate will be under the administrative control of the Institution where he/she works, and will also be subject to the rules and regulations of the Institute.

LEAVE: "Leave will be admissible according to the leave rules of the Institution/University. However, in the case of female research fellows/Associates 180 day's maternity leave with stipend will be admissible. Research Fellow/Associates are not entitled for vacation normally admissible to the staff of an Institution/University"



HRA: HRA will only be paid, if the fellow is not availing any hostel facility. A certificate to this effect should be sent alongwith joining report for payment of HRA.

REPORTS: The awardees shall submit one copy of the Ist annual report with original protocol & soft copy of both for the first 10 months on the prescribed standard Performa from the date of commencement of the fellowship giving complete factual details of the research work done through the Guide along with his/her appraisal. Subsequent annual report should be submitted through the Guide two months before the completion of fellowship tenure. Failure to submit reports in time may lead to termination of the award. One copy of the Final report with original protocol & soft copy of both in the prescribed form clearly shall be submitted one month before the date of termination of the award.

Bioactives and Pharmacology of Lamiaceae

Available April 2023

Save 15

Editor: T. Pullaiah, PhD
Former Professor, Department of Botany, Sri Krishnadevaraya University, Andhra Pradesh, India

This new book, **Bioactives and Pharmacology of Lamiaceae**, provides a wealth of information on plants in the Lamiaceae family, noted for their essential oils bioactives, and pharmacological properties. The chapters investigate a wide variety of species, providing for each an introduction, characteristics, properties, distribution, traditional uses, and current and potential pharmacological applications.

Aiming to be a resource for the development of new drugs based on species within the Lamiaceae family, the volume includes 26 species discussed, including bungleweed (*Ajuga*), Malabar catmint (*Anisomeles malabarica*), beechwood (*Gmelina arborea*), Brazilian mint (Hyptis crenata), rosemary (*Rosmarinus officinalis* L.), holy basil (*Ocimum tenuiflorum*), and many more.

Edited by the noted botanist T. Pullaiah, PhD, this new volume under his AAP Focus on Medicinal Plants book series, will be a valuable reference for those in drug discovery, botany, and fragrance chemists.

CONTENTS

Preface
1. Biological and Chemical Aspects of the Genus Ajuga L.
Bikarma Singh, Sunil Kumar, Jasha Momo H. Anal, Opender Surmal, Mudasir Nazir Bhat, Sunil Kumar, Diksha Kumari, M. G. Prasad, Sneha, Khushboo Khan, Satish Kumar, and Shri Krishna Tewari

2. A Systematic Review on Ethnopharmacology, Phytochemical, and Pharmacological Studies on Ajuga integrifolia Buch-Ham. (Syn.: Ajuga bracteosa Wall. Ex Benth.)
Anchala Guglani, H.K. Pandey, Rajeshwar K.K. Arya, and G.Balakrishna

3. A Review on Pharmacological Activities of Anisomeles malabarica (L.) R.Br. Ex Sims
C. Appa Rao, K. Peddanna and A. Rajasekhar

4. An Updated Review on Gmelina arborea Roxb.
P. Suneetha, Y.S. Meenakshi and S. Rajashekara

5. Phytochemistry and Pharmacology of Hyptis crenata Pohl Ex Benth.: A Review
Vishal P. Deshmukh

6. An Overview on Isodon rugosus (Wall. Ex Benth.) Codd (Family: Lamiaceae)
M. Munirаju, B. Dinesh, and S. Rajashekara

7. Phytoconstituents and Pharmacology of Leucas lspera L.: An Important Aromatic Weed
Shreedhar S. Otari, Suraj B. Patel, and Savaliram G. Ghane

8. Phytochemical Evaluation of Leucas urticaefolia (Vahl) R.Br. Ex Sm. (Family: Lamiaceae)
Veena Satya and Nutan Rajput

9. Bioactives and Pharmacology of Leucas zeylanica (L.) R.Br. (Family: Lamiaceae)
S. Rajashekara, P. Mahesh, M. Shanthala, and M. Munirаju

AAP **New Book Announcement**

Phytochemical Composition and Pharmacy of Medicinal Plants,

2-volume set

Forthcoming April 2023

Save 15%

Editor: T. Pullaiah, PhD
Former Professor, Department of Botany,
Sri Krishnadevaraya University, Andhra Pradesh, India

This new 2-volume set offers a comprehensive review of more than 80 medicinal plant species, providing information on the bioactives and pharmacology of these beneficial plants. It describes the structures of the secondary metabolites found in these plants, the functions of these compounds in human and plant biology, and the biosynthesis of these compounds.

Each chapter begins with a brief introduction about the species. The chapters then delve into the bioactive phytochemicals from the plant along with its chemical structure. The published literature on pharmacological activities on that species is comprehensively reviewed. A wide array of the biological activities and potential health benefits of the medicinal plant (which include antiviral, antimicrobial, antioxidant, anti-cancer, anti-inflammatory, and antidiabetic properties as well as protective effects on liver, kidney, heart and nervous system) are given.

Phytochemical Composition and Pharmacy of Medicinal Plants aims to be valuable source book for scientists, researchers, industry professionals, faculty and students for the development of new and effective drugs from medicinal plants.

CONTENTS

Phytochemical Composition and Pharmacy of Medicinal Plants, Volume 1

Preface

1. Phytochemistry and Ethnopharmacological Review of Autumn Crocus (*Colchicum autumnale L.*)
Santoshkumar Jaygoudar, Harsha V. Hegde, Pradeep Bhat, and Savaliram G. Ghane

2. Bioactive Constituents and Pharmacological Activity of Citrullus colocynthis (L.) Schrad.
Dharam Chand Attri, Deepika Tripathi, Vijaylaxmi Trivedi, Indra D. Bhatt, and Mohan Chandra Nautiyal

3. Bio- Actives and Pharmacology of *Cannabis sativa* L.
Ashish Mishra and Devesh Tewari

4. Phytochemical and Pharmacological Appraisal of *Cassia angustifolia* Vahl (Syn.: Senna Alexandrina Mill.)
Lepakshi Md. Bhakshu, K. V. Ratnam, and R. R. Venkata Raju

5. The Genus Atalantia: A Comprehensive Review of Phytoconstituents, Ethnobotany, and Pharmacological Bioactivities
Rahul L. Zanan and Savaliram G. Ghane

6. Traditional Drug *Aloe vera* (L.) Burm. F.: Phytochemistry and Biological Properties
Digambar N. Mokat

7. Bioactives and Pharmacology of *Anogeissus latifolia* (Roxb. Ex Dc.) Wall. ex Bedd.
Anjali Shukla, Nainesh Modi, and Pooja Sharma

8. A Review on Phytochemistry and Pharmacology of *Calophyllum inophyllum* L.
R. Raji and A. Gangaprasad

9. Phytochemical and Pharmacological Potential of Hard Milkwood: *Alstonia macrophylla* Wall. ex . Don
Digambar N. Mokat, and Tai D. Kharat

10. Bioactives and Pharmacology of Agave sisalana Perrine
Sneha Joshi, Tanuj Joshi, Kiran Patni, Pooja Patni, Ashish Mishra, and Devesh Tewari

11. A Review on Phytochemistry and Biological Activities of *Aerva javanica* (Burm. F.) Juss. ex Schult.
K. V. Madhusudhan, Sibbala Subramanyam, M. Mahesh, and K. N. Jayaveera

12. Phytochemistry and Pharmacology of Prince's Feather Amaranth (*Amaranthus hypochondriacus* L.; Family: Amaranthaceae)
Nayan Kumar Sishu and Chinnadurai Immanuel Selvaraj

13. Bioactives and Therapeutic Potential of Red Root Pigweed (*Amaranthus retroflexus* L.) and Berlandier's Amaranth (*Amaranthus polygonoides* L.)
Vaishali Manoj Hadkar, Nayan Kumar Sishu, and Chinnadurai Immanuel Selvaraj

14. Phytochemicals and Pharmacological Potential of *Acampe ochracea* and *A. Papillosa* (Orchidaceae): An Overview
K. Jhansi, M. Rahamtulla, and S. M. Khasim

15. Phytochemical and Therapeutic Potential of *Aerides odorata* Lour. (Orchidaceae): An Overview
K. Jhansi, M. Rahamtulla, I. V. Kishore, and S. M. Khasim

16. The Mexican Poppy: *Argemone mexicana* L. Bioactives and Biological Activity
Chachad Pervangi and Mondal Manoshree

17. Ethnobotanical Uses, Phytochemistry and Pharmacological Activities of *Cryptolepis dubia* (Burm F.) M. R. Almeida
Harsha V. Hegde, Santoshkumar Jayagoudar, Pradeep Bhat, and S. G. Ghane

18. White Turmeric: Bioactives and Pharmacological Activities
Chachad Pervangi and Mondal Manoshree

19. Phytochemical and Pharmacological Profile of *Cymbidium aloifolium* (L.) Sw.
V. Rampilla and S. M. Khasim

20. Phytochemicals and Pharmacological Potentialities of Lemongrass [*Cymbopogon flexuosus* (Nees ex Steud.) W. Watson]
K. P. Smija, Saranya Surendran, and Raju Ramasubbu

21. Biochemicals and Biological Activities of *Cymbopogon jwarancusa* (Jones) Schult.
Ch. Srinivasa Reddy, K. Ammani, and N. Sarath Chandra Bose

22. Phytochemical Constituents and Pharmacology of *Decalepis arayalpathra* (J. Joseph & V. Chandras.) Venter
Thadiyan Parambil Ijinu, Ragesh Raveendran Nair, Manikantan Ambika Chithra, Thomas Aswany, Varughese George, and Palpu Pushpangadan

23. Chemical Constituents and Biological Activities of *Diospyros vera* (Lour.) Chev.
Ch. Srinivasa Reddy, K. Ammani, and A. Ravi Kiran

24. Traditional Uses, Bioconstituents, and Pharmacological Aspects of Autumn Olive (*Elaeagnus umbellata* Thunb.)
Pradeep Bhat, Harsha V. Hegde, Savaliram. G. Ghane, and Santoshkumar Jayagoudar

25. Bioactive Constituents and Pharmacological Properties of *Ephedra gerardiana* Wall. ex Stapf and *Ephedra intermedia* Schrenk & C. A. Mey.
Santoshkumar Jayagoudar, S. G. Ghane, Pradeep Bhat, Harsha V. Hegde, and Rahul Zanan

26. Biomolecules and Therapeutics of *Eriobotrya japonica* (Thunb.) Lindl.
Savaliram G. Ghane and Rahul L. Zanan

27. Fagopyrum esculentum: A Nutrient-Dense Part of Nature
Sumanta Mondal, G. Shiva Kumar, and K. N. Jayaveera

28. Star Anise (*Illicium verum* Hook. F.): A Systematic Review on Its Traditional Uses, Bioactive Resources, and Pharmacological Properties
Harsha V. Hegde, Pradeep Bhat, Santoshkumar Jayagoudar, and Savaliram G. Ghane

29. *Leptadenia reticulata* (Retz.) Wight & Arn.: A Review on Pharmacological Properties and Bioactives
Savaliram G. Ghane, Pradeep Bhat, Harsha V. Hegde, and Santoshkumar Jayagoudar

30. Comprehensive Overview of the Phytochemistry and Pharmacological Studies of the Genus Lobelia
Saurabha Bhimrao Zimare and Prachi Sharad Kakade

31. Bioactives and Pharmacology of *Matricaria chamomilla* L.
Kannasandra Ramaiah Manjula, Gurumurthy Vanishree, Marabanahalli Yogendraiah Kavyasree, Ramu Nisha, Varsha Rani, Khalid Lubaina, Gubby Lakshminarasimhaiah Sandeep, Shubha, Chalayatta Seenappa Shiva Shankar Reddy, and Somashekara Rajashekara

32. Phytoconstituents and Pharmacological Potential of *Momordica cymbalaria* Fenzl. ex Naudin
C. Appa Rao and M. Saritha

33. The Medicinal Properties of *Monteverdia ilicifolia* (Mart. ex Reissek) Biral
Maria Danielma Dos Santos Reis, Felipe Lima Porto, Rafael Vrijdags Calado, Tayhana Priscila Medeiros Souza, Jamylle Nunes De Souza Ferro, and Emiliano Barreto

34. Phytochemical Composition and Pharmacological Potential of *Myristica fragrans* Houtt.: A Review
S. Stephin and A. Gangaprasad

35. Bioactivity Potential and Pharmacological Efficiency of *Piper betle* L.
Vijay Laxmi Trivedi, Dharam Chand Attri, and Mohan Chandra Nautiyal

36. Pharmacological Activities of Bioactive Compounds from an Aromatic Herb *Piper trioicum* Roxb.
M. Mahesh, M. Mallikarjuna, M. Govindarajula Yadav, and K. N. Jayaveera

37. Bioactives and Pharmacology of *Psidium guajava*
Adheena Elza Johns

38. Bioactives and Pharmacology of *Rauwolfia tetraphylla* L. (Family Apocynaceae)
Kodeeswaran Parameshwaran, Mohammed Almaghrabi, Randall C Clark and Muralikrishnan Dhanasekaran

39. The Black Rice: A Multifunctional Food?
Baluraju Chandramouli, Shaik Ibrahim Khalivulla, and Kokkanti Mallikarjuna

40. Bioactive Potential and Phytopharmacological Activity of *Abuta rufescens* Aubl.

41. Pharmacological Significance of Solanum *Violaceum*
M. Muniraju and, S. Rajashekara

42. Bioactive Compounds and Pharmacology of an Important Medicinal Plant *Spilanthes acmella* Murr.
Deepika Tripathi, Dheeraj Shootha, Shailendra Pradhan, and Mithilesh Singh

43. Pineapple *[Ananas comosus* (L.) Merr.]: A Biological and Pharmacological Active Medicinal Plant
Charles Oluwaseun Adetunji, Mohammad Ali Shariati, Olugbenga Samuel Michael, Osarenkhoe O. Osemwegie, Odoh Uchenna Estella, Olugbemi Tope Olaniyan, Maksim Rebezov, Olulope Olufemi Ajay, Gulmira Baibalinova, Ruth Ebunoluwa Bodunrinde, Juliana Bunmi Adetunji, Mayowa Jeremiah Adeniyi, Ugwu Patience N., Abel Inobeme, John Tsado Mathew, Temidayo Oluyomi Elufisan, and Omotayo Opemipo Oyedara

44. A Review on the Medicinal Value of Halotolerant *Rhizophora mucronata* Lam.: A Mangrove Species
Supriya Vaish, Karuna Vaishya, Sunil Soni, Ajay Neeraj, Asha Humbal, Bhawana Pathak, and R. Y. Hiranmai

45. Phytochemical and Pharmacological Profile of Sunset Musk Mallow (*Abelmoschus manihot* (L.) Medik.
Kuppan Lesharadevi, Theivasigamani Parthasarathi, and Chinnadurai Immanuel Selvaraj

Index

Phytochemical Composition and Pharmacy of Medicinal Plants: Vol 2

46. An Overview of Pharmacological Properties and Bioactives Principles in Indian Mallow [*Abutilon indicum* (L.) Sweet]
Akshaya Thinakaran, Karuppanan Karthik, and Chinnadurai Immanuel Selvaraj

47. *Acalypha australis* L.: Bioactive Potential and Pharmacological Activities
Yogesh Chand Yadav, Anshika, and Pankaj Yadav

48. Bioactives and Pharmacology of *Acalypha wilkesiana* Müll. - Arg.
Geetha Birudala, Harikrishnan N., Vinod Kumar Nelson, and Nagendra Babu Mennuru

49. Pharmacological Aspects of Underutilized Plant *Bridelia stipularis* (L.) Blume
Nilesh Vitthalrao Pawar and Ashok Dattatray Chougale

50. Phytochemical and Pharmacological Profile of *Euphorbia antiquorum* L. (Euphorbiaceae)
Sarojini Devi N. and Rajakullayi Swamy K

51. An Updated Overview on *Euphorbia hirta* L.
Sarojini Devi N. and K. Raja Kullayi Swamy

52. Phytochemical and Pharmacological Profile of *Euphorbia neriifolia* L. (Indian Spurge Tree)
Sarojini Devi N. and K. Raja Kullayi Swamy

53. Phytochemical and Pharmacological Profile of *Euphorbia thymifolia* L.
N. Sarojini Devi and K. Raja Kullayiswamy

54. Phytochemical and Pharmacological Profile of *Euphorbia tirucalli* L. (Pencil Tree)
N. Sarojini Devi and K. Rajakullayi Swamy

55. Phytochemical and Pharmacological Properties of *Excoecaria agallocha* L.
Pradeep Kumar Maharana

56. Biomolecules and Therapeutics of *Flueggea leucopyrus* Willd. [Syn.: *Securinega leucopyrus* (Willd.) Müll. - Arg.]
Swarupa V. Agnihotri

About the Editor

T. Pullaiah, PhD, is a former Professor at the Department of Botany at Sri Krishnadevaraya University in Andhra Pradesh, India, where he has taught for more than 35 years. He has held several positions at the university, including Dean, Faculty of Biosciences, Head of the Department of Botany, Head of the Department of Biotechnology, and Member of the Academic Senate. He was President of the Indian Botanical Society (2014), President of the Indian Association for Angiosperm Taxonomy (2013), and Fellow of Andhra Pradesh Akademi of Sciences. He was awarded the Panchanan Maheshwari Gold Medal, the Dr. G. Panigrahi Memorial Lecture Award of the Indian Botanical Society, the Prof. Y.D. Tyagi Gold Medal of the Indian Association for Angiosperm Taxonomy, and a best teacher award from the Government of Andhra Pradesh. Under his guidance, 54 students obtained their doctoral degrees. He has authored over 50 books, edited 20 books, and published over 330 research papers, including reviews and book chapters. His books include *Advances in Cell and Molecular Diagnostics, Ethnobotany of India* (5 volumes), *Red Sanders: Silviculture and Conservation, Monograph on Brachystelma and Ceropegia in India, Flora of Andhra Pradesh* (5 volumes), *Flora of Eastern Ghats (7 volumes), Flora of Telangana* (3 volumes), *Encyclopaedia of World Medicinal Plants* (7 volumes, 2nd edition), *Encyclopaedia of Herbal Antioxidants* (3 volumes), *Global Biodiversity* (4 volumes), *Handbook of Research on Herbal Liver Protection*, among others. Dr. Pullaiah was a member of the Species Survival Commission of the International Union for Conservation of Nature (IUCN). He received his PhD from Andhra University, India, and attended Moscow State University, Russia.

AAP Focus on Medicinal Plants book series

Editor: T. Pullaiah, PhD
Former Professor, Department of Botany,
Sri Krishnadevaraya University, Andhra Pradesh, India
Email: pullaiah.thammineni@gmail.com

Volumes in this book series discuss each species' bioactive compounds along with their chemical structures and pharmacological activities, which include antiviral, antibacterial, antifungal, antioxidant, anticancer, anti-inflammatory, anti-diabetic, hepatoprotective, cardioprotective, nephroprotective, etc. The volumes aim to be comprehensive desk references on bioactives and pharmacology of medicinal plants and sourcebooks of inspiration for the development of new drugs.

BOOKS IN THE SERIES TO DATE:

Bioactives and Pharmacology of Medicinal Plants, 2-volume set

Biomolecules and Pharmacology of Medicinal Plants, 2-volume set

Phytochemistry and Pharmacology of Medicinal Plants, 2-volume set

Bioactives and Pharmacology of Legumes

Bioactives and Pharmacology of *Lamiaceae*

Phytochemical Composition and Pharmacy of Medicinal Plants, 2-volume set

Order your copy of Phytochemical Composition and Pharmacy of Medicinal Plants, 2-volume set today. Save 15% when you order online and enter promo code APP12.

Calculation of Performance Rate:

1. Ascertain performance score as per the points mentioned against each criteria
2. Calculate each parameter score such as scores of Student feedback, research, academic activities and achievements and extension activities
3. Multiply the parameter score with weight assigned to each parameter. eg. Student feedback X weight (50)
4. Add the weighted parameter score of all four parameters
5. Divide the total weighted score BY 16.000 (the maximum possible weighted score) and multiply with 100 to get performance rate of the faculty for the academic year.

Abstract
Capparis zeylanica L. is a climbing shrub distributed in Indian subcontinent and Mediterranean region. Almost all parts of the plant are used in folk medicine and traditional practices to treat several human ailments. The present study was aimed to investigate the role of *C. zeylanica* L. root extract in preventing cancerous cells growth and proliferation, as well as promoting apoptosis and cell cycle arrest in MDA-MB-231 and MCF-7 breast cancer cells. Methanolic extract of *C. zeylanica* L. (MECz) was prepared and characterized by LC–ESI–MS/MS analysis. In vitro cytotoxicity and anti-proliferative activity of MECz was evaluated by MTT assay, while cell viability, apoptosis and cell cycle progression by Muse Cell analyzer. Furthermore, the mRNA and protein expressions of EMT markers were assessed using qRT-PCR and western blotting techniques, respectively. The MECz was found to be rich in phenolic compounds including chlorogenic acid, 6-gingerol, and certain triterpenes like ursolic acid etc. The apparent anti-metastasis activity of MECz was evident from IC_{50} value of 19.12 and 24.22 µg/mL, respectively, on MDA-MB-231 and MCF-7 cells in MTT assay. An absolute decrease in cell viability (78.1–53.4% and 89.9–49.0%), augmented apoptosis (90.98–48.25% and 88.25–47.70%) and S phase, G_2/M phase cell cycle arrest was found by MECz treatment on MDA-MB-231 and MCF-7 cells. The gene expression studies revealed that MECz could significantly ($p < 0.001$) regulate the expression of EMT markers such as snail, slug, zeb-1, twist-1, fibronectin, vimentin and E-cadherin at molecular level. These findings demonstrate that *C. zeylanica* L. root extract inhibits breast cancer cells growth and proliferation through regulating the expression of key EMT marker genes and proteins. Thus, MECz may be suggested as a potential anti-metastasis agent in the treatment of breast cancer.

Keywords Apoptosis · Breast cancer · *Capparis zeylanica* · Cell cycle · Cytotoxicity · EMT markers

AqECz	Aqueous extract of *Capparis zeylanica*
EMT	Epithelial-to-mesenchymal transition

Introduction

Cancer is the second most prominent cause of death worldwide in people with age of 70 or less and about 30% of cancer deaths are owing to breast cancer (Siegel et al. 2018). The high incidence of cancer is majorly owing to steady rise in life expectancy, increasing urbanization; changes in environmental conditions, food habits and lifestyle (Jemal et al. 2011). According to GLOBOCAN 2020, an estimated 19.3 million people worldwide were diagnosed with cancer in 2020, with 10 million deaths from cancer (Sung et al. 2021). It is predicted that, by 2040, the global prevalence of cancer will be doubled from its current prevalence (29–37%), with low- and middle-income countries (LMICs) account for two-thirds of the prevalence (Shah et al. 2019). Breast cancer is the most widespread cancer among women and in 2022, approximately 2.9 million female breast cancer cases were diagnosed worldwide, accounting for nearly one-fourth of

ABSTRACT

Obesity is a major public health problem that is associated with many metabolic disorders including diabetes, hypertension, and cardiovascular diseases. *Anthophycus longifolius* is a brown seaweed that have been shown to possess antioxidant, antibacterial and anti-inflammatory activities. The present study investigated the anti-diabetic, anti-obesity and oxidative stress ameliorating properties of cold water (CW) and ethanolic (EtOH) extracts of *A. longifolius* using *in vitro* and *ex vivo* experimental models. The extracts significantly inhibited the activities of carbohydrate and lipid digestive enzymes α - glucosidase (IC_{50} = CW: 176.9±2.1 μg/ml; EtOH: 179.8 ±1.9 μg/ml); α-amylase (IC_{50} = CW: 86.1±1.7 μg/ml; EtOH: 77.8±1.9 μg/ml); and pancreatic lipase (IC_{50} = CW: 184.3±1.7 μg/ml; EtOH: 534.1±2.3 μg/ml), and stimulated adipose glucose uptake (CW: 10- 50.5 mg/g adipose tissue; EtOH: 9 - 79 mg/g adipose tissue). Incubation of adipose tissues with $FeSO_4$ significantly depleted reduced glutathione (GSH) level, super oxide dismutase (SOD) and catalase activities, while concomitantly elevated malondialdehyde (MDA) level. These changes were significantly reversed following the treatment of *A. longifolius* extracts. Liquid chromatography-mass spectrometry (LC-MS) analysis of the extracts revealed the presence of rhodomycinone, salsolinol, 5-hydroxyconiferyl alcohol, 2-caffeoylisocitrate and demethylangiside in the cold water extract, while petromyzonol 24-sulfate, atractyloside, abyssinone VI and podecdysone B in the ethanolic extract. Molecular docking analysis revealed potent interactions of the phytochemicals with GLUT4 and leptin. These results indicate the possible antidiabetic, antiobesity and oxidative stress ameliorating potentials of *A. longifolius* extracts at *in vitro* and *ex vivo* experimental models. The identified compounds may be responsible for the observed biological activities.

Thymoquinone mitigates obesity and diabetic parameters through regulation of major adipokines, key lipid metabolizing enzymes and AMPK/p-AMPK in diet-induced obese rats

Keerthi Ramineedu[1] · Karunakaran Reddy Sankaran[1] · Venkataswamy Mallepogu[1] · Devi Prasad Rendedula[2] · Ramesh Gunturu[2] · Sreedevi Gandham[3] · Shahidul Islam Md[4] · Balaji Meriga[1]

Abstract
The present study was designed to evaluate the anti-obesity and anti-hyperglycemic activity of Thymoquinone (ThyQ) isolated from *Nigella sativa* seeds. Male Wistar rats were randomly divided into five groups and fed either normal pellet diet or high-fat diet (HFD) for 18 weeks and water *ad-libitum*. Group I: normal pellet diet (NPD)-fed, Group II: high-fat diet (HFD)-fed, Group III: HFD-fed-ThyQ (20 mg)-treated, Group IV: HFD-fed-ThyQ (40 mg)-treated and Group V: HFD-fed-Orlistat (5 mg)-treated group. Intervention with ThyQ started from 12th week onwards to HFD-fed rats of group III and IV. ThyQ administration significantly ($p < 0.01$) mitigated body weight gain, blood glucose, insulin level, serum and liver lipids (except HDL) and improved glucose tolerance and insulin sensitivity as evaluated by oral glucose tolerance test (OGTT), homeostasis model assessment—insulin resistance (HOMA-IR) and insulin tolerance test (ITT). Furthermore, ThyQ significantly ($p < 0.01$) diminished serum aspartate transaminase (AST), alanine transaminase (ALT), acetyl-CoA carboxylase (ACC), plasma leptin, resistin and visfatin levels but enhanced lipoprotein lipase (LPL) and adiponectin levels. RT-PCR analysis demonstrated down-regulated mRNA expression of sterol regulatory element-binding proteins-1c (SREBP-1c), CCAAT/enhancer-binding protein—α (C/EBP-α) and fatty acid synthase (FAS) but upregulation of Insulin receptor substrate-1 (IRS-1).Western blot analysis displayed phosphorylation of adenosine monophosphate activated protein kinase (AMPK) in ThyQ-treated rats. Liver microtome sections of HFD-fed rats showed degenerated hepatocytes with high lipid stores while that of adipose tissue sections displayed large, fat-laden adipocytes, however, these histological changes were considerably attenuated in ThyQ-treated groups. Together these findings demonstrate that ThyQ can be a valuable therapeutic compound to potentially alleviate diet-induced obesity, hyperglycemia and insulin resistance.

Keywords Adipokines · Glycemic-lipid profile · *Nigella sativa* · Obesity rats · Thymoquinone

IRS-1	Insulin receptor substrate-1
LPL	Lipoprotein lipase
OGTT	Oral glucose tolerance test
SREBP-1c	Sterol regulatory element-binding proteins-1c
ThyQ	Thymoquinone

Introduction

In recent times, obesity has gained unprecedented global importance owing to its central role in inducing hypertension, type-2 diabetes, cardiovascular diseases (CVDs) and certain cancers (Leggio et al. 2017). According to World Health Organization (WHO), 650 million adults, 340 million

Keerthi Ramineedu, Karunakaran Reddy Sankaran have equally contributed to this work.

[b] Food and Nutrition Biotechnology Division, National Agri-Food Biotechnology Institute, S.A.S. Nagar, Punjab-140306, India.

ABSTRACT: In the present study we investigated the impact of the Combination of Astragalin and Rutin (CAR) on restoring gut-microbial dysbiosis and obesity and obesity related disorders. Randomized male C57BL/6J mice were experimentally divided into five groups and fed either a normal diet or a high-fat diet (HFD) for 16 weeks. Compared to vehicle treated group (HFD group), CAR could substantially improve selected gut microbiota abundance (*Akkermansia, Lactobacillus, Bifidobacteria, muciniphila, Roseburia*), reversed the Firmicutes/Bacteroidetes proportions, and inhibited the growth of *Escherichia coli*, *Salmonella*, and *Klebsiella* in obese mice. In addition, CAR-treated mice showed significantly ($P < 0.05$) increased total short-chain fatty acid production, reduced body weight gain, organs' weights, serum lipid profile (except HDL) and insulin resistance. The mRNA expressions of CCAAT/enhancer binding protein-α (C/EBP-α), sterol regulatory element-binding protein-1c (SREBP-1c), peroxisome proliferator-activated receptor-γ (PPAR-γ), acetyl-CoA carboxylase (ACC), adipocyte protein 2 (aP2), and fatty acid synthase (FAS) were downregulated ($P < 0.05$) and the protein expression of PPAR-γ was downregulated while AMPK was phosphorylated in CAR-treated HFD-fed mice compared to the HFD control group. Interestingly, CAR-treated HFD-fed mice showed significantly improved tissue architecture in the liver and fatty tissues. In conclusion, the findings suggest that CAR/*Moringa oleifera* may be beneficial in the treatment of insulin resistance and obesity disorders.

Keywords: astragalin, gut microbiota, *Moringa oleifera*, obesity, rutin.

1. Introduction

The obesity epidemic and associated disorders including non-alcoholic fatty liver disease, type-2 diabetes and cardiovascular diseases (CVDs) are major public health challenges. Poor diet, sedentary lifestyles, increased urbanization and psychosocial stress are factors contributing to the high rates of obesity [1,2]. However, these factors are often difficult to overcome and therefore obesity continues to be a major health concern. Therefore, exploring effective therapeutics to treat obesity and associated disorders has immense potential [3,4]. Weight management drugs currently approved by Food and Drug Administration

ABSTRACT

Enzyme production costs should be reduced by using inexpensively available substrates. In this, we determine the effects of various medium components and food processing waste on *Cladosporium* sp. production of CMCase in SSF. Five factors were tested with a three-level Box-Wilson factorial, central composite design (CCD) to determine how they impacted *Cladosporium* sp. NCIM 901's ability to produce CMCase. For the model, the R^2 (coefficient of determination) value was 0.9349. Based on the process findings, the optimal medium for higher enzyme synthesis had wheat bran (4 g/L), $cacl_2$ (2 g/L), urea (7.5 g/L) and rice bran (8.76 g/L), with the medium's original pH at 5.5. The model's accuracy is confirmed by the experimental result of CMCase, which is 23.42 U/gds and equivalent to the expected yield of 22.31 U/gds. The accuracy of the current experimental design has been verified by experimental validation. The enzyme's properties indicated that its greatest activity occurred at pH 5.5 and that its ideal temperature was about 50 °C. The enzyme is more active toward CMC and less active toward filter paper. $CaCl_2$ and $MgCl_2$ increased the enzyme's activity. Enzymatic hydrolysis of waste-derived polysaccharides into simple sugars is necessary for the industrial manufacture of bioethanol. The efficacy of the produced *Cladosporium* sp. cellulase (CMCase) enzyme to saccharify pearl millet grass results shows that H_2SO_4 treated substrate gave more fermentable sugars compared to the untreated substrate. Results suggest that the indigenous produced-CMCase can be efficiently used for lignocellulosic biomass saccharification (55.40%) compared to the untreated sample (37.10%) in 48 h, which will eventually reduce the cost utilized for purchasing commercial enzymes.

Keywords: *Cladosporium* sp. NCIM 901, Sugarcane bagasse, Wheat and Rice bran, Solid State Fermentation, Central Composite Design, Carboxymethyl cellulase, Characterization, Pearl millet grass saccharification

INTRODUCTION

The abundant microorganisms in nature, especially fungi, play a vital role in agriculture by decomposing organic matter and managing waste. Researchers focus on newly discovered fungal species for their potential in producing essential cellulase enzymes crucial in industrial processes. Extensive research has focused on cellulases in biomass and waste conversion **(Naher *et al.*, 2021)**.

The production of cellulases from less expensive substrates is an effective way to reduce costs. Cellulases, involved in the hydrolysis of cellulose, generally exist in three different kinds. Endoglucanases (EG) attack the carbohydrate chain inside and selectively hydrolyse substituted soluble celluloses like carboxymethyl cellulose (CMC), yet, they are little efficient towards strongly structured crystalline cellulose, for example, Avicel or cotton fibers. Cellobiohydrolases (CBH) can break down crystalline cellulose and produce cellobiose, nevertheless, they have no impact on substituted celluloses. Short cello-oligosaccharides and cellobioses are generated by the enzyme and are hydrolyzed by β-glucosidases to glucose **(Jayasekara and Ratnayake, 2019)**.

For the generation of enzymes, solid-state fermentation (SSF) is an alternative to the more traditional submerged culturing method **(Lopez-Gomez and Venus, 2021)**. Higher output per bioreactor volume, reduced budget and area requirements, simpler apparatus and easy access to downstream processing are some positive aspects of SSF **(Srivastava *et al.*, 2020)**. The development of microbes is restricted by different factors. For microbial development and complex cellulolytic enzyme synthesis during SSF, working parameters including pH, temperature and moisture content are essential **(Farinas, 2018)**. The optimization of crucial factors that influence microbial development and product formation is also essential for an efficient scale-up plan. Optimization of several parameters is sometimes a difficult and time-consuming operation. Response surface methodology (RSM) can be used to assess the importance of a range of variables, mainly when there are complex relationships between the individual components **(Inger *et al.*, 2019)**. RSM based on design of experiments is a set of statistical and mathematical tool for designing experiments and optimizing the effect process variables. The BBD offers optimal results with few experimental runs when compared with other response surface methodology techniques **(Maran *et al.*, 2013)**. Many studies employed RSM design for the cellulase enzyme production **(Shajahan *et al.* 2017; Ahmad *et al.*, 2020)**.

Agro-industrial byproducts can be used in a variety of ways, including wheat straw, cassava waste, sugar beet pulp, maize cobs, wheat bran and apple pomace by using SSF for the stimulation of both cellulolytic and hemicellulolytic enzymes **(Sadh *et al.*, 2018)**. Wheat bran is a compositionally intricate material, comprising cellulose (40–50% of dry matter), hemicellulose (25–35% of dry matter), and lignin (15–20% of dry matter). It represents a valuable source for the production of platform molecules and bioethanol **(Celiktas *et al.*, 2014)**. An important benefit of utilizing wheat bran is that it inherently contains sufficient nutrients, obviating the need for additional carbon and nitrogen sources **(Katileviciute *et al.*, 2019)**. Rice bran constituents vary due to the various processing techniques and machinery utilized, but it typically makes up 5–5% (by weight) of regular rice. Oil normally makes up 14–24% of rice bran, whereas protein is 16–18%, carbohydrate is 33–35% (about 20% crude fiber), water is 7–14% and ash is 8–12%. Additionally, it is abundant in protein, vitamins B and E and other minerals **(Satter *et al.*, 2014)**. Rice bran, wheat bran, and wheat straw were used for cellulase and xylanase production **(Kumar *et al.*, 2016; Devi *et al.*, 2022)**.

The key issue for commercial use is the endoglucanase used in different biotechnological applications, also the high price of manufacture and little titers of this enzyme. As a result, studies on how to enhance the enzyme productivity and the capability of microbial strains to utilise cheap substrate have been conducted. In the current study, an effort was made to improve the medium conditions to increase the enzyme production. The utilization of bagasse, rice bran and wheat bran as the fermentation substrate during SSF while using *Cladosporium* sp. NCIM 901 for CMCase has not received much investigation. Wheat and rice bran are byproducts from the processing of wheat and rice. They have the potential to be utilized as substrates for industrial fermentation since they are commonly obtainable.

Comprehensive review on Next Generation Sequencing methodology and its applications

Deepthi V*, Ramya G.N.V.S, Nandini P and Reddy O.V.S.
Department of Biochemistry, Sri Venkateswara University, Tirupati – 517 502, India

Abstract: The main output of the next generation sequencing is determination of sequence data of DNA or RNA in a vast amount. This sequencing is represented as a series of bases of nucleotides-Adenine, Thymine, Cytosine, Guanine for DNA and Adenine, Uracil, Guanine, Cytosine for RNA. This provides the genetic code of sample which is being sequenced. The first-generation sequencing such as Sanger sequencing analysis which is a time-consuming method when compared with second generation sequencing known as NGS. It may take time from few hours to some days but NGS complete the data sequence of DNA or RNA with in a single day (1). NGS also known as High-Throughput Sequencing (HTS), Massively Parallel Sequencing (MPS), Second generation sequencing etc. This review reflects the importance of NGS methodology and its applications in a simple manner. NGS, a revolutionary advancement over the first-generation Sanger sequencing, enables rapid and comprehensive sequencing of DNA and RNA. NGS deciphers the genetic code of samples with unprecedented speed and efficiency. This review underscores the significance of NGS technology and explores its wide-ranging applications, highlighting its transformative impact on genomic research and diagnostics.

Keywords: NGS methodology, Applications, Advantages and Disadvantages.

Introduction

In the early 21st century the ground breaking technology was proposed which plays a significant role in DNA sequencing known as Next Generation Sequencing (NGS).The introduction of first DNA sequencing method took longer time (25 years) after the discovery of DNA structure by Watson and Crick in the year of 1953 (2, 3). There is a difference between NGS method and Sanger sequencing method. In case of NGS: provides massively parallel analysis, high-throughput from multiple samples at reduced cost (4). Whereas Sanger sequencing method is used to sequence both tiny as well as larger size genomes from bacteria to humans (5).

There are many applications of NGS in the development of Biotechnology, Bioinformatics and molecular biology. Also used in clinical laboratories including DNA testing, typing of Human Leucocyte Antigen (HLA), for the analysis of microbes and gene expression. For the testing of identity by using of short tandem repeats (STRs). At current the most clinically available earliest development is NGS of circulating tumor DNA (ctDNA). Advanced blood group typing like - TypeA1 versus Type A2 (6). This review mainly focuses on methodology of next generation sequencing and its applications and briefly reflects about advantages, and disadvantages. The impact of NGS extends to clinical settings, where it is increasingly used for diagnostic purposes, personalized medicine, and cancer genomics. The ability to rapidly and accurately identify genetic mutations associated with diseases has opened new avenues for treatment and management, highlighting the critical role of NGS in modern healthcare. Despite its remarkable advancements, NGS faces challenges such as data management complexities, the need for high computational power and interpretation of vast datasets. Ongoing improvements in sequencing technologies, bioinformatics tools and data analysis methods are essential to fully harness the potential of NGS. It has emerged as a groundbreaking technology that has revolutionized the field of genomics by providing rapid, accurate, and comprehensive sequencing capabilities. Unlike traditional Sanger sequencing, which sequences DNA one fragment at a time, NGS can sequence millions of fragments simultaneously. This parallel processing enables researchers to achieve a high throughput at significantly lower costs and shorter turnaround. NGS has profoundly impacted biological research and clinical diagnostics, providing deep insights into genetic and molecular mechanisms. As technologies continue to evolve, NGS is expected to become even more integral to personalized medicine, enabling more precise and effective healthcare solutions.

Appraisal of Pancreatic Lipase Inhibitory Potential of *Ziziphus oenoplia (L.)Mill.* Leaves by *In Vitro* and *In Silico* Approaches

Srinivasa R Vulichi [1 2], Ashish Runthala [3], Siva K Rachamreddy [1], Radhika S P Yaramanedi [1], Partha Sarathi Sahoo [3], Prasad V L S Burra [3], Nameet Kaur [4], Sudheer Akkiraju [5], Somasekhar Reddy Kanala [5], Appa Rao Chippada [1 6], Sistla Durga Srinivasa Murthy [6]

Affiliations
PMID: 37214709 PMCID: PMC10193397 DOI: 10.1021/acsomega.2c07361

Abstract

Pancreatic lipase is one of the crucial lipolytic enzymes of the gut that actively facilitates the digestion and absorption of the dietary triglycerides and cholesteryl esters. Although it has been deemed as one of the most reliable targets for the treatment of obesity and/or dyslipidemia, to date, orlistat is the only known FDA-approved, effective, oral pancreatic lipase inhibitor available for clinical use apart from the centrally acting antiobesity agents. However, it is known to be associated with adverse gastrointestinal and renal complications. In this study, we attempted to assess the antioxidant and porcine pancreatic lipase inhibitory potentials of *Ziziphus oenoplia (L.)Mill.* leaves through a systematic combination of *in vitro* and *in silico* approaches. Among the four different extracts including petroleum ether extract, ethyl acetate extract, ethanolic extract, and aqueous extract obtained through successive solvent extraction, the ethyl acetate extract has outperformed the other extracts and orderly displayed competent peroxide scavenging (IC_{50} value: 267.30 μg/mL) and porcine pancreatic lipase inhibitory (IC_{50} value: 444.44 μg/mL) potentials compared to the selected reference compounds: ascorbic acid (IC_{50} value: 251.50 μg/mL) and orlistat (IC_{50} value: 502.51 μg/mL) in the selected in vitro assay models. In addition, based on the molecular docking simulations of the six essential phytoconstituents of the leaves of *Ziziphus oenoplia (L.)Mill.* and their respective chemical analogues against the crystal structure of pancreatic lipase-colipase complex (PDB ID: 1LPB), four best-ranked molecules (PubChem CIDs: 15515703, 132582306, 11260294, and 44440845) have been proposed. Further, among these, the interaction potentials of the two top-ranked molecules (PubChem CIDs: 132582306 and 15515703) were analyzed through molecular dynamics (MD) simulations at a trajectory of 100 ns. Finally, absorption, distribution, metabolism, excretion, and toxicity (ADMET) parameters were theoretically predicted for all of the molecules using Swiss ADME and ADMET lab2.0. In conclusion, *Ziziphus oenoplia (L.)Mill.* leaves could become a prominent source for various potent bioactive compounds that may serve as prospective leads for the development of clinically cognizable pancreatic lipase inhibitors, provided their pharmacokinetic and in particular toxicity properties are thoroughly optimized.

Abstract

In this article an attempt has been made to analyze the effect of high temperature on primary events photosynthesis under *in vitro* conditions.In addition, it particularly alters photosystem II by causing inhibition in electron transport activity.In contrast it enhances the PS I activity due to the opening of new site before plastocyanin.It also induces lipid peroxidation in thylakoid membranes during temperature stress.

Keywords: Electron transport; High temperature; Maize plants ; Photosynthesis.

Introduction

Heat stress is often defined as where temperatures are hot enough for sufficient time that they cause irreversible damage to plant physiological functions and development. Due to this several plant physiological processes are getting affected by temperature and one of such processes is photosynthesis (Bauer,1979; Berry and Bjorkmann, 1980;Hussain *et al.*,2016;Posch *et al.*,2019;Bansal *et al.*,2021). In PS II, the main target for high temperature stress is oxygen evolving complex. As a result, there has been loss of Mn ions and extrinsic polypeptides of water oxidation complex (Nash *et al.*, 1985; Enami *et al.*, 1994;Tan *et al.*,2020). It is suggested that the membrane permeability increases during heat treatment, which results in a decrease in the proton gradient formation across the thylakoid membrane and a suppression of the linear electron flow. The inhibition in PS II catalyzed electron transport activity could be due to the migration of phosphorylated LHC II

Abstract

Now a days environment is getting polluted due to accumulation of toxic contaminants like As, Cd, Cr, Cu, Fe, Mn, Ni, Pb, Zn etc. in the natural ecosystem due to anthropogenic activities like advancements in agriculture, industrialization and urbanization process. It has become a serious problem worldwide because heavy metals are noxious, persistent and non-biodegradable which adversely affect crop yields, soil biomass and soil fertility. Although some of these metals are essential micronutrients responsible for many regular processes in plants, their excess, however, can have detrimental effects and can directly influence the plant growth, metabolism, physiology and senescence. This study discusses the toxic effects caused by various metals and also overview the plants defense strategies to combat the heavy metal stress.

Keywords: Defense mechanism, Heavy metals stress, Oxidative stress, Responses of plan

ISSN : 0950-0707

Introduction

Heavy metal (HM) stress is one of the major abiotic stress which leads to alterations in living beings including plants. The term HM includes only the elements with specific gravity above 5 g cm^{-3} but frequently biologists use this term for a vast range of metals and metalloids which are toxic to plants such as Lead (Pb), Copper (Cu), Iron (Fe), Manganese (Mn), Nickel (Ni), Zinc (Zn), Cobalt (Co), Cadmium (Cd), Chromium (Cr), and Arsenic (As) etc. All heavy metals are non-biodegradable, that is, they cannot be purged out naturally from the environment via any possible natural means, although some of them are reported to be immobile, that is, they cannot move from the place where they are accumulated, while there are others that are termed as mobile, that is, they can be taken up by plants root system via diffusion, endocytosis or through metal transporters. Metals like (Arsenic, Mercury, Chromium, Cadmium, Lead etc.) are non-essential and potentially highly toxic even at lower concentrations. The rate of accumulation and plant's tolerance to heavy metals vary from species to species, with some becoming toxic at a faster rate. Some of the HMs, such as (Nickel, Copper, Zinc, Cobalt, Iron, Manganese and Molybdenum) at lower concentrations act as essential micronutrients that are critically involved in the functional activities of large number of proteins involved in sustaining growth and development of plants.

Defense strategy of plants against heavy metals stress

Heavy metal stress exerts multiple effects on several physiological processes like photosynthesis, water balance, and nutrient capture (Sharma and Dubey, 2005). However, some plant species can still survive, grow and reproduce in environment polluted with heavy metals (HMs), indicating that they developed various inherent and extrinsic defense mechanism for tolerance or detoxification whenever confronted with the stressful condition caused by the high concentrations of HMs. As a first step towards dealing with metal

MERCURY INDUCED ALTERATIONS IN PHOTOSYSTEM-II PHOTOCHEMISTRY IN MAIZE PLANTS

[1]Srinivasulu P, [2]Divya B.J. and [3]Murthy S.D.S.

[1]Research Scholar, [2]Academic Consultant, [3]Professor

Department of Biochemistry, S.V.University, Tirupati, India.

Abstract:

Mercury is a toxic heavy metal and it inhibited PS-II catalysed electron transport activity in a dose dependent manner. 50% loss was noticed with the treatment of 15μM $HgCl_2$. Spectral measurements clearly indicated that there is an enhancement in F_o value due to changes in LHC-II complex of PS-II in maize leaves. There is a positive correlation between the loss of PS-II and Chl a fluorescence which clearly demonstrates that the inhibitory site lies near PS-II reaction centre of maize thylakoids.

Key words: Electron transport; Fluorescence; Mercury;Maize plants; Photosystem II.

INTRODUCTION:

Heavy metals like Zn, Cd, Ni, Cu, Hg, Co and Pb can inhibit photosynthetic electron transport at multiple sites (Van Assche and Cl ijsters, 1980; Cl ijsters and Van Assche, 1986; Mohanty *et al.*, 1989). Photosynthetic organisms showed reduction in PS II supported electron transport activities when they were grown *in vivo* in the presence of supra optimal level of heavy metals like Cd (Baszynski *et al.*, 1980), Zn (DeFilippis *et al.*,1981b). Majority of the observations on the effect of heavy metal ions on partial photochemical reactions are made in isolated systems *in vitro*. The PS II supported electron transport activity is more susceptible to heavy metals like Zn, Ni (Tripathy *et al*, 1981), Co (Tripathy *et al.*, 1983), Cu, Cd and Zn, Cd (Bazzaz and Govindjee, 1974a) Cu (Cedeno- Maldonado *et al.*, 1972; Shioi *et al.*, 1978a; Shioi *et al.*, 1978b; Samuel son and Oquist, 1980; Renganathan and Bose, 1989; Mohanty *et al.*, 1959al Co, Ni, and Zn (Mohanty *et al.*, I 989b) Pb (Bazzaz and Gov i nd j ee, 1974b) and Hg^{2+}(Honeycutt and Krogmann, 1972; Samson and Popovic, 1990). In addition to this it was also shown that this heavy metal ion induced inhibition is dependent on the illuminating intensity (Zn, Cu: Cedeno- Maldonado *et al.*, 1972). At light limiting conditions, the extent of inhibition was found to be less than that at light saturating conditions. Sites of heavy metal action in PS II catalyzed electron transport. Restoration of Hill activity by semicarbazide in the heavy metal ion treated plant chloroplasts (Zn: Van Assche and Clijsters, 1980; Van Assche and Clijsters, 1986) and by $MnCl_2$ (Cd: Baszynski *et al.*, 1980) indicates that the water splitting site is the site of action of heavy metals. In Cd treated maize chloroplasts restoration of Hill activity by DPC suggests that OEC is the site of action (Cd: Bazzaz and Govindjee, 1974b). In this investigation the effects of mercury on PS-II photochemistry as been compared with spectral alterations in maize plants.

MATERIALS AND METHODS:

Healthy seeds of Maize (*Zea mays. L*) were obtained from Regional Agricultural research station, Tirupati. The seedlings were randomly placed in plastic trays and grown in a growth chamber providing with fluorescence light (Phillips, India) with a light intensity of 30- 35 μ moles m^{-2} s^{-1} at 25 ± 1^0C. Fully expanded 8^{th} day leaf segments (4-5 cm long) were cut from apical region and used for treatment. Isolation of thylakoid membranes was done according to the procedure described by Sabat *et al.* (1986). PS II catalyzed electron transport assay (H_2O → *p*-BQ) activity was measured as O_2 evolution in the thylakoid membranes. The 2 ml reaction mixture contains reaction buffers [50 mM HEPES-NaOH (pH 7.5),100 mM sucrose, 2mM $MgCl_2$ and 5 mM KCl], 0.5 mM freshly prepared p-BQ and thylakoid membranes equivalent to 40 μg of Chl. Fluorescence emission and excitation spectras were recorded by using Jasco FP777 Spectrofluorimeter. PAM kinetic fluorimeter is used for measurements.Lipid peroxidation has been measured according to the method of Carmak and Horst (1991).

A STUDY ON ANTIOXIDANT DEFENSE MECHANISMS ADAPTED BY MAIZE PLANTS UNDER HEAVY METAL STRESS

[1]Rajya Lakshmi, C., [2]Divya, B.J. and [3*]Murthy, S.D.S.
[1] Lecturer, [2] Academic Consultant, [3*] Professor

Department of Biochemistry, S.V. University, Tirupati-517502, A.P. India.

ABSTRACT

In this article efforts were made to study oxidant mediated damage and possible protection by antioxidant enzymes in maize plants under heavy metal stress. LPO measurements clearly demonstrated that both cadmium or zinc are able to induce LPO due to the production of toxic oxy radicals like superoxide as well as peroxy radicals which cause damage to thylakoid membrane. The induction of SOD or catalase activities indicate the protection made by the maize plants. Thus the plants are protected in environment from unfavourable conditions.

KEYWORDS: Antioxidant enzymes; Catalase; Heavy metals; SOD; Maize plants.

INTRODUCTION

Toxic metals mainly occur in soil, because the parent material of soil contained the metals. Metal ions are deposited on the surface of the earth due to human interaction with the environment. Metal smelters, foundries, thermal power plants are the major sources of heavy metals which are toxic in air, water and soil. Fungicides and pesticides are also sources of heavy metals in the soil. Inhibition of photoelectron transport activity in heavy metal stressed chloroplasts or algae can be explained in terms of replacement of Mn from OEC and Cu from PCy. Van Assche and Clijsters (1986) suggested that Mn is replaced by Zn in Mn deficient condition.

Excess concentrations of heavy metals such as Cd, Hg, Ni and Pb become extremely toxic and plant growth may be severely restricted by heavy metals and Nagajyothi *et al.,*(2010). Some plant species possess unique ability to adapt rapidly and evolve tolerance to toxic or lethal levels of heavy metals. A variety of tolerance mechanisms observed in biological systems are given below. There are enzymes like oxidases and reductases, which convert metal ions from more toxic into less toxic forms. In addition, some alkylating enzymes and dealkylating lyases, are helpful in detoxification of inorganic and organic mercury compounds (Ludger *et al.*,2013). Possibly blocking the heavy metal cellular uptake by altering the uptake pathway. By spending ATP, the heavy metal reached in the intracellular cytoplasm could be pumped again into the external environment. There is the possibility of altering the thiol containing enzymes, those are sensitive to heavy metals in order to obtain resistance.

MATERIALS AND METHODS

Healthy seeds of maize (*Zea mays .L*) were obtained from Regional Agricultural research station, Tirupati, India. The Protein content was determined according to the method of Lowry *et al.* (1951). Thylakoid membranes have been isolated by following the procedure of Renganathan and Bose (1989). Lipid peroxidation has been measured according to the method of Carmak and Horst (1991). The leaf material was homogenized with 10 ml of 0.1 M potassium phosphate buffer (pH 7.0), in a prechilled mortar and pestle. The homogenate was centrifuged at 10000 x g for 30 min, and the supernatant was used as the source of the enzymes. SOD activity was assayed by measuring its ability to inhibit the photochemical reduction nitro blue tetrazolium (NBT) using the method of Van Rossun *et al.,* (1997). The activity of CAT was estimated by the method of Havir and Mc Hale (1987). CAT activity was calculated using the molar extinction coefficient 36 x 10^3 mM^{-1} m^{-1} and expressed as n moles of H_2O_2 destroyed mg^{-1} protein min^{-1} (Zhang *et al.,* 2016). Six day old seedlings of maize were treated with different concentrations of Cd (50-200 µM) or Zn (100-400 µM) for 72 h. On 9th day primary leaves were collected from control and treated plants and proceeded for experimental work.

DIFFERENTIAL EFFECT OF HIGH TEMPERATURE ON THE PHOTOSYNTHETIC ELECTRON TRANSPORT OF MAIZE PLANTS

[1]Ranjani, R., [2]Divya, B.J. and [3]Murthy, S.D.S*

[1]Professor, [2]Academic Consultant, [3]Professor.

[1]Department of Virology and [2,3]Department of Biochemistry

Sri Venkateswara University, Tirupati-517502, A.P.

ABSTRACT:

In this study an attempt has been made to establish the differential action of high temperature on photosynthetic electron transport mediated by either PS-II or PS- I or both in Maize thylakoids after giving high temperature treatment to primary leaves. The increase in the temperature from 25^{0}C-45^{0}C cause inhibition in PS-II catalysed electron transport. The possible reason for the loss of PS-II catalysed electron transport could be depletion of manganeese from water oxidation complex. In contrary high temperature induced enhancement in PS-I catalysed electron transport due to opening of new site to donate electrons before plastocyanin by reduced DCPIP. Thus high temperature exerts differential effect on PS-II as well as PS-I in Maize plants.

KEY WORDS: Chlorophyll, Electron transport, Photo system, Maize plants.

INTRODUCTION:

In PS II, the main target for high temperature stress is oxygen evolving complex. As a result, there has been loss of Mn ions and extrinsic polypeptides of water oxidation complex (Nash *et al.,* 1985; Enami *et al.,* 1994). It is suggested that the membrane permeability increases during heat treatment, which results in a decrease in the proton gradient formation across the thylakoid membrane and a suppression of the linear electron flow. The changes in the membrane viscosity could be due to the variation of grana and stroma thylakoids ratio. It was observed that the quantity of grana thylakoids in green leaves is enhanced when exposed to damaging temperatures (Gounaris *et al,* 1983). In the past, PS II was considered a key weak link (Santarius 1975; Berry and Bjorkman, 1980; Enami *et* al., 1994) but damage to PS II only occurs at high temperatures, above 35^{0}C (Yamane *et al.,* 1998). Heat stress is often defined as where temperatures are hot enough for sufficient time that they cause irreversible damage to plant physiological functions and development. Due to this several plant physiological processes are getting affected by temperature and one of such processes is photosynthesis (Bauer,1979; Berry and Bjorkmann, 1980). No inhibition in PS I function and intersystem electron transport was detected (Havaux, 1996). HT stress causes conformational change in the Cyt $b_6$fcomplex causing appearance of new electron donor sites (Thomas *et al.,* 1986; Mohanty *et al.,* 1987). In this investigation, an attempt has been made to analyse the effect of high temperature on photochemical activities of maize plants.

MATERIALS AND METHODS:

Healthy seeds of Maize (*Zea mays),* were obtained from Acharya N.G. Ranga Agricultural University, Hyderabad. The seedlings were raised up to 8 days in light. 4-5 long and expanded leaf segments of primary leaves were used for experimental work. Maize primary leaves were taken and given high temperature treatment in growth chamber ranging from 25-50^{0}C for 20 min to perform photochemical assays. After giving the high temperature treatment (35/40^{0}C), the seedlings were placed at growth temperature for 24h and electron transport studies were measured. Thylakoid membranes were isolated according to Swamy *et al.,* (1995) with some modifications. Electron transport rates were measured using Clark type oxygen electrode (Hansatech, UK). These measurements were done at 4^{0}C. The 2 ml reaction mixture contained 50 mM Hepes-NaOH (pH 7.5), 100 mM sucrose, 2 mM $MgCl_2$ and 5 mM KCl and thylakoid membranes equivalent to 40 µg of Chl. The assay mixture was kept continuously stirred during measurements (Sabat *et al.,* 1985). Whole chain electron transport assay (H_2O to MV) was measured as molecular oxygen consumption by using MV as an electron acceptor. PS II assay (H_2O to pBQ) was studied in terms of oxygen evolution in thylakoid membranes. PS I assay (DCPIPH_2 to MV) was studied in terms of oxygen consumption (Mohanty *et al.,* 1987). The thylakoid membranes equivalent to 40 µg Chl were used in all electron transport assays. Intersystem electron transport assay (DQH_2 to MV) was studied in terms of oxygen consumption. Intersystem electron transport assay (DQH_2 to MV) was studied in terms of oxygen consumption (Izawa, 1977).

TECHNIQUES IN RESEARCH ARTICLE WRITING

[1]Divya,B.J. and *Murthy,S.D.S.
[1]Academic Consultant and *Professor
[1]Department of Biochemistry,S.V.University,Tirupati-517502,Andhra Pradesh. India.

ABSTRACT

The tendency of writing article and paper for both printed and online journals and books increases rapidly. The present paper discusses about the techniques of writing good research article. The author has traced the procedures and rule of making abstract of an article. The steps needed to make a good article have been analyzed. Research methodology based on analysis of review of literature and secondary sources have been adopted. The signification of the use of keywords in an abstract is traded under the study. The paper finds out that there are various methods of citing sources and each method has its own procedures for incorporating data in the references. The paper concludes that every good article must be free from plagiarism and if any portion of an intellectual thought is copied then that must be mentioned by sources of references.

KEYWORDS: Online Journals and Books, Research Methodology, Literature, and Secondary Sources

INTRODUCTION

The Information and Communication Technology with its day by day changing mode of production of documents have ushered in a new era in the educational system. This leads to the development of research in the country and consequently, the volume of literature also increases enormously. The tendency of writing article and paper for both printed and online journals and books increases rapidly. It has become a more common scenario in the field of Education. There is a multitude of different types of articles, including news stories, features, editorial, profiles, instructional (how-to) articles, and so on. While each has specific qualities that are unique to its type, all articles share some common characteristics. From forming and researching the author's idea of writing and editing his/her work, writing articles can give him a chance to share compelling and important information with readers. So the research scholars and academicians should think about the type of article that will best suit the points that they want to convey.

The scholar must do an in-depth, balanced review of the primary research literature relevant to the study chosen prior to designing and carrying out the experiments. This review helps the scholars to learn what is known about the topic that is being investigated and may avoid unnecessarily repeating work done by others. The primary and secondary sources are the heart of any research article. The scholars and academicians very much depend on journals, books (monographs, classic), research report, govt. publication, abstracts, and indexes and so on before writing any research article for a journal. Experience shows that many scholars copy big volume of a particular content at the time of writing a research paper.

INFLUENCE OF INDUSTRIAL WASTEWATER ON MORPHOLOGICAL AND CHLOROPHYLL CONTENT OF GROUNDNUT (*ARACHIS HYPOGAEA* L.)

V. SUDHAKAR, JYOTHI MANOHAR CH, K. ABRAHAM AND T. DAMODHARAM

Department of Environmental Sciences, S.V. University, Tirupati 517 502, A.P, India

(Received 27 September, 2023; Accepted 14 November, 2023)

ABSTRACT

The objectives of the present study are to see the influence of industrial wastewater on morphological and chlorophyll content of groundnut (*Arachis hypogaea* L.). Pot culture experiments were conducted on groundnut plants under natural conditions by day and night light in the Department. Seeds were grown in pots for a period of 30 days where the soil was treated with various wastewater concentrations (25, 50, 75 and 100%) collected nearby industrial area and a control was carried out. The heavy metals comprise in experimental crops were determined and observed in experimental days i.e., 10, 20 and 30th day. The metals such as Cr, Cu, Mn, Fe, Ni, Pb, Cd and Zn were estimated in plants by AAS. The germination percentage of seed, seedling growth and chlorophyll content showed a gradual decline with increase in wastewater concentrations. The results have been observed at 25% concentration, there was growth rate in root length, an increase in shoot length and total chlorophyll content up to 20th day. At 30th day, decrease was observed in all the parameters. However, at higher concentrations of the effluent, toxic effects were observed from 20th day onwards.

KEY WORDS : Wastewater, heavy metals, Germination, Cholorophyll, A*rachis hypogaea* L.,

INTRODUCTION

Water and soil pollution has become a global problem due to population growth and industrialization. Wastewater is polluted water which is discharged by human usage and it is unfavorable for any particular purpose like drinking, commercial, agriculture and industrial use.

High concentration of BOD, COD, TDS, AND, Cr etc. in tannery and textile industrial effluents adversely affects soil and water bodies as well as plant growth (P.K. Chhonkar *et, al.,* 2000). Especially the waste water released from the industrial zones is constantly adding toxic substances to the groundwater aquifer. Humans in many parts of the world depend heavily on groundwater for their needs (Babiker *et al.,* 2004; Nair *et al.,* 2006). There are numerous chemical species present in water with concentrations vary from a few mg/l to a few g/l. They are referred as micro-pollutants, which even in small quantities are dangerous to man's health (Ngah WSW *et al.* 2011 and Holzer L *et al.* 2010). The biomass industrial effluents have been showed an adverse affects on morphological parameters and chlorophyll content of green gram (*Phaseolus aureus*). Unsanitary activities and use of waste water for irrigation create serious pollution and adverse effects on soil and crops. Because of the harmful effects of public, hospital, and industrial wastewater on soil, air, water, as well as agricultural product, wastewater treatments and the proper sludge disposal are needed for environmental protection (Dushyanth *et al.,* 2019). Untreated discharge of industrial effluents are responsible for serious water (Otokunefor and Obiukwu, 2005) and soil pollution (Konwar and Jha, 2010), which is considered as one of the major factors responsible for low productivity of crops. Similar findings were revealed on the effect of various industrial effluents

***Corresponding author's email:** enviroabbu@gmail.com

on different crops (Cabral *et al.*, 2010).

The toxic levels of mineral elements like NH4+, NO_3-, PO_4^{3-}, and SO_4^{2-}, and Mg, Ca, K, Na, Cu, Zn, Fe, M, and Ni in the wastewater resulted in a significant decline in the K, P, Si, and Zn content of plant leaves.

MATERIALS AND METHODS

Wastewater sample was collected in the month of June, 2023 (peak hours) from outlets of industrial area situated at Gajulamanyam Industrial Estate, neat by Tirupati air port, Tiruapti district, Andhra Pradesh. Wastewater sample was collected in well cleaned polythene containers; each bottle was washed with fresh water before collection of the sample. Finally bottle was tightly closed. After filtering, pH, electrical conductivity (EC) of the sample was immediately measured in the laboratory and afterwards the samples were stored at 4°C for physico-chemical analysis (APHA, 2005).

Soil sample was collected near Gajulamandyam industrial zone and used for pot culture studies. The seeds of groundnut were obtained from N.G. Ranga Agriculture College, Tirupati and treated with 0.2 N mercuric chloride for 2 min and washed with running tap water to remove contamination of seed coat, prior to germination studies (Singh *et al.*, 2006). The pot studies were carried out with groundnut as a test crop using various concentrations of industrial wastewater 25%, 50%, 75% and 100% and distilled water was served as control. Each treatment including control was carried out in triplicate using 15 seeds per pot. The number of seeds germinated in each treatment was recorded at 10th, 20th and 30th days of the experiment and the germination percentage was calculated. Growth of the root and shoot length were measured with the help of meter scale and chlorophyll content estimated following the method of Arnon (1949) using UV- UIS spectrophotometer 117 model.

RESULT AND DISCUSSION

This study deals the influence of industrial wastewater on The wastewater sample was colourless, alkaline in nature and contained in high levels of heavy metals like Zn, Pb, Cd, Cr and Fe. It contains considerable amount of Ni, Mn and Co. The higher EC alter the chelating properties of receiving water systems, which create conditions for free metal availability to flora and fauna (Nanda *et al.*, 1999 and Jung Eek Son, 2015). The percentage of seed germination on exposure of different concentrations and duration was presented in graph 1. The maximum seed germination percentage was recorded at 25% and minimum was at 100% of wastewater concentrations, as compared to control. At 25% of wastewater concentration, increase in root and shoot length is high at 30th day as compared to control graph 1 and 2, whereas at 100% of wastewater concentration decrease in length of root and shoot was recorded at 10th, 20thh and 30th days. Inhibition of seed germination may be due to high

amounts of dissolved solids in wastewater, which enrich the salinity and conductivity of the absorbed solute by seed before germination (Gautam *et al.,* 1992; Singh *et al.,* 2006) and Murkumar and Chavan (1987) have reported that the higher concentration of effluent decrease enzyme dehydrogenase activity that is considered as one of the biochemical change which may have disrupt germination and seedling growth. Salt stress affects the seed germination and seedling establishment through osmotic stress, ion toxicity, and oxidative stress (Cuneyt Ucarli, 2020). Chlorophyll content was estimated at various time intervals of exposure and concentrations of wastewater have been represented in Tables 3, 3.1 and 3.2. In the wastewater concentration at 25%, chlorophyll a, b and total chlorophyll contents were increased up to the 20th day and decreased at 30th day in groundnut. Wastewater concentration at 100% overall decrease in chlorophyll content was

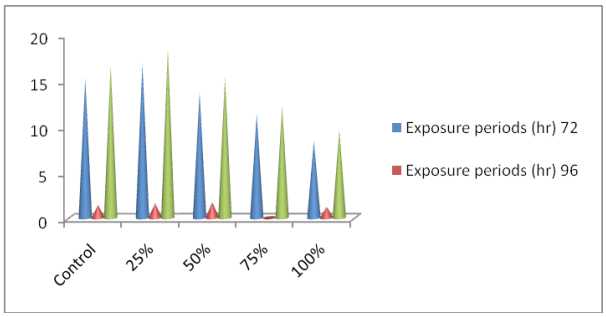

Fig. 1. Germination percentage of groundnut in control and industrial effluent at different time intervals

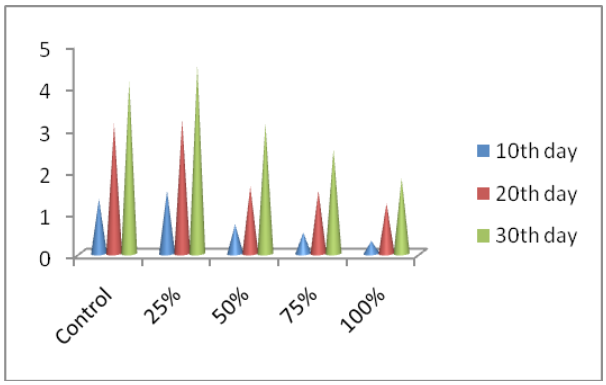

Fig. 2. Influence of industrial wastewater on root length of *Arachis hypogaea* L. (cm seedling^{-1})

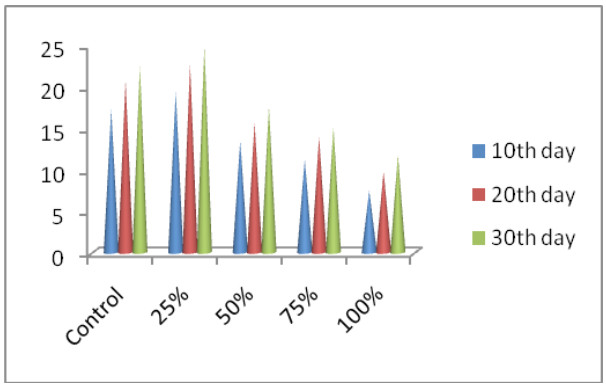

Fig. 3. Influence of industrial wastewater on shoot length of *Arachis hypogaea* L. (cm seedling^{-1})

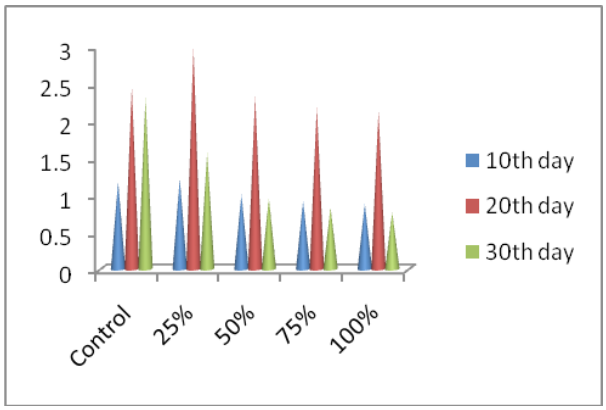

Fig 4. Influence of industrial wastewater on chlorophyll a content of *Arachis hypogaea* L. (mg/g.fr.wt)

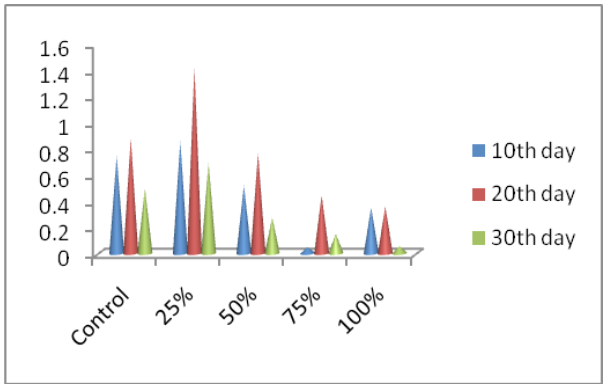

Fig. 5. Influence of industrial wastewater on chlorophyll b content of *Arachis hypogaea* L. (mg/g.fr.wt)

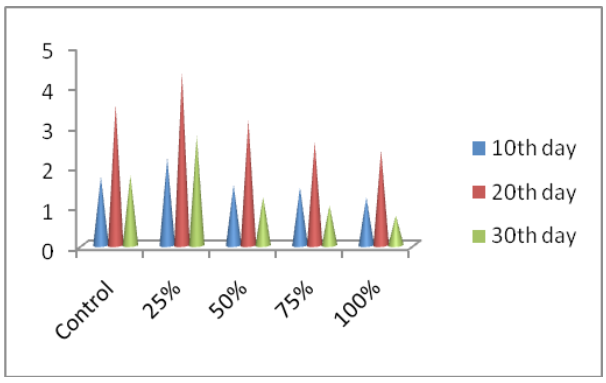

Fig. 6. Influence of industrial wastewater on total chlorophyll content of *Arachis hypogaea* L. (mg/g.fr.wt)

recorded during all the experimental days as compared to control. Changes in total chlorophyll concentration indicate that the chlorophyll synthesizing capacity of the crop has diminished affecting the overall photosynthetic process. Similar findings and observations were reported in earlier investigations (Krupa *et al.,* 1993; Gouia *et al.,* 2003; Shokoofeh Hajihashemi *et al.,* 2020). According to the findings of Klimentina Demerivska – Kepova *et. al.* (2006), Cd has reduced plant length, biomass and leaf pigments and inhibiting the fixation of carbon and decreasing chlorophyll content and photosynthetic activity (Gallego *et al.,* 2012).

Seed germination percentage was reduced at higher concentration of wastewater may be due to the high levels of solids present in the wastewater, which causes changes in the osmotic relationship of the seed and water. Hence the amount of water absorption decreases, resulting in retardation of seed germination due to increasing salinity. Increased salt stress reduces the seed's ability to absorb water (osmotic stress) and causes an ion imbalance in the seed (ionic stress), ultimately inhibiting seed germination and crop production. Therefore, salt water intrusion in growing standard crops can be risk to crop failure (Elizabeth de la Reguera, *et al.,* 2020). Saxena *et al.* (1986) has mentioned that higher concentration of solid in the wastewaters result in a low amount of oxygen in dissolved form, which reduces the energy supply through anaerobic respiration and resulting in limitation of seedling growth and development.

CONCLUSION

This investigation was conducted on the influence of wastewater in morphology and chlorophyll content of groundnut, at higher concentrations of wastewater has clearly showed deleterious effects. Plants growing in such type of polluted waters may accumulate chemical substance at high levels in such plants, if consumed may have similar effects on live-stock and human beings. Hence it may be suggested that nutrients available in 25% in wastewater discharged by industries and it may be used as a suitable liquid fertilizer. It reduces the amount of water required for irrigation and helps conserve water and provides nutrients to the field and plants. Proper precautions should be taken before discharge industrial wastewater to avoid water and land pollution.

An in-depth analysis of the role of women in environmental protection within the Anupalle village, Ramachandrapuram Mandal, Sri Balaji District, Andhra Pradesh, India.

Dr.K.Kiran[a], Miss.Dasireddygari Jyothi[b], Dr. E.Mahadevareddy[c]

a : Academic Consultant, Department of Environmental Science, b: Student, Department of Rural Development, c: Academic Consultant, Department of Adult & Continuing education, Sri Venkateswara University, Tirupati-517502, email: kiran.sairam@gmail.com.

Abstract: **The term "natural environment" encompasses both living and non-living elements that exist independently of human intervention. It is commonly used to describe the Earth as a whole or specific regions within it. This encompasses all forms of life, weather patterns, climate, and natural resources that have an impact on human survival and economic activities. In countries like India, women play a crucial role in managing and conserving resources within their households. They devote significant amounts of time to tasks such as collecting and storing water, ensuring access to fuel, food, and fodder, as well as overseeing the management of various types of land, including forests, wetlands, and agricultural areas. The paper explores the significant role that women play in safeguarding the natural environment through an examination of the behaviours and routines of the women in Anupalle village dedicated to environmental conservation.**

Keywords: Women, India, Anupalle village, Environmental Protection, Sustainability, etc.

I. INTRODUCTION

The concept of "environment," derived from the word "to surround," encompasses the dynamic interactions among water, air, and land, as well as their interconnections with each other, humans, other organisms, and property. Women play a crucial role in the stewardship of natural resources, including land, water, forests, and energy. Particularly in underdeveloped regions, women are primary users of resources like land, forests, and water, as they are tasked with gathering food, fuel, and fodder [1]. They hold a wealth of knowledge encompassing both traditional wisdom and modern insights regarding the natural world that envelops them.

Schultz et al. [2] highlight the women, environment, and development (WED) discourse, which critically examines development policies by underscoring the relationships between modernization/industrialization, technology, and environmental harm.

Historically, women have been marginalized and viewed as the subordinate gender. However, globally, women often bear the responsibility of managing and conserving resources for their households. Women are increasingly making significant contributions across various fields, such as researching water resources worldwide and safeguarding forest reserves.

Historically, women were frequently marginalized or dismissed, but there is now a growing acknowledgment of the profound influence they wield over the environment. Furthermore, there is a mounting awareness of how the environment impacts the health and overall well-being of women. This shift in viewpoint is exemplified by significant occurrences like the 1992 UN Earth Summit, the Chipko movement in India, and the Green Belt Movement in Kenya. These movements underscored the crucial role of women's voices and perspectives in advancing sustainable development across various echelons, from top decision-making entities to grassroots communities. Over the past few decades, environmental movements have surged alongside the burgeoning movements advocating for women's rights. The contemporary fusion of nature conservation with women's rights and empowerment has emerged as a response to the historical encroachment on their rights [3,4].

In the regions of Asia and the Pacific Islands, a significant number of women are involved in the agricultural sector. This sector includes a wide range of activities such as working on their own farms, labouring in small enterprises that process fruits, vegetables, and fish, engaging in paid and unpaid work on others' land, and collecting forest products. However, despite their active participation, only a small percentage of these women, approximately 10-20%, have been able to obtain land tenure. This is primarily due to economic and legal obstacles. One such obstacle is the gender disparity in accessing loans, which leads to women receiving fewer and less favourable loans compared to men when it comes to acquiring land [5].

The active participation of women in environmental matters has led to a profound understanding of it. Consequently, women play various roles such as agriculturalists, water resource managers, and traditional scientists, among others. Due to their primary responsibility for domestic and household management, women have a greater interaction with both natural and man-made environments compared to men. This makes them more susceptible to the adverse effects of deteriorated living conditions, inadequate infrastructure, and substandard homes in their communities. Globally, women bear the primary responsibility for farming and domestic food production. Despite an increasing trend of women taking on additional agricultural tasks and expanding their involvement, the gender-based division of labour in terms of reproductive work remains unchanged (6-9).

Gaining a comprehensive understanding of the different approach's women have taken to actively participate in the preservation and governance of the environment is of utmost importance. The aim of this manuscript is to examine the role of women in environmental management, with a particular focus on a small village, in order to incorporate their contributions into environmental initiatives.

The study revealed that women in Anupalle village actively participated in various environmental initiatives, such as waste management, tree plantation drives, and conservation of natural resources. Their involvement was not only limited to household activities but extended to community-wide efforts, showcasing their dedication towards environmental protection.

The findings of this case study emphasize the importance of recognizing and supporting the pivotal role of women in environmental protection. It is crucial to provide them with equal opportunities, resources, and platforms to actively engage in sustainable practices and decision-making processes. By doing so, we can harness the immense potential of women in creating a greener and more sustainable future for all.

II. STUDY AREA

Anupalle, situated in the Ramachandrapuram Mandal within the Sri Balaji District of Andhra Pradesh State, India, falls under the Rayalaseema region. Positioned 12 KM away from Chandragiri town and 32 KM to the West of the District headquarters Sri Balaji, the village's local language is Telugu. As per the 2011 census, Anupalle Village has a total population of 3173 with around 833 houses, and the female population stands at 48.9%. The literacy rate in the village is 52.3%, with the female literacy rate at 21.5%. The primary occupations in Anupalle include cattle maintenance, agriculture including both seasonal crops and vegetables, and silkworm cocoon cultivation, with some residents also engaged in jobs and businesses in and around Tirupati. This study utilizes two distinct sets of data. The first set comprises secondary source materials gathered from previous studies on women's involvement in environmental conservation and management. These sources include books, journal articles, and online publications. The second set of data was collected directly from primary sources by distributing questionnaires to women living in the rural setting of Anupalle Village.

III. REVIEW

3.1. Women in Agriculture

Women have made significant contributions to agricultural production on a global scale, as reported by the Food and Agriculture Organization, which stated that they were responsible for producing over half of all food grown in 1996. In specific regions like sub-Saharan Africa and the Caribbean, women are responsible for producing an impressive 80% of basic foodstuffs. Jayasheela [10] highlights the diverse roles that women play in Indian agriculture, which include production and distribution, planting and cultivation, weeding, hoeing, harvesting, and storage.Research conducted by Adebayo et al [11] revealed that in Asia, women contribute between fifty and ninety percent of the labor force for rice cultivation, while in Adamawa State, Nigeria, 60% of women are engaged in farming activities.

Women in the village of Anupalle play a crucial role in the agricultural industry, contributing significantly to the cultivation of rice, groundnuts, and sugarcane. They are also actively engaged in the farming of livestock crops for their cows, buffalos, goats, and other animals, showcasing a strong connection between women and the environment, particularly the land.

As individuals affected by soil degradation, women have taken part in various initiatives focused on soil conservation. A prime illustration of their dedication can be seen in the Agroforest project located in Yatenga, Burkina Faso. Furthermore, Igbo women have embraced traditional male agricultural duties, alongside their existing responsibilities within the female domain [12,13].

3.2. *Water Resource Management*

Etta (14) conducted a study in Mariko Lower-income settlement in Lagos, uncovering the crucial role women play in managing communal water resources and meeting household water needs. Women are primarily tasked with overseeing communal taps or water points, often taking measures to protect these sources from damage caused by children.

Within households, women and girls bear the responsibility of fetching water for various domestic purposes like cooking and cleaning. On the other hand, men typically dominate the water trade. Unfortunately, these water sources are vulnerable to pollution, particularly from untreated sewage, leading to significant health hazards [14,15].

In rural settings, women are solely in charge of sourcing water for their households. However, the methods used to collect water, especially from riverbanks, contribute to water contamination [16].

3.3. Solid waste disposal

In the particular field of research, the speed at which solid waste is being accumulated exceeds the rate of population growth. The disposal of solid waste typically takes place in assigned dumping grounds or undeveloped regions. Women, due to their proximity to the environment, actively participate in environmental stewardship by taking on tasks such as cleaning and maintaining cleanliness, especially when it comes to garbage disposal. Recognizing the health risks associated with waste, women take on the responsibility of ensuring its regular removal at the community level.

IV. RESULTS

The following section provides an overview of the results obtained from the questionnaire survey conducted to assess the level of women's participation in environmental management in Anupalle Village. Table 1 presents the demographic characteristics, specifically age and marital status, of the women who participated in the survey. It is important to note that only a small percentage, namely 14.8%, of the surveyed women are below the age of 18. The majority, accounting for 69.7%, fall within the middle age group (18-55 years), while only 15.5% are above the age of 55. This age distribution suggests that a significant number of women are still in their prime years and possess the necessary energy and enthusiasm to actively contribute to environmental management activities.

Table 1. Age and marital status of survey women

S.No	Age Group	Number	Percentage
1	Below 18 years	15	14.8
2	Middle age (18-55) Years	35	69.7
3	Above 55 years (51-75)	10	15.5

In Table 2, it is evident that a significant majority of female participants, specifically 64.8%, are involved in agricultural activities within the study area. Among these activities, organic farming stands out as the most used method for soil conservation by women. Additionally, planting trees is recognized as an effective approach to safeguarding the environment and mitigating hazards like windstorms and erosion. The survey results further support the active engagement of women in tree planting, as almost 73.1% of women in the study area have planted trees or flowers within the past five years. Notably, women frequently plant fruit trees such as mango, sapota, papaya, and various other fruit plants. This practice serves a dual purpose of environmental protection and providing fruits for household consumption.

Table 2 Women involvement in Environmental Management

Involvement in Farming	Percentage(%)
Yes	64.8
No	35.2
Planting trees (Farming/Around the house)	Percentage (%)
Yes	73.1
No	26.9
Conserving methods	Percentage (%)
Organic farming	55.3
planting	44.7
Major activities in Environmental Cleaning	Percentage (%)
Weeding	28
Sweeping	60
Drainage	12

The participants highlighted several obstacles encountered by women in environmental management in the study area. Primarily, a lack of environmental awareness among the public was noted. Additionally, there was a deficiency in waste disposal infrastructure, and lastly, inadequacies were observed in drainage systems.

V. RECOMMENDATIONS

To attain sustainable development, it is advised to encourage the active participation of women in environmental management, taking into account the challenges they are currently encountering.

2. To instigate a shift in the mindset of the public and provide them with necessary knowledge, it is essential to make environmental education compulsory for a large portion of women.

3. This measure will help tackle the problem of individuals thoughtlessly littering paper scraps, fruit peels, plastic bottles, and polythene bags on the streets for entertainment purposes.

4. It is crucial to make women's education a top priority and guarantee girls' access to schooling as a necessary policy measure. Educated women are poised to have a substantial impact on closing the divide between environmental concerns and progress. Recognizing and backing the empowerment of women in sustainable human development, along with their pivotal role in environmental preservation, is of utmost importance.

VI. CONCLUSION

To summarize, married and unmarried women alike have been actively participating in efforts to protect the environment. Nevertheless, a significant number of women involved in these initiatives are married. The high representation of married women in this area suggests that they are more likely to take on the responsibility of preserving and keeping the environment clean, given their roles as homemakers. As a result, this research has explored the various ways in which women have been actively involved in safeguarding the environment and overseeing the use of natural resources, with the goal of promoting the sustainable utilization of environmental resources.

The recommendations put forth in the report emphasize the importance of empowering women, recognizing their pivotal roles as resource managers, environmental advocates, and community activists. It is crucial to ensure that women have equal opportunities to engage in environmental initiatives at various levels, from local to international. Achieving gender parity in decision-making bodies is essential for women to effectively contribute to environmental protection efforts. Consulting and supporting women in their environmental conservation endeavours is paramount, as is increasing their involvement in shaping environmental policies, programs, and funding allocations.

ABSTRACT:

The present work is aimed to study the impact of soil pollutants on groundnut (*Arachis hypogea* L.) seedlings. Soil pollution by heavy metals and their toxicity is a problem of increasing significance for ecological, evolutionary and environmental reasons. Heavy metals even in lower concentrations may inhibit the physiological metabolism of plant. *Arachis hypogea* L. was grown in pots for a period of 30 days where the soils were treated with different effluent concentrations (25, 50, 75 and 100%) collected near an industrial area and a control was carried out. The distribution of heavy metals in the soils and corresponding accumulations in the experimental crop was investigated on different experimental days 10, 20 and 30th day. The metals Fe, Cu, Ni, Cr, Zn, Mn, Pb, and Cd in plants and soil samples were analyzed by AAS technique. In *Arachis hypogea* plants Fe was high in 100% effluent at 10, 20, 30th days. It has been observed that at 25% effluent concentration, there is growth in the root length, an increase in shoot length, germination percentage, Chlorophyll a, b and total chlorophyll content in *Arachis hypogea* L. chlorophyll content have increased up to the 20th day and then decreased at 30th day.

Keywords: Wastewater, heavy metals, Germination, Chlorophyll, A*rachis hypogea* L.,

INTRODUCTION

The problem of environmental pollution due to necessary industrial growth is, in practical terms, the problem of disposal of industrial water, whether solid, liquid or gaseous. Contaminated water, along with other substances, impacts, not only in industrial areas but also in agricultural fields, soil, as well as river beds, creating secondary sources of pollution (Barman, S.C., et al., 2000; Kisku, G.C., 2000). Untreated or poorly treated wastewater can have harmful effects on soil, plants, and the environment, and be dangerous to humans. The heavy metal contaminated wastewater finds its way into the environment, threatening human health and the ecosystem. The heavy metals are non-biodegradable (El-Sherif, I. Y., 2013) and could be carcinogenic (Borba, C. E., et al., 2006; Garcia-Nino, W. R. and Pedraza-Chaverrí, J, 2014; Zou, Y. et al 2016; Taseidifar, M., et al., 2017; Tjandraatmadja, G. et al., 2018;), its presence in water by improper amounts could result in critical health issues to living organisms.

Wastewater produced by the petrochemical industry has been found to be contaminated with various types of toxic pollutants such as heavy metals (Dimoglo, A. et al., 2004; Kumar, N.et al., 2013; Abbasia, M. et al., 2018) and using it for crop irrigation led to lower plant biomass and yield (Sharma, R.K.and Agrawal, 2005; Banon, S. et al., 2011; Lyu, S. et al., 2016). Heavy metal pollution interferes with the absorption of K, Mg, S, P, Ca, Fe, Mn, Zn and Cu and affects their translocation from roots to tops depleting the elements required for plant growth (Benavides, M.P. et al., 2005; Shanker, A.K. et al., 2005; Sharma, P. and Dubey, R.S. 2005; Lefevre, I. et al., 2014) . The central atom of chlorophyll, magnesium, can be replaced by heavy metals like cadmium, copper, zinc, lead, and mercury, which blocks the light-harvesting capability of chlorophylls and impairs photosynthesis in stressed plants (Kupper, H. et al.,1996).

MATERIALS AND METHODS

Study Site:

Wastewater sample was collected in the month of June, 2023 (peak hours) from outlets of industrial area situated at Gajulamanyam Industrial Estate, neat by Tirupati air port, Tiruapti district, Andhra Pradesh. Wastewater sample was collected in well cleaned polythene containers; each bottle was washed with fresh water before collection of the sample. Finally bottle was tightly closed. After filtering, pH, electrical conductivity (EC) of the sample was immediately measured in the laboratory and afterwards the samples were stored at 4^{o}C for physico-chemical analysis (APHA, 2005).

Collection of Groundnut Seeds:

Soil sample was collected near industrial area and used for pot culture. The seeds of *Arachis hypogaea* L. were obtained from Acharya N.G. Ranga Agriculture College, Tirupati and treated with 0.2 N mercuric chloride for 2 minute and washed with running water to remove contamination of seed coat, prior to germination studies. This experiment was carried out with groundnut using various wastewater concentrations (25, 50, 75, 100%) and distilled water which served as control. Each treatment including control was performed in triplicate and in every pot 15 seeds were used. The number of seeds germinated in each treatment was recorded on 10, 20 and 30 days of the experiment and the germination percentage was recorded.

Soil Analysis:

Soil samples were dried at 70°C in the laboratory oven. To 1 gm sample, 8 ml conc. HCl and 2 3 ml conc.HNO were added and kept for overnight at 35°C. Digestion was done according to the method of McGrath and Cunliffe, 1985. After dilution and filtration the digested solution was analyzed for determination of Cr, Cu, Mn, Fe, Co, Ni, Cd, Pb and Zn by AAS.

Effluent Analysis: An wastewater sample was collected during April, 2023 from outlets of industrial are situated at Gajulamanyam Industrial Estate, Renigunta, Tirupati district, Andhra Pradesh. Effluent sample was collected in well cleaned polythene bottle.

Before collection each bottle was washed with fresh water. Finally bottle was tightly closed. After filtering the pH, Electrical conductivity (EC) of the sample was immediately measured in the laboratory and afterwards the samples were stored at 4^0 C for physicochemical analysis, methodology of (Element. In: Lancaster JR) was followed.

Plant Analysis:

The plant leaves were carefully washed with deionized water and oven-dried at 70°C in the laboratory. Powdered plant samples (whole plant, 1 gm) were digested with 5ml diacid mixture, nitric acid (HNO_3) : perchloric acid (HCLO) in the ratio of 3:2 at 110°C for 8 hours. Then distilled water was added to the digested samplees to make up the volume to 50 ml and then filtered by Whatman-42 filter paper. The samples were ready for elemental analysis (Instituto Agronomico de S. Paulo, 1978) by AAS.

Plant Growth and Estimation of Chlorophyll:

Growth of the root and shoot length were measured with the help of meter scale and chlorophyll content estimated (Arnon, D.I. 1949) following the method of Arnon using UV-UIS spectrophotometer 117 model.

RESULTS AND DISCUSSIONS

Results:

Physico-chemical Characters and Metals in wastewater:

The physicochemical properties of the wastewater were analysed and presented in table 1. Wastewater is white in colour and odorless. pH is 8.2, EC (Electrical Conductivity) 11.3µmos/cm these values are compared to ISI (Indian Standard Institution) standards recommended for discharge of wastewater on land for not suitable to irrigation purpose. Total suspended solids, Total dissolved solids values are 716 ± 12.66, 694.24 ± 3.17. BOD (Biological Oxygen Demand) value is 58.9 ± 0.15; COD (Chemical Oxygen Demand) value is 140.51 ± 0.29. Chromium is 0.061 ± 0.003, copper 0.016± 0.002, manganese 0.037± 0.002, Iron 0.050± 0.001, nickel 0.047 ±0.0.005, cadmium 0.026 ± 0.002, lead 0.10±0.002, zinc 6.72±0.120. The rest of the metals like chromium, cadmium, lead zinc are present in high concentration in wastewater when compared to ISI standards and are not suitable for irrigation use.

Effects of Heavy Metals on Growth and Chlorophyll content:

The germination percentage of groundnut seeds on exposure at various concentrations and duration was (120 and 192 hrs) was shown in Fig.1. The highest seed germination was at 25% concentration and lowest at 100% of effluent were recorded, as compared to control. The root and shoot length were increased at 30th day as compared to control (Fig. 2 and 3) Where as at 100% of effluent concentration length of root and shoot was decreased at 10th day, 20th day and 30th day. The chlorophyll content was evaluated and recorded after exposure to different concentrations of effluent. At 25% concentration, chlorophyll a, b and total chlorophyll content showed an increase up to 20 days and a decrease in chlorophyll contents was observed in groundnut at 30 days. An overall decrease in chlorophyll content was recorded at all the experimental days compared to the control at 100% effluent concentration.

Metals concentration in Soils:

The metal concentrations in experimental plant soils fig.1. Pb, Ni, and Zn (mg/g) were high in 100% treatment at 10th day, on 20th day Mn, Cr, Cu, Ni, Fe, Pb and Cd (mg/g) were high in 50% treatment. Mn, Cu, Cr and Zn were high in 50% effluent on 25th day. Fe, Ni, Pb, Cd, Cu, Mn and Zn (mg/g) in 100% treatment on 30th day.

Metals concentration in plants:

The heavy metals in experimental fig.2. Fe was high in 10th day at 100 % treatment (759.32 mg/g) , in 20th day Ni, Cu, Fe and Pb (11.872, 99.601, 899.81, 110.36 mg/g) were high in 100% wastewater. Pb and Cd were (25.473, 64.357 mg/g) high in 100% effluent at 30th day.

Discussion:

Pot culture studies of groundnut were carried out with different wastewater concentrations. Heavy metals at high concentrations have severe toxic properties in crop plants and, therefore, their uptake and utilization are highly regulated by plant cells (Basharat Ali and Rafaqat A. Gill, 2022). High levels of EC can burn the plant or cause it to kill the plant. Blaylock, M.J. and JW Huang (200) has mentioned that high EC alters the chelating properties of receiving water systems and creates possible conditions for free metal availability to flora and fauna. Reduction of seed germination percentage may be caused by the high levels of dissolved solids in wastewater which enrich the salinity and conductivity of the absorbed solute by seed before germination (Gautam et al., 1992; Singh et al., 2006) and Murkumar and Chavan (1987) have reported that the higher concentration of effluent decrease enzyme dehydrogenase activity that is considered as one of the biochemical change which may have disrupt germination and seedling growth. Salt stress affects the seed germination and seedling establishment through osmotic stress, ion toxicity, and oxidative stress (Cuneyt Ucarli, 2020). Cultivation of crops in soil and water contaminated with heavy elements greatly reduces the yield and quality of their crops (Samiksha Singh *et al.*,2016). Inhibition of root length may be due to high levels of Cu. Zobel *et al.,* (2007) noted that inhibition of root growth was accompanied by an increase in root diameter, suggesting that the plant cytoskeleton may also be a target for heavy metal toxicity. According to the findings of Peto *et al.* (2011) High amounts of Cu inhibit plant root elongation and alter morphology by inducing changes in auxin levels that oppose nitric oxide function. A combination of copper and Cd have a negative effect on germination, seedling length and number of lateral roots in *Solanum melongena* (Nanda, P., *et al.*, 1999). The presence of Zn at high concentrations inhibits plant growth and development by interfering with some important metabolic processes (Alia *et al.*,1995). Salt D.E., *et al., (*1998) has reported that heavy metal induced reduction in total chlorophyll in pigeon pea due to Cd and Ni stress. Dong et al., (2005) mentioned that cadmium stress severely effects the photosynthetic rate and intracellular CO2 concentration in tomato seedlings. Maleva *et al.* (2012) have reported that heavy metals such as Mn, Cu, Cd, Zn and Ni drastically decreased the levels of chlorophyll contents accompanied by a decrease in the photochemical efficiency of photosystem II (PSII) in *Elodeadensa* and in *Thalassia hemprichii (*Li *et al.*,2012). Cadmium in one of the most dangerous heavy metals due to its high mobility, affecting plants even to low concentrations (Barcelo, J. and C.H. Poschenrieder, 1992). Excess levels of cadmium absorbed by plants reduced the concentration of ATP and chlorophyll content and decreased oxygen production. Pb is also one of the heavy metals that control plant growth and showed severe damage in growth and photosynthetic activity of many plants.

Pb is found in plants from many sources, including soil, but reports of the metal in plants were vary (Motto, H.L., *et al.,* 1974 and Muthusamy, A. and N. Jayabalan, 2001). High concentration of Lead causes to retardation in plant growth, negative effects on photosynthesis, blackening of roots and disturb mineral nutrition and water balance, changes hormonal status and affects membrane structure and permeability (Farouk S Nas and Muhammad Al., 2018). Arun K. Shanker *et al.,* (2005) reported that Cr also causes deleterious effects on plant physiological processes such as photosynthesis, water relations and mineral nutrition.

Conclusion

This work was carried out on the impact of soil pollutants on groundnut seedlings. Heavy metals at higher concentrations showed deleterious impacts in experimental plants. Plants growing in such type of contaminated soils and waters; crop yielding reduces and finally it effects live-stock and on human beings. Hence it may be suggested that 25% of wastewater contains nutrients and can be used as a suitable liquid fertilizer for irrigation use. Higher concentrations of heavy metals significantly reduced the plant growth and crop yield. The data presented here are also useful for detecting pollution load in soils due to accumulation of heavy metals from untreated wastewater which is discharged into drains without proper treatment.

Abstract- The effect of Lead contamination on the germination and seedling growth of arachis hypogaea was evaluated through a pot culture experiment on Arachis hypogaea. L. (Groundnut) under ordinary laboratory conditions with and without Lead treatment. Lead treatment at 3, 4 and 5 mg/L influenced seed germination when compared to the control. Lead concentrations of 2,3,4, and 5 mg/L influenced root and soot length as compared to the control. The greater dose of 5 mg/L had a significant ($p<0.05$) effect on the seedling and physiological changes. With increasing Lead concentrations, there was a significant decrease in seed germination, seedling development, root, and soot length.
Index Terms – Lead Nitrate, Pot culture, seedling, germination, etc.,

I. INTRODUCTION

The presence of heavy metals poses a significant concern due to their toxic nature, which has adverse implications for ecological, evolutionary, and environmental aspects [1]. Lead, symbolized as "Pb" on the periodic table, is an elemental substance that originates from the Latin term "plumbum." With an atomic number of 82, it falls under the category of heavy metals. The toxicity of lead is significantly detrimental to both humans and other living organisms. Exposure to this element can result in a wide array of health complications, particularly impacting the nervous system. It is important to note that even minimal levels of lead exposure can be detrimental, especially for children, as their developing brains and bodies are more vulnerable to its adverse effects. Various sources contribute to lead exposure, including lead-based paint, lead pipes found in outdated plumbing systems, lead-acid batteries, and the previous utilization of lead gasoline. Additionally, industrial processes, soil contamination, and specific consumer products may also play a role in the exposure to lead.

Lead toxicity often results in the hindrance of seed germination and the stunted growth of plants[2,3,4,5,6,7]. Lead pollution is the result of the introduction of lead, a hazardous heavy metal, into the environment. This contamination can have significant and far-reaching implications for both human health and the environment. The accumulation of lead pollution in soil can occur through various means, such as the presence of lead in old gasoline, industrial runoff, and the deterioration of paint. Additionally, the combustion of lead gasoline, although largely phased out in many areas, and industrial emissions can release lead into the atmosphere. The adverse health effects of lead pollution have been extensively documented and can be particularly severe, especially in children. Exposure to lead can result in neurological and developmental issues, as well as other health complications in both children and adults.

The global concern over the influx of heavy metals into water bodies from various sources, including industrial, agricultural, and domestic activities, is due to their well-documented negative impacts on both human health and ecosystems [8]. The effects of lead on the shoot, root lengths, and seedling dry biomass of Lythrum salicaria were found to be highly significant [9]. The concentration of lead in soil and wheat tissues, as well as along roads, was found to decrease with increasing distance from the roads [10]. Lead-induced changes in germination behavior, growth and inhibition of δ-aminolevulinic acid dehydratase activity in Raphanus sativus L [11]. Effects of lead on seed germination and seedling growth of wheat (triticum Aestivum) [12]. The release of harmful exhaust gases and toxic pollutants, such as unburnt and partially burnt hydrocarbons and lead compounds, from dense traffic contributes to the pollution of urban environments. The objective of the current study was to examine the impact of lead on the process of seed germination and subsequent seedling growth of Arachis hypogaea.

II. METHODOLOGY

Seeds of Arachis hypogaea L. were procured in a random manner from Dr. A. G. Ranga Agricultural University in Tirupati, Andhra Pradesh, India. To eliminate any impurities from the seed coat, a treatment of 0.1N Lead Nitrate was administered for a duration of two minutes, followed by five washes with running tap water. The study was conducted on Arachis hypogaea L. using varying concentrations of Lead Nitrate (1, 2, 3, 4, and 5 mg/L), with distilled water serving as the control. Twenty-five seeds were placed in petri dishes, and a daily addition of 10 ml of Lead Nitrate solution was made. Each day, twenty-five seeds were planted in petri dishes on Whatman paper No.42, along with 5 ml of the heavy metal Lead Nitrate solution. The research was carried out in a laboratory setting, both during the day and at night, to evaluate the root, shoot length, and seedling growth of Arachis hypogaea L. through a pot culture experiment. After an incubation period of 5 days, the number of seed germinations was recorded and expressed as a percentage of germination. Following 21 days of seedling growth, the length of the roots and branches was measured using a meter scale.

III. RESULTS

The data on groundnut seed germination, seedling, root, and shoot lengths are presented in Table 1. The application of Lead Nitrate solution at varying concentrations (1,2,3, 4 and 5 mg/L) resulted in a reduction of these parameters as compared to the control. Notably, the Lead treatment at concentrations of 3 mg/L, 4 mg/L, and 5 mg/L had a significant impact on seed germination. Additionally, an increase in Lead Nitrate content by 5 mg/L had a substantial effect on the growth of groundnut seedlings in comparison to the control. However, an increase in the concentration of Lead Nitrate up to 3 mg/L had detrimental effects on root growth and shoot length.

Treatment Lead Nitrate (Pb) mg/ L	**Seed germination (%)**	**Root Length (cm)**	**Shoot Length (cm)**	**Seedling Length (cm)**
Control	90 ± 0.276	6.5 ± 1.006	10 ± 1.062	11 ± 0.186
1mg/ L	86 ± 0.514	4.4 ± 0.112	7.9 ± 0.375	10.7 ± 0.698
2 mg/ L	66 ± 0. 286	2.6 ± 0.128	7.4 ± 0.129	10 ± 0.682
3mg/ L	48 ± 0.012	2.4 ± 0.126	7.1 ± 0.216	5.6 ± 0.445

Table 1. Effect of different concentration of Lead Nitrate on seed germination, root, shoot and seedling length of Arachis hypogeae *L*.

Number followed by the identical letter within the corresponding column exhibit no substantial variation at a significance level of $P< 0.005$.

IV. DISCUSSION

Arachis hypogaea L, a member of the Fabaceae family, is a valuable cash crop and rotation crop. The byproducts of groundnut, including shell, haulms, and hay, serve as excellent sources of fodder. Groundnut cake, a nutritious feed for cattle, can also be utilized as manure following oil extraction. Its high dietary fiber content renders it an ideal food for digestion. Trees and plants can directly or indirectly absorb metals through water and soil contamination. Lead, which is detrimental to human health, as well as bacteria, plants, and animals, exhibits a gradual decrease in concentration during the process of seed germination and seedling growth in Arachis hypogaea L. The treatment of Lead significantly inhibits seed germination in comparison to the control group. However, the shoot length and root growth of Arachis hypogaea L show an increase with rising concentrations of Lead when compared to the control group. Ultimately, it has been determined that Lead Nitrate poses a significant hazard to the growth of seedlings in Arachis hypogaea L.

V. CONCLUSION

The necessity for additional investigation into Lead contamination in plants via soil is underscored by the findings of this study on the impact of Lead Nitrate on Arachis hypogaea L. This research holds considerable significance in elucidating the effects of Lead pollution on plants through soil, as it facilitates the exploration of plant physiology by utilizing diverse metal concentrations. Furthermore, it is imperative to conduct further research to comprehensively analyze metal determination in the environment and various plant regions.

Abstract- Mercury is the only common metal which is liquid at ordinary temperatures and occurs in several forms, all of which can produce toxic effects in high enough doses. In the laboratory, a pot culture experiment was performed on Arachis hypogaea. L. (Groundnut) with and without mercury chloride treatment. Mercury treatment at 6, 8 and 10 mg/L influenced seed germination when compared to the control. Mercury concentrations of 4, 6, 8, and 10 mg/L influenced root and soot length as compared to the control. The greater dose of 10 mg/L had a significant (p 0.05) effect on the seedling and physiological changes. With increasing Hg concentrations, there was a significant decrease in seed germination, seedling development, root, and soot length.

Index Terms - Mercury, Pot culture, seedling, germination, etc.,

I. INTRODUCTION

Mercury (Hg) is a perilous heavy metal that, when found in aquatic ecosystems, has the potential to disturb the ecological equilibrium. It is noteworthy that mercury is the sole common metal that remains in a liquid state under normal temperatures and exists in various forms, all of which possess the ability to induce toxic effects when administered in sufficiently high quantities. The existence of heavy metals in the atmosphere, soil, and water, even in minute concentrations, can give rise to severe complications for all living organisms. It is important to note that heavy metals, when present in concentrations surpassing a certain threshold within a narrow range, transform into toxic substances [1].

Mercury (Hg) is a hazardous heavy metal element that poses a significant threat to both organisms and the environment when it contaminates aquatic environments. The accumulation of Hg in aquatic habitats is attributed to both natural and anthropogenic sources. Natural sources include geologic parent material, rock outcroppings, wind-blown dusts, volcanic eruptions, marine aerosols, and forest fires, while anthropogenic sources include mining, coal combustion, and hazardous industrial solid/liquid waste disposal. The release of Hg into ecosystems worldwide is a result of modern industrialization and urbanization. [2-4].

While it is widely acknowledged that the toxicity of mercury in plants is linked to its availability in the surrounding environment, limited research has been conducted on the effects of mercury under controlled conditions with restricted concentrations. Plants employ two primary strategies, namely accumulation and exclusion, to respond to high levels of heavy metals [5]. Heavy metals pose a significant environmental concern, and their increasing presence has become a pressing issue from ecological, evolutionary, and environmental perspectives [6]. The pollution caused by mercury has emerged as a critical global problem due to its detrimental impact on the environment [7]. In the 1950s and early 1960s, mercury was utilized in the separation of lithium isotopes to produce nuclear weapons [8].

The increasing influx of heavy metals into the human body as a result of industrial, agricultural, and domestic activities is a matter of global concern due to their well-documented negative effects on both human health and ecosystems [9]. Heavy metal contamination has been observed in various locations worldwide, impacting the biosphere [10-12]. The accumulation of trace metals, particularly heavy metals, in the soil has the potential to hinder the soil's functionality, cause toxicity to plants, and contaminate the food chain [15]. The presence of heavy metals can lead to a significant ecological crisis, as they are non-degradable and tend to accumulate in plant parts, resulting in a detrimental biological impact that is magnified through trophic levels. For instance, mercury has been found to reduce the levels of potassium, manganese, and magnesium in roots, while accumulating iron in root tips [16]. It is worth noting that the effects of metals are typically studied under sterile and simplified laboratory conditions, which may differ to varying degrees from real-world field conditions [17]. Plant-based bioassays offer a cost-effective and appealing approach to assess the impacts and hazards associated with various contaminants or environmental factors [18]. Moreover, they can provide valuable guidance for biomonitoring and bioremediation efforts [19, 20]. These procedures rely on the unique ability of plants to accumulate specific substances [21]. Recently, there has been a growing interest in utilizing duckweed for biomonitoring and bioremediation purposes. Duckweeds belong to the Lemnaceae family and are a type of free-floating aquatic plant. They can be found in diverse freshwater habitats, including ponds, lakes, ditches, and rice paddies [22]. Additionally, several studies have investigated the effects of mercury on seed germination [23, 24].

II. METHODOLOGY

Seeds of Arachis hypogaea L. were obtained in a random manner from Dr. A. G. Ranga Agricultural University in Tirupati, Andhra Pradesh, India. To remove any contaminants from the seed coat, the seeds were subjected to a treatment of 0.1N Mercuric chloride for a duration of two minutes, followed by five washes with running tap water. This experiment was carried out on Arachis hypogaea L. using different concentrations of Mercuric chloride (2, 4, 6, 8, and 10 mg/L), with distilled water serving as the control. Twenty-five seeds were placed in petri dishes, and daily 10 ml of $Hgcl_2$ solution was added. Each day, twenty-five seeds were planted in petri dishes on Whatman paper No.42, along with 5 ml of the heavy metal $Hgcl_2$ solution. The investigation was conducted in a laboratory setting, both during the day and at night, to assess the root, shoot length, and seedling growth of Arachis hypogaea L. through a pot culture experiment. After a period of 5 days of incubation, the number of seed germinations was recorded and expressed as a percentage of germination. Following 21 days of seedling growth, the length of the roots and branches was measured using a meter scale.

III. RESULTS

Table 1 presents the data on the seed germination, seedling, root, and shoot lengths of groundnut. The application of mercuric chloride solution (2, 4, 6, 8, and 10 mg/L) resulted in a reduction in the parameters of groundnut as compared to the control. Notably, the mercury treatment at concentrations of 6 mg/L, 8 mg/L, and 10 mg/L exhibited a significant impact on seed germination. Furthermore, a 10 mg/L increase in mercury chloride content had a substantial effect on the growth of groundnut seedlings in comparison to the control. However, an increase in the concentration of mercuric chloride up to 6 mg/L had detrimental effects on root growth and shoot length.

Treatment Mercury chloride (Hg) mg/ L	**Seed germination (%)**	**Root Length (cm)**	**Shoot Length (cm)**	**Seedling Length (cm)**
Control	92 ± 0.282	6.3 ± 1.042	10 ± 1.084	12 ± 0.186
2mg/ L	84 ± 0.523	4.6 ± 0.114	8.0 ± 0.357	11.8 ± 0.707
4 mg/ L	63 ± 0. 298	2.8 ± 0.136	7.5 ± 0.132	11 ± 0.707
6mg/ L	46 ± 0.075	2.5 ± 0.135	7.3 ± 0.217	5.9 ± 0.434
8 mg/ L	32 ± 0.074	2.0 ± 0.286	6.0 ± 0.244	5.5 ± 0.189
10 mg/ L	24 ±0.220	1.8 ± 0.162	5.0 ± 0.242	5.1 ± 0.296

Values are arithmetic mean ± S. E. of three replicates.

Table 1. Effect of different concentration of $Hgcl_2$ on seed germination, root, shoot and seedling length of Arachis hypogeae *L*.

Number Followed by the same letter in the same column are not significantly different at P< 0.005.

IV. DISCUSSION

Arachis hypogaea L, a member of the Fabaceae family, is a valuable cash crop and rotation crop. The byproducts of groundnut, including shell, haulms, and hay, are excellent sources of fodder. Ground nut cake is a nutritious feed for cattle and can also be used as manure after oil extraction. Its high dietary fiber content makes it an ideal food for digestion. Trees and plants can absorb metals directly or indirectly through water and soil contamination. Mercury is harmful to human health, as well as bacteria, plants, and animals. The concentration of mercury in seed germination and seedling of Arachis hypogaea L. gradually decreased. Mercury treatment significantly reduced seed germination when compared to the control. However, shoot length and root growth of Arachis hypogaea L increased with increasing mercury concentrations when compared to the control. Finally, it was discovered that mercury chloride posed a significant hazard to the seedling growth of Arachis hypogaea L.

V. CONCLUSION

The findings of this study regarding the impact of mercuric chloride on Arachis hypogaea L highlight the necessity for further investigation into mercury contamination in plants via soil. This research holds significant importance in elucidating the effects of mercuric pollution on plants through soil, as it enables the exploration of plant physiology through the utilization of diverse metal concentrations. Moreover, additional research is imperative to comprehensively analyze metal determination in the environment and various plant regions.

WOMEN ROLE IN ENVIRONMENTAL PROTECTION: A CASE STUDY IN GANGUDUPALLI VILLAGE, CHANDRAGIRI MANDAL, SRI BALAJI DISTRICT, ANDHRA PRADESH, INDIA.

Dr.K.Kiran[a], Ms. Dasireddygari Jyothi[b], Dr. E.Mahadevareddy[c]

a : Academic Consultant, Department of Environmental Science, b: Student, Department of Rural Development, c: Academic Consultant, Department of Adult & Continuing education, Sri Venkateswara University, Tirupati-517502,

Abstract: The natural environment refers to all living and non-living components that exist without human interference. This word is frequently used to describe the Earth or specific areas of it. It includes all living organisms, weather patterns, climate, and natural resources that influence human survival and economic endeavours. In developing countries like India, women bear the primary responsibility for managing and conserving resources within their families. They dedicate significant amounts of time to tasks such as gathering and storing water, ensuring access to fuel, food, and fodder, as well as overseeing the management of various types of land, including forests, marshes, and agricultural areas. This paper discusses about how a women play a key role in protecting the natural environment by studying the practices and daily activities of Gangudupalli village women towards environmental protection.

Index Terms: **Women, India, Gangudupalli village, Environmental Protection, Sustainability, etc.**

I. INTRODUCTION

The term "environment," which means "to surround,". The word "environment" refers to the interaction of water, air, and land, as well as their interactions with one another, humans, other living things, and property. According to Schultz et al., [1] the women, environment and development (WED) -debate is based on a critical perspective of development policies, emphasizing the connection between modernization/industrialization, technology, and environmental degradation. Women, on the other hand, have long been considered the lower sex. On a worldwide scale, women are often in charge of managing and saving resources for their families. Women are breaking new ground in a range of sectors, including the investigation of the world's water resources and the conservation of forest resources.

Women play a vital role in the management of natural resources, including land, water, forests, and energy. Women in underdeveloped regions of the world are regarded as the primary consumers of natural resources such as land, forests, and water, as they are accountable for collecting food, fuel, and fodder [2]. They possess both traditional and modern knowledge about the natural environment surrounding them. In the past, women were often overlooked or disregarded, but there is now a growing recognition of the significant impact they have on the environment. Additionally, there is an increasing understanding of how the environment affects the health and well-being of women. This shift in perspective is evident in events such as the 1992 UN Earth Summit, the Chipko movement in India, and the Green Belt Movement in Kenya. These initiatives highlighted the importance of women's voices and perspectives in promoting sustainable development at all levels, from the highest decision-making bodies to local communities. In recent decades, environmental movements have increased as the movements for women's rights have also increased. Today's union of nature preservation with women's rights and liberation has stemmed from invasion of their rights in the past [3,4].

In the Asian and Pacific Island regions, the majority of women involved in the economy are engaged in the agriculture sector, which encompasses various activities such as work in own-account farms, labor in small enterprises for processing fruits, vegetables and fish, paid and unpaid work on other people's land, and collecting forest products. However, only a small percentage of these women, ranging from 10-20%, have been able to secure tenure to the land they work on due to economic and legal barriers. One such barrier is the gender disparity in access to loans, which results in women receiving fewer and less favorable loans to acquire land compared to men [5].

Women's direct involvement with the environment has resulted in a deep grasp of it. As a result, Women act as agriculturalists, water resource managers, traditional scientists, etc among others. Women interact with the natural and man-made environments more extensively than males, owing to their major duty for domestic and home administration. As a result, individuals are more vulnerable to the negative consequences of degraded home, neighbourhood, and city environments, and they incur a greater cost associated with living in substandard homes and communities with inadequate residential and health infrastructure. Women are predominantly responsible for farm work and domestic food production across the globe [6,7,8,9]. Although there is a growing trend of women taking on more agricultural tasks and expanding their involvement, the gender-based division of labour remains unchanged in terms of reproductive work.

It is imperative to comprehend the diverse methods through which women have actively engaged in the preservation and administration of the environment, with the intention of incorporating them into environmental management initiatives. The purpose of this manuscript is to evaluate the participation of women in environmental management, specifically focusing on a small village.

II. STUDY AREA

Gangudupalli is a Village in Chandragiri Mandal in Chittoor District of Andhra Pradesh State, India. It belongs to Rayalaseema region. It is located 6 KM from Chandragiri town and 21 KM towards West from District headquarters Sri Balaji. According to 2011 census, Gangudupalli Village Local Language is Telugu. Gangudupalli Village Total population is 1080 and number of houses are approximately 250. Female Population is 53.3%. Village literacy rate is 61.6% and the Female Literacy rate is 33.0%. Their major occupation is Agriculture, Cattle maintenance, Silkworm cocoon cultivation. Apart from that, few of them doing Jobs and businesses at various sectors located in and around Tirupati.

In this paper, we employ two different categories of data. The initial category consists of secondary source materials, acquired from prior research on women's participation in environmental preservation and control. These materials encompass books, journal publications, and articles obtained from online sources. The second category of data was procured from primary sources, specifically through the distribution of questionnaires to the women residing in the rural area of Gangudupalli Village.

III. REVIEW

3.1. Water Resource Management

Etta [10] conducted a survey in Mariko Lower-income settlement in Lagos, which revealed that women hold a pivotal role in managing communal water resources and fulfilling household water requirements. Women are primarily responsible for regulating and supervising communal taps or water points, and they often secure these sources to prevent damage by children. At the household level, women and girls are burdened with the task of fetching water for various domestic activities such as cooking and washing. Conversely, men tend to dominate the water trade. Unfortunately, these sources are susceptible to pollution, especially from untreated sewage, which poses significant health risks [11,10]. In rural areas, women are solely responsible for procuring water for their domestic needs. However, the methods and practices employed in obtaining water, particularly from riverbanks, contribute to water pollution [12].

3.2. Women in Agriculture

Women's contributions to agricultural production have been significant worldwide, with the Food and Agriculture Organization reporting that they are responsible for producing more than half of all food grown in 1996. In certain regions, such as sub-Saharan Africa and the Caribbean, women produce an astonishing 80% of basic foodstuffs. Adebayo et al [13] found that in Asia, women provide between fifty and ninety percent of the labour force for rice cultivation, while in Adamawa State, Nigeria, 60% of women are involved in farming. Jayasheela [14] outlines the various roles that women play in Indian agriculture, including production and distribution, planting and cultivation, weeding, hoeing, harvesting, and storage.

Women in Gangudupalli Village play a significant role in the agricultural sector by contributing to the production of rice, groundnuts, and sugarcane. Additionally, they are actively involved in cultivating livestock crops for their cows, buffalos, goats, and other animals. This highlights the close interaction between women and the environment, particularly the land. As victims of soil degradation, women have actively participated in initiatives aimed at conserving soil. A notable example of their involvement is the Agro-forestia project in Yatenga, Burkina Faso. Moreover, Igbo women have taken on traditional male agricultural responsibilities, in addition to their existing roles within the female sphere [15, 16].

3.3. Solid waste disposal

In the specified research domain, the rate of solid waste accumulation surpasses the pace of population expansion. The disposal of solid wastes commonly occurs at designated dumping sites or undeveloped areas. Women, owing to their proximity to the environment, actively engage in environmental stewardship by undertaking responsibilities such as cleaning and upholding cleanliness, particularly in relation to garbage disposal. Acknowledging the health hazards linked to waste, women assume the responsibility of ensuring its consistent removal at the communal level.

IV. RESULTS

The present section presents the outcomes of the questionnaire survey carried out to examine the extent of women's involvement in environmental management within the specified study area, namely Gangudupalli Village. The demographic characteristics, specifically age and marital status, of the women are presented in Table 1. It is worth mentioning that a mere 17.6% of the women surveyed are below the age of 22 years. The majority, accounting for 66.4%, belong to the middle age group (23-50 years), while only 16.0% are aged above 50 years. This distribution of age indicates that a significant proportion of the women are still in their prime years and possess the necessary Vigor to actively engage in environmental management activities.

Table 1. Age and marital status of survey women

S.No	Age Group	Number	Percentage
1	Below 22 years	18	17.6
2	Middle age (23-50) Years	65	66.4
3	Above 50 years (51-75)	17	16

Table 2 displays that a significant majority of female participants, specifically 66.4%, are involved in agricultural activities in the study area. Organic farming is the most used method of soil conservation by women. Planting trees is recognized as an effective approach to safeguarding the environment and mitigating hazards such as windstorms and erosion. The survey results indicate that almost 76.2% of women in the study area have planted trees or flowers within the past five years, further supporting the notion that women actively engage in tree planting. Fruit trees, such as mango, sapota, papaya, and various fruit plants, are frequently planted by women, serving the dual purpose of environmental protection and providing fruits for household consumption.

Table 2 Women involvement in Environmental Management

Involvement in Farming	Percentage(%)
Yes No	66.4 33.6
Planting trees (Farming/Around the house)	Percentage (%)
Yes No	76.2 23.8
Conserving methods	Percentage (%)

Organic farming planting	55.7 44.3
Major activities in Environmental Cleaning	Percentage (%)
Weeding Sweeping Drainage	22 63 15

The challenges faced by women in environmental management within the study region were identified by the participants as follows: firstly, there is a lack of environmental consciousness among the general population; secondly, there is a shortage of waste disposal facilities; and finally, there is an insufficiency in drainage systems.

V. RECOMMENDATIONS

To achieve sustainable development, it is recommended that active involvement of women in environmental management be promoted, while considering the obstacles they currently face. To bring about a transformation in the mindset of the populace and equip them with relevant knowledge, it is crucial that environmental education becomes mandatory for the majority of women. This will address the issue of individuals carelessly discarding paper scraps, fruit peels, plastic cans, and polythene bags on the streets for mere amusement.

Additionally, prioritizing women's education and ensuring access to education for girls should be considered a policy imperative. Educated women will play a significant role in bridging the gap between the environment and development. It is important to duly acknowledge and support the empowerment of women in sustainable human development, as well as their role in safeguarding the environment.

VI. CONCLUSION

In conclusion, it is evident that both married and single women have actively engaged in the preservation of the environment. However, a noteworthy proportion of women involved in this endeavour are married. This substantial presence of married women within the study area implies that they are more inclined to assume responsibility for the conservation and cleanliness of the environment due to their roles as homemakers. Consequently, this study has examined the diverse ways in which women have actively contributed to the protection of the environment and the management of natural resources, aiming to ensure the sustainable utilization of environmental resources.

Based on the findings, recommendations are proposed, particularly those that can facilitate the empowerment of women. The crucial role of women as managers of resources, advocates for the environment, and activists within their communities must be acknowledged when devising strategies for environmental protection. It is imperative to provide women with the opportunity to participate in environmental matters at the local, regional, national, and international levels. For women to have a substantial influence on decision-making processes, their representation should be equal to that of men. As resource managers, women should be consulted and supported in their ongoing efforts to safeguard the environment. Specifically, a greater inclusion of women in decision-making processes concerning environmental policies, programs, and funding is essential.

LANDFORMS AND LAND SYSTEMS OF CHITTOOR DISTRICT, ANDHRA PRADESH, INDIA

Dr. K. Bhupal * and Dr. M. Reddi Bhaskara Reddy
Dept. of Geography, Sri Venkateswara University, Tirupati, Andhra Pradesh
Corresponding Author E-mail: bhupalgeography@gmail.com

Abstract
Landforms and Land systems are the collective form of Geomorphology, which contributes more to the ground water and agricultural resources of an area. Ground water and Agricultural resources are basic for the economic prosperity of a country. The various land systems and landforms include Mountains, Plateaus, Plains, Rocky mounds, Escarpments, Domal hills, etc. As the human settlements and activities are generally restricted in regions where mountains dominate, the population in such regions is comparatively sparse. Agriculture is not well developed because of the scarcity of level land, the problem of soil erosion and restricts the ground water flow in the area. Chittoor District, in which the present study is one, is one of the drought prone areas of the State of Andhra Pradesh due to its peculiar location in the leeward side of the Western Ghats. So, in the present paper an attempt has been made to identify various landforms and landsystems and examine how they contribute to ground water resources and allied agricultural activities.

Key Words: *Landforms, Land systems, Undulating terrain, Fluvial plains, Escarpments, Palaeo-channels, Landslides, Lineaments, Geological formations.*

Introduction

Geomorphology is the science of different Landforms. Since each landform has its own characteristic attributes that reveal the conditions that lead to its formation, reconstruction of the physical process that operated or operating in the area can be interpreted based on the identification of landforms in that area. As such geomorphology assumes importance, since it involves interpretation of the origin and dynamics of various Earth's surface features and thus provides essential inputs for evaluation of resources like groundwater, soils and materials; Civil engineering (i.e. for locating suitable sites for the construction of roads, canals, buildings, bridges and dams etc.) and other branches of knowledge which requires understanding of the Earth's surface. It also explains the occurrence of landslides, which is one of the natural hazards of this area. So, the identification and mapping of landforms and land systems is an important facet of geomorphology. They are treated as '**Land Resources'** of the study area. So the aim of the present study is to deciper the various land systems and landforms of Chittoor District keeping in view its role in the formation of soils, ground water flow and agricultural activities.

Study Area

Chittoor District derives its name from Chittoor, its head-quarters town from 1st April 1911. It was located 12° 37' to 14° 8'N and 78° 3' to 79° 55'E. It is bordered by Anantapur, Cuddapah and Nellore districts in the north and by Tamil Nadu State in the south and east and by Karnataka State towards the west. It is situated in the south-eastern fringe of Andhra Pradesh. It is the smallest district in area compared to all the districts of Rayalaseema, covering an area of 15,152 sq.km with a population of in 2001 census, Chittoor had a population of 37,45,875 of which males were 1,889,690 and remaining 1,856,185 were females. Survey of India (SOI) Toposheets bearing the numbers 57K, 57L and 57O on 1:50,000, 1:25,000 scale (1975) formed the base for mapping the region and the satellite imageries of IRS-IC (LISS-IV) (2006) and CARTOSAT for the study of temporal changes that occurred. That was centuries ago. All that has changed. The resources of land and water have become minimum and prosperity has yielded place to poverty. For the last hundred years, the economic history of Rayalaseema, in which the present study is one, has been the very history of droughts and famines mainly due to failure of monsoon and hence today "Rayalaseema is referred to as the "Famine Zone of South India", "the blakest spot on the famine map of India" and the Mezzogiorno" of Andhra Pradesh.

Review of Literature

Many attempts have been made by Geologists, Hydrogeologists, Geographers and other scientists to map various land resources, as they are extremely significant in the formation of soils, soil erosion, ground water occurrence and ground water flow etc. Such a study is also useful to note the areas of landslides, which is one of the natural hazards of this area. In this context, Jayaraju and Bhaskara Reddy (1989) worked much on the identification of Landforms of Chittoor district, basing upon LANDSATS on scale 1:250,000. The "Indian Photo interpretation Institute" at Dehradun and the 'National Remote Sensing Centre" at Hyderabad have been instituted by the Government of India to publish Aerial Photographs and LANDSATS, which are of great use in assessing land resources and landuse. Raghavaswamy and Vaidyanadhan (1981), worked on the Landforms of Visakhapatnam District. Sambasiva Rao and Nageswara Rao (1983), worked more on the Landforms of Godavari and Krishna rivers respectively. Vohara (2008) has published a paper on "Land and water management problem in India" basing upon the availability of landforms and landsystems.

Methodology

Remote Sensing and Geographical Information System (GIS) techniques were adopted to study the Landsystems, Landforms, Landuse, Lineaments and Relief etc. The studies were undertaken critically on Air Photos on scale 1:60,000, Landsats 1:1 million, 1:250,000 and False Color Composits (Fcc's) 1:1 million and 1:250,000. The Survey of India (SOI) Topographical numbers 57K, 57L and 57O on 1:50,000, 1:25,000 scale were used as the base maps.

Geological Formation

The nature and structure of geological formations have many indirect influences on agricultural lands. Geological formations provide the basic materials and structures for the parent materials of the soils. Through the relief, the geological formations have a strong impact on climate and hydrology. Hence, these geological formations were studied in greater depth, which is also a land resource. The rock types met within the district are of diverse types ranging in age from Archaean to recent. Most of the area in Chittoor district is covered by precambrian granites, which are highly magmatised. Cuddapahs and Upper Gondwanas occur as outliers at one or two places. The geological sequence of the district is given below.

Geology Map of Chittoor Distirct

Age	Formation
Quaternary	
Subrecent –alluvium	Gravels, course to fine sands, silts and clays 3 to 5mts. thick.
Recent –Talus	Pebbles and other debris in valley fill areas.
Pleistocene-Laterite	Very hard and compact rocks of fine quartz graining in ferruginous material
Upper Gondwanas	Conglomerates of quartizite pebbles embedded in ferruginous matrix.
Lower Cuddapahs – Nagari	Quartzites with intercalating shales.
Archaeans – Dharwars and other Crystallines	Dolerite Dykes, granites and gneisses with (Porphyritic) feldspar, quartz, mica and hornblende.

RELIEF AND LAND SYSTEMS

The influence of relief on agriculture is multifaceted. Relief is the expression of the interact ion of several different phenomena and processes within the earth Is crust and on its surface. Its forms and dimensions are primarily related to geological formations and to the climate, which have either directly or indirectly acted upon these formation through the process 3f weathering and the concomitant soil formation, So, relief is therefore typically connected with many of the other land resources. Its influence on climate (which was mentioned previously), hydrology and formation of soils (including its negative aspect of soil degradation) are largely dependent upon the nature of the relief. In the present course of investigation the interactions of relief can be observed clearly in *the* formation of soils, climate, hydrology, landforms, drainage and even in the distribution of population, etc. *The* study area lies in a morphologically transitional zone between the interior plateau and the coastal plain. In addition, the north-aouth running Eastern Ghat ranges run in the middle of the district forming its backbone and *the* water divide for many streams, The district slopes down from west to east from an average elevation of about 750 mts,, on the west to about 50

mts on the eastern margin. The district may conveniently be divided into 3 natural divisions as given below.

(a) The Western Hilly Region he Karnataka plateau)

Which comprises isolated hills and hillocks covering the areas of Punganur, Madanapalli and Thamballapalli.

(b) The Central Upland Region

Which comprises three ranges, i.e., (1) Mahendragiri hills covering the areas of Kuppam, Palamaner, Chittoor, Chinnagottigallu and Vayalapadu, (2) The southern portions of Palakonda and Velikonda ranges partly covering the areas of Vayalapadu, Srikalahasti and Chandragir Fort and (3) Nagari hill s covering parts of the areas of Puttur, Nagari and Satyavedu.

(c) **The Plain Region**

Which consists of the valley plains of Bahuda, Pincha, Swarnamukhi, Paler, Arani and Nagari rivers and the coastal plain which lies to the east of Palakondas and Nagari hils.

The relief and land systems of the study area have been delineated based on studies from topographic sheets and false colour composites (F.C.C'S) of LANDSATS. The land systems are delineated based on the assumption that similar grey tones under similar topographic expression reflect similar surface and subsurface moisture conditions, vegetation and organic content of the soils. Tentatively light tones were considered to reflect red soils, colluviurn and sands medium tones to reflect sandy soils to sandy loams on rolling plains and dark tones to reflect sandy, silty , clays on level plains, namely, flood plains, ancient channels, etc. These tones may help in deleneating areas of relative importance in locating groundwater. Field trips have been carried out to various parts of the district to counter check the various systems identified from the study of topographic and related fields. The various land systems identified are:

(1) Hilly terrain

The western part of the district is bordered by a group of hills which belong to Eastern Ghats trending NE-NNE and SE direction, These hills are composed of mainly granites, quartzites and charnockites, The general elevation in these hills range from 1,314 mts. (Horsely Hills) to 1,131 mts. (Tirumala hills) above MSL., with steep slopes exceeding 20 per cent. Field studies in these regions also throw light on differential weathering particularly in the regions where sections of folds are clearly exposed. The general alignment of the disturbed hills in the western and central parts presents that this region in the geological history could have been a major domal structure and this contention has been proved owing to the presence of general 'Radial pattern of drainage' in the district.

(2) Undulating terrain

The central undulating terrain constitutes the hilly slopes, pediments, piedmont plains, valley fills, pediplains and colluvial fans. The slope in this terrain varies from 5 to 25 per cent. The irregularity in the distribution of material in extent and thickness is due to irregular

bed profiles, slope and different geomorphic agents to work. The presence of piedmont plains and colluvial fans with convex facing slopes is an indication of the fact that the rate of accumulation is exceeding the rate of transportation.

(3) Rolling Plains

The slope in these plains is low and varies from 2 to 5 per cent or less than 2 per cent and constitutes of creep built plains, wash plains aid mixed soil plains. The rolling nature of the plains is attributed due to differential rate of weathering, erosion and deposition of materials by gravity stream and wind action. The rolling plains occupy the major part of the district constituting red sandy soils, sandy loans and black soil plainer and reflect low to medium grey tones on the LANDSATS. A few isolated hills/insul bergs stand out prominently in the plains along without crops and give hindrance to agricultural operations.

(4) Fluvial plains

The major rivers during their course of development of river valleys have deposited fine textured alluvial soils on either side of the banks especially on the eastern part and hence this region is 'somewhat plain' in nature, with less than 2 per cent slope, These soils are very fertile and are usually used for cultivation of Rice, Sugarcane, etc., which reflect in dark grey tones on LANDSATS of band 7. As the western and central parts of the district composed of a number of hills and hillocks with exposed outcrops, the panoramic view gives the idea that it is more slopy and undulating. As the rainfall is frackish and erosion of the top soil is more, agriculture in this region is more discouraging and uneconomic. The etymological study of some of the place names in the western part of the district may supports this contention, For example, Rallabuduguru (a place with stones), Bodabandla (etymology Bodibandla, which means 'a barren hill), Ghattu (a hillock), Peddatippa Samudram (Pedda means big, Tippa means rock ‘samudram’ denotes here the 'uncultivable) . In the same way, as the eastern part which is somewhat plain and low lying in nature, some place names like 'pallam' (low lying area) 'Thungundram' (slope of a hill) may supports this view.

3. LANDFORMS (GEOMORPHOLOGY)

The various landforms identified based on grey tonal variation, crustal trends, nature of vegetation, soil texture and drainage characteristics, etc., are classified into broad divisions based on major geomorphic processes involved in their formation. They are

I. Destructional Landforms

Landforms which are grouped to this category owe their origin predominantly by sheet movements of weathered material by erosion and deposition. Exogenetic process, namely, degradation, weathering, mass-wasting and erosion have collectively played important roles in the destruction of these landforms. Field checks to various parts of the district denote that predominantly mechanical weathering process dominates over chemical weathering process due to semiarid nature of climate. Differential weathering in different

parts of the hilly terrain particularly in Horsely Hills in the west and Nagari Hills in the east throw light that structural disturbances might have played significant role in partial destruction of granitic terrain in this part of the district.

(a) Remnants of planation surfaces

Relatively flat topped with gentle slopes with barren surfaces and isolated hills which reflect light to medium grey tons are recognized at an altitude of about 750 m., in the district are presumed to be some of the remenants of planation surfaces. However**,** these surfaces are not associated with lateritic cappings in the eastern part of the study area. Planation surface is an amnibus term and includes Davisian's peneplain, or peneplane concept (Fairbridge, 1968).

Subrahmanyam (1982) while studying the morphology and evolution of Dharmapuri district has identified a series of etchplains at different altitudes where stripping and dissecting are important processes which are involved in the development of these plains. However, such plains are hardly recognized in the study area. A series of profiles taken in E-W direction throw light that there could have been 4 denudational levels, namely, 150-300 m., 300-600 m., 600-900 m., and above 900 m., above MSL, of the 4 denudational levels, it is presumed that levels lying in between 150-300, 300-600 and 600-900 m.**,** clearly depict that these could have been planated surfaces.

Pediments

These are cut rock surfaces with thin to thick veneer of debris. According to Mabbut (1966) they are rarely composed of sub-alluvial semiments over the existing pediments possibly due to lateral deposition of sediments by fluvial action. The pediments are distinctly noticed in and around Tirumala hills and Kuppam hills, The main process involved in the moulding of pediments are back weathering, rain wash, sheet wash and sheet flow. The low angle of pediment and meagre relative relief of residual remnants are presumed to be due to uniform lithology. In a few pockets granites and charnockites are left as residual boulder remenants indicating that the pediments here owe t h e i r origin more too lithological control and differential erosion.

Pediplain

A pediplain is defined as a sum of all pediments, together with residual nubbins (monadnocks) on any flood plains of major rivers (King, 1962). 'Pediplanation is generally accepted as the process responsible for landscape evolution as an alternative to the concept of process of peneplanation. A pediplain is also considered as a plain resulting from coalescence of a number of pediments over a sizeable area developed by the process operating in a semiarid cycle of denudation (Bajada). In the study area, the pediplain is well marked on the northern and western part of the district. They are in continuation of the pedlplain described by Vaidyanathan (1975). These plains in Chittoor District are covered by red sandy soils with a few residual hills and reflect very light in grey tone in the LANDSAT band 7,

Escarpments

An escarpment or scarp is defined as steep rock faces of great length. Two general types are recognized, namely, structural and erosional escarpments. Structural escarpment is a direct product of fault displacement, In the present study area the Tirumala hills, Nagari hills, parts of Kupparn hills and other minor hill ranges show distinct steep escarpments, which run to a distance of about 2 to 5 km. The Tirumala escarpment might have been formed by the structural activity during the development of Tirupati valley upto Nagari nose.

Residual Hills

The multi cyclic residual mountains, namely, exfoliation domes, tors, boulders, domal hills are well distributed on the plains of piedmont colluvial plains, pediments and pediplains. Typical tors and boulders of granitic gneisses are numerous in and around the study area, which causes hindrance to agricultural operations.

Constructional Landforms

The term denudation should in strict sense relate to destructional farms, but has been widely used to constructional forms related to gravitational process could be included under the heading constructive denudational forms to conform to the IGU Classification (Denmek, 1972).

Creep built plains

These are the deposits composed of unassorted material with angular gravel, pebbles and cobbles in a matrix of coarse sand and grit. These creep built plains are partly derived from the bordering hilly terrain and the piedmont colluvial plains by gravity, sheet wash and sheetflow. The thickness of sediments in these plains also varies from 2 to 7 meters and the slope ranges from 2 to *5* per cent. The creep built plains are very widely deposited on the eastern and central parts of the district.

Wash plains

These are stretches of plains next to creep built plains and pediments near to residual hills, with less than 2 per cent slope. These are composed of mixed soils, namely, red sandy and silt soils, which might have formed partly due to overflowing of water over these plains during peak flood periods along major river courses. On the eastern part of the district, soma patches of black soil plains which have been derived from insitu biotite gneisses may also be noticed.

Valley fills

These are the deposits derived from the bordering hilly terrain by gravity, sheet wash and sheet flow. The valley fill deposits consist of fine to coarse textured sandy soils and sandy loams with a few pebbles and cobbles derived from the surrounding hills.

Colluvial fans

A fan is an accumulation of debris brought down by a stream descending through a steep ravine and debounching in the plain beneath, where the debris materials spread out in

the shape of a fan (Denny, 1967). A number of fans are noticeable on either side of Tirupati valley, where plantations of cashew nut and red sanders could be seen. The material is a well weathered colluviurn with stone layers separating successive contributory lobes. In each lobe, the basal horizon is usually constituted by a less weathered stone layer and the upper structure by a very well weathered colluvium.

Flwial plains

The river Swarnamukhi, Arani, and Ponnai have developed canspicuous flood plains which are likely to be inundated during peak flood periods. The plains relatively show law relief, A flood plain is usually built by later deposits with an overlay of vertical accration of flood deposits (Leopold, 1957). The river built plains are utilized for cultivation of rice, sugarcane and banana, Old channels of river Arani could be traced on LANDSAT and due to the change of river courses fluvial terrances could also be traced.

Aeolian deposits

Patches of aeolian sands are recognised in between Madanapalli and Thamballapalli on the piedmont colluvial plains. The extensions of these deposits are very limited.

LINEAMENTS

An analysis of lineaments of the district denotes that NE-SW and NNE-SSW trending lineaments predominate and lie more or less parallel to the structural trends of the hilly terrain. The district possesses hard rock terrain and therefore due importance has to be given to study the lineaments traced from LANDSAT for excavation of groundwater resources. The prominent hills, namely, Mahendragiri, Palakonda, Velikonda, Chandragiri hills, Tirumala hills and Nagari hills are subjected to have low to moderate lineaments, The dominant trend on these parts of the hills is NE-SH and NNE-SSW. Similar lineaments are also traced on plain and upland regions. A careful analysis in the study of name of structural trend, topographic variations and drainage denote that some of the rivers are structurally controlled. For example, the river Poini in Chittoor town which flows to south-east found to be genetically controlled by a fault, lying parallel to the river course. From the study of lineaments, it may be concluded that 14 lineaments lie in between 0°-So to 26'-30° NE in direction having a cumulative length of 314.42 kms., 32 lineaments lie in between 31°-3S0 to 56'-6S0 NE in direction, with a total cumulative length of 823.04 km., and 4 lineaments in between 61°-65' to 71°-7S0 NE in direction with cumulative length of 102-40 km. The total number of lineaments in north-west direction is 22. Out of them, 12 lineaments lie in between 0°-5O and 26O-35O NW in direction with cumulative length of 222.93 km., 10 lineaments lie in between 3b0-40° to 56°-600 NW in direction with a cumulative length of 302.08 km., and only one lineament lies in between 80°-85 NW in direction with a length of 10.24 km. Further studies with the help of air photos and geophysical studies may throw light on the Neotectonics of the district.

Conclusion

The various landsystems, hilly terrain, undulating terrain, leveled plains and fluvial plains and landforms identified with the help of LANDSATS (F.C.Cs) aerial photographs,

geological maps and survey of India toposheet comprise the fluvial landforms(Rapids, waterfalls, pediments, pediplains, terraced plains, riverbuilt plains, flood plains and palaeo channels). The Aeolian lanforms(Tors and mounds, residual hills, taluscones/Talus and Debris slides) structural landforms (Escanpments and landslides) and fluvial-colluviallandforms(Washplainsandcreepbuiltplains).Mostofthe plains in the study area are "creep-built plains', "wash plains", "pediment plains" and "fluvial plains', which hardly supports the agricultural development of the area.

Study Area Map

A comprehensive approach using remote sensing and geographic information systems (GIS) is proposed for the purpose of optimizing water resources in the Tirupati Revenue Division, located in the Chittoor District of Andhra Pradesh.

[1] Dr. V.Charan Kumar Reddy, [2] M. Reddi Bhaskara Reddy (Associate Professor)

Department of Geography, Sri Venkateswara University, Tirupati, Andhra Pradesh, India

Abstract: This research highlights the imperative need for the implementation of strategic water resource management strategies in order to address the increasing water scarcity resulting from population increase, industrialization, and urban development in the specific geographical region under investigation. The proposal suggests the implementation of small-scale projects along the Swarnamuki river belt with the objective of improving water resources for agricultural development in areas with high concentrations of water bodies in the eastern region, as well as addressing anticipated storage deficiencies. By using satellite data and the METRIC approach, this study computes the evapotranspiration (ET) for the Tirupati region, therefore uncovering significant water requirements for crops such as sugarcane. The research provides support for the use of drip and sprinkler systems as new irrigation technologies, emphasizing their potential to effectively reduce water usage. Furthermore, it proposes the use of drip irrigation techniques for sugarcane cultivation and the adoption of the System of Rice Intensification (SRI) for paddy farming as effective measures to mitigate water wastage, emphasizing the need of flexible agricultural approaches. In general, the research offers significant insights into irrigation methods that may effectively reduce water wastage and improve agricultural output, so making a vital contribution to the sustainable management of water resources.

1. Introduction:

Water supplies are being put under strain as a result of population growth, industrialization, and urbanization. Water scarcity is caused by factors such as large fluctuations in annual and inter-annual rainfall, ineffective infiltration, low hydraulic conductivity and storitivity, and high evaporative demand. The development and management of watersheds involve optimal use of water, land, and biomass resources in order to satisfy fundamental necessities in a manner that is environmentally sound. In order to accomplish this goal, runoff and soil loss must be reduced, and infiltration must be increased. Saving water can be accomplished by lowering surface runoff, increasing infiltration rates, and constructing buildings that are suited to their environments. Thematic data can be generated and analyzed with the use of remote sensing and GIS. However, remote sensing provides frequent synoptic coverage of the ground surface, which can be easily researched and represented in GIS. This is a significant advantage. For the purpose of runoff computation, it may include information on land utilization, land cover, and terrain topography (elevation, slope, and drainage network). Therefore, geospatial techniques may be used to select water harvesting sites in order to maximize the availability of surface and ground water for irrigation, domestic usage, and other purposes (Krishnan & Sankararajan, 2021).

The most severely impacted industry across the board is agriculture due to the global water crisis. Seventy percent of the world's freshwater is used for agriculture. Water is essential to the production of food. Since the production of biomass requires a significant amount of water, we could argue that agriculture is both the source of and a victim of water scarcity. The rising demands brought on by population growth come at

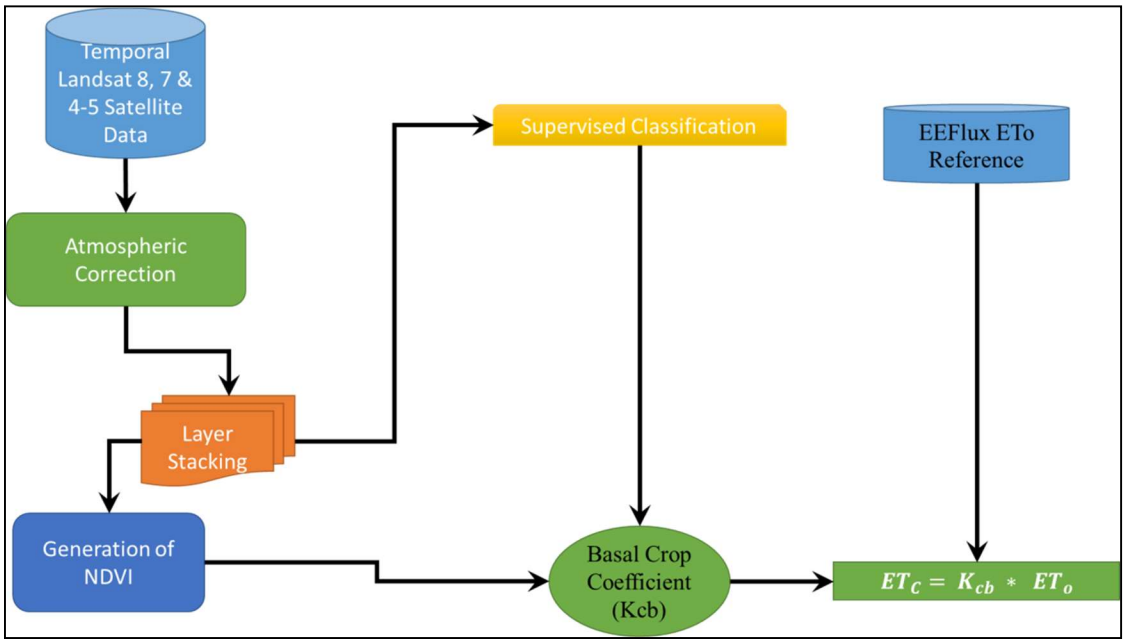
a high cost to the environment. The supply of water and the demand for it, in addition to agricultural practices, could be impacted by climate change and the generation of bioenergy. Agriculture, both rain-fed and irrigated, is impacted by climate change because of the way it alters hydrological regimes and the availability of freshwater (López-Mata et al., 2019). There has been an increase in temperature, as well as increased rainfall variability, semi-arid regions have seen a decrease in precipitation, while temperate regions have seen an increase in rainfall. This has a particularly negative impact on agriculture in tropical and subtropical regions. River runoff and aquifer recharge both have an effect on the amount of water that is available and enhance the demand that humans place on water resources.

Water is scarce in India since the country has 16% of the world's population but just 4% of its pure water supply. Irrigation accounts for the majority of water consumption. Agriculture consumes up to 80 percent of the world's fresh water resources. Irrigation uses up roughly 80 percent of India's available water resources. Given its size of 3.3 million square kilometers and annual rainfall of 1170 millimeters, it is estimated that India has water resources equal to 4,000 cubic kilometers. Over half of this water is lost through processes such as evaporation, percolation, and underground flow to the oceans, which leaves 1953 billion cubic meters (BCM) of water that can be accessed. According to Phansalker and Verma (2005), the amount of water that is available varies, bringing the total down to 1086 BCM. It is anticipated that by the year 2025, the Annual Water Resource will have decreased to 1496 cubic meters, from 2214 cubic meters in 1996. According to (Gulati et al., 2009) findings, just 25 percent of the water resource that is available has been developed

2. Materials and Methodology

Crop evapotranspiration refers to the combined process of evaporation from the soil surface and transpiration from plants. It is a ETc, or reference evapotranspiration, is a fundamental parameter used in the assessment of crop water needs and the development of effective irrigation management strategies. In this study, the estimation of crop evapotranspiration (ETc) was conducted using a combination of satellite-derived reference evapotranspiration (ETo) and the crop coefficient (Kcb) technique. Following the pre-processing of satellite pictures, the estimation of ETc was conducted over the whole of the research region. The FAO-56 technique is often used for calculating evapotranspiration (ETo) and is frequently accessed via the Google Earth Engine Flux (EEFlux) webpage on a daily basis. The estimation of the basal crop coefficient (Kcb) is conducted via the use of the normalized difference vegetation index (NDVI) in relation to Kcb. The procedure for this estimation is elucidated as follows.

2.1 Data Used



In order to accomplish the purpose of the current study, the researchers used several satellite products, supplementary data, and software tools.

Remote sensing data refers to the collection of information about an object or phenomenon from a distance, often using sensors or instruments.

The satellite dataset used in this work is shown in Table 1. Specifically, Landsat 8, 7, and 4-5 data were employed throughout the pre-monsoon and post-monsoon periods of the years 1997, 2008, and 2016.

S. No	Data Type	Date of Acquisition	Resolution	Source
1	Landsat - 8	April 2016 December 2016	30 m	https://earthexplorer.usgs.gov/
2	Landsat - 7	April 2008 December 2008	30 m	
3	Landsat 4-5	March 1997 December 1997	30 m	
4	METRIC (ET reference)	April 2016 December 2016	30 m	http://eeflux-level1.appspot.com/

Table 1 : Details of satellite data products used in this Study

Methodology flowchart

2.2 Ground Measurements

GPS coordinates were collected from study area for the sample sites for accurate identification of particular locations and for further analysis. Ground measurement site map is shown in figure 1.

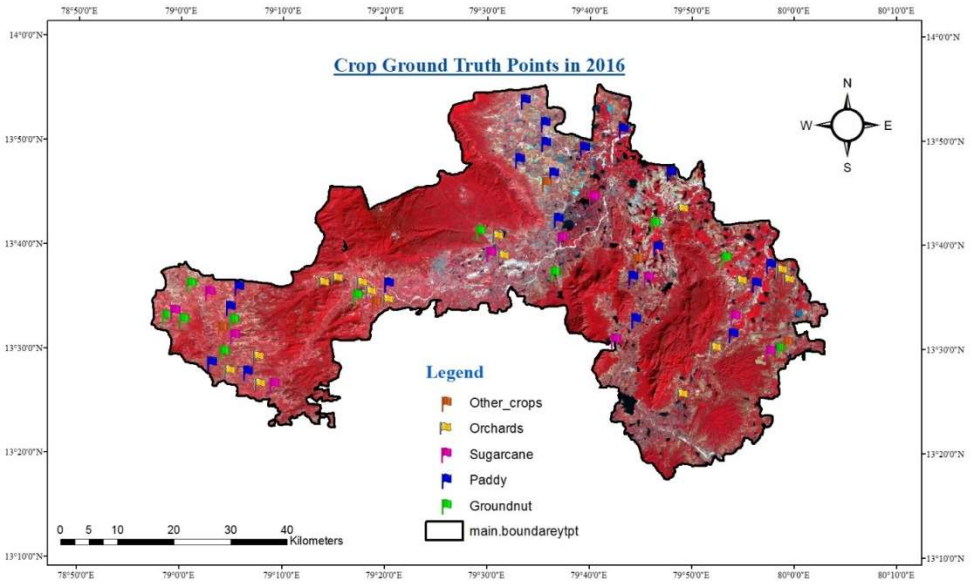


Fig 1: Ground truth measurement site map

2.3 Basal Crop Coefficient

The approaches for determining crop coefficients play a vital role in the estimation of crop evapotranspiration (ETc) and the formulation of irrigation scheduling strategies. The use of generalized coefficients often necessitates the implementation of local adjustments, hence generating inherent uncertainty. Vegetation indices (VIs) obtained using remote sensing techniques, such as the normalized difference vegetation index (NDVI), provide immediate and valuable information on crop variability. There is a scarcity of research available that indicates the potential of vegetation indices (VIs) in accurately estimating the basal crop coefficient (Kcb). The primary objective of this work is to use NDVI measurements in order to estimate Kcb values, with the ultimate goal of enhancing irrigation water management.

$$K_{cb} = K_{cb\max} \frac{(NDVI - NDVI_{min})}{(NDVI_{max} - NDVI_{min})} \quad (1)$$

Where $K_{cb\max}$ is Basal crop coefficient and $K_{cb\max}$ is Basal crop coefficient at effective full ground cover i.e., 1.3 (Hunsaker, 1994)

2.4 Potential/ Reference Evapotranspiration

The use of the METRIC technique, in conjunction with Landsat data and the Google Earth Engine Evaporation Flux (EEFlux), offers a straightforward and precise means of estimating soil water storage

capacity at a spatial resolution of 30m. Notably, this approach does not need the use of soil or vegetation maps. The process of evapotranspiration (ET) is of utmost importance in the hydrological cycle, and it is significantly influenced by sun radiation. The Potential Evapotranspiration (PET), also known as grass reference Evapotranspiration (ETo), plays a crucial role as an agrometeorological parameter, contributing to water balance models and regional evaluations of water demand for rainfed agriculture. The PET product has a precision level ranging from 80% to 90%.

2.5 Crop Evapotranspiration

Crop evapotranspiration (ETc) is defined as the combined process of evaporation and transpiration from a healthy crop, cultivated in expansive agricultural areas with enough water and fertilizer supply (Ding et al., 2013). The estimation of crop evapotranspiration (ETc) plays a crucial role in the calculation of the soil water balance and the development of effective irrigation scheduling strategies. The behavior of ETc is influenced by weather patterns and the state of the crops. Mathematically, the expression for ETc may be formulated as

3. Results and Discussion

3.1 Water Harvesting Sites

Dams block water or subsurface streams. They retain, gather, and store water for equal distribution (Zhang et al., 2023). Worldwide, dams have provided agricultural and urban water for millennia (Chelshi, 2023). The appropriateness of a built dam type in a possible dam site is always questioned. Dam type appropriateness decisions may include trade-offs between various intangibles.

Many methods are used to identify water collecting locations. The most prevalent method, AHP, combined with remote sensing and GIS, provides a worldwide site selection notion (Jayswal et al., 2023). Water harvesting and recharge locations rely on terrain, climate, precipitation, soil porosity, stream order, catchment area, and slope. These characteristics are acquired from various sources, incorporated into the GIS environment using multi-criterion decision making, and the location is chosen. The table below lists water harvesting site selection criteria.

Structure	**Slope %**	**Porosity and permeability**	**Runoff potential**	**Stream order**	**Catchment area (*10^4 m^2)**
Farm ponds	0–5	Low	Medium/high	1	1–2
Check dams	<15	Low	Medium/high	1-4	>25
Subsurface dyke	0-3	High	Medium/low	>4*	>5
Gully plug	15-20	Low	High	1	-
Percolation pond	<10	High	Low	1-4	25-40

Table 2: Selection criterion used for water harvesting sites

3.2 Slope Role

Line slope specifies its steepness and direction. It calculated slope steepness. One of the most essential elements in choosing locations for water collecting structures like check dams is topography steepness and surface runoff potential.

The slope indicates topography, which helps choose water gathering sites. The slope % is defined according to Integrated Mission for Sustainable Development (IMSD, 1995) and Food and Agriculture Organization (FAO, 1977) recommendations for choosing water collecting location. Present area slope classifications are displayed in the figure. CartoDEM (30m resolution) is used to generate % slope map in ArcGIS surface tools.

The slope map provides significant data on the zone's steepness, allowing us to estimate spillover. The region's slope may be divided into seven slant classes: (a) ‘nearly level’ (0–1%), (b) ‘very gentle’ (1–3%), (c) ‘gentle’ (3–5%), (d) ‘moderate strong’ (5–10%), (e) ‘strong’ (10–15%), (f) ‘moderate steep’ (15–30%), and (g) ‘very steep’ (> Slope grades 'nearly level' and 'sensitive' are increasingly suitable for water collection.

3.3 Runoff Generation

Runoff potential depends on DEM slope. According to slope-based criteria for surface runoff production, slope categories will be graded from least to most suited, with steeper slope categories generating more runoff. Runoff potential is classified as ‘moderate’ (200-300 mm), ‘poor’ (100-200 mm), and ‘very poor’ (<100mm).

Proposed aircraft for water resource management research. With above prospects and previous chapter studies of drainage morphometry, land resources, and land use land cover analysis and GIS integration, acceptable and necessary proposals are presented to the research region. Slop is the main source of runoff, thus the Tirupati Revenue Division receives water and soil conservation site suitability maps from slop and existing water resources location study.

Building modest irrigation projects

Apart from its tributaries, the Swarnamuki River runs 80 kilometers in Tirupati Revenue Division. Detailed examination after even shows no irrigation project except Kalyani tributary river. This river has greater discharge than others when it rains more. This project using natural briars is low-cost and beneficial for agriculture and drinking water.

3.4 Building medium and minor check dams

With serious stream network analysis and runoff calculations, a location map was proposed for the constriction of check dams like rock bonds, concrete dams, and earth bounds, especially in the west due to water scarcity. More check dams in that region will help recharge ground water and meet agricultural water needs Farm pound digging and contour ditching from the vast area of research, it is difficult to identify potential locations, but GIS was used to extract barren and fallow land locations suitable for these types of

construction to recharge ground water and expand the agricultural mask. This structure is simple and affordable. This style is also suggested for agricultural land and will assist farmers. Fig.5.5 shows where to build farm pound and contour ditches.

3.5 Other water-saving methods Except from above, this area has additional water saving methods like fallows.

3.5.1. Reusing wastewater Tirupati Revenue Division's largest city produces more urban waste water. Industrial and associated uses of urban waste water may boost indirect agricultural development using waste water cleansing plants. As fresh water can be converted to agriculture, more irrigated land is feasible. However, adopting and managing it is more expensive, so the government may lead water conservation.

3.5.2. Modernized irrigation

Modern drip, sprinkler, and subsurface irrigation minimize water evaporation compared to surface irrigation. It also waters plants straight at their roots. Thus, water waste will decrease and production will increase. According to FAO, converting traditional irrigation methods to modern irrigation will increase the irrigated area by three times. A small attempt was made to irrigate the area with 100% modern irrigation methods using existing water.

The calculation of Evapotranspiration values was conducted during the pre-monsoon and post-monsoon seasons of 2016. This was done in order to provide accurate ground truth data on crop conditions for that specific year, enabling the categorization of crops for the same time period. The subsequent years, namely 1997 and 2008, were analyzed by referring to the District Hand Book and assuming ET values similar to those of 2016.

3.6 Pre-Monsoon Water Requirement

The reference data for evapotranspiration (ET) has been multiplied by the basal crop coefficient (Kcb). The following ranges of evapotranspiration (ET) were observed for the key crops during the Pre-monsoon season of 2016.

S.No	Crop	Range (mm/day)
1.	Groundnut	3.5 to 4.01
2.	Paddy	5.7 to 6.12
3.	Sugarcane	4.16 to 4.438
4.	Orchards	2.271 to 3.246

5.	Other Crops	1.545 to 2.116

Table 3: ET ranges in 2016 pre-monsoon

The Paddy crop exhibits a wider range of ET values during the pre-monsoon period in 2016, with Sugarcane and Groundnut following suit. The range of evapotranspiration (ET) values for orchard crops is quite low due to the prevalence of younger plantings, which constituted around 20% of orchard crops between 2008 and 2016, as reported in the handbook. Younger plants typically need less water during their first growth phases.

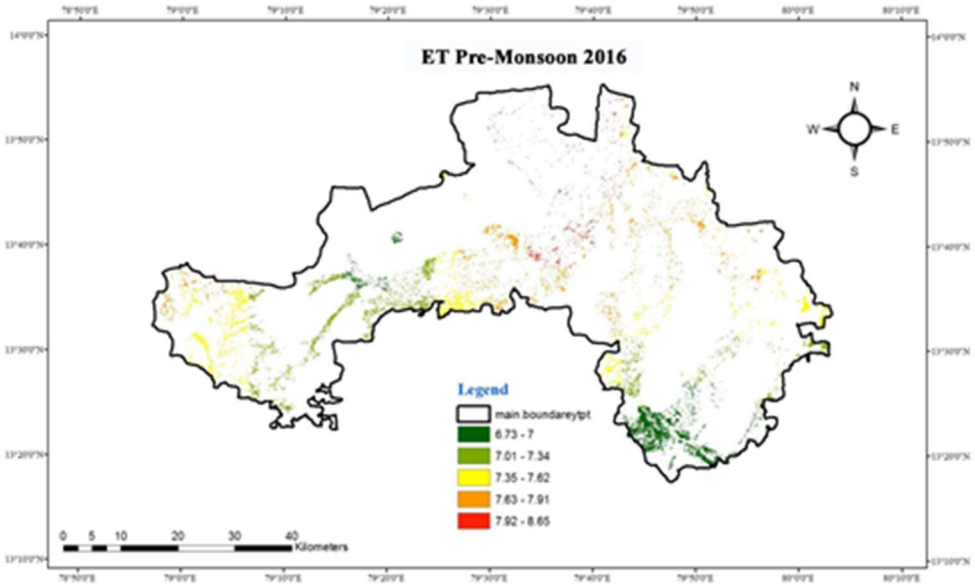

Fig 2. Evaporation in 2016 pre monsoon

The mean values of evapotranspiration (ET) for different crops are as follows: 3.76 mm/day for Groundnut, 5.91 mm/day for Paddy, 1569.14 mm/day for Sugarcane, and 2.76 mm/day for Orchards. The water consumption of the aforementioned crops per hectare, taking into consideration their respective growth periods, is as follows:

S. No	Crop	Growing Period	Average ET (mm/day)	Water requirement (mm/growing period)	Water requirement (cubic meter/ ha)
1.	Groundnut	140	3.76	525.70	5257.00
2.	Paddy	140	5.91	827.40	8274.00
3.	Sugarcane	365	4.30	1569.14	15691.35

4.	Orchards	365	2.76	1006.67	10066.70
5.	Other Crops	90	1.83	164.70	1647.00

Table 4 :Pre-monsoon average ET and water requirement per ha

Sugarcane, a significant agricultural commodity in the nation, necessitates a substantial amount of water over its whole growth cycle, which spans from 12 to 18 months. The specific duration of this cycle is contingent upon the agro-climatic areas, which range from sub-tropical to tropical. According to the Food and Agriculture Organization (FAO), the yearly water demand for this particular crop is within the range of 1500-2500 mm. The estimated yearly water demand for sugarcane in our research region is 1569.14 mm during a period of 12 months.

S. No	Crop	Water requirement (cubic meter/ ha)	Area (Ha) Pre monsoon			Total Water Consumption (Million Cubic meter/Total Cropped Area)		
			1997	2008	2016	1997	2008	2016
1.	Groundnut	5257	21348	419	3326	112.23	2.20	17.48
2.	Paddy	8274	22774	2252	3132	188.43	18.63	25.91
3.	Sugarcane	15691	8653	4475	4992	135.78	70.22	78.33
4.	Orchards	10066.7	7563	8463	10402	76.13	85.19	104.71
5.	Other Crops	1647.	7201	796	1090	11.86	1.31	1.80

Table 5: Pre-Monsoon Water requirement and Consumption for different crops

3.7 Post-Monsoon Water Requirement

The ET reference data has been multiplied by the basal crop coefficient (Kcb). The following information presents the range of evapotranspiration (ET) values for the key crops during the post-monsoon season of 2016.

S.No	Crop	Range (mm/day)
1.	Groundnut	3.42 to 3.76
2.	Paddy	5.538 to 5.914
3.	Sugarcane	3.84 to 4.564
4.	Orchards	2.193 to 3.346
5.	Other Crops	1.21 to 1.896

Table 6: ET ranges post-monsoon

The range of evapotranspiration (ET) values for the aforementioned crops varies from 1.21 to 5.91 mm/day, with the maximum ET being reported by the paddy*:*

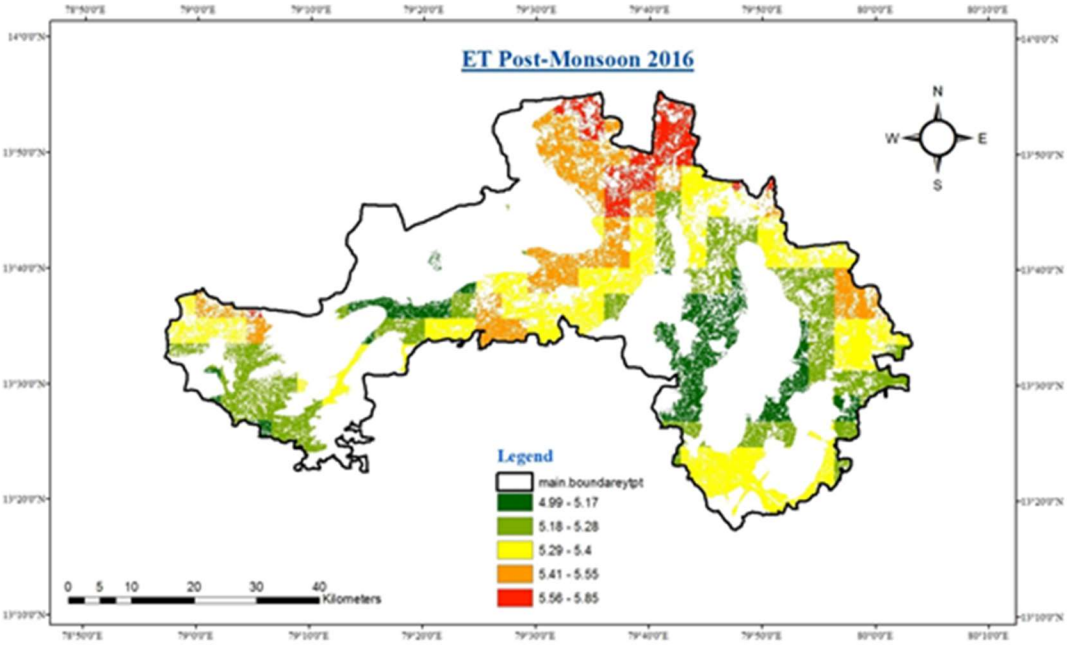

Fig 3. Evapotranspiration in 2016 post monsoon

S.No	Crop	Crop Period	Water Requirement Avg. Value (mm/day)	Water requirement (mm/crop period)	Water requirement (cubic meter/ ha)
1.	Groundnut	140	3.59	502.60	5026.00
2.	Paddy	140	5.73	801.64	8016.40
3.	Sugarcane	365	4.20	1533.73	15337.30
4.	Orchards	365	2.77	1010.87	10108.68
5.	Other Crops	90	1.55	139.77	1397.70

Table 7: Post-monsoon average ET and water requirement per ha

The groundnut crop exhibits an average evapotranspiration of 3.59 in its third position during the post-monsoon season, with a water need of 5026 cubic meters per hectare. The rice crop has the greatest average evapotranspiration (ET) value, whereas sugarcane surpasses it in terms of water

need, with a daily rate of 15331.3 mm/day. This is due to the longer growth time of sugarcane compared to paddy.

S.No	Crop	Water requirement (cubic meter/ ha)	Area (Ha) Pre monsoon			Total Water Consumption (Million Cubic meter / Total Cropped Area)		
			1997	2008	2016	1997	2008	2016
1.	Groundnut	5026.00	26384	20594	20594	132.61	103.51	103.51
2.	Paddy	8016.40	38414	44440	34440	307.94	356.25	276.08
3.	Sugarcane	15337.30	8653	4992	5732	132.71	76.56	87.91
4.	Orchards	10108.68	7563	8463	10402	76.45	85.55	105.15
5.	Other Crops	1397.70	37599	32765	22382	52.55	45.80	31.28

Table 8: Post-Monsoon Water requirement and Consumption for different crops

The water consumption for high water need crops, such as paddy, saw a drop in 2016 as compared to the levels seen in 1997. This occurrence may be attributed to a decline in the overall cultivated land area. Nevertheless, under the provided cropping plan, rice cultivation continued to occupy the top position. The total area under cultivation is mostly allocated to crops other than paddy. However, if the current tendency persists, there is a possibility of further reduction in the cultivated area for paddy, perhaps leading to its replacement by other crops such as orchards, which have shown an increasing trend in cultivated area over the years. Hence, the adoption of System of Rice Intensification (SRI) may be considered for paddy farming, while the implementation of drip irrigation can be recommended for sugarcane production, with the aim of mitigating excessive water consumption in both agricultural practices.

3.8 Other important factors in growth performance of agriculture sector

3.8.1 Fertilizers Consumption

Soil productivity increases with proper fertilizer and manure application. From 2007 to 2016, Tirupati Revenue Division consumed more fertilizers, as seen in Fig. 5.10. Urea, NPK, DAP, and others are used 76, 25, 95, and 200 percent more. Chemical fertilizers have helped farmers grow crops since the 1930s. Chemical fertilizers can cause stream pollution, crop burn, air pollution, soil acidification, and mineral loss. Farmers in these regions should limit fertilizer use and switch to organic farming to naturally increase soil fertility.

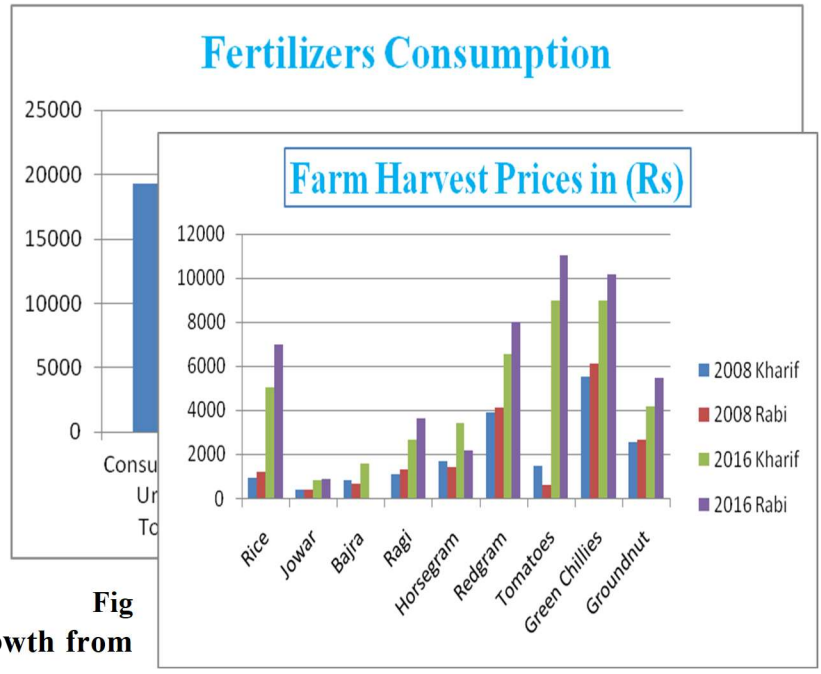

Fig 4. Fertilizers consumption growth from 2007-2016

3.8.2 Farm Harvest Prices

Agricultural harvest prices include product and input prices at various marketing phases. In India, the government's agricultural price strategy tries to ensure growers receive fair prices to stimulate investment and productivity. Annual minimum support prices for main agricultural goods are set after considering Commission on Agricultural Costs and Prices recommendations. In real life, harvesting prices are rising double and triple but minimum support rates are not, so farmers are converting to laborers and losing agricultural land. Fig 5.11 displays agricultural crop harvest prices. Massive increases lead to agricultural deficits. The government will disclose the minimum support price as rates rise.

Fig. 5 Farm harvest prices growth from 2008-2016

3.8.3Agricultural Credit

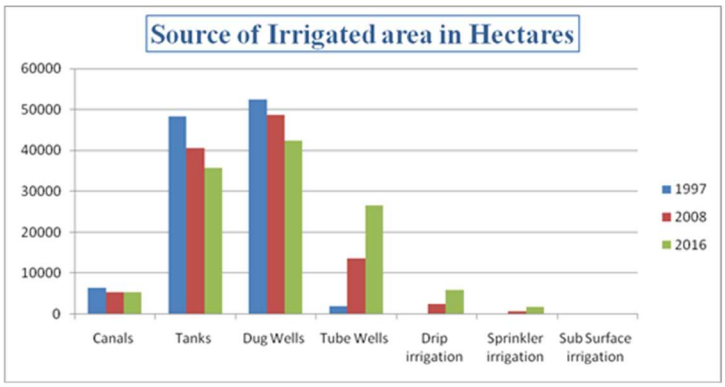
Each economic sector relies on credit. Farmers need credit for investment and working capital. Poor investment credit hinders HYV seed expansion and optimal input use. Like other sectors, agriculture needs easy, appropriate, and timely credit. Even though India has several Rural Financial Institutions (RFIs), the formal banking industry neglects a substantial percentage of the rural population. However, formal Indian banks have rigid credit flows and security-based lending. Additionally, "Long gestation period, lack of educated technical staff to discover potential activity, inadequate eligibility, and security issues contribute to limited loan flow to agriculture. For agriculture financing to move quickly, it must be fixed.

3.8.4 Irrigation system

The Revenue Division's agriculture and allied operations require irrigation, thus the study area's needs must be met. Modern drip, splenkar, and tube well irrigation increases, as seen in Fig.5.12. It is good, but only 10–15% of the remaining land uses traditional methods, which require more water. The irrigation system in this income division has to be changed.

Fig. 6 Irrigation system growth from 1997-2008-2016

3.8.5 Agricultural literacy



Agricultural literacy involves critical thinking and value judgments regarding agriculture's economic, environmental, and social and political impacts. An agriculturally literate person can assess “trade-offs” to people and society from agricultural activities. Decisions and values shape agricultural content. The ability to discuss and make decisions about societal choices shows agricultural understanding.

However, the Revenue division does not have clear statistics on this, and most of the area is rural, and I have seen little agricultural literacy. Thus, farmers must be educated through street performances, night schools, and other techniques to use technology immediately.

3.8.6 HYV, SRI and Mechanization

Modern methods and technology including high-yielding variety (HYV) seeds, tractors, irrigation infrastructure, herbicides, and fertilizers transformed Indian agriculture into an industrial system during the Green Revolution. Mostly found by M.S. Swaminathan. The Green revolution, started by Norman Borlaug, used agricultural research and technology to boost output. Implementation of high yields variety is not complete in study area.

The System of Rice Intensification SRI maximizes farmers' land, labor, and capital returns by lowering their seed, water, and labor needs. This boosts their incomes and helps the environment. SRI plants are resilient to water stress, storm damage, pests, and diseases, which is needed as climate change threatens. This skill may grow in importance. According to the divisional agriculture officer interview, the revenue division has practiced fewer than 20 to 30 hectors of SRI during the past five years. Thus, ground-level technological deployment is crucial for water and agricultural sustainability.

The income division is improving as mechanization continues, but the percentage is low. According to the district statistical handbook, the improvement from 10 years is only 15 to 20% in all types of mechanization. The research region did not properly implement technological mechanization including harvesting machinery and cultivator’s machinery save for land ploughs and electrical pump sets.

3.8.7 Agricultural research staff and centers

The study region had 1–2 agricultural staff per mandal and little technical staff, who were mostly involved in administrative tasks. Most of the study area lacks time to solve basic difficulties. The Southern Zone headquarters, Regional Agricultural Research Station (RARS), Tirupati, is one of two research stations in the study area. The station is 7 kilometers from Tirupati on the Tirupati–Chittoor route. The station was founded in 1979 to research groundnut and groundnut-based agricultural systems, soil and water management, pulses, biofuels, watershed management, and fodders. By 2011, RARS, Tirupati had established Agricultural Polytechnic College in addition to research. Institute of Frontier Technologies was founded in RARS, Tirupati with modern infrastructure and lab facilities to explore biotechnology, bioinformatics, nanotechnology, bio control, soil and water analysis, and quality analysis. The university and Tirupati's best labs are at this institute. Another research station is Krishi Vigyan Kendra, Vanasthali, in Renigunta mandal near Karakambadi. Has district-level Farm Science Centers created by the Indian Council of Agricultural Research (ICAR), New Delhi to speed up technology transfer to farmers. These centers transfer cutting-edge agricultural technologies to end users to boost production and productivity. It collaborates with other agencies. Farmers are interacting with both research sites and answering their agricultural questions. Research is also being implemented locally.

4. Conclusion

In conclusion, the research emphasizes how urgently the study region requires strategic water resource management, in particular as a reaction to the concentrated distribution of current water bodies in the eastern side and the expected gap in water storage projects. The plan that has been presented places an emphasis on the building of modest projects along the Swarnamuki river area. The goal of the strategy is to strengthen water resources in order to facilitate increased agricultural production.

In addition, a technique that is based on remote sensing is used in the research to estimate the amount of evapotranspiration (ET) that occurs in the Tirupati Region. The use of the METRIC method makes it easier to calculate ET values for a variety of crops throughout the pre-monsoon and post-monsoon seasons in the year 2016. The results highlight the enormous water needs of crops such as sugarcane, calling for novel irrigation techniques such as micro-irrigation, with drip and sprinkler systems displaying significant water consumption savings. The findings also call for innovative irrigation strategies such as micro-irrigation.

According to the findings of the study, there is a possibility that excessive water consumption may be reduced by applying the System of Rice Intensification (SRI) for paddy farming and by boosting drip irrigation for sugarcane. In addition, the research identifies fluctuations in farmed areas across various types of crops, which indicates the need for adaptable agricultural techniques. In general, the study produces useful insights for the management of water resources in a sustainable manner, and it argues for the use of contemporary irrigation practices in order to improve water usage efficiency and agricultural yields in the area.

Quantifying Crop Water Consumption and Stress Patterns in Bagpath District, Western Uttar Pradesh: A Comprehensive Analysis Using Multidate Resourcesat Satellite Data

[1] Dr. V.Charan Kumar Reddy, [2] M. Reddi Bhaskara Reddy (Associate Professor), [3] Paavan Kumar Reddy Gollapalli.

[1&2] Department of Geography, Sri Venkateswara University, Tirupati, Andhra Pradesh India.
[3] Secretary, WG-SDTA, International Commission on Irrigation and Drainage

Abstract

This research utilizes remote sensing techniques and incorporates NDVI-based classification methods to estimate crop evapotranspiration (ETc) in the region of Bagpath, located in Western Uttar Pradesh. The approach employs NDVI profiles to accurately map sugarcane-wheat and rice-wheat cropping systems, achieving an accuracy of 86.86% for Kharif crops and 79.72% for Rabi crops. The potential evapotranspiration exhibits seasonal variations, characterized by significant peaks in Kcb values between the months of September and February for both systems. The research examines the variation in ETc, ranging from 3.09 to 6.87 mm day−1, throughout the period of June 2017 to April 2018, with a specific focus on the water requirements for cultivating sugarcane. The dynamics of water stress, as shown by WS_LSWI data, exhibit a correlation with the various phases of crop development, therefore emphasizing the influence of harvesting operations on the levels of water stress.

1. Introduction

Agriculture has significant importance across all economic sectors due to its susceptibility to water constraint. At present, the agricultural sector is responsible for around 70% of the total worldwide freshwater withdrawals. Water has a pivotal role as an essential element in the process of food production. Given the substantial water transpiration demands associated with biomass production, it would not be inaccurate to assert that agriculture serves as both a catalyst and a casualty of water shortage. The exponential increase in population has resulted in significant environmental consequences due to the escalating demands placed on natural resources. The potential effects of climate change on water supplies and water demand, as well as the influence of bioenergy generation on agriculture, are subjects that now lack certainty. Climate change has the potential to modify hydrological patterns and the accessibility of freshwater resources, hence affecting both rain-fed and irrigated agricultural practices (FAO, 2008; FAO, 2011a). There has been seen an augmentation in precipitation levels within temperate regions, along by a decline in precipitation within semi-arid areas. Additionally, there has been noted a heightened variability in the distribution of rainfall, coupled with an overall rise in temperature. The aforementioned factors have a distinct influence on agriculture in tropical and sub-tropical regions. Changes in runoff in rivers and recharging of aquifers have a significant impact on the availability of water, hence exacerbating the strain on water resources caused by human activities.

India has a significant scarcity of water resources, as it accommodates around 16.0 percent of the global population but possesses just 4.0 percent of the available fresh water suitable for use. The irrigation industry is the largest consumer of water resources. Approximately 80% of the global water resources are allocated for the purpose of irrigation. In India, irrigation accounts for almost 80% of the used water resources. The projected water resources of India amount to 4000 cubic kilometers, based on the country's geographical

size of 3.3 million square kilometers and an average annual rainfall of 1170 mm. Approximately half of the water undergoes various processes such as evaporation, percolation, and subterranean flows towards the seas, resulting in a loss. Consequently, only a total of 1953 Billion Cubic Meters (BCM) of water is accessible. According to Phansalker and Verma (2005), the presence of water is subject to temporal and spatial fluctuations, resulting in a further reduction to 1086 BCM. According to estimates, the Annual Water Resource, which measured 2214 cubic meters in 1996, is projected to decrease to 1496 cubic meters by the year 2025. According to Gulati et al. (2005), the Developed Water Resource (DWR) accounts for about 25% of the total accessible water resource.

Low water availability limits plants. Stomata regulate plant water, oxygen, and carbon dioxide flow. Water stress causes stomata to shut to save water, limiting the oxygen, water, and carbon dioxide exchange route and decreasing photosynthesis (Porporato et al., 2001). Thus, water stress affects leaf development more than root growth because roots can adjust. Reduced photosynthesis due to water scarcity reduces crop growth and development. Soil moisture, canopy temperature/evapotranspiration (ET), leaf water content, and LWP affect crop water stress.

Water stress detection helps farmers reduce output losses. Remote sensing and ground-based methods may identify water stress.

Traditional stress assessment methods include predawn leaf water potential (Dixon, 1914), leaf pigment concentration (Lichtenthaler, 1987), leaf chlorophyll fluorescence (Muller, 1874) and ET (Priestley and Taylor, 1972). Predawn leaf water potential estimation employs pressure chamber. This method has measured tree and shrub water relations for 40 years. Manual operation is sluggish and laborious. Leaf water content approach analyzes plant water status by measuring relative leaf water content. Most plant water is in mesophyll cells. The ratio of fresh, dry, and turgid leaf weights determines relative leaf water content. This approach is time-consuming since the water potential difference between stressed and non-stressed plants is largest in the morning. Leaf pigment concentration approach assumes plant pigment concentration changes with species, phenology, and natural and human stress. Chlorophyll levels are higher in healthy plants and lower in stressed ones. Traditional chemical methods involve destructive sample and time-consuming laboratory studies, whereas chlorophyll meters are simple, portable, and fast. Leaf chlorophyll fluorescence is being employed to study photosynthetic equipment. This approach employs a portable optical equipment and fluorescence meter. Photosynthesis is dependent on light, water, and nutrients, which cause plant stress. Thus, this device is a useful diagnostic of plant stress because Chlorophyll fluorescence changes before tissue degradation is noticed in plants, allowing stress to be diagnosed before physical damage. The downside is that this method does not produce commercial instruments. Plant ET is measured with lysimeters.

All ground-based measurements can quantify plant water stress at ground level or local regional level, but not at large geographical scales like remote sensing. Either ground measurement can ground truth remote sensing applications.

Remote sensing for plant and environmental research became popular in the 1980s.Remote sensing provides accurate, quantitative, and timely crop condition data at a lower cost than field approaches (Shen et al., 2009). Remote sensing detects crop growth, stress, and assists agricultural development decisions (Shen et al., 2009). The spectral characteristics of vegetation are determined by leaf internal structure and elements like water, nitrogen, cellulose, and lignin absorption and scattering. Leaves' cellular structure and water content are identified in near and mid-infrared, while their colors are recognized in visible band.

Chlorophyll and water content are key plant stress indicators. Stressed flora has less chlorophyll, which affects leaf pigment light absorption. Therefore, it directly impacts plant spectral signature by lowering

green band reflection and increasing blue and red band reflection, modifying normal plant spectral signature. Thus, Visible, Near Infrared (NIR), SWIR, and TIR bands may detect water stress. Vegetation water stress index (VWSI) and Land Surface Wetness Index (LSWI) are SWIR and NIR indices (Ghulam et al., 2007), while Crop Water Stress Index (CWSI) and Water Stress Index (WSI) are TIR indices.

Precision agriculture depends on irrigation scheduling to avoid water stress and maximize production under restricted water circumstances, hence satellite monitoring of vegetation water stress is crucial. This research used optical data to diagnose sugarcane water stress in Bagpath, western UP.

2. Study Area

The study area includes Bagpath, located in Western Uttar Pradesh. The Western U.P region makes a significant contribution to the overall food grain output, accounting for 34 percent at the state level and 6 percent at the national level. The prevailing agricultural produce in this area is sugarcane.

The research region is situated within the latitudinal range of 28.8 degrees to 29 degrees and the longitudinal range of 77 degrees to 77.5 degrees. The western region is geographically demarcated by the presence of the Yamuna River, which serves as a natural boundary separating it from the neighboring states of Haryana and Delhi. The research was carried out in the Bagpath district located in western Uttar Pradesh.

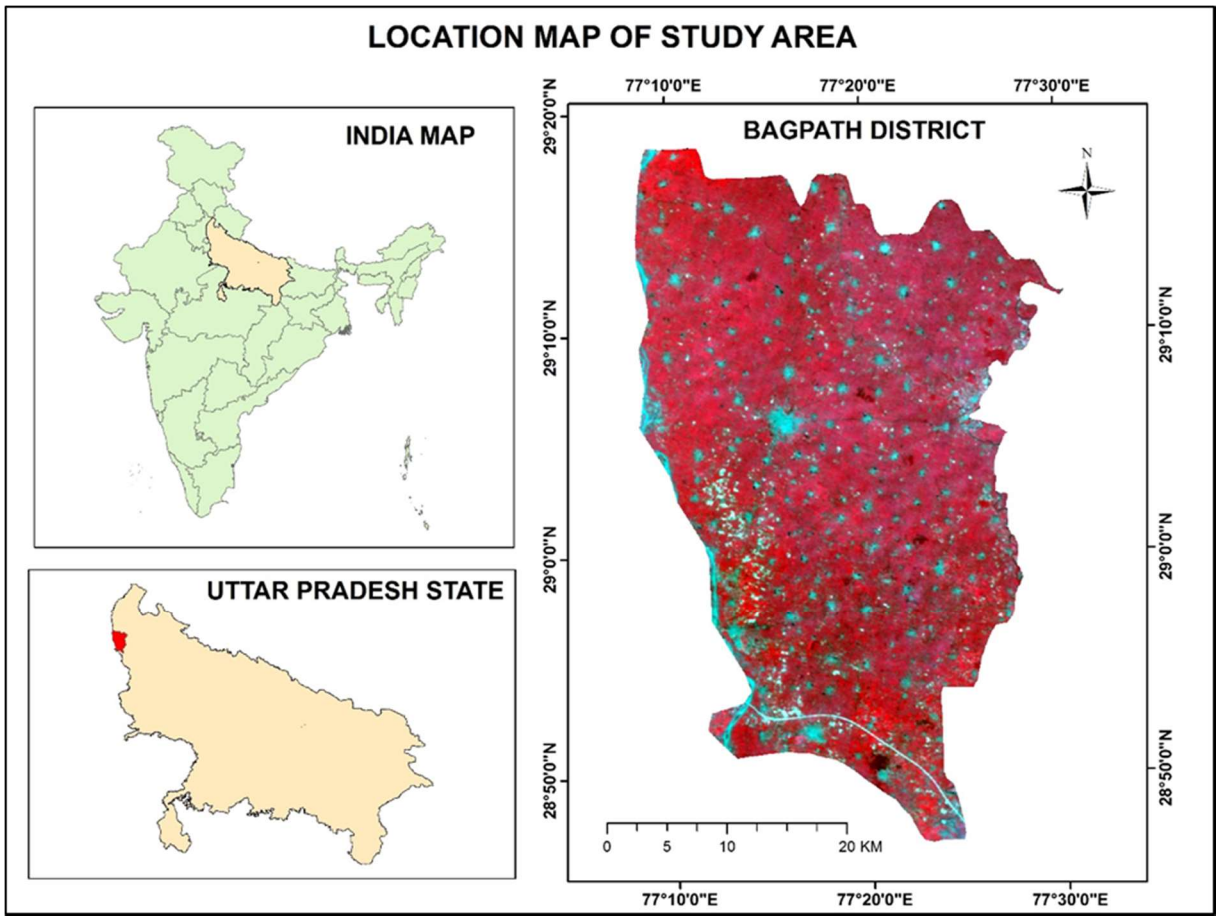

Fig 1. Location Map of the study area

2.1 Soils

Western UP soil is coarse-to-medium alluvium and somewhat alkaline. Their dark gray color indicates considerable organic matter. Loam and silty clay loam cover much of the terrain. 2016 (Nitika et al.)

2.2 Farming Method

Farmers' main business is crop production. This area also farms dairy. Agro-horticulture and agro-forestry are other growing agricultural industries in this area. Sugarcane dominates this region's commercial crop. Due to delayed sugarcane harvesting, wheat field preparation begins in November and lasts until the second week of December. Over 90% of land is irrigated wheat, which receives 4–5 irrigations. 2016 (Nitika et al.)

3. Materials and Methodology

Evapotranspiration of crops ETc provides the foundation for agricultural water needs assessment and irrigation control. This study evaluated ETc using satellite-derived ETo and Kcb. ETc was calculated for the whole research region after satellite image preprocessing. ETo is most often calculated using the FAO-56 technique, which is retrieved daily from MOSDAC. NDVI is used to determine the basal crop coefficient Kcb, as detailed below.

3.1 Data Used

Satellite products, supplementary data, and software were employed to fulfill the study's goal.

3.2 Remote sensing data

Table 3.2 lists the satellite dataset utilized in this investigation.1. AWIFS data was unavailable in February, March, and April 2018, hence Sentinel data was utilized.

S. No	Data Type	Date of Acquisition	Resolution
1	Sentinel-2A	25th April 2018 26th March 2018 14th February2018	10 m (Resampled to 56 m)

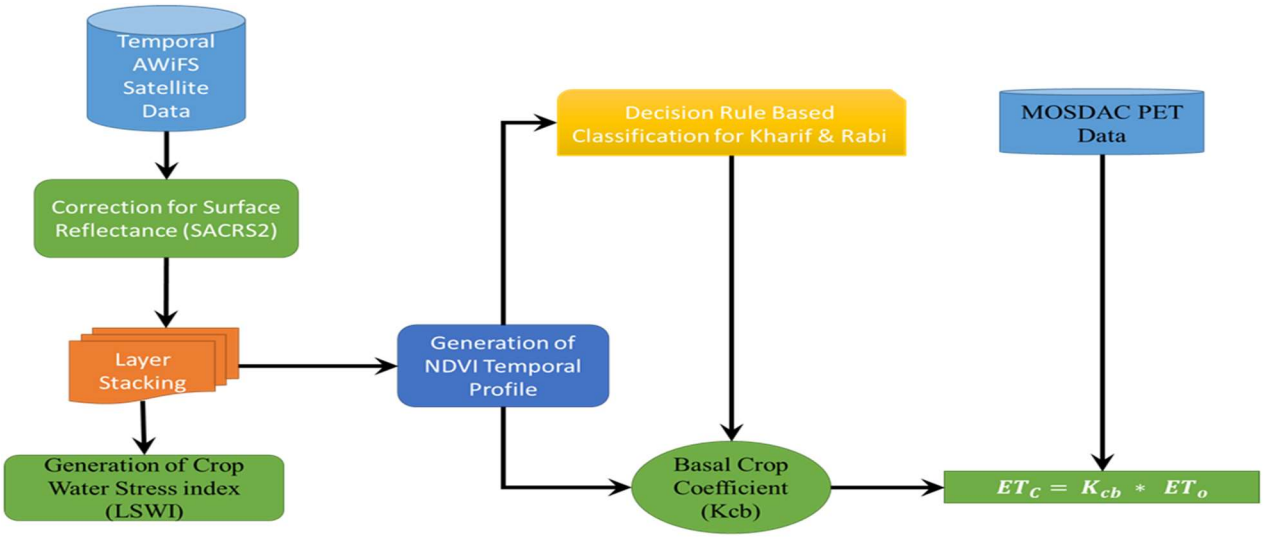

Fig 2. Methodology flowchart

3.3 Basal Crop Efficient

Estimating crop ETc for irrigation scheduling using crop coefficient methods is common. Generalized crop coefficient curves in the literature only estimate ETc for "optimum" crop conditions within a field, which must be modified for local conditions and cultural practices and adjusted for seasonal crop and weather variations. Thus, generalized crop coefficient uncertainties may lead to ETc predictions that are considerably different from real ETc, which might lead to poor irrigation water management. Crop attributes like percent cover and leaf area index may be modeled using vegetation indices (VIs) to quantify real-time crop fluctuations from remotely-sensed VI measurements. VIs can also predict the basal crop coefficient (Kcb) for maize and cotton, according to limited studies. This study estimated Kcb using NDVI measurements.

$$\boldsymbol{K_{cb}} = \boldsymbol{K_{cb\,max}} \frac{(\boldsymbol{NDVI - NDVI_{min}})}{(\boldsymbol{NDVI_{max} - NDVI_{min}})} \qquad (1)$$

Where $\boldsymbol{K_{cb\,max}}$ is Basal crop coefficient and $\boldsymbol{K_{cb\,max}}$ is Basal crop coefficient at effective full ground cover i.e., (Hunsaker, 1994)

3.4 Evapotranspiration potential

INSAT 3D is a geostationary meteorological satellite launched in 2013 as an exclusive INSAT spacecraft. This radiometer has four bands: wide VIS (0.52-0.75), SWIR (1.55-1.70), MIR (3.8-4.0), WV (6.5-7.0), and thermal TIR1(10.2-11.2), TIR2 (11.5-12.5) with 19 sounder channels. VIS and SWIR have 1 km x 1 km spatial resolution, whereas MIR, WV, and two thermal IR bands have 4 km x 4 km. INSAT Meteorological Data Processing System (IMDPS) automates ‘full-globe’ and ‘sector’ data products in all bands at half-hour intervals at 4 km spatial resolution. Daily purchases are limited to 48.

Evapotranspiration (ET) drives the hydrological cycle. ET is unique in its position as a link between the energy and water cycles. Solar radiation, wind speed, air temperature, and vapour pressure deficit affect ETo. Solar radiation is the most sensitive, affecting ETo variability by 60-70%. PET, also known as grass reference ETo, is the quantity of water transferred per unit time to atmosphere from a water-non-limiting surface covered with evenly and actively growing short grass like Alfalfa. ETo is the atmospheric evaporative demand for a given climate. Water stress results from moisture deficiency. Reference Evapo-transpiration is a hydrological and agricultural variable. It is a crucial input in soil water balance models together with precipitation. Many of these models use daily or hourly evapotranspiration data to predict plant water needs. The regional water demand would vary by agroclimatic conditions and agricultural season. Space rainfall and ETo may enable rainfed agriculture monitor water shortfall and excess throughout growing season. PET product accuracy is 80-90% (INSAT-3D Manual, 2015).

3.5 Crop Evaporation Transmission

Crop ETc is the evapotranspiration of a disease-free crop produced in wide fields with plenty of water and fertilizer (Doorenbos and Pruitt, 1977). Calculating soil water balance and irrigation schedule requires ETc estimation. Weather and crop conditions determine ETc. ETc is mathematically represented as $\boldsymbol{ET_C = K_C * ET_O}$ (2)

Kc is the crop coefficient, which varies by crop and growth stage, and ETo is the reference crop evapotranspiration.

3.6 Land Surface Wetness Index

LSWI assesses stress using NIR and SWIR. This measure is sensitive to soil background and total vegetation liquid. LSWI was estimated using this equation:

LSWI=NIR-SWIR/NIR+SWIR (3)

Water stress scalar (Ws) was calculated using estimated LSWI (Xiao et al., 2005).

$$W_S = \frac{1-LSWI}{1+LSWI_{max}} \quad (4)$$

Where LSWI is pixel value and LSWImax is maximum pixel LSWI value for growth season.

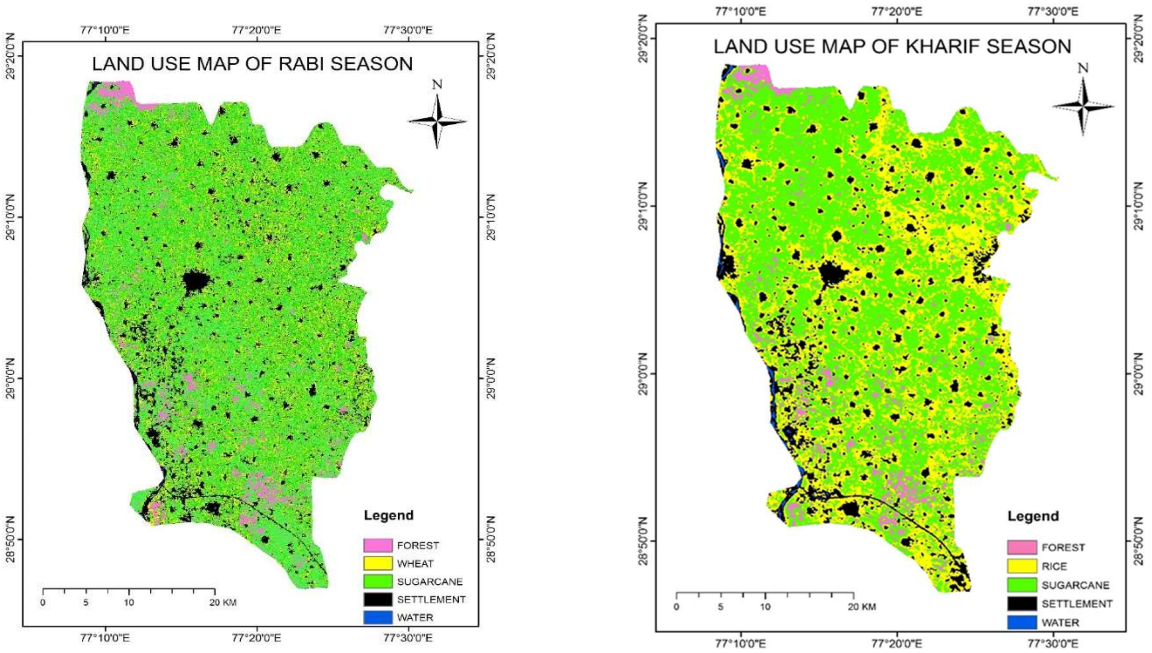
4. Results and Discussion

4.1 Crop discrimination

Each crop has a distinct spectral signature, therefore remotely sensed data can distinguish crops. Typical crop spectral reflectance displays pigment absorption in visible area (0.62-0.68 m) and significant near infrared reflection owing to leaf cellular structure. Red absorption and near-infrared reflectance indicate crop health (Navalgund et al., 1991b).

A rule-based classification analysis identified and distinguished rice, sugarcane, and wheat crops from other land use/land cover groupings. Rule-based feature selection using basic mathematical logics is successful. For crop discrimination, AWiFS temporal NDVI was utilized to create rules based on NDVI values of

various seasons, such as September. The transformation NDVI*127.5+127.5 linearized NDVI values between 0-255 (Ray S S et al., 2000).



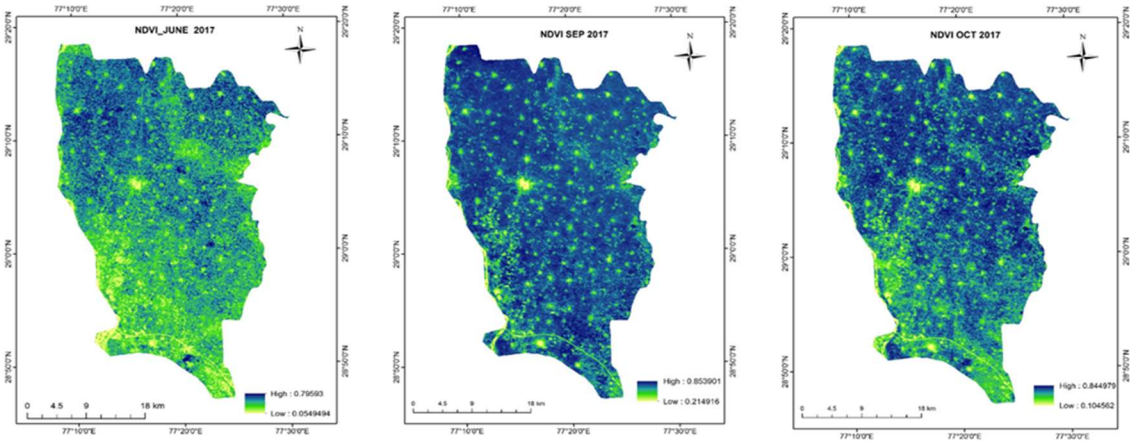


Fig 3. Shows the crop inventory map of Kharif Season & Rabi Season

4.2 NDVI Variation Throughout the Crop Season

A time-series of NDVI was created from all 9 AWiFS dates throughout crop growing seasons. Figure 4 show the 2017–2018 Kharif and Rabi NDVI temporal and geographical variance in the research region. NDVI peaks in November, whereas Rabi season (November–April) peaks in February. The greatest NDVI score indicates crop peak growth in Kharif and Rabi seasons. Kharif season had a higher average NDVI than Rabi season, perhaps owing to factors that accelerated crop growth: Higher rainfall (south-west monsoon), increased photosynthesis due to longer sunny hours, and wider crop area in Kharif season.

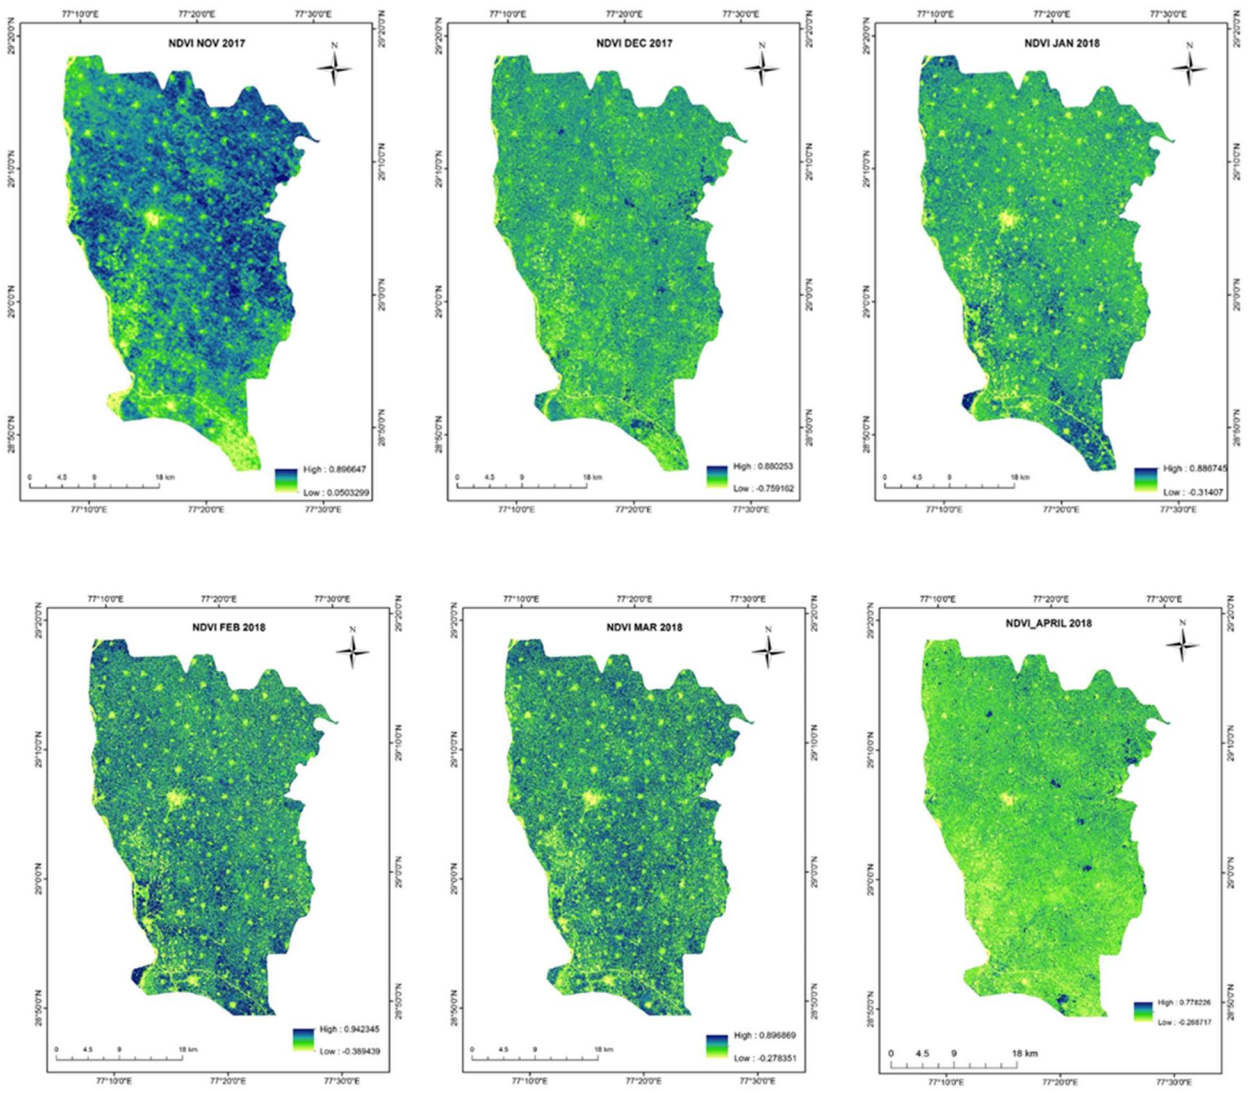

Fig 4. Spatial distribution of NDVI for June 2017 to April 2018

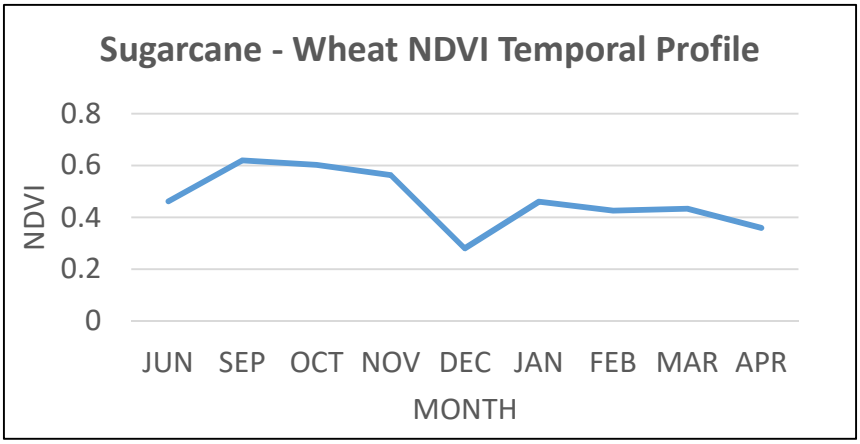

Fig 5. Temporal variation in NDVI for sugarcane–wheat cropping system

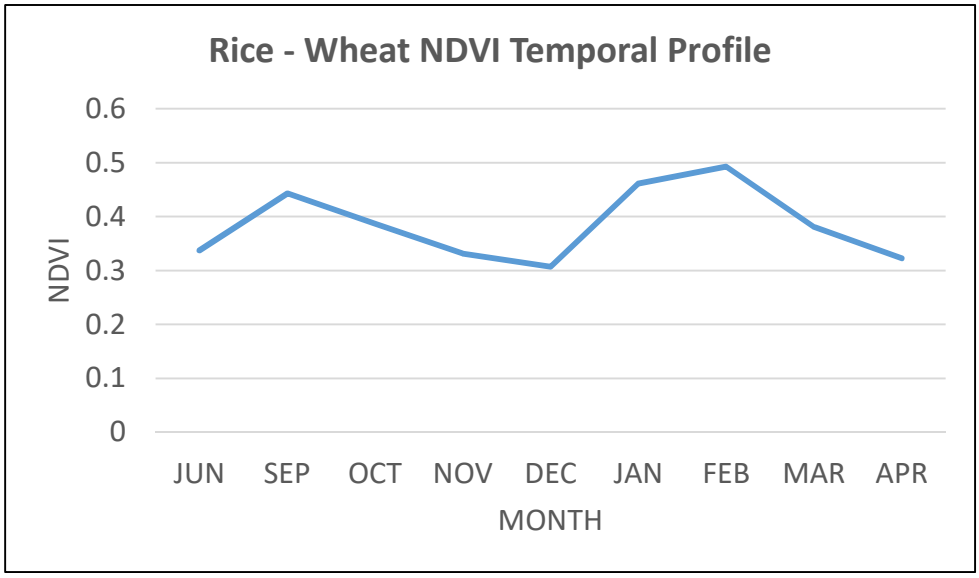

Fig 6. Temporal variation in NDVI for rice–wheat cropping system

The Normalized Difference Vegetation Index (NDVI) exhibited variability in relation to different crops and their phonological progression throughout the course of the growing season. The temporal fluctuations in NDVI for the sugarcane-wheat cropping system and the rice-wheat cropping system are shown in Figure 5 and 6, correspondingly. Figure 5.23 clearly demonstrates a decrease in NDVI values during December 2017. This decline corresponds to the development of wheat throughout the winter season after the harvest of sugarcane, as well as the early vegetative stage of sugarcane. The majority of the sugarcane crop was gathered in the month of December under the sugarcane-wheat agricultural system. Furthermore, a well-defined Normalized Difference Vegetation Index (NDVI) curve was found for the rice-wheat cropping system (refer to Figure 6). This curve clearly illustrates the trend of NDVI values while the rice and wheat crops undergo continuous phonological growth. These fundamental factors have effectively distinguished between the two systems. The observed NDVI patterns in this study exhibit similarities to the NDVI patterns reported by Kumari et al. (2013) in the context of sugarcane-wheat and rice-wheat cropping systems.

4.3 Basal Crop Coefficient

NDVI was used to derive the basal crop coefficient. The spatial representation of maps is below. Kcb and ETc fluctuated with crop and phenological development throughout the season, affecting crop water requirements. Fig.7 shows the temporal change of Kcb in Rice-Wheat and Sugarcane-Wheat cropping systems. Fig.7 show a fall in November and December 2017 owing to rice harvesting from Kharif season and a rise in Rabi season wheat transplanting. Rabi season adopts same profile. When temporal profile peaks, crop plant growth is maximum, hence water requirements are higher. The rice-wheat cropping system peaked in September and February with Kcb values of 1.2 and 1.23. In sugarcane-wheat cropping

system, Kcb temporal profile peaks in September and February with values of 1.24 and 1.03, although wheat peak value is low, perhaps because to mixed pixel combination with immature sugarcane plantings.

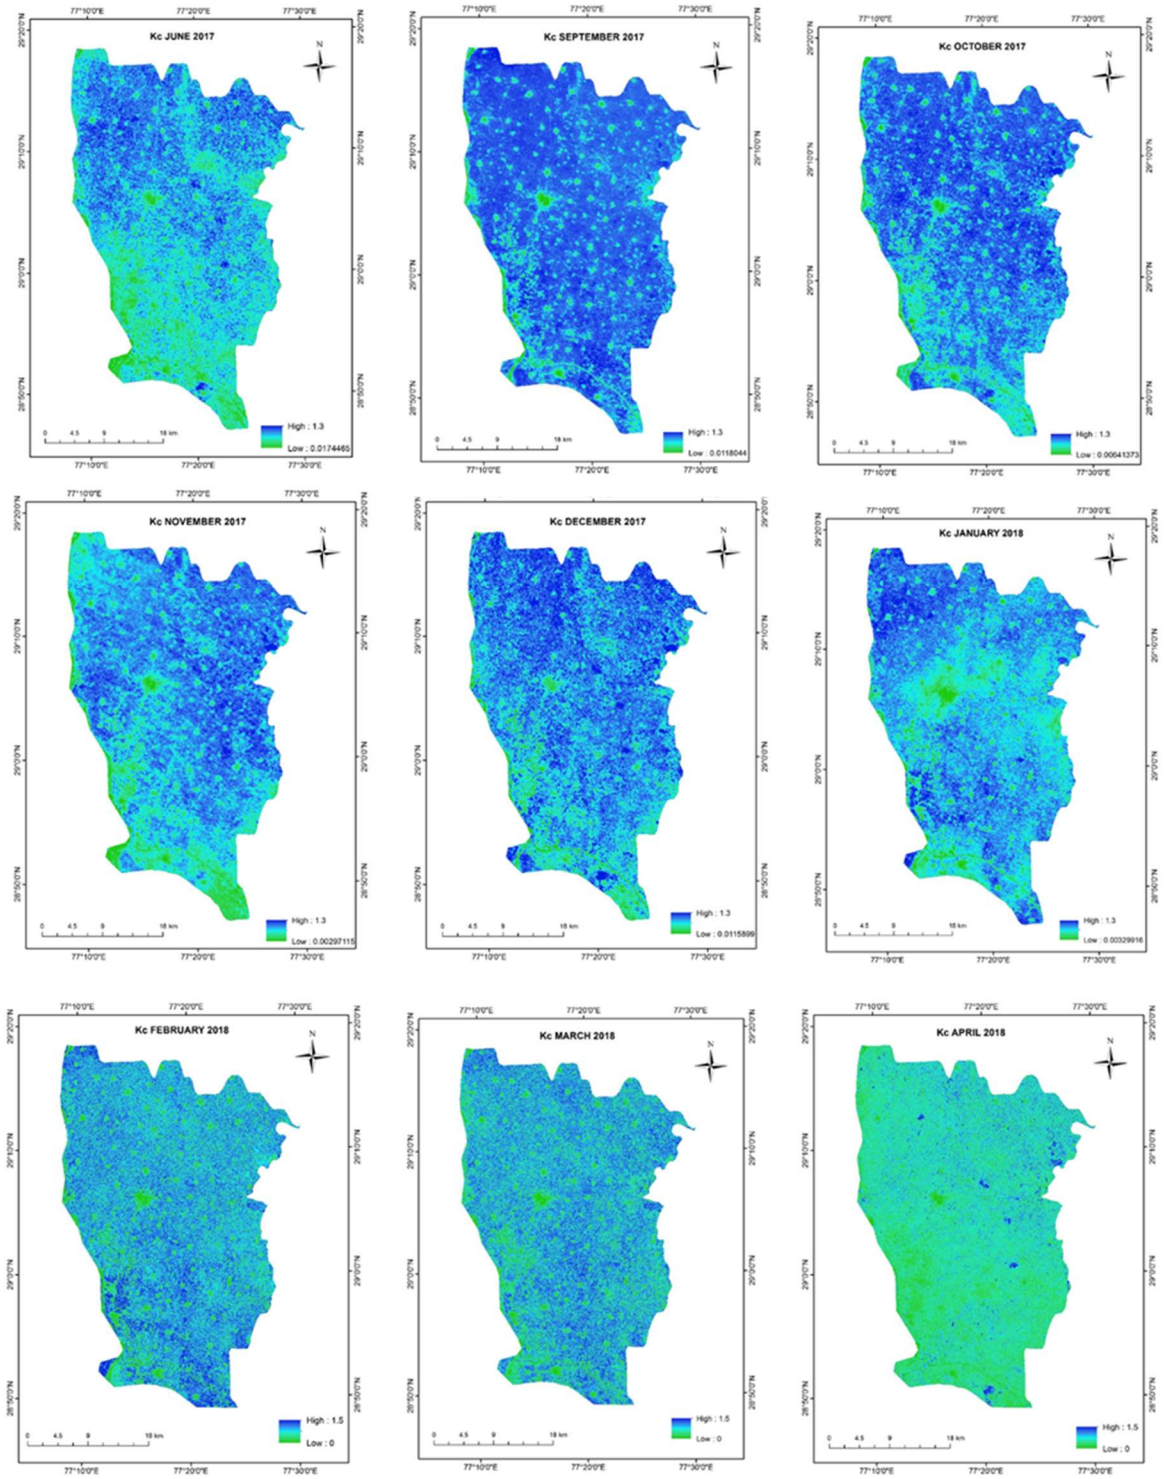

Fig 7. Spatial distribution of Kcb for June 2017 to April 2018

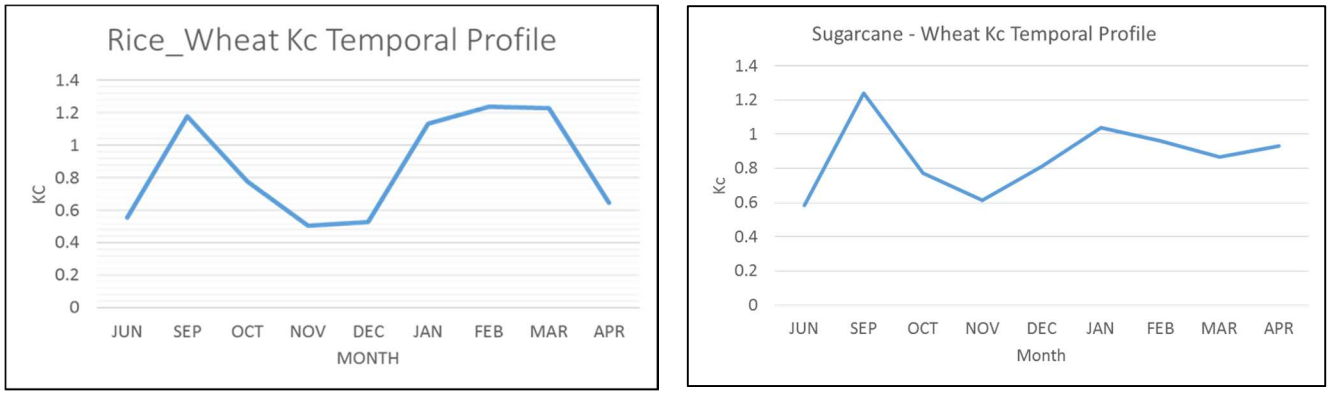

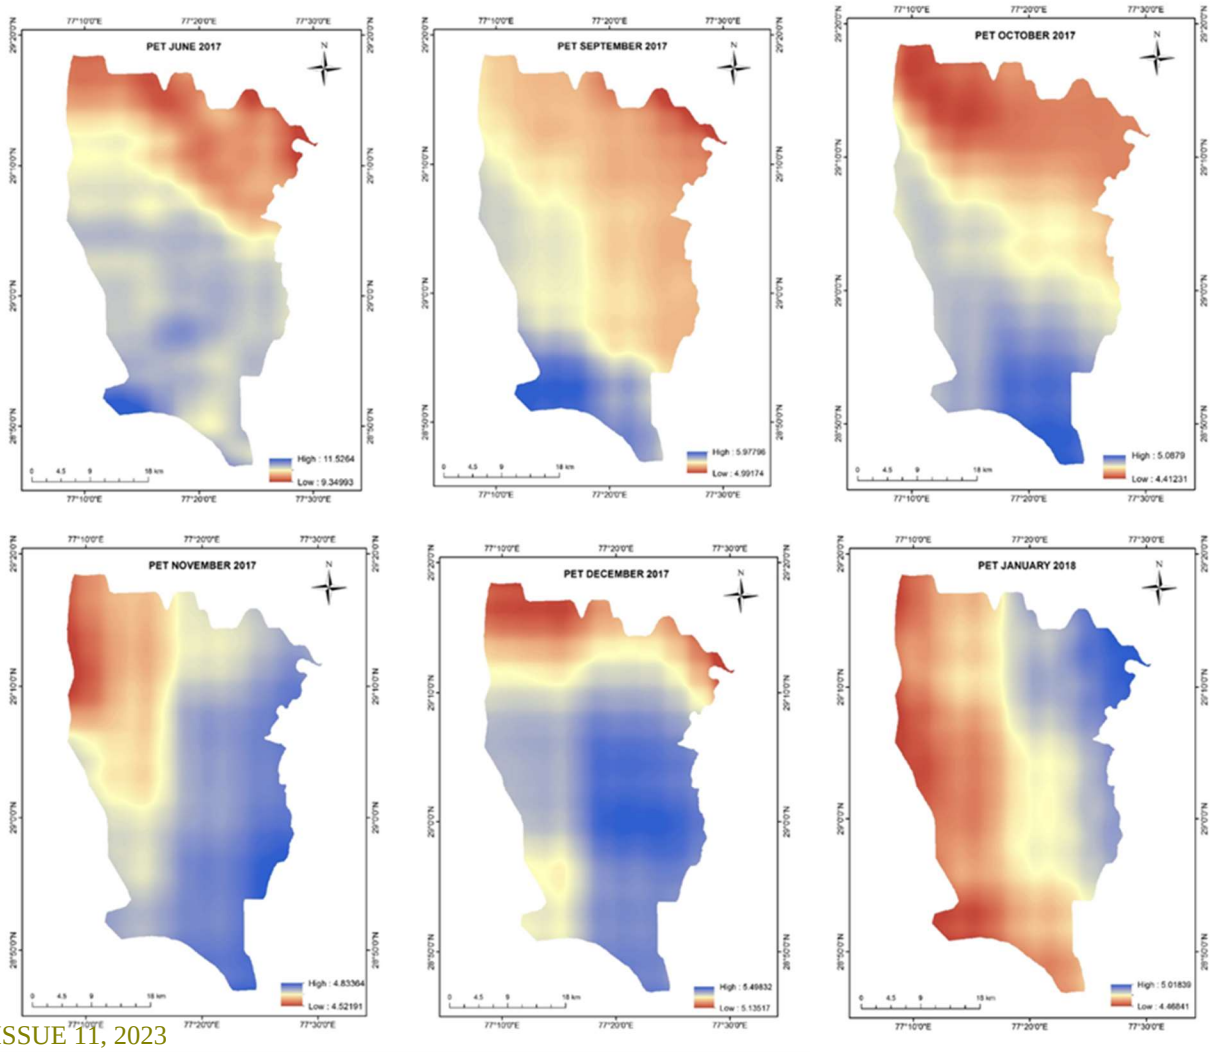

Fig 8 Temporal variation in Kcb for rice–wheat & sugarcane–wheat cropping system

4.4 Potential Evapotranpiration

The daily PET data downloaded from MOSDAC with a resolution of 5 km is resampled to 56 m resolution of AWiFS data. This is a daily average data product and the units of the PET data is in mm/day. The accuracy of the PET product is about 80-90% (INSAT-3D Manual, 2015). The temporal variation of daily PET as shown in figure 9. In Kharif and Rabi season the average value of PET in ranges between 4.41 to 5.91 mm/day and 3.30 to 5.42 mm/day

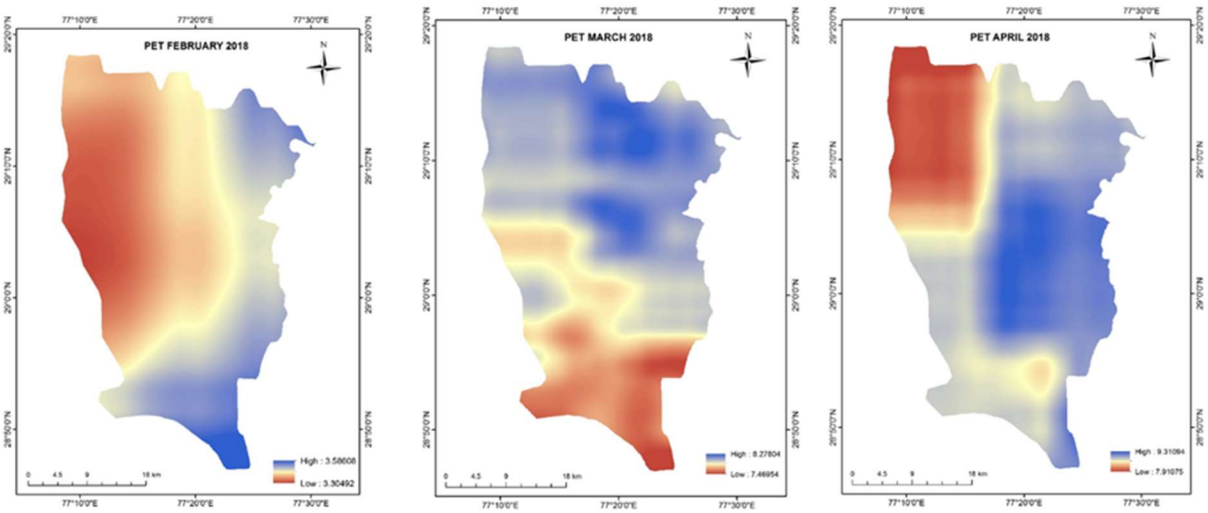

Fig. 9 Spatial distribution of PET (mm/day) for June 2017 to April 2018

4.5 Crop Evapotranspiration

The daily data from the PET (Potential Evapotranspiration) has been multiplied by the base crop coefficient (Kcb). The analysis of actual evapotranspiration (ET) based on the baseline crop coefficient and potential evapotranspiration (PET) reveals a marginal increase in ET during the month of November, followed by a fall in February. This may be attributed to the growth of sugarcane in November, with a significant portion being harvested by December. Lower readings are being recorded in February owing to the early vegetative development of wheat. The monthly photos exhibit a discernible pattern in the geographical distribution of monthly evapotranspiration. The evapotranspiration (ETc) exhibited a range of 3.09 to 6.87 mm day−1 throughout the period from June 2017 to April 2018. It is noteworthy that the mean ET value for sugarcane cultivation was determined to be 4.29 mm day−1. Sugarcane, a significant agricultural commodity in the nation, necessitates a substantial amount of water over its whole growth cycle, which typically spans 12 to 18 months. The specific duration may vary based on the agro-climatic areas, which range from sub-tropical to tropical. The crop's yearly water need in sub-tropical states like as Uttar Pradesh, Punjab, Haryana, and Bihar has been estimated to be 2000 mm (Shukla, S.K, 2017). The Food and Agriculture Organization (FAO) suggests that the range for this requirement falls between 1500-2500 mm. The estimated annual water demand for sugarcane in our research region is 2316.6 mm over a period of 18 months, and 1544.4 mm over a period of 12 months. The graphic shown below illustrates the spatial distribution of evapotranspiration (ET) and its temporal change.

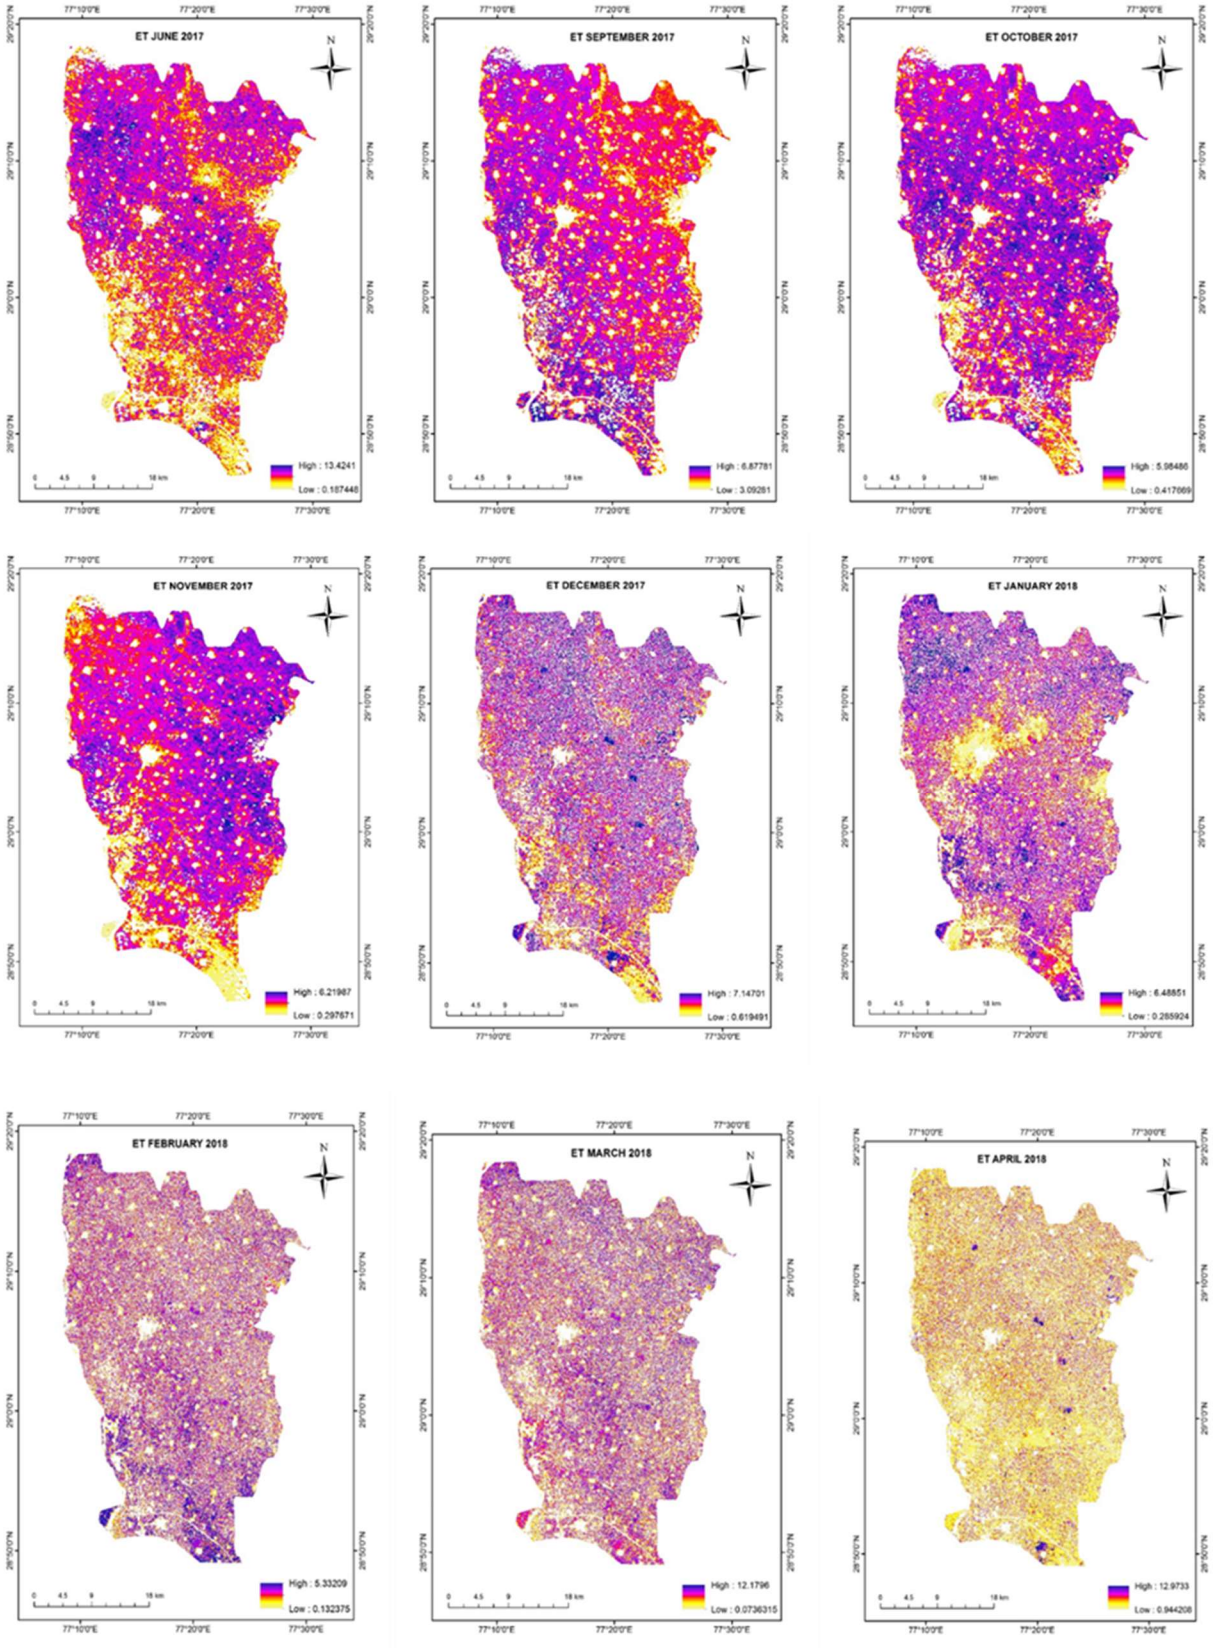

Fig. 10 Spatial distribution of Daily ET (mm/day) for June 2017 to April 2018

4.6 Land Surface Wetness Index (Lswi)

Land surface wetness index is a linear combination of NIR and SWIR bands. LSWI value ranges between -1 to +1 (Xiao et al., 2005).

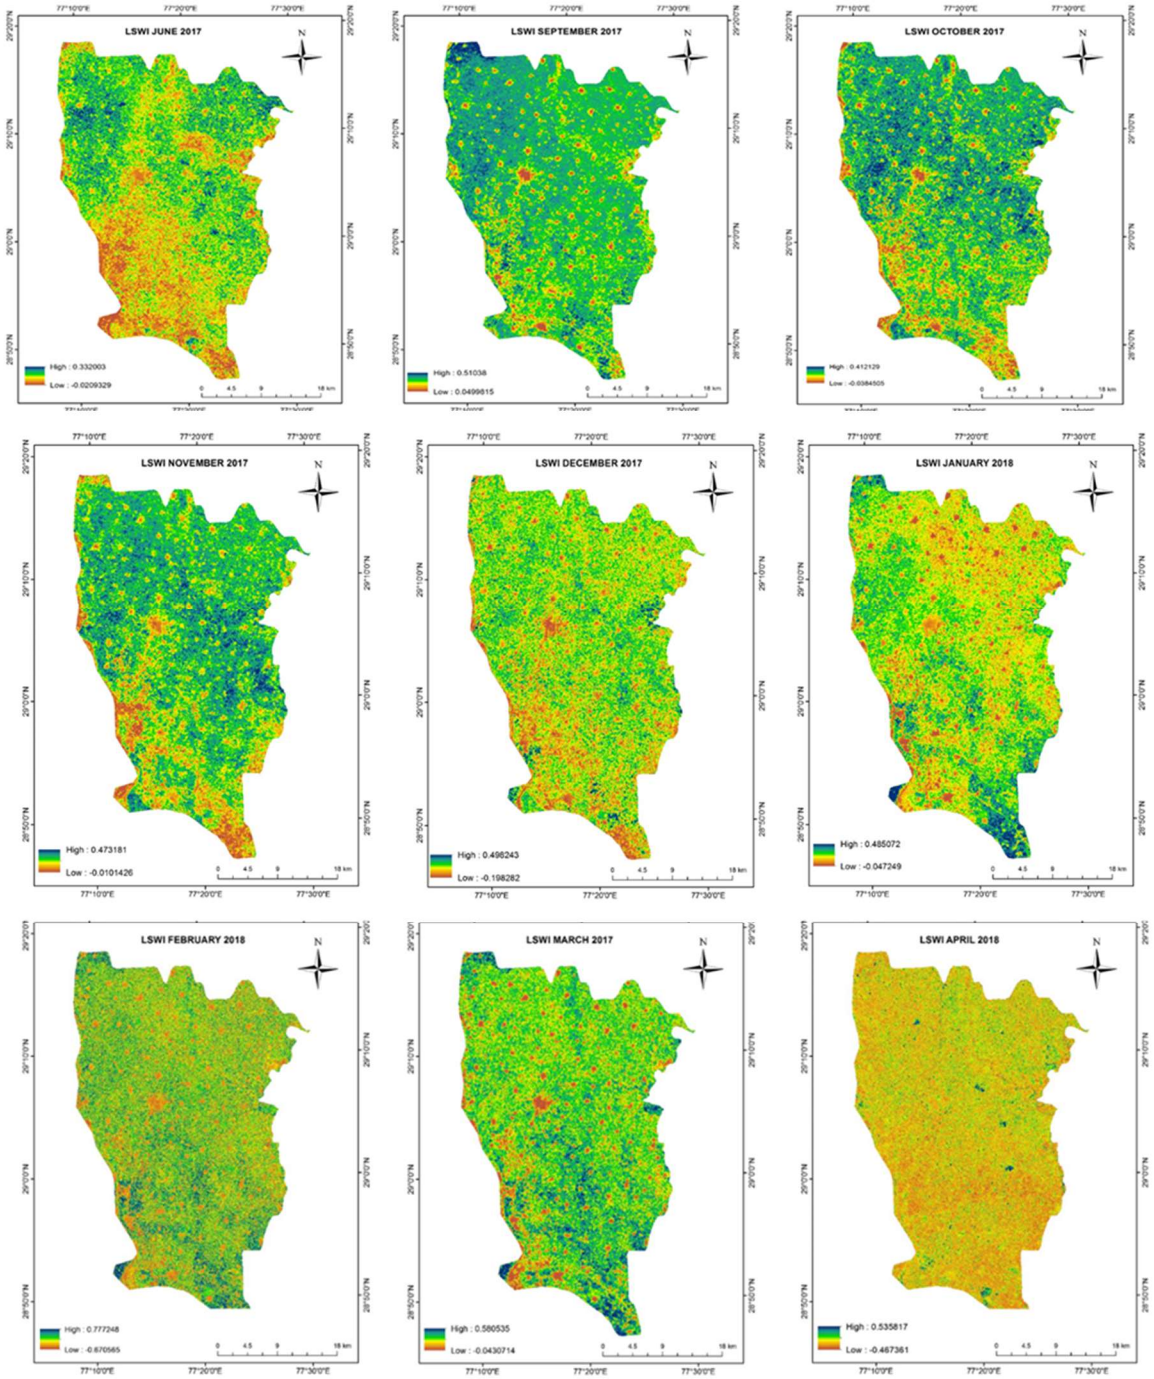

Fig. 11 Spatial distribution of LSWI for November 2017 to April 2018

4.7 Water Scalar Land Surface Wetness Index (Ws_Lswi)

The index is characterized by a numerical scale ranging from 0 to 1, with 0 denoting the absence of stress and 1 representing the presence of severe stress. The time distribution of water scalar may be noticed in Figure 5.71. Based on the findings from the period spanning June 2017 to January 2018, the observed trend may be attributed to the successive cultivation of kharif crops followed by rabi crops, leading to increased strain on the agricultural system. Subsequently, from February to April, the recorded values indicate a decline, which can be attributed to the commencement of crop harvesting during this period. In the month of June, a stress level of 0.56 was detected. However, in the subsequent months of September and October, the stress level exhibited a declining trend due to the increased vegetative development of sugarcane and rice crops. In November, there was a modest rise in the stress level, and by December, the value reached 0.50. This increase in stress may be attributed to the harvesting activities of rice and the presence of older sugarcane farms. The water scaler values show a decline subsequent to December, indicating a decrease in water stress. This trend aligns with the development of wheat crops occurring in January, February, and March. However, in April, a greater level of stress is noticed, as indicated by a value of 0.69, which may be attributed to the harvesting of wheat during this period.

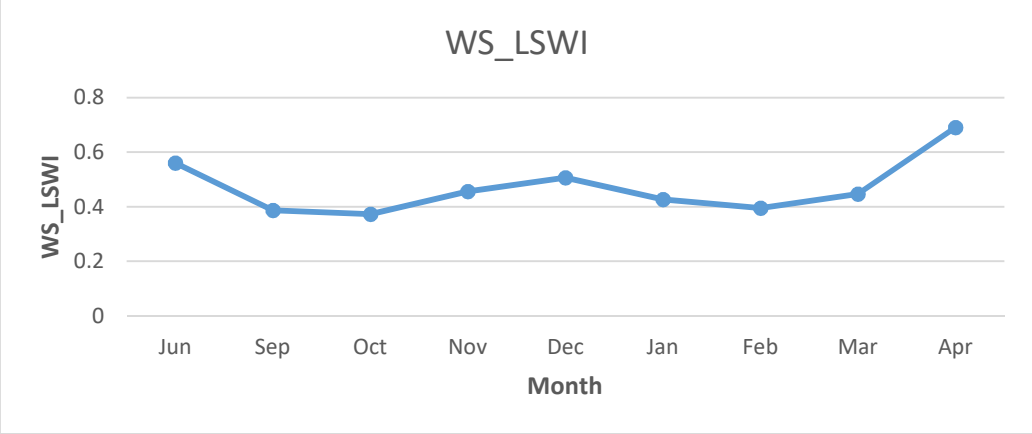

Fig. 12 Temporal variation in WS_LSWI

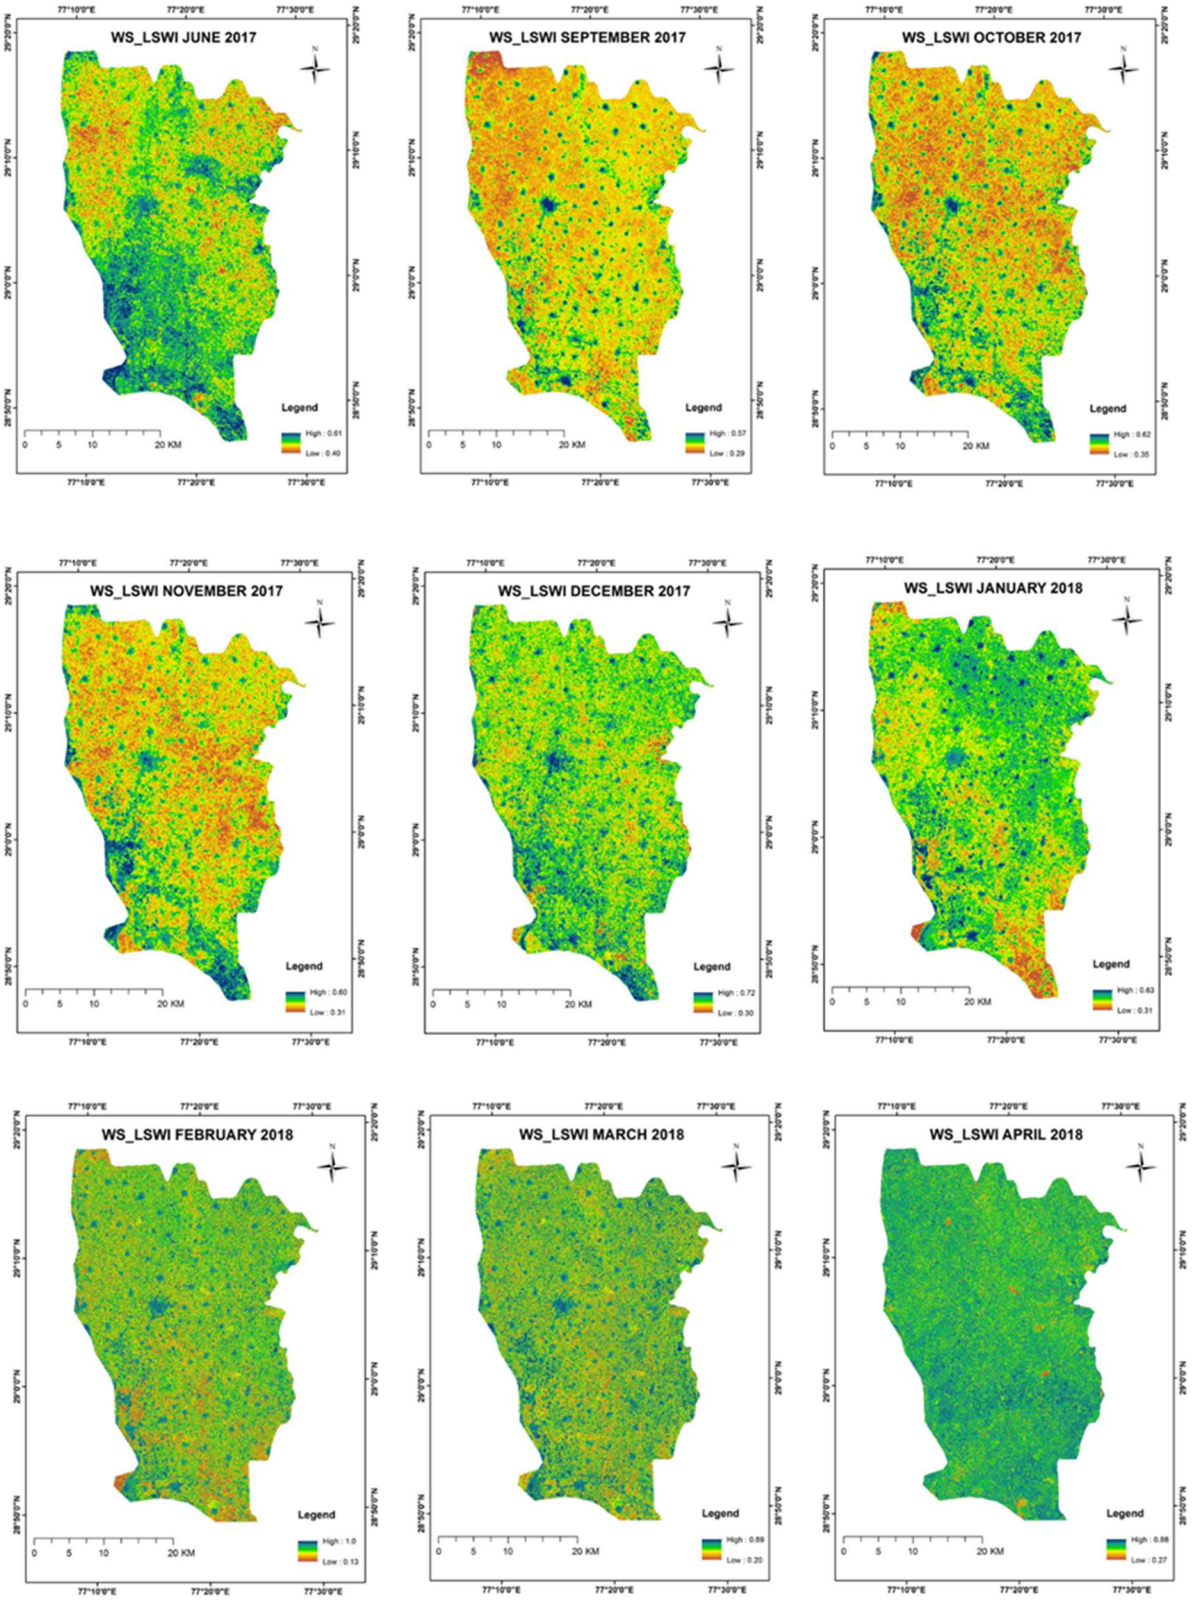

Fig. 13 Spatial distribution of WS_LSWI for June 2017 to April 2018

CONCLUSIONS

The current work used a remote sensing-based technique to estimate crop evapotranspiration (ETc) from Bagpath, located in Western Uttar Pradesh. A rule-based classification using the Normalized Difference Vegetation Index (NDVI) was conducted to classify Kharif and Rabi Seasons. This included establishing thresholds for various classes within the research region. The resulting classification achieved an overall accuracy of 86.86% for Kharif crops and 79.72% for Rabi crops. The kappa coefficients for Kharif and Rabi crops were determined to be 0.81 and 0.712, respectively. The assessment of the NDVI profile effectively covers the growth season of the sugarcane-wheat and rice-wheat cropping system, allowing precise crop mapping within the designated research region. During the Kharif and Rabi seasons, the mean potential evapotranspiration (PET) varies from 4.41 to 5.91 mm/day and 3.30 to 5.42 mm/day, respectively. In the rice-wheat cropping system, a notable surge was seen between the months of September and February, with corresponding Kcb values of 1.2 and 1.23, respectively. The temporal profile of Kcb in the sugarcane-wheat cropping system exhibits peaks in the months of September and February, with corresponding values of 1.24 and 1.03, respectively. However, it is seen that the peak value of wheat is relatively lower, which might perhaps be attributed to the presence of mixed pixels resulting from the mixture of young sugarcane plants. The evapotranspiration (ETc) exhibited a range of 3.09 to 6.87 mm day−1 throughout the period spanning from June 2017 to April 2018. It is worth noting that the average ET value for sugarcane cultivation was determined to be 4.29 mm day−1. The estimated yearly water demand for sugarcane in our research region is 2316.6 mm over a period of 18 months and 1544.4 mm over a period of 12 months. The WS_LSWI data was collected between June 2017 and January 2018. In the month of June, a stress level of 0.56 was recorded. However, in the subsequent months of September and October, the stress level exhibited a downward trend due to the significant rise in vegetative development of sugarcane and rice crops. In November, there was a modest increase in stress levels, which may be attributed to certain factors. Finally, by December, the stress level reached a value of 0.50, likely due to the harvesting activities of rice and the presence of older sugarcane farms. The water scaler readings show a decline subsequent to the month of December, indicating a decrease in water stress. This decline coincides with the growing period of the wheat crop, which occurs mostly in the months of January, February, and March. However, in April, a greater level of water stress is detected, with a recorded value of 0.69. This increase in stress may be attributed to the harvesting of the wheat crop during this period.

Enhancing Urban Resilience: An Innovative Software Model for the Design and Administration of Gully Control Structures in Storm Water Systems

[1] Dr. V.Charan Kumar Reddy, [2] Paavan Kumar Reddy Gollapalli, [3] M. Reddi Bhaskara Reddy (Associate Professor)

[1&3] Department of Geography, Sri Venkateswara University, Tirupati, Andhra Pradesh India.
[2] Secretary, WG-SDTA, International Commission on Irrigation and Drainage

Abstract

Gully control structures are primarily used for the sake of soil and water conservation, as well as the development of plants. These structures are comprised of dams of many designs that are built with the intention of stabilizing the slope, storing water, and mitigating the speed of runoff. Software models refer to abstract representations or descriptions of software systems, which are used to facilitate understanding, analysis, and design of these systems. Various design options for permanent gully control structures are now available on the market. However, the focus of our work is on evaluating these options. An endeavor was initiated to build software that offers a simplified manner for the design of check dams. Permanent gully management structures are engineered interventions designed to mitigate the erosive effects of gullies in a long-lasting manner. The model was built with the Visual Studio 2013 software. The validation of GCS_Designer was observed in the check dam, resulting in an error of 2.7523%. The highest value for the lowest compressive stress was determined, with an associated error of 0.0681%. The minimum length requirement for the check dam. A total of 25 criteria are taken into consideration. The validation of GCS_Designer for check dam involves assessing the percentage of compliance with the 10 parameters. The error and remaining values indicate a zero % error. The aforementioned figures are subject to an overestimation of 80%. The positive value is seen, whereas the remaining numbers indicate an underestimation. The drop spillway has a length of 28.6 units. The percentage of values that are overestimated is greater than the percentage of values that are underestimated, with 71.4% of values falling into the latter category. In a similar vein, a mistake has been identified. The event took place at a drop inlet spillway, involving a total of eight parameters. It is worth noting that 87.5% of the values examined did not exhibit any errors. the present study, we aim to investigate the impact of social media on adolescent mental health. The design of chute spillways resulted in overestimation and underestimation of values, with 87.5% and 12.5% respectively. Please provide individual estimates for each item. Design considerations may be undertaken for the construction of a check dam, drop spillway, drop inlet spillway, and chute. The GCS_Designer program was used with great effectiveness to design a spillway that is adequate for the local circumstances.

1. Introduction

The issue of soil erosion in India exhibits significant variation in terms of extent, intensity, and characteristics throughout various regions of the nation. These variations are influenced by factors such as climate, terrain, soil composition, land use, and the prevailing agricultural economy. According to the research conducted by Dhruva and Ram in 1983, it was shown that soil erosion occurs at a rate of about 5334 metric tons per year, equivalent to 16.35 metric tons per hectare, alone as a result of agricultural and related activities.

The rivers of the nation transport around 2052 metric tons, equivalent to 6.26 tons per hectare. Approximately 29% of the total eroded soil, amounting to roughly 1572 million metric tons, is transported annually by rivers to the sea. Additionally, around 480 million metric tons of soil are deposited in different reservoirs, leading to a loss of storage capacity ranging from 1 to 2%. India has a total geographical area of 329 million hectares (Mha), with around 167 Mha (51% of the total) being impacted by significant water and wind erosion, as estimated by Das in 1985. Approximately 127 million hectares (Mha) of land are affected by significant soil erosion, while an additional 40 Mha have been degraded due to various factors such as gully formation, ravines, shift cropping, water logging, salinity, alkalinity, changing river courses, and desertification. According to Maji (2007), in India, about 120.72 million hectares of land, out of a total geographical area of 329 million hectares, are impacted by different types of land degradation. Among these, water-induced soil erosion above 10 megagrams per hectare per year accounts for 82.57 million hectares.

1.1 Control Measures for Gullies

Structures are primarily used for the purposes of soil and water conservation, as well as the development of plants. These structures are comprised of dams of different designs that are built with the intention of stabilizing the slope and decreasing the speed of runoff. Temporary and permanent structures may be used in situations where runoff is not severe and may be effectively managed via the presence of well-stabilized vegetation. The user's text is too short to be rewritten in an academic manner. Within gullies, the growth of vegetation is crucial until it becomes firmly entrenched. Temporary constructions are constructed using readily accessible materials found in the surrounding area, such as brush, poles, woven wire, loose gravel, and boards. In cases when runoff is substantial and the implementation of vegetation-based control measures is not viable, the use of permanent gully control structures becomes necessary. Several types of gully control structures include the check dam, drop spillway, drop inlet spillway, and chute spillway.

1.1.1 Check Dam

A check dam is a small-scale structure constructed across a watercourse to control the flow of water and prevent erosion. It is typically A check dam is a diminutive and transitory barrier positioned inside a ditch or watercourse with the intention of impeding erosion by diminishing the speed of fluid motion. The installation of a dam inside a ditch or channel disrupts the natural movement of water, resulting in a decrease in its velocity. While it is true that sedimentation may occur behind a dam, it is important to note that check dams are not primarily designed to catch sediment. Instead, they are often built using loosely distributed erosion stone or rip rap, or by using stone-filled gabions. The drop spillway, also known as a stepped spillway, is a hydraulic structure often used in dam engineering to safely release excess water from a reservoir.

The drop structure under consideration is classified as a weir structure, with a maximum allowable drop of 3 meters. The water passes through a hydraulic structure known as a weir, where it subsequently cascades over an apron, resulting in the dissipation of the water's energy. These structures are strategically positioned at regular intervals along a waterway, with the purpose of stabilizing it by altering its configuration from a consistently steep slope to a sequence of gradually sloping sections. Additionally, they serve as discharge points for tile and surface water located at the upstream terminations of drainage ditches. In the majority of soil conditions, it is feasible to construct drop spillways using commonly available masonry materials such as stone or brick, as well as concrete and concrete blocks, with or without reinforcing. The use of temporary storage to achieve a significant decrease in discharge along the structure is not appropriate.

1.1.3 Drop Inlet Spillway

The drop inlet spillway is a hydraulic structure often used in civil engineering projects to manage the flow of water. It is designed to efficiently divert excess water. A drop inlet or shaft spillway is characterized by the ingress of water by a horizontally oriented riser or inlet, often in the form of a circular or rectangular box. Subsequently, the water proceeds through a circular conduit, which may be either horizontal or nearly horizontal, towards an outlet protection system. The drop inlet spillway is a suitable solution for situations when it is necessary to regulate the flow of the downstream channel by creating a temporary storage area upstream of the structure. The structure comprises of a dam constructed from earthen materials and a spillway designed in the form of a pipe. The dam facilitates the temporary retention of runoff from the contributing watershed, while the spillway allows for the controlled release of the designed flow downstream. The adaptation occurs when the descent exceeds a magnitude of 3.0 meters. The drop inlet structure is comprised of three main components: the inlet, conduit, and outlet. When the form of the intake resembles a funnel, it is sometimes referred to as a Morning Glory or Glory Hole spillway.

1.1.4. The chute spillway

chute spillway is a hydraulic structure often used in dam engineering to safely discharge excess water from a reservoir. A chute spillway, also known as an open channel or trough spillway, is a hydraulic structure designed to transport the discharge of water from the upper portion of a channel or reservoir to the downstream channel level. This is achieved by using an open channel that is positioned next to a dam, abutment, or saddle. Chute structures are often used for the purpose of gully head management, proving to be effective for drops ranging from 5 to 6 meters in height. The chute spillway offers more advantages compared to the drop spillway in situations when there is a need to discharge a significant amount of runoff from a particular location. The flow in a chute spillway occurs at velocities that are classified as super-critical.

1.2 Design Planning

The design of structures necessitates thorough research into the numerous components that impact the characteristics of runoff approaching the structure. These investigations should include unique site circumstances, downstream flow characteristics, and any other special needs. There is a lack of universally applicable answers for the many challenges experienced in the field.

The design should include a comprehensive review of all the pertinent aspects that exert influence on the task. The data necessary for the design of these structures is as follows.

1. The topographic map of the contributing watershed and the adjacent downstream region is being referred to.

2. Soil data refers to information pertaining to the composition, properties, and characteristics of the soil within a certain area or region.

3. Rainfall data and characteristics include the quantitative measurements and qualitative attributes associated with precipitation, including its frequency, intensity, duration, and spatial distribution.

4. The existing land use pattern denotes the current arrangement and use of land within a specific geographic area, including various activities such as agriculture, residential, commercial, industrial, and natural areas.

1.3 Study Scope

The primary objective of a watershed development program is to mitigate the adverse effects of water and soil by enhancing the process of infiltration into the soil. This is achieved via the implementation of measures to regulate and mitigate excessive runoff, effectively manage and harness runoff, and minimize soil erosion in order to safeguard the integrity of the land. The successful design of buildings that are both economically efficient and safe requires a comprehensive understanding of the subject matter, proficiency in engineering principles, and much practical experience in the area. It is important to consider the local design factors, which include the soil texture, rainfall patterns, and agricultural practices of the indigenous population. A significant number of individuals engaged in watershed management lack enough proficiency in design, while existing textbooks on soil and water conservation fail to provide comprehensive design guidance tailored to specific regional contexts. Hence, it is important to develop a complete software solution for the purpose of managing soil and water conservation structures. There are other software models that exist for the creation of permanent gully control systems. However, the focus of our work was to produce software that is characterized by its simplicity.

The method for the design of check dams and permanent gully control systems. The model was constructed with Visual Studio 2013. The model was developed with the purpose of serving as a dam designer for field workers, while also functioning as an instructional tool for students to analyze the impact of modifying input parameters on the design output.

Taking into consideration the aforementioned concerns, the current investigation was conducted with the accompanying aims. The objective is to **1. create software that may be used for the purpose of designing gully control structures. 2. A Comparative Analysis of Various Parameters between Software-generated Output and Manually-generated Output. 3. The statistical analysis is used to compute the error for various parameters of structures.**

2. MATERIAL AND METHODS

Process for Gully Control Structure Design The gully control structure design process has three phases: hydrologic design, which calculates runoff rates and volumes. intended to manage, hydraulic design examines dimensions' needs. structure to withstand high runoff via drop and chute structures and structural design provide components strength and stability. Structural components. It analyses structure-affecting forces.

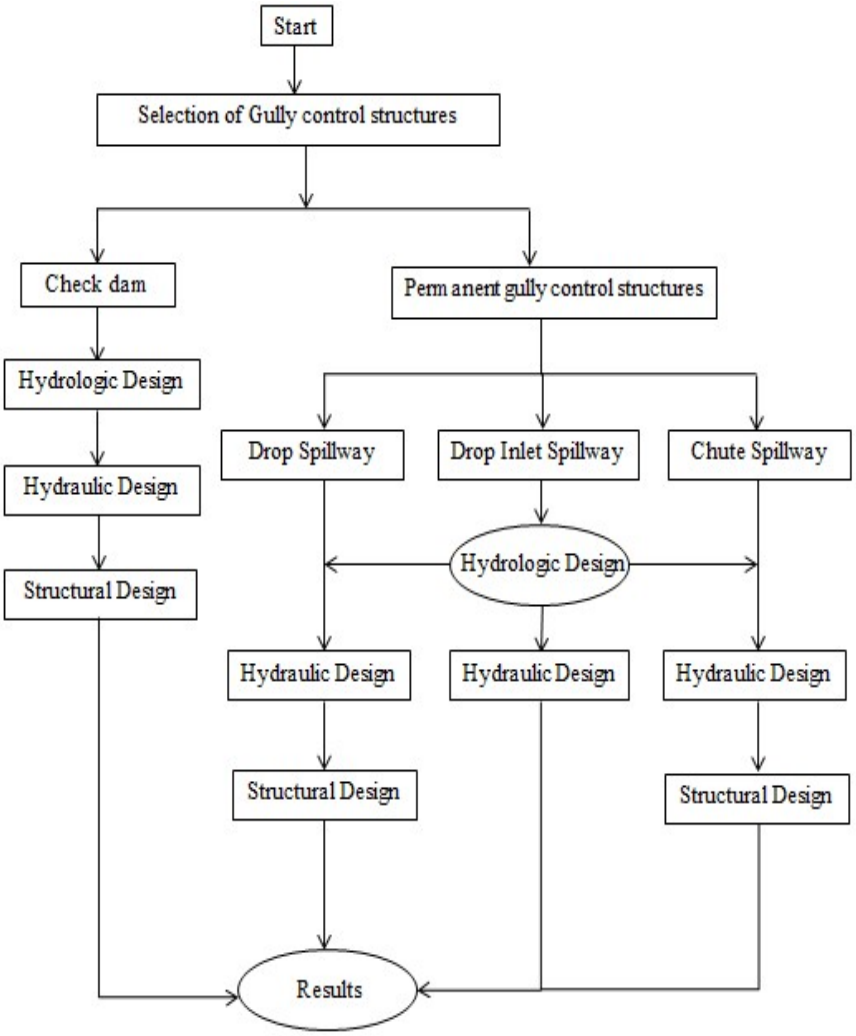

Fig.2.1 Flow chart for software design of gully control structures

2.2 DESIGN PROCEDURE OF CHECK DAM

2.2.1 Hydrologic Design

Structure can be designed for the maximum possible peak runoff rate which may occur within a reasonable frequency of interval (25/30/50 Years).The peak rate of runoff for a catchment is generally estimated for check dam by Dicken's Method.(WALAMTARI)

Computation of maximum flood discharge $\boldsymbol{Q = CA^{3/4}}$, cusecs

Where, **Q** = Maximum flood discharge (Cusecs)

C = Dickens constant (Appendix-I)

A = Catchment Area (square miles)

2.2.2 Hydraulic Design

The step by step procedure of check dam hydraulic design for software development by using the visual basic as described below.(Dhan Foundation, Chittoor)

I. CREST LEVEL OF THE CHECK DAM ($\mathbf{l_C}$)

The apex of the weir body wall where water is at full reservoir level is its crest.

II. HEIGHT OF THE CHECK DAM($\mathbf{H_b}$)

It is the elevation difference between the highest point and lowest point of water flow in the watershed.

III. LENGTH OF CHECK DAM, $\boldsymbol{L = 4.75\sqrt{Q}}$, m

IV. DISCHARGE PER METER RUN, $\boldsymbol{q = \frac{Q}{L}}$, Cumecs

V. APRON LEVEL, $\mathbf{l_A = [\, l_c - H_b]}$, m

VI. TOP LEVEL OF DOWNSTREAM(D/S) SOLID APRON, $\mathbf{l_{DA} = l_A}$, m

VII. DOWNSTREAM TAIL WATER LEVEL (T W L)

Tail water depth, $\mathbf{d_t = [\frac{Q}{1.656L}]^{2/3}}$, m

T W L on D/S, $\mathbf{l_{TW} = l_{DA} + d_t}$, m

VIII. UPSTREAM MAXIMUM FLOOD LEVEL

The depth of water flowing over the crest of the Check Dam is the difference between the Maximum Water Level and Full Reservoir Level.

- Head over crest

$$\mathbf{d_c=[\frac{Q}{1.845L}]^{2/3}}, \text{ m}$$

- Maximum flood level on U/S

$$\mathbf{l_{FU} = l_c + d_c}, \text{ m}$$

Provide 0.3 m thickness of foundation wall below the bottom level of check dam

IX. SCOUR DEPTH CALCULATIONS

- Regime Scour depth **R = 1.346 $[\frac{q^2}{f}]^{1/3}$,** m

  f = Laceys silt factor (Appendix-II)

- D/S bottom level of foundation = **[l_{TW} - 1.5R],** m

  Provide D/S cut-off wall 1.5 m below the body wall of check dam

  - U/S bottom level of foundation = **[(l_{FU}) - R],** m
  - Provide U/S cut-off wall 0.9 m below the foundation bottom level

X. LENGTH OF APRONS , L_A = **$10C_a [(H_b * q)/231]^{0.5}$**, m

XI. LENGTH OF SOLID APRON **(L_{SA})**

L_1= [1.5 + 2*(dc* h)$^{0.5}$], m

Where,**h = [(l_{FU}) - (l_{TW})],** m

L_2= [2*(H_b + d_c)], m

L_3= [4*C_a *(H_b/33)$^{0.5}$], m

L_{SA}= [(L_1+L_2+L_3)/3], m

XII. LENGTH OF TALUS, **L_T = L_A- L_{SA},** m

Provide length of talus at least 2 m

XIII. THICKNESS OF SOLID APRON, **t_{SA} = [0.5 * (d_c + h)$^{0.5}$],** m

Provide solid apron for a thickness of (t_{SA} – 0.1) m with 0.1 m thick wearing coat over it.

2.2.3 Structural Design

The following components are designed to develop software for the structural stability of the structure as given below. (Dhan Foundation, Chittoor)

I. BODY WALL OF THE CHECK DAM

- Top width of the check dam, **Tw = [(3*d_c)/(2*spwc)],** m

  Note: Provide 0.6 m top width if calculated T_W is less than 0.5 m

- Bottom width of the check dam, **Bw = [(H_b + d_c)/(spwc)$^{0.5}$],** m

  Note: Provide B_W as equal to H_b, if calculated B_W is less than H_b

II. THICKNESS OF CUSHION WALL

Solid wall constructed at the downstream end of apron, **t_c = (Tw/2),**m

III. STABILITY CALCULATIONS OF WALL

Stability of the wall can be calculated in two cases namely consider water is up to the crest level and water is discharging at maximum flood level.

Case I: Consider water is up to the crest level

For Calculating stability of wall formulas are considered as shown in the Table3.1

Table: 2.1 Inflow water is up to crest level

Force (1)	Magnitude (t/m) (2)	Lever arm (m) (3)	Moments about A(t) (2)*(3)
W_1	T_W*H_b*spwc	$(T_w/2)$	
W_2	$0.5*(B_w - T_w)*H_b*spwc$	$\{[(B_w - T_w)/3]+T_w\}$	
W_H	$[H_b]^3/6$	-	
Total	$\sum W =$		$\sum M =$

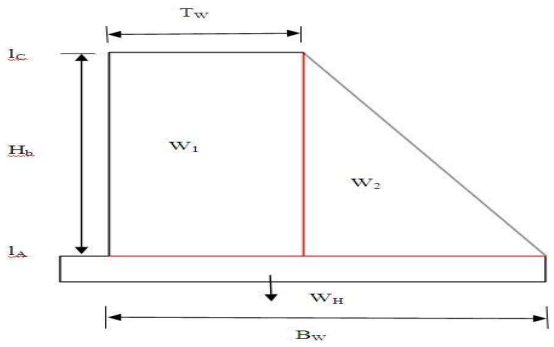

Fig.2.2 Water is up to crest level of the check dam

- Resultant $R_{s1} = \sum M/\sum W$, m

a) Check against tension

The resultant thrust lies in the middle third of the base width {**i.e.** $(B_w/3)$ **to** $[(2*B_w)/3]$m,then the wall is safe against tension at its base.

b) Check against overturning

The resultant thrust is passing within the base then the wall is safe against overturning.

c) Check against compression

- Eccentricity developed $(e) = [(0.5*B_w) - R_{s1}]$, m
- Eccentricity limit $= \{B_w/6\}$, m
- Compressive stress developed

*Maximum compressive stress $=\{(\sum W/B_w)*[1 + \{(6*e)/B_w\}]\}$ t/m^2

*Minimum compressive stress $=\{(\sum W/B_w)*[1 - \{(6*e)/B_w\}]\}$ t/m^2

The stresses developed are within permissible limits then it is safe against compression.

Case II: Water is discharging at maximum flood level

For Calculating Discharge at maximum flood level formulas are considered as shown in the Table 3.2

Table: 2.2 Water is discharging at Maximum flood level (M F L)

Force (1)	Magnitude(t/m) (2)	Lever arm (m) (3)	Moments about A (t) (2)*(3)
W_1	T_W*H_b*spwc	$(T_w/2)$	
W_2	$0.5*(B_w - T_w)*H_b*spwc$	$\{ [(B_w - T_w)/3]+T_w \}$	
W_3	T_w*d_c*spww	$(T_w/2)$	
W_4	$0.5*[(d_t/H_b)*(B_w - T_w)]*d_c*spww$	$\{ [\{(d_t/H_b)* (B_w - T_w)\}/3]+T_w \}$	
W_5	$[(d_t/H_b)*(B_w - T_w)]*(l_c - l_{TW})*spww$	$\{ [(B_w - T_w)/2]+T_w \}$	
W_6	$0.5*[(d_t/H_b)*(B_w - T_w)]*d_t*spww$	$\{ (B_w)- [(d_t/H_b)* (B_w - T_w)] \}$	
W_H	$[H_b]^3/6$	-	
Total	$\sum W =$		$\sum M =$

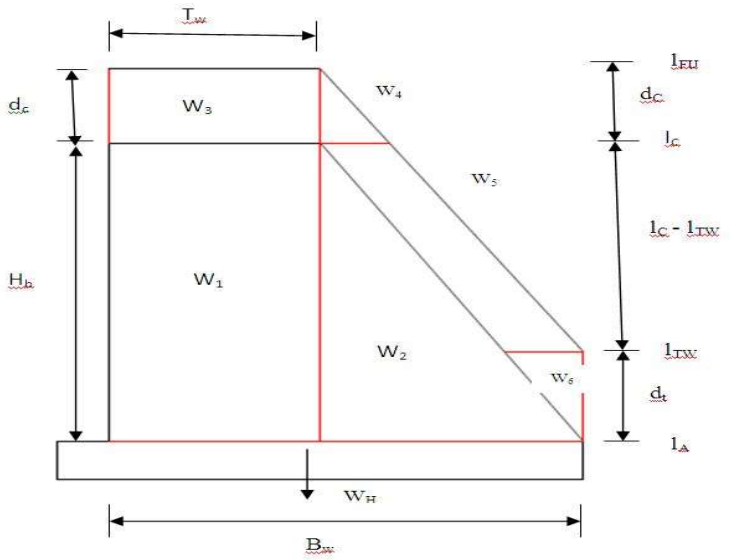

Fig.2.3 Check dam is discharging at maximum flood level

- Resultant $\mathbf{R_{s2}} = \sum \mathbf{M}/\sum \mathbf{W}$, m

a) <u>Check against tension</u>

The resultant thrust lies in the middle third of the base width **{i.e, $(B_w/3)$ to $[(2*B_w)/3]$**m,then the wall is safe against tension at its base.

b) Check against overturning

The resultant thrust is passing within the base then the wall is safe against overturning.

c) Check against compression

- Eccentricity developed **(e) = [(0.5*B_w) – R_{s1}]**, m
- Eccentricity limit = **{B_w/6 },** m
- Compressive stress developed

*Maximum compressive stress=**{ (∑W/B_w)*[1 + {(6*e)/B_w}] }** t/m^2

*Minimum compressive stress=**{ (∑W/B_w)*[1 - {(6*e)/B_w}] }** t/m^2

The stresses developed are within permissible limits then it is safe against compression.

IV. CREEP LENGTH PROVIDED FOR CHECK DAM

- Creep Length required, **C_L = ($C_a$$H_b$),** m
- Creep length provided, **C_{LP} =L_h + L_v** , m

= [2T_W+B_W+L_A+L_T] + [0.3+0.9+t_{SA}+H_b]

If Creep length provided is more than the creep length required hence design is safe against creep otherwise Provide “creep length required”

V. CHECK AGAINST PIPING

- Weighted creep ratio (C_W) = {[∑L_h + 2∑L_v]/(3H_b)}

The calculated C_w is greater than tabulated C_w value (Appendix-III) then the structure is safe against piping.

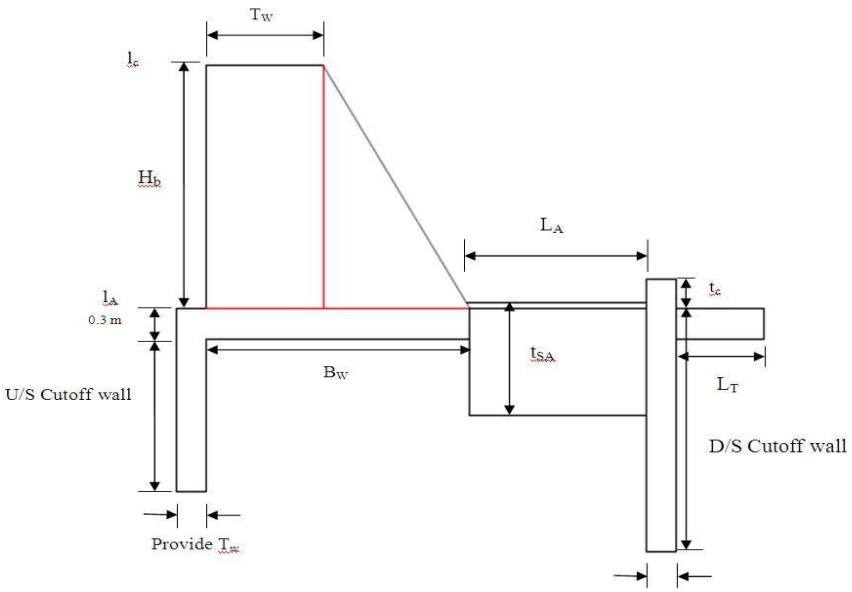

Fig.2.4 Creep path provided for check dam

2.3 DESIGN PROCEDURE OF DROP SPILLWAY

2.3.1 Hydrologic Design

Flood discharge volume calculated by computing the runoff rate for 25/ 30/ 50 years return period. Runoff rate is calculated by Rational method. (Ghanshyam Das, 2012)

Computed discharge value, **Q=CIA/360**

Where, Q= peak runoff rate, cumecs

C= coefficient of runoff (Appendix-IV)

= **(1/A)*(C_1A_1+ C_2A_2+ C_3A_3+……..+ C_nA_n)**

I= Intensity of rainfall, mm/h

2.3.2 Hydraulic Design

The width of gully and depth of gully are known then determining the length of crest, depth of the weir to provide required capacity and maintain free board. (Ghanshyam Das, 2012)

I. LENGTH OF WEIR CREST, **L=Width of gully – 0.5,** m

II. HEIGHT OF WATER AT CREST, **$Q=(2/3)* C_d *(2g)^{1/2}*L*h^{3/2}$,** cumecs

Where C_d = discharge coefficient (0.6)

g = 9.8, m/sec^2

L = length of weir crest, m

h = height of water at crest, m

III. HEIGHT OF THE WEIR, **d = h+0.15**, m

IV. HEIGHT OF WATER DROP FROM THE CREST, **H=depth of gully –d,** m

V. BASIN/APRON LENGTH, $\mathbf{L_B = 0.75(H+d)+H,}$ m

VI. WIDTH OF THE SIDE WALL, **W=H+d+1,** m

VII. HEIGHT OF THE SIDE WALL

a) At the end sill end = at least 1.5d $\geq$H/2, m

b) At the weir end = equal to gully width, m

VIII. LENGTH OF THE WING WALL, $\mathbf{L_W = 2.25h}$, m

IX. DEPTH OF THE TOE WALL, **h +0.1**, m

2.3.3 STRUCTURAL DESIGN

The force analysis of drop spillway can be carried out here. (Ghanshyam Das, 2012)

I. TOTAL UPLIFT PRESSURE, $\mathbf{P_U = H-0.5,}$ m

II. ANALYSIS OF FORCES

Drop spillway structural forces can be calculated, if know the volume of component, material density, lower arm length of the structure as described in the Table 3.2.

Table: 2.3 Analysis of forces of the Drop Structure

Forces on structure	Volume of component per unit length (m^3)	Material density (kg/m^3)	Force per unit length of structure (kg/m) (2)*(3)	Lower arm length (m)	Moment(kg) (4)*(5)	Type of moment
(1)	(2)	(3)	(4)	(5)	(6)	(7)
P_1	(d*H)*1			0.5*H		Over Turning
P_2	$0.5*H^2*1$			(1/3)*H		Over Turning
P_{u1}	$0.5*(L_B+1.5)*1*1$			$(2/3)*(L_B+1.5)$		Over Turning
P_{u2}	$0.5*(L_B+1.5)*1$			$0.5*(L_B+1.5)$		Over Turning
W_1	(H-0.5)*1*1			$((L_B+1.5)-0.5)$		Restoring
W_2	0.5*(H-0.5)*0.5			$L_B+[(2/3)*0.5]$		Restoring
W_3	$0.5*(L_B+1.5)*1$			$0.5*(L_B+1.5)$		Restoring

1- Safety against overturning

Safety against overturning is calculated by following formula

Total restoring moment > Total overturning moment

2- Safety against sliding

For safety against sliding,

$\sum f_h$ should not be greater than $C_f*\sum f_h+C_rA$ i.e. **[$\sum f_h < (C_f*\sum f_v+C_rA)$]**

Where, $\sum f_h = P_1+P_2$ = horizontal forces, m^3

$\sum f_v = W_1+W_2+W_3 - P_{u1} - P_{u2}$ = vertical forces, m^3

$C_f = \tan\emptyset$, ($\emptyset$ = angle of internal friction of soil)

C_r = cohesion resistance of soil (Kg/m^2)

$A = [H*(L_B+1.5)]$=area of plane of sliding , m^2

If it satisfies $\sum f_h < (C_f*\sum f_v+C_rA)$ sliding is safe otherwise redesign

3- Safety against tension

The eccentricity (e) should not be greater than [width (d)/6] then the structure is safe against tension.

$e = Z-[Width(d)/2]$, m

$Z=[\sum moments/(\sum f_v)]$, m

4-Safety against compression

The force should be compressive in nature, so that there is no floatation of the structure. Thus, the resultant force should act downwards,

$$\text{Contact pressure, } P_e = \{(\sum f_v/A)*[1\pm(6e/d)]\}$$

Where the +ve sign will give pressure at the upstream, and the –ve sign will give pressure at the downstream.

5- Safety against piping

The weighted creep ratio (C_W) should be higher than the recommended value then the structure is safe against piping.

$$C_W = \{(\sum L_h+2\sum L_V)/(3H)\}$$

Where, C_W = Weighted creep ratio

$\sum L_h$ = Sum of all horizontal (flat) contact distances, m

$\sum L_V$ = Sum of all vertical r steep contact distances, m

H = Head between the head water and the tail water, m

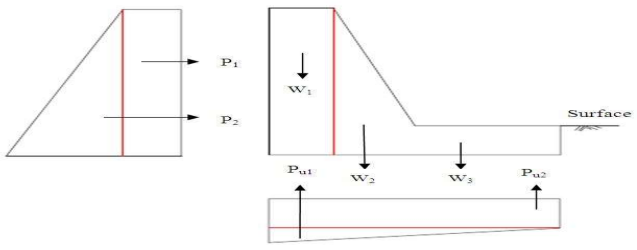

Fig.2.5 Analysis of forces for Drop spillway

2.4 DESIGN PROCEDURE FOR DROP INLET SPILLWAY

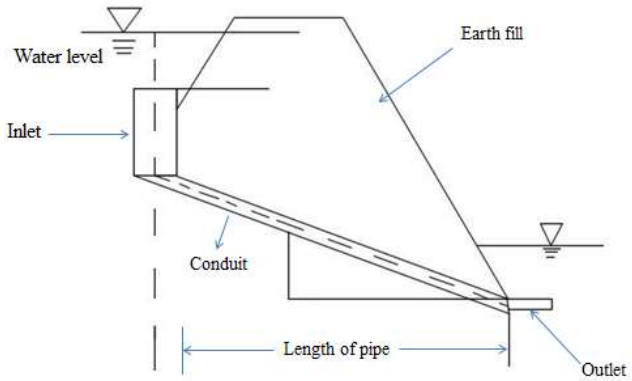

Fig.2.6 Components of Drop inlet spillway

2.4.1 Hydrologic Design of drop inlet spillway

Estimation of flood discharge volume by computing the Runoff rate for 25/ 30/ 50 years return period. Runoff rate is calculated by Rational method.(Ghanshyam Das, 2012)

Computed discharge value, **Q=CIA/360** , cumecs

Where, Q= peak runoff rate, cumecs

C= coefficient of runoff (Appendix-IV)

$= \mathbf{(1/A)*(C_1A_1+ C_2A_2+ C_3A_3+\ldots\ldots\ldots..+ C_nA_n)}$

I= Intensity of rainfall, mm/h

2.4.2 Hydraulic Design for drop inlet spillway

The width of gully and depth of gully are known, the design consists of determining the length of the pipe, velocity of flow, radius of pipe, natural slope. (Ghanshyam Das, 2012)

I. LENGTH OF PIPE,**L**=Base width of the embankment, m

II. VELOCITY OF FLOW IN CULVERT PIPE, $\mathbf{V= (2gH)^{0.5}/(1+K_e+K_cl)^{0.5}}$, m/s

Where, K_e = Coefficient of entrance losses

K_c = Head loss coefficient

g = 9.81, m/s^2

H= water head, m

III. CROSS SECTIONAL AREA OF A PIPE, $\mathbf{A=Q_0/V}$, m^2

Where, Q_0=discharge, cumecs

IV. RADIUS OF A PIPE, $\mathbf{r = (A/\pi)^{0.5}}$, m

V. DIAMETER OF THE PIPE, **d = 2 * r,** m

VI. NATURAL SLOPE, $\mathbf{S_n= (K_cV^2/2g) /(1-(K_cV^2/2g)^2)^{0.5}}$, **%**

VII. PIPE SLOPE=**height of drop/pipe length,%**

2.5 DESIGN PROCEDURE OF CHUTE SPILLWAY

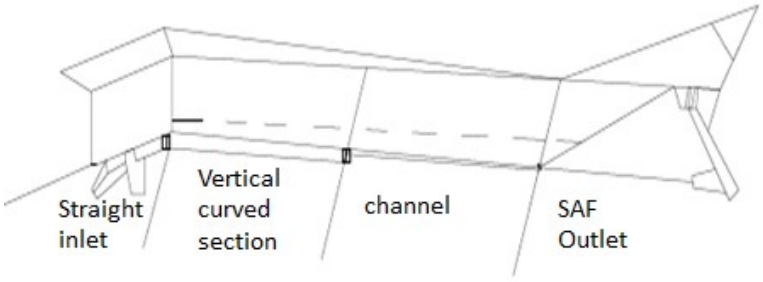

Fig.2.7 Chute spillway

2.5.1 Hydrologic Design of chute spillway

Estimation of flood discharge volume is calculated by computing the runoff rate for 25/ 30/ 50 years return period. Runoff rate is calculated by Rational method. (Ghanshyam Das, 2012)

Computed discharge value,**$Q=CIA/360$**

Where, Q = peak runoff rate, cumecs

C= coefficient of runoff (Appendix-IV)

= **$(1/A)*(C_1A_1+ C_2A_2+ C_3A_3+\ldots\ldots\ldots..+ C_nA_n)$**

I= Intensity of rainfall, mm/h

2.5.2 Hydraulic Design of chute spillway

The design consists of determining the length of weir, head loss, sequent depth, if know the width and depth of gully. (Ghanshyam Das, 2012)

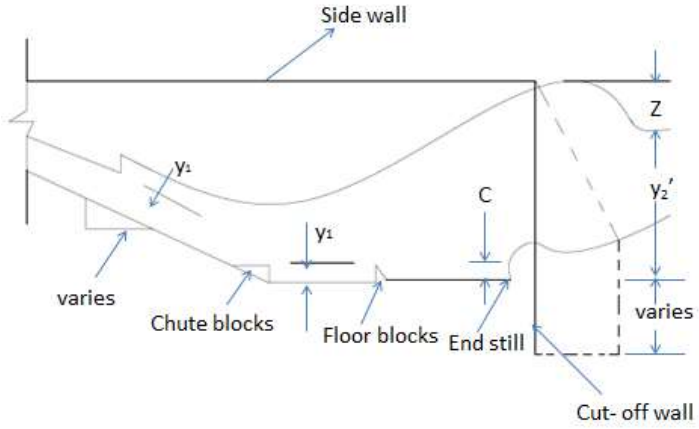

Fig.2.8 Sectional view of chute spillway

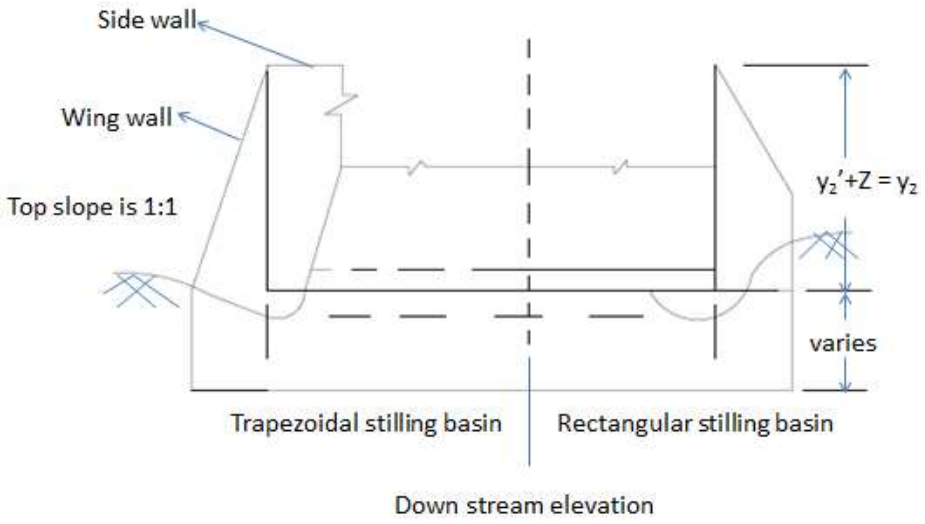

Fig.2.9 SAF stilling basin outlet

I. LENGTH OF STRAIGHT INLET , **$L=Q/1.77*H^{3/}2$,**m

Q=Discharge, cumecs

H=Depth of flow, m

II. HEAD LOSS AT TOE, **h_e=drop in gully head(D)-10% of gully head(D),** m

2.5.3 STRUCTURAL DESIGN OF THE CHUTE SPILLWAY

I. FORCES ANALYSIS

Forces can be analyze by using head of each section upstream, head of each section downstream, force per horizontal width of the water body as shown in Table 3.4. (Ghanshyam Das, 2012)

Table: 2.4 Force analyses for Chute spillway structure

Pressure diagram section no. 3. RESULTS AND DISCUSSION

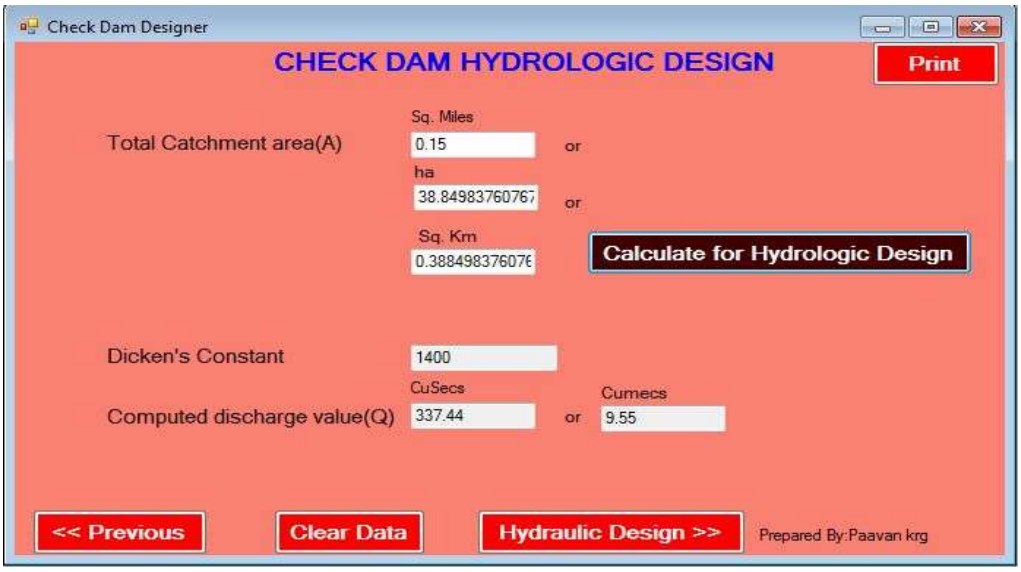
Gully control structures, such as check dams, drop spillways, drop inlet spillways, and chute spillways, are developed using hydrologic, hydraulic, and structural stages.

3.1 Check Dam Design Hydrologic design for gully control structures is similar, but check dam design differs. Hydraulic and structural designs vary each structure. Using mathematical formulas from the previous chapter, structures are constructed in Visual Studio 13.3.1 Check Dam Design - Hydrologic design based on numerical formulas - Fig. 3.1 - Hydraulic design procedure - Fig. 3.2 - Structural design - Fig. 3.3 - Check dam discharging at maximum flood level - Fig. 3.4 - Check against



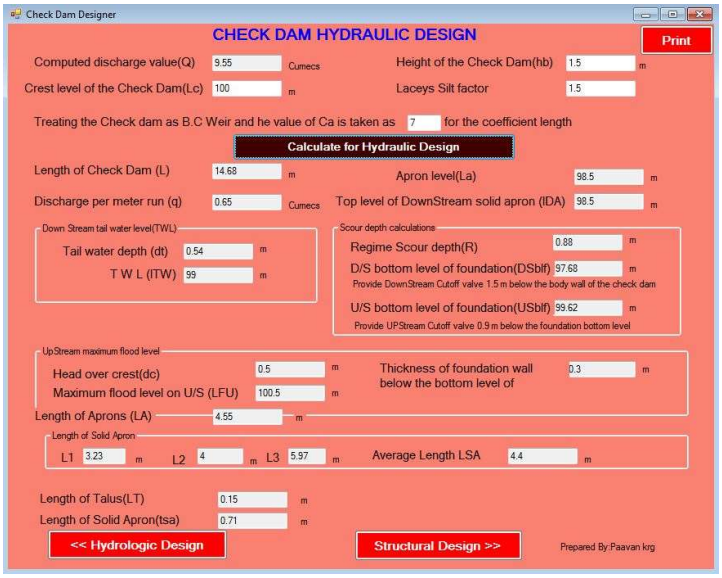


Fig.3.1. Hydrologic design of check dam

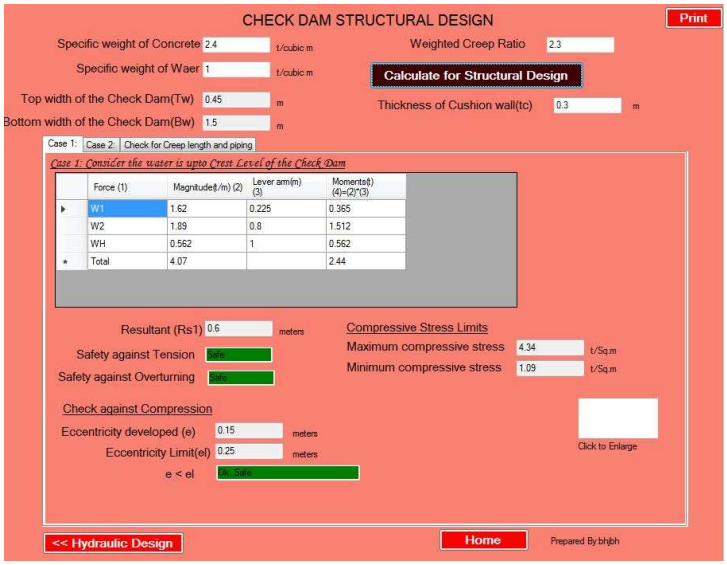

Fig.3.2. Hydraulic design of check dam **Fig.3.3. Water is up to crest level of check dam**

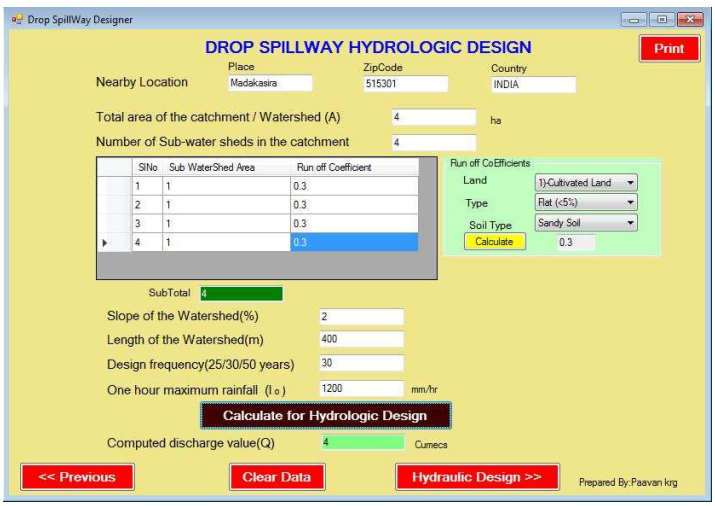

Fig.3.4. Check dam is discharging at maximum flood level

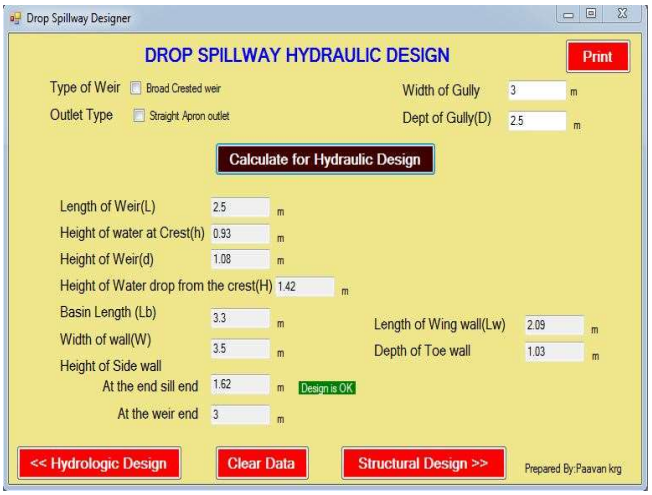
Fig.3.5. Check against creep length and piping

4.2 Drop spillway design

The hydrologic design of a drop spillway is determined by the rational formula, as shown in Figure 3.6. The hydraulic design process for the drop spillway is illustrated in Figure 3.7. Additionally, the structural design of the drop spillway is analyzed by force analysis.



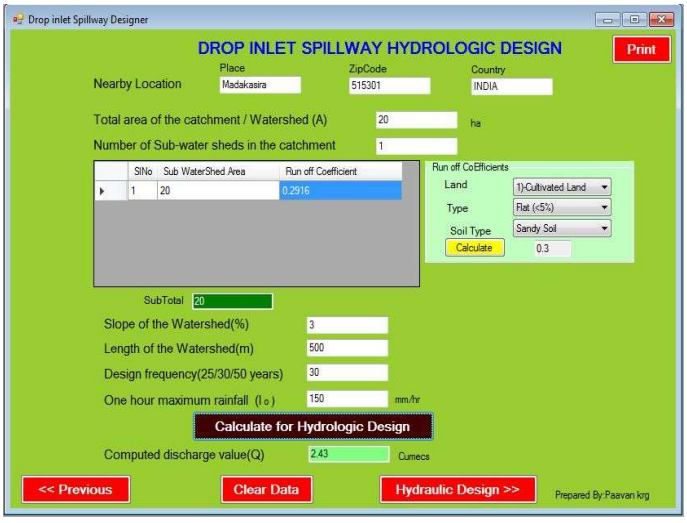


Fig.3.6. Hydrologic design of Drop Spillway **Fig.3.7. Hydraulic design of Drop Spillway**

4.3 Drop Inlet spillway design

The design of the drop intake spillway takes into account the hydrologic design, as shown in Figure 3.8, and the hydraulic design of the pipe spillway, which considers factors such as the percentage of pipe flow, as illustrated in Figure 3.9.

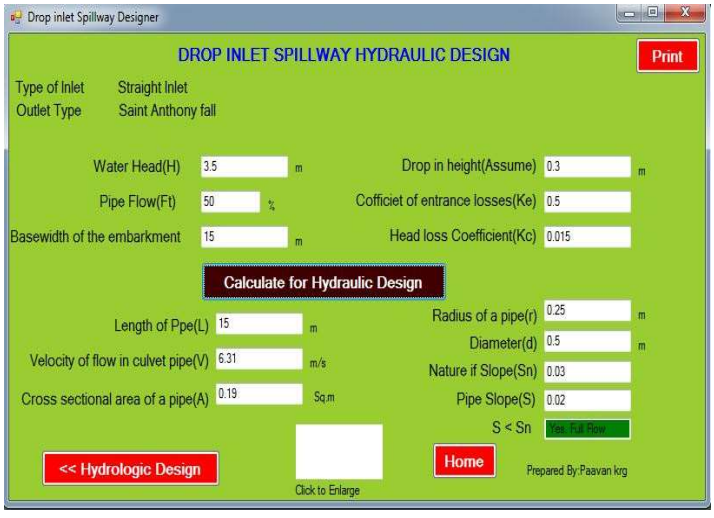

Fig.3.8. Hydrologic design of Drop Inlet Spillway **Fig.3.9. Hydraulic design of Drop Inlet Spillway**

3.4 Chute spillway design

The hydrologic design of a chute spillway is also determined by using the rational method for calculating the maximum flood flow, as seen in Figure 3.9. The dimensions of the chute spillway are determined by the hydraulic design technique, as seen in Figure 3.10. The structural design of the chute spillway involves the performance of strength and stability calculations.

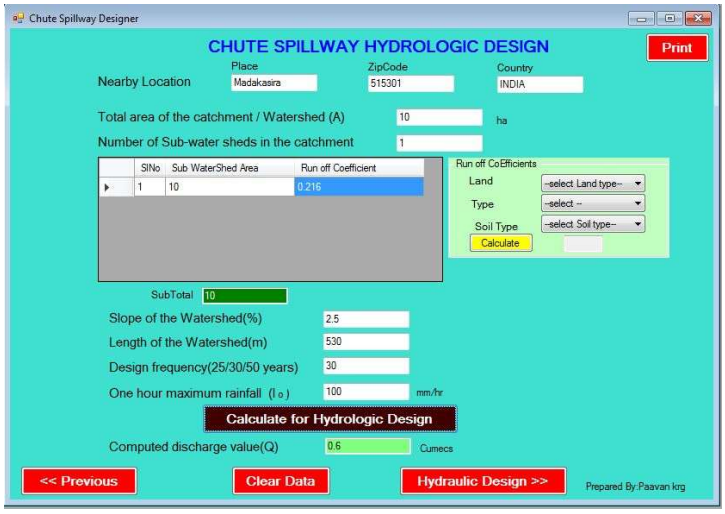

Fig.3.9. Hydrologic design of Chute Spillway

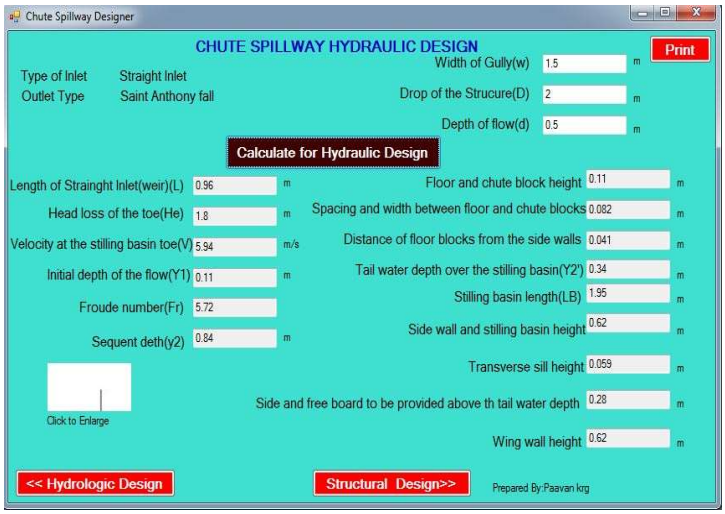

Fig.3.10. Hydraulic design of Chute Spillway

3.5 Validation of GCS_Designer for check dam

Table 3.1 shows the hydrologic, hydraulic, and structural design parameters computed by the program and compared to manual output or human computation for the check dam. GCS_Designer software and hand calculation yielded the same maximum flood discharge of 9.55 m3/s, hence no mistake was discovered.

The manual check dam length was 14.67 m and the GCS_Designer length was 14.68 m, and the truncation error was 0.0681 due to rounding. Except for length of apron 4.54 m and 4.55 m, length of solid apron 4.39 m and 4.40 m, and thickness of solid apron 0.70 m and 0.71 m for manual and GCS_Designer, the remaining hydraulic design parameters have similar values in both outputs and zero percentage error.

In two cases, structural design parameters have split. In circumstance 1 (water up to the check dam crest), manual and GCS_Designer had maximum compressive stress of 4.37 and 4.34 t/m2 and minimum of 1.06 and 1.09 t/m2. Maximum and lowest compressive stresses have -0.6192% and 2.7523% errors.

In case 2 (check dam discharge at maximum flood level), manual and GCS_Designer had maximum compressive stress of 4.93 and 4.90 t/m2 and minimum of 2.25 and 2.31. Maximum and lowest compressive stresses have errors of -0.6122% and 2.5974%.

Manual and GCS_Designer creep lengths were 12.34 m and 12.36, with weighted creep ratios of 4.25 and 4.26. Creep length and weighted creep ratio have 0.1618 and 0.2347 percentage errors. Table 4.1 creep length for structural design was correct.

GCS_Designer validation in check dams yielded 2.7523 % error for minimum compressive stress and 0.0681 % inaccuracy for length. Validating GCS_Designer for check dam involves 25 parameters. 10 parameters have % errors while the rest have zero. The remainder are under estimate (negative) and 80% are above estimate (positive).

Table: 3.1. Validation of GCS_designer for check dam

Design parameter	Manual output	GCS_Designer output	% of Error	Remarks
Hydrologic Design				
Computation of maximum flood discharge (Q),m^3/s	9.55	9.55	0.0000	do
Hydraulic Design

Eccentricity limit (el),m	0.25	0.25	0.0000	do
Check against creep and piping				
Creep Length required (C_L), m	10.50	10.50	0.0000	do
Creep length provided (CLP), m	12.34	12.36	0.1618	Truncation
Weighted creep ratio (C_W)	4.25	4.26	0.2347	Truncation

3.6 Validation of GCS_designer for drop spillway structure

GCS_Designer software and hand calculation yielded the same maximum flood discharge of 4.00 m3/s, hence no mistake was discovered.The height water at the crest was 0.93 m and 0.96 m (error = -3.2258 %), the weir was 1.08 m and 1.11 m (error = -2.7778 %), the water drop from the crest was 1.42 m and 1.39 m (error = 2.1127 %), the basin apron was 3.30 m and 3.27 m (error = 0.9091%), and the wing wall was 2.09 m and 2.16 m (error = -3.3493%). The weir crest length, side wall width, and side wall height were correct. In structural design of drop spillway, total uplift pressure was 0.92 m in both outputs, therefore no mistake occurred. The findings were in Table 4.2. GCS_Designer validation in drop spillway showed -3.3493 % error for wing wall length and -0.0309 % error for head wall extension at end sill end. Out of 12 parameters analyzed for GCS_Designer drop spillway validation, 7 exhibit % error and the rest show zero. 28.6% of drop spillway values are above estimate and 71.4% are under estimate.

Table: 3.2. Validation of GCS_designer for Drop Spillway Structure

Design parameter	Manual output	GCS_Designer output	% of Error	Remarks
Hydrologic Design				
Computed discharge value (Q),m^3/s	4.00	4.00	0.0000	do
Hydraulic Design				
Length of weir crest (L),m	2.50	2.50	0.0000	do
Height of water at crest (h),m	0.96	0.93	-3.2258	Truncation
Height of the weir (d),m	1.11	1.08	-2.7778	Truncation

At the weir end, m	3.00	3.00	0.0000	do
Structural Design				
Total Uplift Pressure (P_u),m	0.92	0.92	0.0000	do

3.7 Validation of GCS_designer for Drop Inlet spillway

The discharge value of 2.43 m3/s was determined for both the manual calculation and the output from the GCS_Designer program. The velocity of the flow in the culvert pipe was measured to be 6.31 m/s and 6.30 m/s (with an error of 0.0016%) for the GCS_Designer software output and manual output, respectively. However, no error was observed in the measurements of the pipe's length (15 m), cross-sectional area (0.19 m2), radius (0.25 m), natural slope (0.03%), and pipe slope (0.02%), as indicated in Table3.3. The user's text is incomplete and does not provide any information. The validation of GCS_Designer was seen in the drop inlet spillway, resulting in a velocity of flow in the culvert pipe with an inaccuracy of 0.0016%.

The validation of GCS_Designer for drop inlet spillway involves the consideration of a total of 8 parameters. Among these parameters, one parameter exhibits a percentage of error, while the rest

parameters exhibit zero % error. A mistake has been observed in the drop inlet spillway among a total of 8 parameters, while the remaining 87.5% of values do not exhibit any errors.

Table: 3.3. Validation of GCS_designer for Drop Inlet Spillway

3.8 Validation of GCS_designer for Chute spillway

The discharge value of 0.60 m3/s was determined using the GCS_designer program, and no errors were detected throughout the hydrologic design process. The Froude numbers were determined to be 5.72 and 5.85, with an error of -2.2727%. The sequent depths were measured to be 0.84 m and 0.82 m, with an error of 2.3810%. The spacing and width between the floor and chute blocks were found to be 0.082 m and 0.08 m, with an error of 2.4390%. The distance of the floor blocks from the side walls were measured to be 0.041 m and 0.04 m, with an error of 2.4390%. The tail water depth over the stilling basin was determined to be 0.34 m and 0.33 m, with an error of 2.9412%. The length of the stilling basin was measured to be 1.95 m and 1.85 m, with an error of 3.0769%. The height of the sidewall and stilling basin was found to be 0.62 m and 0.60 m, with an error of 3.2258%. The transverse sill height was measured to be 0.059 m and 0.06 m, with an error of -1.6949%. The side wall free board above the trailed water depth was determined to be 0.28 m and 0.27 m, with an error of 3.5714%. The wing wall height was measured to be 0.62 m and 0.60 m, with an error of 3.2258%. The GCS_Designer software output and manual output yielded these results, with no errors found in the remaining parameters of the hydraulic design of the chute spillway, as presented in Table 3.4.

Design parameter	Manual output	GCS_Designer output	% of Error	Remarks
Hydrologic Design				
Computed discharge value (Q),m3/s	2.43	2.43	0.0000	do
Hydraulic Design				
Length of pipe (L),m	15.00	15.00	0.0000	do
Velocity of flow in culvert pipe (v), m/s	6.30	6.31	0.0016	Truncation
Cross sectional area of a pipe (A), sq.m	0.19	0.19	0.0000	do
Radius of a pip(R),m	0.25	0.25	0.0000	do
Diameter of a pipe(d),m	0.50	0.50	0.0000	do
Natural slope (Sn), %	0.03	0.03	0.0000	do
Pipe slope(S), %	0.02	0.02	0.0000	do

Table: 3.4. Validation of GCS_designer for Chute Spillway

The chute spillway's structural design parameters were length of the total channel 3.61 m and 3.6 m

Design parameter	Manual output	GCS_Designer output	% of Error	Remarks
Hydrologic Design				
Computed discharge value (Q),m^3/s	0.60	0.60	0.0000	do
Hydraulic Design				
Length of the straight inlet(L),m	0.96	0.96	0.0000	do
Head loss at toe (H_e),m	1.80	1.80	0.0000	do
Velocity at stiiling basin toe (V), m/s	5.94	5.94	0.0000	do
Initial depth of the flow (Y1),m	0.11	0.11	0.0000	do
Froude number (Fr)	5.85	5.72	-2.2727	Truncation
Sequent depth (Y2),m	0.82	0.84	2.3810	Truncation
Floor and chute block height, m	0.11	0.11	0.0000	do
Spacing and width between floor and chute blocks, m	0.08	0.082	2.4390	Truncation
Distance of floor blocks from the side walls, m	0.04	0.041	2.4390	Truncation
Tail water depth over the stilling basin(Y2'),m	0.33	0.34	2.9412	Truncation
Stilling basin length(LB),m	1.89	1.95	3.0769	Truncation
Sidewall and Stilling basin height, m	0.60	0.62	3.2258	Truncation
Transverse sill height, m	0.06	0.059	-1.6949	Truncation
Side wall free board to be provided above the trailed water depth, m	0.27	0.28	3.5714	Truncation
Wing wall height, m	0.60	0.62	3.2258	Truncation
Structural Design				
Horizontal length of spillway(x),m	3.00	3.00	0.0000	do
Length of the total channel(L),m	3.60	3.61	0.2770	Truncation
Length of each section, m	0.90	0.90	0.0000	do
Weight of the base of each section, kg	466.70	466.75	0.0107	Truncation
Weight of two side walls on each section, kg	310.20	310.50	0.0966	Truncation
Total weight of each section(W_t), kg	778.35	778.41	0.0077	Truncation
Weight of the stilling basin				
Weight of the base, kg	1035.00	1035.00	0.0000	do
Weight of the side walls, kg	965.00	966.00	0.1035	Truncation
Total weight of the stilling basin(Wts), kg	2000.00	2001.00	0.0500	Truncation

(error = 0.2770%), weight of each section's base 466.75 kg and 466.70 kg (error = 0.0107%), weight of two side walls 310.50 kg and 310.20 kg (error = 0.0966%), total weight of each section 778.41 kg and 778.35 kg (error = 0.0077%), and weight of the stilling basin side walls 966 kg and 965 kg (error = 0.1035%). For GCS_Designer software output and manual output, chute spillway structural design was error-free. Horizontal length was 3.0 m, section length was 0.9 m, and stilling basin base weight

was 1035 kg. GCS_Designer proved valid in chute spillway with 3.5714 % error for side wall free board above tail water depth and 0.0077 % error for total section weight. 16 of the 25 parameters analyzed for GCS_Designer chute spillway validation exhibit percentage of error, while the rest show zero percentage error. 87.5 % and 12.5% values were over estimate and under estimate, respectively.

THE DECCAN GEOGRAPHICAL SOCIETY, INDIA

The Deccan Geographical Society, India established in 1962 at Hyderabad (India) and started publication of Geographical Journal, namely, **"The Deccan Geographer"** since 1962 and **"Bhugol- Shastra Sansodhak"** Journal (Marathi+Hindi and English) since 2006. The journals are devoted to the publication of research papers in the diverse fields of Geography. Papers are invited on any of the themes involving the application of Geographical methodology and the research towards the solution of human problems. It includes papers on recent techniques and currents problems which deal with the issues related to the Environment, Social, Urban, Population and Food Security. The membership of journal is open for geographers, research scholars, planners, decision makers and allied disciplines. The interested persons can enroll for 5 years membership. The membership form is available on DGSI website:

HUMAN VULNERABILITY AND RISK OF LANDSLIDE HAZARD IN UPPER RAVI RIVER CATCHMENT- A SPATIAL APPROACH

Pooja Sharma, Vishwa B.S. Chandel, Simrit Kahlon, and Som Nath Thakur

Abstract

The paper examines landslide hazard in relation to human vulnerability and risk in River Ravi catchment. The work is built on the understanding that slope failure processes are inherent to mountainous regions, however, vulnerability and risk potential to such a hazard is rooted in human attributes of the landscape. Therefore, an attempt has been made to address the local contexts of landslide vulnerability to highlight human risk using a spatial approach. By taking into account the elements at risk and their exposure levels and vulnerability (physical, social, economic and environment), the research highlights significant variations in risk potential. Chamba town and its surroundings emerge as the most risk prone area on all accounts while remotely located areas on account of low development exhibit relatively low risk. The analysis establishes a positive relation between landslide risk and anthropogenic activities; high degree of risk in populated and developed areas underscores seriousness of problem that requires proactive mitigation strategies.

Introduction

The burgeoning risk of disasters is a testimony to the severity of undesirable events of both natural and human origin. The mounting impact and devastations observed globally is attributed to increasing frequency and magnitude of disasters. However, occurrence alone does not define disaster risk. It is the combined effect of hazards coinciding with vulnerability of exposed elements and lack of societal capacity to cope with adverse situations that yields disturbance and stressors on human population. Disasters in the 21st century has paralyzed the world (Ismail-Zadeh and Cutter, 2015) especially in the Asia-Pacific region where according to number of disaster events, death toll and people affected was maximum in recent years. The contemporary thinking places disaster risk analysis at the center of sustainable development practices. Risk reduction has become the most advocated initiative after the adoption of Sendai Framework for Disaster Risk Reduction (2015-2030).

The framework specifically focuses on understanding risk and strengthening risk governance for building resilience against the impacts of disasters. The recent catastrophic events in India, viz. cyclones in the Indian Ocean, floods in Uttarakhand in 2021, landslides and flash floods in Himachal Pradesh in 2023 have further highlighted the necessity of coordinated efforts to lessen disaster risk and human vulnerability. It has been estimated that risk due to disasters is likely to increase by 40 per cent by 2030 (UNDRR, 2022). In this context, vulnerability and risk assessment, therefore, becomes instrumental in ensuring effective disaster mitigation. Disasters and disaster risk have spatial specificities and locational predisposition. The nature, type, mechanisms, and impacts of disasters are guided by geographical and locational attributes. For mountainous areas, landslide is amongst the devastating processes causing tremendous loss of lives and infrastructure. In India, 48 major landslides recorded in the recent past has killed over 5000 people, affected 4 million and caused loss of US$ 55 million (EM-DAT, 2016). Such events have the propensity to occur in mountainous landscapes where risk factor is amplified by geo-tectonic attributes in association to accelerated human-induced landscape transformations (Sharma & Kumar, 2008; Chandel, Brar, & Chauhan, 2011). The geo-tectonic characteristics certainly make an area susceptible to slope failures, however, it is the human-induced changes that adds to the problem by making such fragile unstable slopes vulnerable (Barnard et al., 2001) risking human population and infrastructure. Therefore, contemporary research must address the local contexts of hazard, human vulnerability, and risk for appropriate solution to multidimensional problem of disasters.

Study Region

Ravi River catchment in Himachal Pradesh extends over four tehsils, viz. Chamba, Bharmour, and Holi of Chamba district and Multhan tehsil of Kangra district. Situated between the Pir-Panjal range in the north, and the Dhauladhar mountains in the south, a high altitudinal range (700-6100 meters above the mean sea level) has produced diverse micro-climates in this catchment. Summers are mildly warm whereas winters are severely cold. The mean annual precipitation is more than 1300 mm; a significant decrease in rainfall takes place to the north-eastern and eastern parts. Winter precipitation is driven by the western disturbances that also cause heavy snowfall in areas above 2000 meters elevation. Ravi is the main river fed by glacial melt and several tributary streams. The geomorphology of the areas is carved by tectonic and fluvioglacial processes. Active faults, joints, and lineaments have dislocated slopes thus making the landscape susceptible to slope failure.

A number of landslides observed along roads indicate human alteration of slopes (Chandel, Brar, & Chauhan, 2011; Sharma, Chandel, & Kahlon, 2018) for infrastructure and developmental activities in recent years (Thakur, Kahlon, & Bhutani, 2016). In such a scenario, it is likely that risk to human life and livelihood may get amplified posing serious challenges in times to come.

Objectives

The paper intended to examine the exposure, spatial vulnerability and risk to landslide hazard in the catchment of Ravi River in Chamba district of Himachal Pradesh. The key objectives were (a) to analyse the elements of risk and their exposure to landslides in the catchment and to analyse the vulnerability and risk potential to landslide hazard in the study area

Database and Methodology

This work offers an insight to human vulnerability and exposure of elements at risk. Primary data involved identification of past landslides through field survey wherein an inventory template was designed to record information on location, type, size, material involved, and key terrain characteristics of landslide sites. The researcher logged 100 sites of slope failures during the fieldwork out of which debris slides, rock slides, slumps, and rock & debris fall were the most common slope failure (75 per cent) type; the subsidence and lateral spread was observed mainly along road edges adjacent to river Ravi. It was noticed that rock fall sites are associated with exposed slopes in proximity to road construction sites. Similarly, earth flow, mud flow, and debris flow were spotted at numerous places. Almost every site of earth flow revealed reactivated landslides. Debris flows were noticed near streams, roads, and in areas where toe erosion by streams is prevalent. In addition to physical factors, anthropogenic activities have significantly triggered slumps in agricultural areas and slides along road construction and widening sites. The inventory on landslide sites and types formed the basis to evaluate risk factor by taking into account exposure, vulnerability, and the amount of elements-at-risk. The level of exposure (association between elements-at-risk and landslide hazard) was computed via spatial overlay of susceptibility (landslide probability under given set of terrain conditions) and vulnerability of elements-at-risk. This paper examined vulnerability in terms of 17 elements of risk. The index value closer to 1 indicate very high potential for damages and vice a versa. The risk assessment involved vulnerability calculation using Spatial Multi-Criterial Evaluation (SMCE) method using AHP model. The reliability of assessment was verified through

consistency index (CI) and consistency ratio (CR); its values for all elements-at-risk did not exceed the threshold value (0.1) which confirms the reliability of weightages assigned by the research. The study focussed on four vulnerability subgroups. Physical vulnerability expresses potential for physical impacts on built-up environment on account of landslide manifestation. Its indicators include settlements, roads (National, State, and Village roads), and helipads. Social vulnerability refers to potential impact on exposed societal groups. Here, we have defined social vulnerability in terms of population density (total, female and child population), essential and non-essential services (euclidean distance to healthcare facility, educational facility, postal facility, nutritional centers, and public distribution shops. Economic vulnerability is evaluated in terms of exposure to cropland, plantation, and forest cover whereas the environmental vulnerability is evaluated in terms of potential impacts on protected forests, reserved forests, and water bodies. The overall vulnerability was computed by aggregating physical, social, economic, and environmental vulnerability using weighted linear combination. Finally, the risk analysis was done through an indicator-based approach using input layers (landslide susceptibility, vulnerability, and amount of exposed elements-at-risk) via spatial overlay wherein risk factor was analysed for all elements-at-risk to produce the overall risk assessment.

Results and Discussion

Exposure of Elements-at-Risk

The 'elements-at-risk' represents people, assets, and things valuable to individuals or community that may get affected or suffers from loss due to hazard manifestation. For geographers, elements-at-risk (people, buildings, and infrastructure etc.) have locational stipulations; their exposure depends on proximity to hazard and degree of susceptibility. Here, we examined exposure of 17 elements of risk (Table-1). The physical element at risk defined in this work relates to settlements that being located in the vicinity of observed landslides have a potential to suffer from damages. Total area under settlements is 5007.53 hectare out of which majority area falls in Chamba (3927.45 hectare or 78.43%) tehsil. About 2313.81 hectare (46.20 per cent) has high to very high exposure (index value ≥ 0.6) to landslides while another 31.70 % has moderate exposure. The degree of exposure exhibits spatial variation; about 50 per cent settlements in Chamba especially around the town have high exposure and another 33 percent are moderately exposed to landslide hazard. Settlements in Bharmour (30%),

*Other Essential Services includes three types of elements- Postal Services, Nutritional Centres and Public Distributional Services (PDS)

Holi (47.13%) and Multhan (21.5%) tehsils also shows a considerable area under high to very high exposure. The exposure of demographic elements (total population, female population and child population) reveals significant facts. The study area has a total population of 205528 residing in 537 villages (including 226 uninhabited). Population concentration exhibits influence of proximity to urban centre and roads. People of different ages, gender, and other demographic characteristics display distinct exposure levels. Females are amongst the most vulnerable due to social inequalities and lack of learning and economic opportunities. Similarly, exposure is also high for child population due to their dependency, lack of knowledge and ability to cope with disasters on their own. Over half of the total population (56.08%), female (56.30%), and child (58.17%) population is exposed to landslides hazard of moderate to very high level (index value ≥ 0.4). As much as a quarter (27.80 %, 28.10%, and 28.06 %, respectively) of these demographic groups has high-very high (≥ 0.6) exposure. In terms of absolute number, Chamba tehsil has the largest proportion of total population as well as female population and child population exposed to landslide hazard.

The provision of essential and non-essential services is vital to deal with disaster risk. The availability and accessibility to such services not only facilitate effective response but is crucial during disaster emergency. Health services are vital to ensure quick medical support for disaster-affected population. The study area has provision of medical services at 226 locations (Table-1), of which 142 are in Chamba tehsil, 59 in Bharmour, and 24 in Holi tehsil whereas Multhan tehsil has only one dispensary. The majority facilities are dispensary, primary health sub-centre, and primary health centre that provides basic health services only. However, lack of adequate doctors, staff, and medicines was observed during the field work. Moreover, these centers do not have adequate provisions for disaster emergency as in-patient care facility is absent except for a few locations. As per the exposure analysis, more than 63 per cent such services have moderate to very high exposure of landslides and one third fall in high to very high exposure class. Chamba tehsil has maximum number (142) of different medical services available of which 71.83 per cent falls in moderate to very high exposure; this proportion is 42.37 % and 62.50 % for Bharmour and Holi tehsils whereas Multhan tehsil being remotely located and having only one medical institution exhibits moderate exposure to landslides. Poor road connectivity is a challenge for providing emergency services in the area especially during the monsoon season and winters wherein landslides induced road blockades leads to delayed response of medical teams.

The study area is predominantly rural; life in such areas rely heavily on services such as post offices, sub-post offices, post telegraph offices, public distribution system, integrated child development scheme, Anganwadi centres, and nutritional centres. Any discontinuity in the availability of such services has serious impact on rural life. These services have locational bias; interior villages are either devoid of such provisions or services are inadequate, especially in Multhan tehsil. The exposure analysis shows that 29.71 per cent (Table-1) of such essential services has high to very high exposure. Chamba (33.65%) tehsil has the maximum proportion of these services under high to very high exposure followed by Bharmaur (23.30%) tehsil. The distribution of services is more in Chamba and Bharmour compared to other two tehsils where these are almost absent, particularly in Multhan. The exposure of educational institutions to landslide hazard is higher during the monsoons wherein several incidents in the past occurred in the proximity to such institutions. The study area has a total of 838 different educational facilities ranging from elementary schools to higher education institutes. Out of these, nearly a third (31.98%) have high to very high exposure of landslide hazard. The higher educational facilities are few and have low to moderate exposure. However, primary and middle schools have considerable exposure ranging from moderate to high level. As many as 214 (35.08%) such facilities in Chamba, 22 (26.19%) in Holi, and 32 (23.53%) in Bharmour has high to very high exposure. Multhan tehsil being a remote tribal region does not have higher educational institutes and number of schools is limited.

Therefore, its low to moderate exposure level is due to the unavailability of facilities and not because of the higher level of safety measures. Transportation is a crucial element in hilly regions that establishes links between sparsely and remotely located settlements and facilitates key services. Out of the total 537 villages, only 132 villages have access to all-weather roads. The total length of roads in the area is 951.49 km; however, road access is limited to certain villages. Moreover, many settlements have poor road conditions; most are unmetalled and in dilapidated conditions due to landslides, especially during monsoon and winter seasons. It was observed during the fieldwork that roads are highly vulnerable to landslides; frequent blockade restricts the movement of people and halts supply of key services. Nearly 41.55 % area along roads has high to very high exposure. The road network is denser in Chamba tehsil wherein 49.52 % land area along the roads has high exposure to landslides. Similarly, nearly 43.56 % and 24.09 % land along the roads in Holi and Bharmour tehsils have high to very high exposure of slope failure.

In addition to road transportation, there are 5 helipads out of which three are in Chamba and one each in Bharmour and Holi tehsil. Out of these, 2 helipads in Chamba are exposed to a high level and another 2 located in Chamba and Holi show a moderate level of exposure to landslides. A major source of livelihood in the area is agriculture and allied activities. Such activities are done on terraced farms and valley slopes susceptible to landslides during high intensity rainfall. This results in economic loss and stressed livelihood. Total cropland in the study area is 13301.67 hectare; more than 3/4th is in Chamba tehsil alone while other tehsils account for a much smaller area under cropland. Out of the total area of 98.37 hectare under plantation, Holi tehsil leads with 40.2 hectare followed by Chamba (33.25 hectare), and Bharmour (24.92 hectare). In contrast, people in Multhan tehsil so far are dependent on subsistence farming. Overall, a substantial land under agriculture (50.70%) and plantation (38.08%) displays high to very high exposure (Table-2). A significant level of exposure reflects from the fact that 81.45 % cropland in Chamba, more than 75 % in Holi, 66 % in Multhan, and 62 % in Bharmour shows moderate to very high exposure. Landslide inventory and field visits reveals several landslide sites in natural settings as well. In Holi tehsil, 31 hectares of protected forests have very high exposure. Approximately 108 hectares in Bharmour and 136 hectares in Chamba has very high to moderate exposure; the same is also observed for areas under reserved forests.

Vulnerability to Landslides

Vulnerability is a crucial component of disaster risk analysis; it is dynamic and determined by physical, environmental, social, and economic factors. Physical vulnerability has direct impact on population and infrastructure. Here, we have analysed physical vulnerability of key elements-at-risk, i.e., settlements, roads (national, state-highway, and village roads), and helipads on a relative scale of '0' (no damage) to '1' (total damage); their weightage were defined depending on each element's relative importance. The analysis shows only 0.75 % of the total area has very highly vulnerability (index ≥ 0.8) to landslides while another 14 % has moderate to high vulnerability (Table-2). Chamba (64.83 hectare) has the largest proportion under very high vulnerability followed by Holi (5.99 hectare) and Bharmour (3.93 hectare). Since population is concentrated in low altitude zones and along the roads, the physical vulnerability too is confined to such areas. It is higher in the western parts where settlements are more and larger. It has also been observed that vulnerability decreases towards higher altitudes and in the interior areas.

The other tehsils have low vulnerability that is confined to the valley floor and areas adjacent to roads and settlements.

Source: Computed by Authors Note: Area in hectares.

Social vulnerability expresses weakness in societal structure to deal with disasters. Its key markers include socially disadvantageous groups and essential services such as healthcare, educational facilities, postal facilities, nutrition centres, and PDS. These elements-at-risk examined via normalised vulnerability scores shows as much as 26 % area has moderate to very high vulnerability; about 4.18 % has very high vulnerability and another 6 % exhibits high vulnerability (Table-3). Chamba tehsil being the most populous has higher social vulnerability; more than 40 % area shows moderate to very high vulnerability while 15 % area is under high to very high vulnerability. About 14 % area in Bharmour too has moderate-very high vulnerability out of which 6 % is in high vulnerability class. The spatial distribution of social vulnerability shows concentration around certain pockets in the western and central parts of study area while eastern and northern areas have low vulnerability. The high vulnerability zone is apparent around Chamba town and other large settlements such as Sarol, Mehla, Dharwala, and Bharmour. The remaining areas are either uninhabited or have small size settlements with low population. Overall, about 26 % area exhibits high social vulnerability; such zones coincide with high population density in the study area. Economic vulnerability defines the threat of landslide to economic assets. The study area being an agrarian economy relies heavily on agriculture, horticulture, and other allied activities for livelihood and income. About 6 % area shows moderate to very high economic vulnerability.

Table-3: Risk Assessment of Upper Ravi River Catchment

Risk Elements	Risk Level (area in Hectare)					
	Very Low (Below 0.2)	Low (0.2-0.4)	Moderate (0.4-0.6)	High (0.6-0.8)	Very High (Above 0.8)	Total
Settlement Area (ha.)	1294.67 (25.85)	617.02 (12.32)	1237.32 (24.71)	1371.17 (27.38)	487.35 (9.73)	5007.53 (100)
Number of Villages	61 (19.81)	101 (32.79)	94 (30.52)	51 (16.56)	1 (0.32)	308 (100)
Total Population	22045 (10.73)	60696 (29.53)	61659 (30.00)	41195 (20.04)	19933 (9.70)	205528 (100)

Note: Values in the parenthesis are in percentp

In terms of spatial distribution, Chamba (146 hectare) tehsil has maximum area under high to very high vulnerability followed by Bharmour (38 hectare) and Holi (25 hectare) whereas less than 5 hectares in Multhan has high vulnerability (table-3). However, in terms of proportion, Multhan (7.19 %) has maximum area under moderate to very high vulnerability. It suggests that landslides have a higher potential to cause economic risk in remotely located areas. The proportion of moderate to high vulnerability in Chamba is 6.95 % while in other tehsils it remains below 4 per cent. The distribution pattern shows higher vulnerability along rivers and roads; it decreases with the altitude due to absence of arable land. A large part of study area is either uninhabited or sparsely populated with low infrastructure development. Such areas are covered with forests, highland pastures, and water bodies. An insignificant area (0.02 per cent) under such features has very high vulnerability. Holi tehsil has largest percentage of very high vulnerability; however, Chamba (97.33 hectare) and Bharmour (11.02 hectare) account for maximum area of high vulnerability. Holi tehsil has less than 10 hectares under high vulnerability; it is below 2 hectares in Multhan.

The two zones of vulnerability are most visible. First is the valley floor along the river Ravi in the western parts of Chamba tehsil and the other comprises of low to moderate vulnerability in the higher altitude areas of Holi and Multhan tehsils. The cumulative index derived by aggregating physical, social, economic, and environmental indicators shows a considerable area (19 %) under moderate to very high vulnerability (Fig.-1). Less than a per cent area falls in very high vulnerability. Out of the total 2156.27 hectare under this class, more than 85 per cent is in Chamba (1840.42 hectare) tehsil followed by Bharmour (175.4 hectare), and Holi (139.51 hectare). High vulnerability area accounts for 14321.97 hectare (4.43 per cent); Chamba is the leading vulnerable tehsil (11320.48 hectare) whereas Bharmour and Holi tehsils have a little over 1400 hectare under high vulnerability. Similarly, 45051 hectare (14 percent) display moderate vulnerability. In this category too Chamba (29427.98 hectare) has the largest proportion followed by Bharmour (7148.02 hectare), Holi (6745.16 hectare), and Multhan (1730.32 hectare). The analysis shows a visible spatial pattern of vulnerability in the catchment; clusters of high to very high vulnerability are confined to the western parts (Fig.1). The most critical sites include areas around Chamba town, Sarol, Mehla, Dharwala, and Bharmour. Moderate vulnerability surrounds these areas of high vulnerability. Chamba tehsil having more infrastructure, urban population, bigger rural settlements, and human activities display higher vulnerability especially at lower elevations and along the valley floor.

Fig. 1

Vulnerability pattern reveals higher damage potential in the narrow valley along the highway between Chamba and Bharmaur. Bharmour and Holi tehsils, where road development has taken place recently to boost hydropower projects also show moderate to high vulnerability.

Risk Assessment

Ravi River catchment demonstrate varying spatial patterns of vulnerability. These in conjunction with landslide susceptibility and the amount of elements-at-risk were further examined to analyse risk potential. The gravity of landslide risk reflects from the fact that out of the total 5007.53 hectare under settlements, more than 37 % has high to very high risk (index ≥ 0.6), and another 25 % in moderate risk category. Similarly, 17 % and 31 % villages are at high and moderate risk, respectively. In terms of population characteristics (Table-4), as much as 10 per cent, 20 per cent, and 30 per cent of the total population as well as female population is at very high (index above 0.8), high (0.6-0.8), and moderate (0.4-0.6) risk of landslides, respectively. Such proportions for child population too are of the same magnitude. The contribution of human-induced risk is therefore evident as majority of high-risk settlements are in the relatively developed parts of Chamba tehsil and its surrounding areas. The basic essential services like educational institutes under risk certainly emerge as a matter of concern since more than a quarter (25.78 per cent) are at high to very high risk alongside another 30 per cent at moderate risk (Table-4). The majority of such services are related to primary and middle schools wherein the young population do not have the skills to deal with hazardous situation. The state of affairs is no different for health services and infrastructure. A similar level of risk exists for health-related services. The areas of Holi and Multhan tehsils exhibiting low risks have no health facilities. Hence, low risk in these areas is not due to better facilities but because of its non-availability (Table-4).

Table-4: Overall Risk Assessment

Risk Class (Index Value)	Risk Potential (Area in Hectares)				
	Bharmour	Chamba	Holi	Multhan	Total
Very Low (Below 0.2)	81790.86 (38.08) (83.61)	34794.73 (16.20) (35.51)	47534.84 (22.13) (73.98)	50693.65 (23.60) (80.31)	214814.1 (100) (66.47)

Note: Values in the parenthesis are in percent

The risk is high for road infrastructure as well; 37 % of areas have high-very high risk and another 33 % have moderate risk thus making over 70 % areas along roads at risk of landslides. The worse affected areas include Chamba and Holi tehsils. Such a high risk to road infrastructure also impacts other essential and non-essential services as these provisions are directly linked to road accessibility. As a result, these services get affected and become non-functional in case of roads blocked by landslides. Rural livelihood too is at risk as cropland, plantations, and forest resources display substantial risk. The cropland and area under plantation show 36 % and 29 % area under high to very high risk while another 37 % and 32% have moderate risk, (Table-6). With more than 70 % of the area that provides income and livelihood to people under persistent risk, it is but obvious that the catchment exhibits a high degree of uncertainty in the attainment of income and the well-being of its population. The analysis demonstrates uneven spatial distribution of landslide risk. About 14.30 % area has very high (above 0.8) to moderate (0.4-0.6) risk. A noteworthy variation in the spatial distribution of risk is discernible. Three areas, viz. Multhan (95.96%), Bharmour (94.87%), and Holi (91.78%) display minimal risk; the degree of moderate to high risk in these is limited. On the contrary, Chamba tehsil has about 12 % area under high to very high risk and additional 22.42% area has moderate risk (Table-3 and Fig. 2).

Here, it is important to acknowledge that this high-risk zone has the largest proportion of population. Looking at risk potential in terms of proportion of each tehsil to the total area under a specific risk class, it is evident that risk proportion in Chamba tehsil successively increase towards higher risk classes while the same diminishes in rest of the three tehsils. Out of the total 170.86 hectare under very high-risk class, nearly 94.98% falls in Chamba alone while other three cumulatively account for less than 5 %. The same is true for high and moderate risk classes wherein Chamba alone accounts for 81.11% and 68.24%, respectively whereas remaining tehsils have much smaller proportion in these risk classes. A higher risk in Chamba tehsil is due to greater concentration of population and infrastructure whereas remotely located areas despite a high susceptibility possesses far less risk of damages by landslides. However, as infrastructure development is gradually extending to remote areas, risk to landslides in these tehsils is likely to increase.

Conclusion

This paper intended to examine the likely threats of landslides to physical, social, economic, and environmental elements in the Ravi River catchment. Visualizing risk is crucial to envisage appropriate mitigation measures and capacity building to ensure safe development. Landslides are not life-threatening in all circumstances; however, these certainly impact human activities and crucial resources in mountainous regions. Landslide driven damage to life and property is exorbitantly high in the study area. This study evaluated landslide exposure, vulnerability, and risk via a blend of quantitative or qualitative approaches. Realizing the high degree of physical susceptibility to landslides in the Ravi River catchment, this paper outlined threat potential to human population and infrastructure. The study places Chamba as one of the most perilous tehsils in the catchment in terms of landslide risk to people, settlements, agriculture, infrastructure, essential services and economic activities. On the contrary, Multhan, a poorly developed tehsil displays the least risk on account of it being low development. It is evident that the area has high degree of susceptibility to slope failure, however, risk is the product of development coinciding with landslide potential. The more developed areas possess higher risk to landslides and vice versa. The risk assessment shows high-risk clusters around Chamba town and its surrounding areas mainly Sarol, Mehla, Dharwala, and Bharmaur. The very high to moderate risk exists along the roads and an inverse relation is evident between distance from the roads and degree of risk. A discernible spatial pattern emerges that shows clusters of higher risk in the western parts of the study area. High-risk zones exist at fewer locations that are surrounded by moderate risk.

The overall assessment shows maximum risk in Chamba tehsil followed by Bharmour, Holi, and Multhan tehsils. The higher risk to landslide in Chamba tehsil is attributed to clustered human population and economic activities whereas remotely located areas of Holi and Multhan despite high physical susceptibility show much less human risk and vulnerability to landslide hazard. The latter represents a landscape with limited anthropogenic meddling; low human occupancy, and underdeveloped roads and other infrastructure. Consequently, risk to human assets and resources is low. However, as the infrastructure development would proceed to such areas, landslide hazard may pose serious challenge. The spatial distribution of high-risk zones also establishes a positive association between landslide hazard and anthropogenic activities. The analysis points to the role of human transgressions in this tectonically and climatically sensitive area. It is clear that the large parts of the catchment, either habited or uninhabited, have high susceptibility to slope failure. However, high degree of risk in populated and relatively developed parts underlines the seriousness of existing threat to human life, property, and infrastructure. Landslides may not always be life-threatening but the ongoing process of infrastructure development is likely to escalate the degree of risk. This research contributes towards anticipating threat that the local community might face in the future. It provides a base to devise appropriate mitigation measures and build capacities to deal with the risk that landslides may pose.

AN ASSESSMENT OF RAINFALL VARIABILITY ON GROUND WATER LEVEL IN TELANGANA USING LINEAR REGRESSION MODEL

Anupama Dubey and Sanjit Kumar

Abstract

Climate change will have a significant impact on freshwater supplies, as evidenced by a number of recent international studies. Groundwater is necessary for life as we know it. Global climate change can affect the availability of groundwater by influencing the amount and quality of water that is recharged, evaporated and transpired, and indirectly by affecting the amount of water pumped and abstracted. In regions where the water tables are relatively close to the surface, alterations to the groundwater system can also impact the surface water system. It is essential to comprehend the potential ramifications of climate change on groundwater systems in order to effectively and strategically manage the water supply. But it is not feasible to forecast the potential impact of climate change on groundwater systems. Forecasting impacts of climate change on groundwater systems is currently very difficult. The problem is exacerbated by the presence of uncertainty around future climate predictions.

Introduction

Climate change is expected to accelerate the hydrological cycle globally, aggravating regional and temporal differences in hydrological resource distribution (Huntington, 2006, Trenberth, 1999). Global warming is anticipated to increase the severity of extreme rainfall events in many places, even if the mean rainfall is decreasing (e.g., Wilby and Wigley, 2002). Climate adaption methods typically require accurate knowledge on the frequency of these catastrophic events. (Kumke, 2001). Many studies have been done on the issue of rainfall trends in India over the century. Others have studied changes in southwest monsoon/annual rainfall in India. According to Dash et al. (2009), Over the previous 50 years, moderate-to-heavy rainfall has decreased. India is seeing more frequent and longer monsoon

breaks with 100 mm per day rainfall in some locations, confirm this (Goswami et al., 2006). Alterations in precipitation, temperature, and evapotranspiration have a direct influence on the replenishment of groundwater. Precipitation and groundwater recharge are positively correlated. The thawing of permafrost will lead to an increase in groundwater recharge (Potter 2002; Kitabata et al. 2006). Modifying the rate of recharging will primarily result in adverse outcomes. Regions characterized by abundant rainfall are projected to experience an upward trend in precipitation, while regions with little rainfall and high rates of evaporation, which are now facing water scarcity, are anticipated to witness a decline (IPCC 2007; Issar & Zohar 2007). Immediate modifications to the existing infrastructure network are necessary in order to adapt to evolving circumstances (Potter 2002; Semadeni-Davies et al. 2007). The primary objective of this study is to investigate the impact of fluctuations in precipitation on local water resources and the accessibility of groundwater, as well as to identify significant risks and determine the most important measures for adaptation. Groundwater systems will also be affected by land use, surface water availability, human water needs, the distribution of native and cultivated plant communities, and climate change and rising carbon dioxide levels that affect native and crop plant water consumption. (Eckhardt & Ulbrich; Scanlon et al., Thomson et al.; Green et al.). Currently, there is a lack of adequate observation, understanding, and measurement of how groundwater resources respond to short-term climate variability, such as changes occurring within a year or decade. Climate change can affect groundwater systems in four ways: alterations in precipitation quantity and distribution, shifts in precipitation type (rain versus snow), and modifications in the rates of evaporation, transpiration, and groundwater extraction. Alterations in rainfall patterns can directly impact the replenishment of groundwater systems, while modifications in multiple other climatic factors can influence the different processes via which groundwater (and soil moisture) is discharged, either individually or in conjunction.

Study Region

Telangana was created on June 2, 2014, becoming the 29th state of India. Hyderabad is the capital of the state of Hyderabad. It is surrounded by four states: Maharashtra to the northwest and north; Andhra Pradesh to the south and east; and Karnataka to the west. From 15°46'N to 19°47'N is the latitude range, and from 77°16'E to 81°43'E is the longitude range. There are 1,12,077 square kilometers (43,273 square miles) in the expansion.

Objective

This paper is an attempt to correlate two variables of climate change, precipitation and ground water.

Database and Methodology

Data was compiled from various government reports, websites, census reports Telangana State Ground Water Boards, the Irrigation Department, CWC, the Ministry of Jal Shakti, and other relevant departments. The association between yearly mean rainfall and groundwater depth in the research area was determined using SPSS software. SPSS software enables us to run a linear regression model using a single dependent variable and a few independent variables. Groundwater depth was used as a dependent variable in this study, while the impact of rainfall was examined as an independent variable.

Result and Discussion

Even after mild rainfall, most of the districts in the research area had a deep groundwater level, according to the findings. The association between groundwater level and climate change is found to be similar in the state, highlighting the impact of climate change on groundwater levels. The irregularity in rainfall affects the depth of groundwater in all three states, as seen by the map of rainfall and groundwater depth. The average annual rainfall in Telangana varies between 650 m to 1200 m, depending on the region. Districts in the north and north-eastern region receive high rainfall, whereas southern districts near receive comparatively less rainfall hence coming under the first category. The coefficient of variation, on the other hand, is relatively high in southern districts and continues to decrease as one moves north-eastern in the state. This variation in rainfall has an impact on groundwater depth across the state, which may be shown on a map. Districts with substantial yearly rainfall fall into the group of districts with very shallow groundwater depths. Districts with minimal annual rainfall, on the other hand, reveal that the depth is extremely high in most part of the district. (Fig. 1)

Status of Ground Water Resources in Selected Sample States

Status of Ground Water resources in Telangana

Based on the data of Telangana district-wise average depth of ground water level data, the minimum water level is 5.43 meters below ground level (m bgl) in

Fig. 1

Khammam district and the maximum is 20.84 m bgl in Medak district in 2018. Table-1 depicts the water index of ground water levels in Telangana. Ground water levels in the range of 5.43 to 8.51 m bgl in extremely shallow depth cover 33114.64 square kilometers in Telangana, with a percentage of 28.84. This area was covered on the east and north sides of Telangana in 2018, as well as a tiny part on the south side. This range includes the whole Bhadradri (Kothagudem), Komram Bheem, and Manchrial districts, as well as portions of Wanaparthy, Hyderabad, Jagityal, Warangal Rural, Adilabad, Mahabubabad, Khammam, and Peddapally districts. In Telangana, ground water levels in the low depth range of 8.52 to 11.59 m bgl cover 31188.27 sq km, with a percentage of 2.58. In 2018, this area was covered in the northeast and south to northwest parts of Telangana, as well as a tiny amount in the southwest. This range encompasses parts of the Medak and Sanga Reddy districts. Ground water levels in the intermediate depth range of 12 to 14.67 m bgl cover 33605.2 sq km in Telangana, with a proportion of 29.26. In 2018, this area was covered in Telangana from the northwest to the middle to the south and southwest. This range includes the whole Yadadri and Sircilla districts, as well as portions of Nizamabad, Kama Reddy, Jangaon, Medchal, Nalgonda, Nagarkurnool, Rangareddy, and Mahabubnagar (Fig. 2). In Telangana, ground water levels in the range of 14.68 to 17.75 m bgl (high depth) cover 13973.73 sq km, with a percentage of 12.17. This area was covered under Telangana's west side in 2018. This range comprised the entire Vikarabad district, as well as parts of the Kama Reddy, Medak, Sanga Reddy, Rangareddy, Mahabubnagar, and Siddipet districts. Ground water levels in the range of 17.76 to 20.83 m bgl, which is very deep, cover a total area of 2958.159 sq km in Telangana, with a percentage of 28.84. This area was covered under Telangana's west side in 2018. This range includes the whole Bhadradri (Kothagudem), Komram Bheem, and Manchrial districts, as well as portions of the Wanaparthi, Hyderabad, Jagityal, Warangal Rural, Adilabad, Mahabubabad, Khammam, and Peddapally districts.

Correlation and Variation

The SPSS linear regression was used to create (Table-4). Whereas average yearly rainfall serves as the independent variable in this model, groundwater depth serves as the dependent variable. Below is a table that summarizes the model. If the R-value exceeds 0.4, which is comparable to 40%, further inquiry is necessary to establish the correlation between the maximum groundwater depth and the quantity of rainfall received. Hence, the number is 0.664, which is equal to 66.4%,

Fig. 2

indicates that model fits well under for the available data. The R-squared value rises above 0.4, indicating that more than 40% of the variable variance can be explained. The model accurately describes water usage, which is 0.440 or 44.0 percent. The decreasing R-square value indicates discovery frequency. The adjusted R-square number represents the generalizability of the results, which is also known as sample variation. The R-square and Adjusted R-square should have a marginal disparity, with both values being .390 or 39.0%, which is deemed satisfactory. Begin by referring to the model summary table. The P-value and 95% confidence level for this table were established in advance of conducting this research. As a result, statistical significance is defined as a p-value less than 0.05. As a result, the effect is substantial. As a result, the findings are critical. Similarly, the F ratio quantifies the accuracy with which a model predicts a given variable after accounting for the model's flaws. A model that is efficient can be developed with a F ratio of 8.659, which is greater than one. It explains the suitability of the sample for conducting the test. Based on these findings, there is a chance to reject the null hypothesis that there is no significant difference in groundwater depth and rainfall received, because the ANOVA's p-value is less than the tolerated level of significance. Annual rainfall and groundwater depth have a close link. This study established a relationship between the estimates (predictors) of the independent factors and the dependent variable. For each unit change in parameter estimates, the projected value increases or drops by the same amount. Univariate analysis of variance can employ effect size, parameter estimations, and cross-sectional approaches. The R square and adjusted R square values (0.440 and 0.390) remain unchanged from the previous technique, which employed a fixed effects dummy variable (t values, significant levels). The regression value of the dummy variable differs due to its interaction with a discrete dummy coexistence. The data is presented (Table-1, 2 and 3). Demonstrates a strong correlation between the depth of groundwater and the average annual precipitation.

Evaluation of Telangana Government Schemes to Increase Water Storage

Mission Kakatiya – Telangana: The aim is to increase the storage capacity of minor irrigation water resources like tanks and ponds.

Methodology Adopted

(1) Desiltation of tanks, repair of bunds, re-sectioning of irrigation channels, restoration of tributary channels, and increasing water level to Full Tank Level (FTL).

(2) Villagers participated in Gramasabhas to discuss the action plan for managing water resources in containers and ponds. Farmers were motivated to incorporate the silt into their plots.

(3) Establishment of district-level Coordination Committees to ensure continuous village participation in irrigation management.

(4) Formation of Coordination Committees at the district level to activate the villagers continuously to participate in irrigation management.

Results

(1) Increase in the capacity of reservoirs and other bodies of water to store water. The availability of water extended to small and medium-sized producers.

(2) By tilling in sediment into the fields, the land's capacity to retain water was enhanced. Additionally, the incorporation of silts into fields increased their nutrient content, which reduced the need for chemical fertilizers and increased the value of crop diversification.

(3) Groundwater level elevation. Progression of livestock and fisheries.

Conclusion

Region-specific, the average annual precipitation in Telangana ranges from 650 to 1200 meters. Northern and northeastern districts experience substantial precipitation, while southern districts in close proximity receive comparatively less precipitation, thus falling within the first category. In contrast, the coefficient of variation exhibits a comparatively high value in the southern districts and progressively declines as one traverses towards the northeastern region of the state. This variation in precipitation affects the depth of groundwater throughout the state, which may be depicted on a map. Districts characterized by significant annual precipitation are

classified as having extremely shallow groundwater depths. Conversely, districts with negligible annual precipitation exhibit exceptionally deep water throughout the majority of the district. Realizing the urgent need of water storage and percolation, government of Telangana has implemented various schemes such as Mission Kakitya and Swar, depicting substantial productive outcomes of the plans. But still there is a long way to cover, for securing water for the upcoming generations.

AVAILABILITY OF HOUSEHOLD AMENITIES AND ASSETS AMONG SCHEDULE CASTES AND NON-SCHEDULE CASTES IN RURAL HARYANA

K. V. Chamar and S. K. Chamar

Abstract

Availability of household amenities and assets reflects a household's quality of life among various social groups. For the present research work, primary data has been collected from 1365 households comprising 975 from scheduled castes category and 390 from non-scheduled castes from 39 selected villages of 15 blocks covering the five districts of Ambala, Panipat, Rohtak Rewari, and Sirsa that represent the northern, eastern, central, southern, and western parts of the Haryana state respectively. The surveyed households were represented by 37 castes comprising 24 castes from non-scheduled castes and 13 castes from scheduled castes. After that, caste-wise as well as among the scheduled castes and non-scheduled castes availability of household amenities and assets were worked out. Thereafter, caste-wise availability of amenities and assets of all the selected 16 indicators in the households were worked out in percent in proportion to total sample households. Furthermore, the weighted score has been assigned to selected amenities and assets depending upon their relative function and value to derive composite weighted scores. To find out the 'composite weighted scores' of availabilities of amenities and assets among select caste in respect to each of the indicator the 'weighted scores' have been added of all the selected indicators. Finally, to assess the levels in availability of household amenities and assets of each caste among scheduled castes and non-scheduled castes in rural Haryana, 'average composite weighted scores' have been identified by dividing the number of households of each caste among scheduled castes and non-scheduled castes of the total composite weighted scores. The analysis reveals marked variations in availability of amenities and assets among scheduled castes and non-scheduled caste in rural Haryana.

Introduction

Availability of household amenities and assets reflects a household's quality of life among various social groups. It plays an important role in our day to day life.

It also helps in the socio-economic importance of housing, improvement of housing and the condition of the households. "Safe drinking water and sanitation facilities reduce the prevalence of gastrointestinal diseases in any society. The availability of piped water, facility of electricity within the household and better electric appliances and furniture facilitate effective education among children. Likewise, availability of motor vehicles, communication and mass media strengthen the household's connection to the country as a whole. Access to these amenities thus reflects a household's quality of life. In modern era, they also act as symbol of social status among various social groups" (Desai et. al, 2010). Similarly, computer technology has also become an essential part of our daily lives. It can do complex tasks including data processing, storage and retrieval, and calculations fast, effectively and accurately. Many studies have been undertaken on the availability of household amenities or facilities and assets in different forms in India. Tiwari and Nayak, (2013) examined, "the drinking water and sanitation facilities in Uttar Pradesh.

They described the inter-regional disparity in Uttar Pradesh in the availability of drinking water and sanitation facilities. The study reveals that female literacy rate plays a significant role for improving access to sanitation facilities". Kaur and Sharma (2021) examined, "living conditions of POJK displaced persons in Jammu district by considering the various parameters such as demographic profile, family composition, family system, education, occupation, income, drinking water, house design, and housing facilities. The study reveals that the magnitude of loss of POJK displaced persons was very high. Hence, proper compensation, social security and political representation are very important issues and should be taken up seriously". Besides that few studies at micro level have also been conducted by the researchers in India. Some studies explore regional inequalities in the quality of living space in the rural areas of Haryana using tehsil level census data (Bairagai and Chamar, 2019; Chamar and Bairagi, 2019). Others are based on data collected through primary survey at micro level. Using a similar approach some studies have examined differentials in quality of living space among different clans in scheduled castes in different rural areas of Haryana at micro level (see Chamar and Rekha, 2016; Chamar and Chamar, 2018; Rani and Chamar, 2019: Dhanak and Chamar, 2021).

Study Region

Haryana is one of the most prosperous states of India. It is a landlocked state and located to the north-western part of India. It extends from 27º 39′ 0" to 30° 55′ 5" north latitudes and 74° 27′ 8" to 77° 36′ 5" east longitudes. It covers an

area of about 44,212 km2. Yamuna is the important perennial river of the state, which make its eastern boundary. Physiographically, the eastern sector of Haryana is largely plain, more fertile and featureless with better transport facilities, high literacy rate whereas the western sector is traversed by numerous sand dunes. Basically, Haryana is an agricultural state. It plays a vital role in the economy of Haryana and it is the main occupation of the people of the state. Its agriculture and manufacturing industries have experienced continuous growth after the formation of Haryana as an independent state. The economy of Haryana also relies on manufacturing, retailing and information outsourcing. Ambala, Yamunanagar, Sonipat, Gurgaon and Faridabad are the big industrial hubs of Haryana. On the other hand, Kurukshetra and Rohtak are important educational hubs. The location factor that is nearness to the National Capital (New Delhi) has helped the state to achieve the status of a leading industrialized state in India. As per 2011 census, it has 21 districts, 74 tehsils, 114 community development blocks and 6955 (6764 inhabited and 191 un-inhabited) villages. According to census 2011, out of total population of Haryana, about 165.09 lakh persons (65.12 %) live in rural areas comprising 87.74 lakhs males (53.15 %) and 77.35 lakh females ((46.85 %) persons. The total rural scheduled castes population in the study area is 37.20 lakh (22.53 %) persons, comprising 19.73 lakhs males (53.04 %) and 17.47 lakh females (46.96 %) persons, which reside in 7.23 lakh households.

Objectives

The major objective of the study is to analyze the levels in availability of household amenities and assets among scheduled castes and non-scheduled castes in rural Haryana.

Database and Methodology

The present study is based on the primary data collected on the basis of a well-structured schedule and personal interview conducted with the head/member of the household. The primary data has been collected from 1365 households comprising 975 from scheduled castes category and 390 from non-scheduled castes with the help of stratified random sampling from 39 selected villages of 15 blocks covering the five districts of Ambala, Panipat, Rohtak, Rewari, and Sirsa that represent the northern, eastern, central, southern, and western parts of the Haryana state respectively. To identify the levels in availability of household amenities and assets the following 16 indicators such as; Pipe water (X_1), Hand pump (X_2), Tube well (X_3), Toilet Facility (X_4), Electricity Facility (X_5), Chair (X_6), Fan (X_7),

Pressure Cooker (X_8), Refrigerator (X_9), Radio/Transistor (X_{10}), Television (X_{11}), Mobile only (X_{12}), Computer/Laptop (X_{13}), Bicycle (X_{14}), Scooter/Motorcycle (X_{15}), and Car/Jeep (X16) have been considered. After that, caste-wise total households have been bifurcated. The surveyed households were represented by 37 castes comprising 13 castes from scheduled castes and 24 castes from non-scheduled castes including seven from general castes and 17 from other backward castes. Initially, caste-wise availability of amenities and assets in the households were worked out in percent in proportion to total sample households. Furthermore, the weighted score has been assigned to selected amenities and assets depending upon their relative function and value (Table-1) to derive composite weighted scores. To find out the ‘composite weighted scores' of availabilities of amenities and assets among select caste in respect to each of the indicator the 'weighted scores' have been added of all the selected indicators. Finally, to assess the levels in availability of selected amenities and assets of each caste among scheduled castes and non-scheduled castes in rural Haryana, 'average composite weighted scores' have been identified by dividing the number of households of each caste among scheduled castes and non-scheduled castes of the total composite weighted scores.

Table-1: Selected Indicators and Weighted Scores

Selected Indicators	Weighted Score	Selected Indicators	Weighted Score
Pipe Water	1.0	Refrigerator	2.0
Hand Pump	0.5	Radio	0.2
Tube Well	0.5	Television	3.0
Toilet Facility	1.0	Mobile	2.0
Electricity Facility	1.0	Comp./Laptop	8.0
Chair	0.1	Cycle	0.5
Fan	0.2	Scooter/ Motorcycle	20.0
Cooker	0.2	Car/Jeep	100.0

Source: Compiled by Authors.

Results and Discussions

Based on data pertaining to 1365 sample households, the total population of 37 select castes is 6796 persons comprising 3582 males (52.71 %) and 3214 (47.29%) females in the study area (Photo-1 and 2). The data collected for study related to select 13 from scheduled castes and 24 non-scheduled castes.

Photo -1: Fieldwork Survey

Photo -2: Fieldwork Team

Population Characteristics

Based on 975 sample households, the Chamar, the Balmiki and the Dhanak are numerically dominant castes among scheduled castes which accounts for more than 84 percent population in the study area. The Odh and the Majhabi Sikh castes each shared by about four per cent. The other select castes namely the Meghwal, the Bazigar, the Khatik, the Sansi, the Doom, the Ramdasia Sikh, the Bawaria, and the Sapera accounts for nearly eight percent. The overall literacy rate among scheduled castes is about 76 percent, while the male and female literacy rates are 84 percent and 68 percent respectively. The average sex ratio is recorded 908 females per thousand males and the average size of the household is found 5 persons/household. Among the non-scheduled castes, it is noted that the Jat, the Brahman, the Ahir, the Jatt Sikh, and the Punjabi are dominant castes, which accounts for three-fifths of the total population at the time of survey. The literacy rates vary across among social groups. The highest literacy rate is observed among other backward castes (86 %) which are almost identical to that of among general castes but much higher as compared to that among scheduled castes with 76 per cent. The sex ratio is recorded 897 females/1000 males in rural Haryana. The highest sex ratio (909 females/ 1000 males) is recorded among other backward castes followed by scheduled castes (908 females/ 1000 males) and general population (841 females/ 1000 males). The average size of the household in rural Haryana is 5.0 persons, and there is not much of variation in the same across different social groups. It is recorded 4.8 persons per household among general castes, 4.9 persons among other backward castes and 5.0 persons in scheduled castes groups.

Availability of Household Amenities and Assets among Scheduled Castes

Based on sample survey, it is recorded that more than two-third households used pipe water for drinking; about 31 percent households used water from hand pump and nearly 15 percent households used tube well water for drinking. The facility of hand pump for drinking water is not available in any of the household in Odh caste. Pipe water is used by all the households belonging to the Doom and the Bawaria castes; hand pump is used by the Sapera caste and tube well is used by all the households belonging to the Ramdasia caste. About three-fifths households have the facility of toilet in the study area. Except the castes such as the Balmiki, the Dhanak, the Doom and the Sapera, all other castes have toilet facility above the average percentage. The facility of electricity is much better among all the households. About 92 percent of the households have the facility of electricity. Further, it is observed that more than two-third households have the asset of chair.

Fan is available in all the households belonging to the castes like the Khatik, the Sansi, the Ramdasia Sikh and the Sapera. Pressure cooker is used by about 46 percent of the total sample households, while little more than one-fifth households have the asset of refrigerator. The maximum availability of refrigerator is found in the Bawaria caste, followed by the Ramdasia Sikh and the Bazigar castes, while the refrigerator was not available in any of the household belonging to the castes such as the Khatik, the Sansi, the Doom and the Sapera at the time of field survey. Furthermore, it is found that about 12 percent households still fond of radio, but it is not available in any of the household belonging to the castes like the Khatik, the Sansi, the Bawaria and the Sapera. More than three-fifths households have the availability of television, and castes like the Balmiki, the Majhabi Sikh, the Sansi, the Doom and the Sapera have the asset of television below the average (62 %) in rural Haryana. On the other hand, about 73 percent households have mobile. The availability of mobile is found in all the households of the Sapera caste, followed by the Meghwal, the Odh, the Dhanak, the Ramdasia Sikh castes and the least is recorded in the Doom caste.

It may be noted that only three percent households among scheduled castes have the asset of computer and laptop, and only the Bazigar and the Chamar castes have such assets above the average that is 4.8 percent and 4.2 percent respectively. The other castes like the Odh, the Balmiki and the Dhanak have also asset of computer/ laptop. About half of the sample households have used the cycle, but it is not used in any of the household belonging to the Sapera caste. Further, about one-tenth households have scooter/motor cycle in the study area. The maximum number of households having such asset in the caste like the Bawaria, followed by the Doom and the Ramdasia castes. The lowest is recorded among the Majhabi Sikh and it is followed by the castes like Dhanak and Balmiki. Scooter/motor cycle is not found in any of the household belonging to the Sapera caste. Similarly, less than two per cent households have own car. The Odh caste has the highest number of households having own car (8.1 %), followed by the Bazigar, the Meghwal, the Majhabi Sikh and the Chamar castes, while the lowest is recorded among the Balmiki. On the other hand, the household belonging to the castes like the Dhanak, the Khatik, the Sansi, the Doom, the Ramdasia Sikh, the Bawaria and the Sapera have not their own car in the study area.

Availability of Household Amenities and Assets among Non-Scheduled Castes

Among the non-scheduled castes, it is recorded that about two-third households used pipe water for drinking; nearly one-third households used water from hand

pump and more than one-fourth households used tube well water for drinking. Pipe water is only used by all the households belonging to the Maniyar caste. On the other hand, the facility of hand pump is not available in any of the household belonging to the castes such as Rajput, the Kamboj, the Gujjar and the Muslim; and tube well water is not used by the Kumhar, the Sunar, and the Mali castes. Hand pump water is used by all the households of the Darji caste, and tube well water is used by all the households belonging to the Dhobi caste. Further, it is observed that, 86 percent households have the facility of toilet. All the caste belonging to general category and the castes belong to other backward castes such as the Jhinwar, the Kamboj, the Gujjar, the Sunar, the Darji and the Dhobi have the toilet facility above the average in the study area. All the households, except the castes like the Jhinwar, the Khati and the Lohar have the facility of electricity among the non-scheduled castes in rural Haryana.

Further, it is found that 87 percent households have the asset of chair. Except the caste like the Punjabi and the Rajput, all the households have chair among the general castes. Likewise, fan is available in nearly 97 percent of the surveyed households. The Rajput among general castes and the Jhinwar, the Khati, the Joginath, the Saini, the Kumhar and the Kashyap among other backward castes have the asset of fan below the average percentage. Pressure cooker is used by more than four-fifths of the total sample households. Little more than three-fifth households have the asset of refrigerator, while it was not available in any of the household belonging to the castes like Kashyap, the Maniyar and the Dhobi. It may be noted that a little less than one-fifth of the sample households have radio and half of the households belonging to the Rajput and the Gujjar castes still enjoying the voice of radio. Conversely, it is not available in any of the household belonging to the castes such as the Kashyap, the Mali, the Darji, the Maniyar and the Dhobi in the study area. Furthermore, about 85 percent of the surveyed households among non-scheduled castes have television and castes like the Mali and the Muslim have the asset of television less than half of the households. On the other hand, nearly 90 percent households have mobile and it is available in all the households belonging to the Bania, the Kamboj, the Gujjar, the Sunar, the Kashyap, the Mali, the Darji and the Dhobi castes and the least is found in the Maniyar caste. Only 16 percent households among non-scheduled castes have the asset of computer and laptop. However, nearly 24 percent and seven percent households have computer/laptop among the general castes and other backward castes respectively. It is not found in any of the household except the castes like the Ahir, the Kamboj, the Gujjar, and the Sunar at the time of survey in the study area.

It may be noted that more than three-fifth of the sample households still have used the cycle, but it is not found in any of the household belonging to the Maniyar and the Dhobi castes. About 48 percent households have scooter/motor cycle in the study area. All castes among the general castes and the Ahir and the Sunar among the other backward castes have scooter/motor cycle above the average percentage. Scooter/motor cycle is not found in any of the household among the caste like the Mali, the Darji, the Maniyar, the Dhobi, and the Muslim. Similarly, a little more than one-fifth of the households have own car. Half of the households belonging to the Rai Sikh caste has own car, followed by the Sunar and the Jatt Sikh castes, while the lowest is recorded among the Saini caste. On the other hand, car is not found in any of the household except the castes like the Sunar, the Ahir, the Kamboj and the Saini among the other backward castes in rural Haryana. In the preceding sections, the relative position in terms of individual variables of each of the castes among scheduled castes and non-scheduled castes of the selected variables has been discussed. In the present section, an attempt has been made to analyze the average composite weighted scores in the availability of amenities and assets of each of the caste among scheduled castes and non-scheduled castes in rural Haryana.

Caste-wise Average Composite Weighted Scores of Selected Amenities and Assets among Scheduled Castes

On the whole, based on sample households, the Odh caste has the highest average composite weighted scores in the availability of amenities like drinking water, sanitation and electricity, while the Ramdasia Sikh caste reports the lowest position followed by the Sapera and the Meghwal castes among the scheduled castes (Table-2). The castes like the Bazigar, the Khatik, the Sansi, the Majhabi Sikh and the Bawaria report above the average composite weighted scores that is 2.4. Table-2 also summarizes the caste-wise average composite weighted scores of selected assets among the scheduled castes in rural Haryana. It is found that the Odh caste has also obtained the highest average composite weighted scores of 15.8, followed by the Bazigar (13.4) and Meghwal (12.5) castes in the availability of various assets among the scheduled castes. Conversely, the Sapera caste reports the lowest position with average composite weighted scores of 3.8 and it is followed by the Sansi and the Doom castes with 5.2 scores. The other castes like the Dhanak, the Khatik, the Balmiki, and the Majhabi Sikh report below the average composite weighted scores (8.5) in the study area. Finally, it is also recorded that the first rank is obtained by the Odh caste with total composite average weighted scores of 18.5, followed by the castes like Bazigar (16.0) and Meghwal (14.6) in the availability

of various amenities and assets among the scheduled castes. On the other hand, the Sapera caste reports the lowest position with total average composite weighted scores of 5.8 and it is followed by the Doom and the Sansi with 7.4 and 7.8 scores respectively. However, the Bawaria, the Ramdasia Sikh and the Chamar castes have also better position in amenities/facilities and assets and obtained the total average composite weighted scores above from average scores in rural Haryana (Table-2).

Table-2: Average Composite Weighted Scores among Scheduled Caste

Castes	Based on Selected Amenities			Based on Selected Assets		Based on Selected Amenities and Assets

Average Composite Weighted Score of Selected Amenities and Assets among Non-Scheduled Castes

Based on sample households, the average composite weighted scores has been recorded 2.9, 2.6 and 2.8 in the availability of amenities like drinking water, sanitation and electricity among the general castes, other backward castes and non-scheduled castes respectively. However, the Rai Sikh caste has the highest average composite weighted scores (3.3), followed by the Kamboj caste (3.0),

while the Kumhar caste reports the lowest position with 2.3 average composite weighted scores in the availability of amenities among non-scheduled castes. The study also reveals that only the Kamboj, the Sunar, the Jhinwar and the Saini castes have above the average composite weighted scores (2.6) among the other backward castes particularly. Further, it may be noted that except the castes such as the Rai Sikh, the Jat, the Bania, the Rajput among the general castes, and the Kamboj and the Sunar which includes in the category of other backward castes report above the average composite weighted scores (2.8) among non-scheduled castes (Table-3). The caste-wise average composite weighted scores of selected assets among general castes, other backward castes as well as non-scheduled castes in rural Haryana has also been summarized in Table-3.

The average composite weighted scores have been recorded 50.4, 23.7, and 38.6 in the availability of various selected assets among the general castes, other backward castes and non-scheduled castes respectively. The Rai Sikh caste has also obtained the highest average composite weighted scores of 75.6, followed by the Sunar and the Jatt Sikh with average composite weighted scores of 63.8 and 60.6 respectively in the availability of various assets among the non-scheduled castes in rural Haryana. On the other hand, the Maniyar caste reports the lowest position with average composite weighted scores of 2.9, and it is followed by the Muslim and the Mali castes with 3.6 and 4.3 scores. The Bania and the Brahman castes reports below the average composite weighted scores of 50.4 among the general castes. While except the castes such as Sunar, the Kamboj, the Ahir and the Dhobi, all other select castes belong to other backward castes have below the average composite weighted scores of 23.7 in the study area. Finally, it is also recorded that the households belonging to Rai Sikh caste has comparatively better condition in availability of amenities and assets with total average composite weighted scores of 78.9, followed by the Sunar (66.5) and the Jatt Sikh (63.3) castes among select non-scheduled castes in rural Haryana.

Table-3: Average Composite Weighted Scores among Non-Scheduled Castes

Source: ICSSR: ESCAC, Field Survey, 2012-14 (Haryana). Compiled by Authors.

On the other hand, the Maniyar caste reports the lowest position in availability of amenities and assets with total average composite weighted scores of 5.4 and it is followed by the Muslim (6.1), the Mali (6.9), the Darji (8.6) the Lohar (9.7), the Jhinwar (10.0), the Kashyap (10.9) Joginath (11.1) and the Kumhar (12.2) respectively have less than half of the total average composite weighted scores among the other backward castes particularly. However, it may also be noted that the households belonging to the Brahman, the Ahir, the Punjabi, the Jat and the Rajput castes have also better position in availability of amenities and assets among non-scheduled castes in rural Haryana.

Conclusion

It is concluded that the household's quality of life among various social groups is influenced by the availability of household amenities and assets and very large variations still exist among scheduled castes and non-scheduled castes in the study area. It is recorded that Odh caste has better access to the availability of amenities and assets as compared to other scheduled castes. The first rank is obtained by the Odh caste with total composite average weighted scores of 18.5, and followed by the castes like Bazigar and Meghwal, while the Sapera caste reports the lowest position with total average composite weighted scores of 5.8 and it is followed by the Doom and the Sansi castes. The Bawaria, the Ramdasia Sikh and the Chamar castes have also better position in amenities and assets and obtained the total average composite weighted scores above from average scores (10.9) among scheduled castes in rural Haryana. Likewise, among the backward castes except the castes such as the Sunar, the Kamboj, the Ahir and the Dhobi, all other select castes have below the average composite weighted scores (26.3) in the study area. Similarly, only Brahman and the Bania castes among general castes have below the average composite weighted scores of 53.3 in the study area. Further, it may be noted that very large difference (30.5) has been observed in the average composite weighted scores between the scheduled castes (10.9) and non-scheduled castes (41.4) in the study area. Finally, it is suggested that the government should provide incentives to enhance their income level for minimizing the inter castes variations in respect of availability of household amenities and assets among scheduled castes and non-scheduled castes in particularly rural areas of Haryana state. Secondly, proper implementation and regular monitoring of schemes and programmes launched by government for better housing conditions and poverty alleviations.

WOMEN AT MARGIN: EXPLORING THE VILNERABILITY OF WOMEN IN UNORGANISED SECTOR OF JAMMU CITY

Suman Kumari, Ekjot Kour and Professor Anuradha Sharma

Abstract

The unorganised sector also known as informal sector is an important stakeholder in Indian economy. It not only contributes a significant proportion to the GDP but also provides employment to large number of low and unskilled workers. However, despite its major contribution the unorganised sector is characterised by plethora of issues such as meagre wages, poor working conditions, lack of job security etc. Further, women in this sector are more vulnerable as they face various types of exploitation owing to both economic and social status. The present paper aims to analyse the condition of women in unorganised sector of Jammu city. For the purpose of study, the workers have been categorised into various categories such as domestic, agricultural, construction and others. The study is based on primary survey where 50 respondents have been interviewed. The collected data has been tabulated with the help of MS Excel. Simple statistical tools have been used to draw the analysis. Moreover, composite index has been used to examine the vulnerability of females in this sector. It has been found that the females in this sector are more vulnerable as they are exploited in various forms such as delayed payments, physical and verbal abuse.

Introduction

In India, the unorganized sector refers to economic activities that operate outside the scope of formal labour regulations and social protection programs. This industry is characterized by its informal nature, lack of fixed hours, lack of job security, and restricted access to benefits such as health insurance, pension, and paid vacations. It includes, among others, street vendors, domestic workers, construction workers, agricultural labourers, and artisans (Rani, 2016). Despite its informal nature, the unorganized sector employs a substantial portion of the country's workforce, including a large number of women. Women's participation in this sector is driven by various factors, including the need to contribute to household income, lack of formal education and skill opportunities,

and social norms that confine them to certain occupations (Monisha & Rani, 2016). The Periodic Labour Force Survey (PLFS) 2018-2019 data reveals that approximately 96 percent of employed women in India work in the informal or unorganized sector. This staggering statistic underscores the magnitude of women's presence in this vulnerable labour market segment (Masood, 2015). While women's participation in the unorganized sector is significant, they face numerous vulnerabilities and challenges. Indeed, in the unorganized sector, both male and female workers experience exploitation, but women are particularly vulnerable due to their gender (Manju, 2017). The lack of formal employment contracts often leads to lower wages and exploitative working conditions. The women situated at the lower end of the social and economic hierarchy rely on low-paying occupations that lack recognition and job security, commonly referred to as "informal" employment (Dubey, 2016). Many women in this sector work as daily wage labourers, facing uncertainty in income and job stability. Additionally, they often lack access to maternity benefits, paid leave, and safe working conditions. Women in the unorganized sector also confront social biases and gender discrimination. Women workers are more susceptible to the dangers of sexual harassment and exploitation (Saradamoni ,1995). In some occupations, they are paid less than their male counterparts for similar work. The lack of formal recognition and protection leaves them vulnerable to harassment and abuse, with little recourse to legal support.

Study Region

Because of its historic temples and Hindu shrines, Jammu is referred to as the "City of Temples". It is the biggest city in the Jammu division of Jammu and Kashmir's union territory. This city functions as both the administrative centre for the Jammu district and the winter capital of the J&K UT. Its longitudinal extension is from 740 24' E to 750 18' E, while its latitudinal extension is between 320 50' N and 330 30' N. Situated on the banks of the Tawi River, it occupies an area of 240 square kilometres. Jammu is tucked away among the jagged, lower-elevation slopes of the Shivalik hills (Kumari et al, 2019). It is bordered to the north, east, and southeast by the Shivalik Range, to the northwest by the Trikuta Range, and the south by the northern plains. Jammu is the second most populous city in the union territory, with a sizable population. Jammu city had 502,197 residents as of the 2011 census, with 8.47% of those under the age of six. 52.7 percent of the population was male, and 47.3 percent was female. Compared to the 940 national average sex ratio, there were 898 females for every 1,000 males in the city. With a male literacy rate of 93.13% and a female literacy rate of 85.82%, Jammu's average literacy rate was

significantly higher than the 74.4% national average literacy rate. It is located in the province of Jammu's largest urbanised district (Kumari & Singh, 2024). In J&K UT, almost 85% of the workforce is employed in the unorganised sector.

Objectives

(1) To assess the socio-economic status of women workers in the unorganised sector and conditions of their work environment.

(2) To understand and analyse the level of vulnerability among different categories of women workers in the unorganised sector and issues involved.

Database and Methodology

This study was purely based on primary data collected through well-prepared schedules. To achieve the objectives, 50 women respondents were selected from different categories of informal workers based on the categorization done by the Ministry of Labour, Government of India. They have categorized the unorganized labour force into four groups in terms of occupation, nature of employment, specially distressed categories and service categories. Under the Terms of Occupation, we had taken agricultural labourers and construction workers. Under the Terms of Nature of Employment and Terms of Service Category, migrant workers and domestic workers & vendors, had been taken respectively (Dhas & Helen, 2008). To find out the level of vulnerability among different categories of informal workers, different indicators were taken i.e., physical harassment, verbal harassment, sexual harassment, mental harassment, low wage, delayed payment and irregular payment. Scores have been assigned to the frequency of harassment faced by them. Based on the above criteria, the level of vulnerability has been calculated using the composite index

Results and Discussions

Socio-economic characteristics

Table-1 shows the socio-economic profile of the unorganised workers in the Jammu city. 42 percent of women working in the unorganised sector are between the ages of 30 and 40 years, 34 percent of the respondents were between 18-30 years of age, and 24 percent were above 40 years. The unorganised sector in Jammu city constitutes 90 percent of women respondents who are married. Only 6 percent of respondents have completed the 10th standard whereas 66 percent of respondents have studied only up to the primary level in this sector.

Low level of education is one of the factors responsible for engagement in the unorganised sector. Only 19 percent of women workers in the informal sector are domiciled in J&K and the remaining 81 percent are migrants from other states, thus, making them more vulnerable to abuse, exploitation, and discrimination in unfamiliar settings. Income varies for different categories of unorganised workers according to their average daily working time. Vendors have the highest average daily working hours of 11 hours and thus the highest average monthly income of Rs. 22,300 whereas domestic workers have the lowest average monthly income of Rs. 7000 because they work for only 5 hours a day (Table-1 and Fig.-1).

Table-1: Socio-economic Characteristics of Respondents (%)

Age			Domicile		Educational level			Marital status		
18-30	30-40	More than 40	Yes	No	Primary	Middle	Secondary	Married	Unmarried	Widow
34	42	24	38	62	65.7	28.6	5.7	90	2	8

Source: Primary Survey, 2022

People may be involved in informal work because of many reasons such as lack of formal job opportunities, limited education and skills, poverty and economic necessity, lack of legal documentation, seasonal and temporary work, etc. 38 percent of the respondents reported that they are forcibly involved in the informal sector while 62 percent comes in this sector willingly. Poor educational background is the most significant factor contributing to involvement in the informal sector as 60 percent of the respondents are involved in this sector due to this reason. This suggests that individuals with limited education may find it challenging to access formal job opportunities requiring higher qualifications, leading them to opt for informal work to earn a living. Family issues combined with poor educational background are responsible for 20 percent of the respondents for involvement in this sector. This indicates that family circumstances and responsibilities can compound the challenges faced by individuals with inadequate education, making it even more difficult for them to secure formal employment. The lack of jobs in the formal sector, combined with family issues, is responsible for another 10 percent of the respondents. This suggests that in some instances, individuals may be forced into the informal sector due to a lack of available formal job opportunities in their

region or sector of expertise. The involvement of the remaining 10 percent was attributed to other reasons such as lack of legal documentation, discrimination, and preferences for the flexibility and autonomy offered by informal work. Informal workers often face challenges when accessing different facilities such as loans or credit, medical, and child care facilities. The data reveals that 28 percent of women workers have access to credit facilities, 8 percent reported that they occasionally receive credit and 64 percent of them don't get credit in times of need. Moreover, these informal workers receive credit from either their employers or private lenders rather than from banks or any other financial institutions as loans. None of the respondents had access to on-site medical facilities or any kind of medical insurance. Also, all the respondents don't have access to basic amenities like toilets and child care. Only 12 percent of the respondents have child-care facilities at their workplace. It is important to mention here that they don't have proper child-care facilities but only they are allowed to bring their child to work. Additionally, 88 percent of the respondents have access to the toilet, and the remaining 12 percent that don't have toilet facilities at work mostly belong to agricultural labourers and vendors (Mishra, 2018).

Vulnerability among Different Categories of Workers in Unorganised Sector

The level of vulnerability was assessed among the five categories of informal workers based on different parameters such as physical harassment, verbal harassment, sexual harassment, mental harassment, low wage, delayed payment, and irregular payment. The index value ranges from 0.25 to 0.41, with vendors having the highest value (0.41), making them the most vulnerable group of informal workers, and agricultural labourers having the lowest value (0.25), making them the least vulnerable (Fig. 2).

Vendors

Vendors are the most vulnerable among the other categories of informal workers with an index value of 0.41. One of the major reasons that contribute to their vulnerability is that they have no fixed working hours (Vara & Subhashini, 2019). Vendors work an average of 11 hours each day, which is the most among all categories of informal workers. Firstly, the indicator which adds most to their vulnerability is the verbal harassment they face at their work being it from customers or fellow vendors, especially from male vendors (George, 2024). Vendors work in public spaces, such as streets or open markets,

where they are exposed to various risks, including accidents, theft, and harassment from local authorities or law enforcement, leading to constant fear and insecurity in their work environment. Secondly, irregular payments make them economically vulnerable. Although among the different types of informal workers, vendors earn the most money still they are the most vulnerable because their income is highly dependent on daily sales and fluctuations in demand.

Domestic Workers

Among the different categories of informal workers, domestic workers rank as the second most vulnerable category with an index score of 0.36. Domestic workers work in private homes, isolated from public view, which can lead to increased vulnerability to abuse, harassment, and exploitation (SEWA, 2014). The lack of visibility also makes it difficult to monitor working conditions and enforce labour standards (Neetha, 2023). The main indicators that make them vulnerable are low wages and delayed wages (Singh, 2023). They have the lowest average wages among all categories of informal workers. Domestic workers often depend entirely on their employers for their livelihood, accommodation, and often food and other basic necessities (Singh, 2023). This dependency can make it difficult for them to assert their rights or report abuses for fear of losing their jobs or being evicted. Additionally, the fact that they don't take enough breaks and off days makes their job more exploitative. They may be expected to be available 24/7, with little regard for their well-being.

Construction Workers

Construction workers are more vulnerable than agricultural labourers with an index value of 0.28. The indicator that adds the most to their vulnerability is mental harassment. Construction work can be physically demanding, and the strain on the body can take a toll on the mental health of workers, especially when they do not have access to proper healthcare or recovery time (Banu & Sampath, 2018). They got minimal time for rest and relaxation and thus fatigue and stress can build up, affecting the mental well-being of workers. Low wages and the uncertainty of finding continuous work can cause financial stress and job insecurity among construction workers, leading to anxiety and depression. Moreover, women involved in construction work are migrants who are away from their families and communities, feelings of isolation and loneliness can also lead to mental health challenges.

Agricultural Labourers

Agricultural labourers are the least vulnerable category among the other categories of informal workers with an index value of 0.25. They have fixed working hours in a day and fixed wages which at least ameliorates their vulnerability a little. Despite their low wages, they believe that they have stable incomes because of the timely disbursement of wages. Moreover, they are less prone to verbal and physical harassment as their interaction with their employer and fellow workers is quite less. Their work is of seasonal and temporary nature depending on the crop cycles which leaves them vulnerable because of lack of job security and income stability resulting from their uncertain employment (Dineshkumar, 2017), (Kiranekumar, 2022).

Others Workers

Other informal work categories include women working in shops, parlours, boutiques, etc. This category is also the second most vulnerable group among the other categories of informal workers. Like vendors, their job is also interactive which makes them vulnerable to verbal abuse. They work for an average of 10 hours every day. They work long hours with no set schedule, which leaves them with little time for rest. Additionally, they also face problems of delayed and irregular payments. Informal workers face a range of challenges and issues due to the nature of their employment and the lack of formal protections. They face issues such as difficulty in managing family life, not enough income, health issues, not enough time for rest, etc (Ansari, & Mehaboob, 2018). Different categories of informal workers face different issues due to their work as shown in Figure 3. 40 percent of domestic workers reported that they face issues of difficulty in managing family life, low income, health issues, and not enough time for rest. 10 percent of them reported that they feel their income is low and also face health issues especially backaches due to the nature of their work. Moreover, 10 percent of them don't face any such issues. In case of agricultural labourers, 40 percent of them reported issues of difficulty in managing family life and not enough time for rest. It is interesting to note here that agricultural labourers don't feel that their wages are low. This may be due to the reason that they get their wages timely. 20 percent of them reported that they don't get enough time for rest due to which they face health problems. 60 percent of construction workers reported that they face difficulties in managing family life, do not have enough income to meet their needs, and also do not have enough time for rest (Kumar & Banu, 2018).

Due to all these issues, 20 percent of these workers face issues related to their health. Moreover, construction sites are also not completely safe for work and if they meet any accident, they do even not get any insurance. Three main issues that are faced by 60 percent of vendors: low income, health challenges, and difficulty juggling family responsibilities. It is noteworthy to mention that all surveyed vendors have issues that make vendors the most vulnerable among the other categories of informal workers. The category of "Others" includes women working in shops, parlours, boutiques, etc. 50 percent of such workers stated that they face difficulty in managing their family with their work. This is due to their long and not fixed working hours. Thus, 10 percent stated that they don't get enough time for rest. Additionally, 10% of them believe that their income is insufficient given their long work hours and also, they face different health problems.

Conclusion

It has been found that the women working in unorganised sector face the dual pressure of balancing work and family life. Due to lack of security, women in this sector have to work for longer hours with limited wages. Moreover, women in this category are not skilled as a result they are employed in low-income jobs. The women in this sector do not get facilities for medical care and child care. Although the women working in this sector feel that they are willingly doing this job, still they are forced by external conditions such as poor educational background, family issues and lack of jobs in the formal sector. Currently, there is a lack of official statistics on this particular sector. The govt. has come out with a good initiative called the e-shram portal for collecting and organising the data of informal workers. Skill development programmes can be organised for women working in this sector so that they can get better remuneration. There should be some provisions for insurance and medical facility for workers in this sector.

SPATIO-TEMPORAL ANALYSIS OF CROPPING PATTERN IN NILAKOTTAI TALUK OF DINDIGUL DISTRICT, TAMIL NADU

V. Parameswari and Dr. V. Emayavaramban

Abstract

The concept of agricultural regionalization is not dividing a land into different fragments but also a method of understanding the agricultural patterns. The existing patterns will strongly show the combinations of physical and socio-economic balance of an area. To map the cropping pattern the following analysis were required they include crop combination, crop diversification and crop combination. The results suggest that there are seven crops widely occupies in the study area. Among the Seven crops Flowers, Vegetables, cereals, e were the top three crops. (The high Crop diversification is observed in 23 Villages of the study area. Majority of villages are in Nilakottai block they are Kolladipatty (0.71), Nilakottai (0.75) Kullalakundu (0.71), the low crop diversification is observed Viralimayanpatti (0.17) and Kanavaipatty (0.34) in north and north eastern part of Batlagundu blocks shows lower crop diversification, other blocks in the study area have the index value more than 0.7 which indicates that the blocks have high diversification. The crop combination analysis also sight that Flowers, Vegetables, as fist ranking crop in several blocks, similarly cereals, paddy, founds as second ranking crop and paddy is found as third ranking crop in the study area. The cropping pattern analysis will provide the agricultural and agro-climatologist to suggest better land use planning of an area.

Introduction

Cropping patterns are defined as the sequence and spatial arrangement of annual crops on a piece of land. Knowledge of cropping patterns is crucial for crop production and land-use intensity. (Mahlayeye et al., 2022: Osama et al 2017). Crop concentration means the variations in the density of crop in an area/region at a given point of time (Mazid Hussain, 1965), Crop combination is a technique used to establish the boundaries of agricultural regions based on statistical comparison of acreages Florence (1948), Compared the share of a region with that of the

entire nation with the help of a location quotient method. Vivekananda M. and Sathyapriya V. S., (1994). Similarly, Bhatia (1965) used the quotient method to determine the regional concentration of crops. In the present work Jasbir Singh's (1976) technique has been adopted to identify the regional concentration of crops. Overall development depends on food production in service of existing or growing population with maximum benefits and optimal utilization of water and land resources. (Alabdulkader et al., 2012: Shreedhar et al., 2015: Vinothini et al 2019). The introduction of these crop combination methods by Bhatia (1960), Athawale (1966),). Vivekananda M. and Sathyapriya V. S., (1994). Kalaiselvi, V. (2009). In the present study Weaver's method of crop combination technique has been used to identify the temporal changes in the study area. The production has increasing trend for major crops. Productivity has increased and state agricultural growth rates are more satisfactory than national averages. (Goyal et al 20113: Peng et al., 2011: Aghajani et al 2013). The study of crop diversification is essential to the rotation of crops and the area under different crops. (Akhtar, R., & Acharya, 2015: Sun et al., 2015). . (Singh et al., 2001: Chen et al., 2018: Nematollahi et al., 2017,In order to identify the crop diversification, in present study, Gibb's Martin's Index has been applied and computed for Nilakottai Taluk ,This Journal also analysis the Nilakottai taluk ,Cropping pattern that happened between 2008-09 and 2017-18.

Study Region

The present study area Nilakottai taluk is in Dindigul district located between 1000'N to 100 17'North latitude and 77040'E to 770 68'East longitudes. Nilakottai taluk is found in the southern most part of Dindigul district. Nilakottai taluk shares borders with Kodaikanal, Aathur and Dindigul taluk in North and East Madurai district in the South of Nilakottai, Theni district is in the west. The NH 7 and state high passes through this taluk. The taluk is divided into two community block and 40 villages and 5 town panchayats of urban area for the implementation of development activities. The panchayats are grouped into two development Blocks.

Objectives

(1) To describe the crop concentration of the study are

(2) To bring out the crop combination

(3) To identify the crop diversification Disparity in Nilakottai taluk.

(4) To analysis farmers cultivated crops and their benefits

Database and Methodology

The present study is based on primary and secondary data sources. Primary data was collected at household surveys through questionnaires. A number of statistical techniques have been evolved and applied for the demarcation of crop concentration regions of which the location quotient method has been adopted by Bhatia (1965)

$$\frac{\text{Area of "x" Crop in a component aerial unit}}{\text{Area of all crops in a component aerial unit}}$$

Concentration Index of "x" Crop = Area of "x" Crop in entire region

The crop data has been computed with the help of Weaver's technique of crop combination. This is expressed as:

$$SD= \sum d2n$$

Where, d= Difference between actual crop percentage in the study region and the percentage in the theoretical distribution. n= number of crops in the given combination. The theoretical curve for the standard measurement was employed as follows; Monoculture = 100 % of the total harvested cropland in one crop. Two crop combinations = 50 % in each of two crops. Three crop combination = 33.3 % in each of three crops Four crop combination =25 % in each of four crops Five crop combination = 20 % in each of five crops Ten crop combination = 10 % in each of ten crops -Area of all crops in entire region. In present study, Gibb's Martin's Index has been applied and computed for Nilakottai Taluk. The formulas used to calculate area, as follows

$$\text{Index of Diversification} = 1-\sum x2/(\sum x)2$$

Here x is the one hundredth of total cropped area occupied by an individual crop. According to this method crop diversification varies between 0.1 - 0.9. This method is directly related to the magnitude of diversification. Here higher the index higher the diversification and lower the index lower the magnitude of diversification. where x is the percentage of total cropped area occupied by each crop under an individual crop ,if the index of diversification value close to I, the diversification is relatively high and the value not close to one ,it indicates the areal units have low diversification, If the total area in a region is devoted to one crop.

Result and Discussion

Crop Concentration in Nilakottai Taluk (2008 to 2018)

Cereals and Spices

When comparing the temporal years 2018 and 2008, it is to be noted that, the percentage of area occupied by cereals is varies from -6.50 to +37.64 per cent in that minimum is noted in Sevugampatty village of Bathalagundu block and maximum is noted in Kanavaipatty village of Bathalagundu block. Based on the data, it was observed that nearly 28 villages in the study area have decrease in area under cereals cultivation and 15 villages have notable increase in cereals cultivation. These cereals cultivation are high in Nilakkotai block than Bathalagundu block. Mean while decrease is also maximum in Bathalagundu block compared to Nilakottai block. The area under spices is not found in 5 villages in the study area, namely, Bodiakoundenpatti village of Nilakottai block, Kolladipatty village of Nilakkotai block, Kullichettipatty village of Nilakottai block, Mattaparai village of Nilakottai block and Pannaipatty village of Nilakottai block. The percentage of change is varies from -16.82 (Kanavaipatty village of Bathalagundu block to +23 per cent (Viralipatti village of Bathalagundu block). The area under cultivation of spices is decreased in 28 villages mainly distributed in the blocks of Nilakkotai and the area is increased in 10 villages distributed in the Bathalagundu blocks.

Sugar and Vegetables

Among the total 43 villages, the area under sugar crops is decreased in 22 villages and increase is noted in 5 villages namely (Nakkaluthu, pillyar natham, Malayagoundanpatti, Kullakundu, kolladipatty in southern side of Nilakotai block). The distribution of sugar crops is not found in 17 villages when comparing the temporal years. The area under change in sugar crops are varied from -16.71 per cent in Kullalakundu village of Nilakottai block to +44.8 per cent in Kanavaipatty village of Bathalagundu block. When comparing both the blocks, the sugar crops cultivation is increased in Nilakottai block than Bathalagundu block. The sugar crops cultivation is not found or no change is distributed mainly in Bathalagundu block. The cultivation of vegetables is increased in 21 villages in the study area when comparing both the years 2018 and 2008. Spatially these areas are distributed high in Bathalagundu blocks compared to Nilakottai block. The decrease is

noted in 22 villages mainly spread in the Nilakottai blocks than Bathalagundu blocks. The area under cultivation of vegetables is varies from -32.5 per cent in Ramarajapuram village of Nilakottai block to +23.73 per cent in Kanavaipatty village of Bathalagundu block.

Fibre Crops and Oil Seeds

Among the total of 43 villages, 21 villages in the study area have no cultivation of fibre crops. These villages are distributed high in Bathalagundu block than Nilakottai block. The area under fibre crops in the study area is varies from -12.02 per cent to +17.01 per cent. The minimum is noted in Viralipatti Batlagundublock and Ramarajapuram village inNilakkotai block. It is to be noted that 11 villages have increase and decrease of fibre crops in the study area. When comparing both the blocks the changes are high in Bathalagundu block than Nilakottai block. The change in area under cultivation of oil seeds is varies from -22.97 per cent in Viralimayanpatti village of Bathalagundu block to +16.63 per cent in kanavaipatty village of Bathalagundu block. From the changes data it has been observed that, increase in oil seed crop cultivation is noted in 21 villages and decrease is noted in 22 villages. The changes are noted high in Bathalagundu block compared to Nilakottai block in oil seeds cultivation during the two temporal years over the study area. (Table-1)

Flowers

The change in flower cultivation in the study area varies from -11.31 per cent in Chinnamanaickankottai village of Nilakottai block to +12.86 per cent in Musuvanuthu village of Nilakottai block. The increase in flower cultivation is noticed in 23 villages spread spatially high in _ Nilakkotai block compared to Bathalagundu block. The decrease is noted in 20 villages which are distributed high in Bathalagundu block than Nilakottai block. So, the changes in area under flower cultivation is high in Nilakottai block than block.

Crop Combination

The crop data has been computed with the help of Weaver's technique of crop combination. This is expressed as:

$$SD= \sum d2n$$

In the present study an attempt has been made to show the changes in the crop combination regions, during the period of 2008-09 and 2017-18.

Mono and Double Crop Combination

Crop combination is one of the important aspects in farming. It will help to rotate the crop and enrich the nutrients in the soil. Among the 43 villages in the taluk during 2008 and 2018, mono crop cultivation is dominated only in 5 villages of the study area. The major dominant groups of crops cultivated in the taluk are cereals, flowers and paddy. In cereals, the major crop cultivated is Bajra mainly found in Batlagundu village covering an area of 20.21sq.km constitutes 4.16 per cent of total land area of the taluk is noted in both the time periods. Among the flowers, Rottana flowers, Jasmine and Tuberose are cultivated widely in Ethilode, Malayagoundanpatti and Nadakottai villages respectively in 2008 but in 2018, Rose, Jasmine and Tulip rose are cultivated widely in Ethilode, Malayagoundanpatti and Nadakottai villages respectively. About, 31.55 sq.km of the land area was under flower cultivation covering 6.15 percent of the total land area of the taluk. The Ramarajapuram village is dominated by paddy cultivation covering the land area of 11 sq.km in both time periods. In the double crop combination, flowers, cereals, fruits, vegetables and cotton in 2008 and flowers, cereals, fruits, paddy and coconut are mixed widely in 2018 by the farmers in the study area.

It is to be noted that even though, varieties in flowers are dominantly cultivated as double crops, Rottana flowers and pitchy in Bangalapatti village, jasmine and pitchy in Kodainaickanpatti village where flowers are dominated covering the land area of 1.57 and 5.39 sq.km respectively, constitutes 1.43 per cent of the total land area of the taluk in 2008. But in 2018, along with the above said flower combinations, Charisanthiyam and Jasmine in Sivagnanapuram were also included and the total land area under flowers is 11.92 sq.km. The cereals and flowers combinations of crops cultivated in an area of 14.42 sq.km distributed in Chinnamanaickankottai and Kullalakundu villages are noted in both time periods. The double crop combination such as, flowers and fruits (Jasmine and Sapota) in Silukkuvarpatty village (9.23 sq.km), flowers and vegetables (Flag him and Olinder) combination in Koovanuthu (8.54 sq.km), paddy and vegetables (Paddy and Banana) combinations (24.02 sq.km) in Kunnuvarayan kottai and Mattaparai and Vegetables and cotton combinations (Cotton and Banana)is found in 3 villages namely Sithargal Natham, Sivagnanapuram and Pannaipatty cultivated in an area of 31.32 sq.km constitutes 6.45 per cent of the total land area of the taluk during the year 2008. But in 2018, the double crop combination such as, flowers and fruits (Jasmine and Sapota) in Silukkuvarpatty village (9.23 sq.km), flowers and fruits (Sapota and Olinder) combination in Koovanuthu (8.54 sq.km) are dominantly

found in the study area. The fruits and paddy group mainly banana and paddy are cultivated in Kunnuvarayan Kottai and Mattaparai village. The banana and coconut are cultivated in Sithargal Natham and Pannaipatty village of the study area.

Three and Four Crop Combination

The increase in the number of crops for cultivation indicates the diversification in crop combinations. The crop group under triple crops are, flowers, vegetables, fruits, paddy, cereals, cotton, oil crops and coconut are the combination widely distributed in the study area in the year 2008. But during the year 2018, the triple crop combinations are flowers, vegetables, fruits, paddy, cereals, cotton and coconut. In three crop combinations, most of the farmers cultivated flowers and vegetables as one of the mixed crops in most of the villages under triple crop in both the temporal years. The crop varieties such as, paddy, jasmine, bajra, cotton, coconut, millets, tomato, pitchy, Chrychantum, oleander, tupe rose, rose, mango, lemon, flag him and drumstick in 2008 and the crops such as paddy, jasmine, banana, coconut, lemon, tomato, millets, Chrychantum, pitchy, oleander, rose, mango, tulip, snake guard, pomegranate, flag him and drumstick are dominantly cultivated by the farmers in trip crop combinations in the study area by the year 2018. About 20 similar villages in both time periods have three crop combinations distributed in the total land area of 254 sq.km constitutes 52 per cent of total land area of the taluk but the combination of crops differs only in few villages during the study period. In the year 2008, in four crop combinations flowers, vegetables, cereals, cotton and mango are the dominant crops but in 2018, flowers, vegetables, cereals, fruits and coconut cultivated are the dominant crops by the farmers of the study area. The important crops cultivated in the four crop combinations are jasmine, oleander, drumstick, flag him, pitchy, Bajra, sorghum, mango, rose and coconut in both the time period meanwhile snake guard were added additionally in the year 2018. Only four villages in the study area have four crop combinations namely, Jambudurai kottai, Musuvanuthu, Nakkaluthu and Pallapatti. About 53.17 sq.km of the area under four crop combinations constitutes 11 per cent of the total land area of the taluk. Flowers are cultivated in four crop combinations in all the four villages of crop combinations in both time periods of study.

Five Crop Combination

Viralimayanpatti is the only village in the study area that has had five crop combinations in the past few years. The major crops group under five crop combinations are cotton, vegetables mainly tomato, paddy, cereals mainly sorghum
